Examples

```
-- Interrupt the task
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide.  For this example we will just resume.

EXEC DBMS_SQLTUNE.RESUME_TUNING_TASK(:conc_task);
```

SCHEDULE_TUNING_TASK Function

This function creates a tuning task for a single SQL statement and schedules a DBMS_SCHEDULER job to execute the tuning task. One form of the function finds the information about the statement to be tuned in the shared SQL area, whereas the other finds the information in AWR.

> **See Also:** SQL Tuning Advisor Subprograms on page 154-11 for other subprograms in this group

Syntax

Shared SQL Area Format

```
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER                    := NULL,
  start_date      IN TIMESTAMP WITH TIME ZONE  := NULL,
  scope           IN VARCHAR2                  := SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER                    := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2                  := NULL,
  description     IN VARCHAR2                  := NULL,
  con_name        IN VARCHAR2                  := NULL)
RETURN VARCHAR2;
```

AWR Format

```
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER                    := NULL,
  start_date      IN TIMESTAMP WITH TIME ZONE  := NULL,
  scope           IN VARCHAR2                  := SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER                    := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2                  := NULL,
  description     IN VARCHAR2                  := NULL,
  con_name        IN VARCHAR2                  := NULL)
RETURN VARCHAR2;
```

Parameters

Table 154–39 SCHEDULE_TUNING_TASK Function Parameters

Parameter	Description
begin_snap	The beginning snapshot identifier. The range is exclusive, which means that SQL statements in this snapshot ID are not included.
end_snap	The end snapshot identifier. The range is inclusive, which means that SQL statements in this snapshot ID are included.
sql_id	The SQL ID of the statement to be tuned.
plan_hash_value	The plan hash value of the statement to be tuned. For example, the tuning job fetches captured binds for this SQL plan.
start_date	The date on which the schedule becomes valid. If null, then SQL Tuning Advisor immediately executes the task.
scope	The scope of the tuning job: limited, or comprehensive.

Table 154–39 (Cont.) SCHEDULE_TUNING_TASK Function Parameters

Parameter	Description
time_limit	The maximum duration in seconds for the SQL tuning session.
task_name	Optional SQL tuning task name.
description	Description of the SQL tuning session. The description can contain a maximum of 256 characters.
con_name	The container from which SQL Tuning Advisor accesses the SQL statement information.

Return Values

A SQL tuning task name that is unique for each user. Multiple users can assign the same name to their advisor tasks.

Usage Notes

- The task is scheduled once only.
- The name of the scheduler job is created as follows: `sqltune_job_`*`taskid`*`_`*`orahash`*`(`*`systimestamp`*`)`.
- The caller must possess the `CREATE JOB` privilege for the job.

SCRIPT_TUNING_TASK Function

This function creates a SQL*PLUS script which can then be executed to implement a set of Advisor recommendations.

> **See Also:** SQL Tuning Advisor Subprograms on page 154-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SCRIPT_TUNING_TASK(
  task_name         IN VARCHAR2,
  rec_type          IN VARCHAR2  := REC_TYPE_ALL,
  object_id         IN NUMBER    := NULL,
  result_limit      IN NUMNBER   := NULL,
  owner_name        IN VARCHAR2  := NULL,
  execution_name    IN VARCHAR2  := NULL)
 RETURN CLOB;
```

Parameters

Table 154–40 SCRIPT_TUNING_TASK Function Parameters

Parameter	Description
task_name	Name of the tuning task for which to apply a script
rec_type	Filter the script by types of recommendations to include. Any subset of the following separated by commas: or 'ALL: ''PROFILES'' ''STATISTICS'' ''INDEXES''. For example, a script with profiles and statistics: 'PROFILES,STATISTICS'
object_id	Optionally filters by a single object ID
result_limit	Optionally shows commands for only top *n* SQL (ordered by object_id and ignored if an object_id is also specified)
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner
excution_name	Name of the task execution to use. If NULL, the script is generated for the last task execution.

Return Values

Returns a script in the form of a CLOB.

Usage Notes

- Once the script is returned, it should then by checked by the DBA and executed.
- Wrap with a call to DBMS_ADVISOR.CREATE_FILE to put it into a file.

Examples

```
SET LINESIZE 140

-- Get a script for all actions recommended by the task.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task) FROM DUAL;

-- Get a script of just the sql profiles we should create.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'PROFILES') FROM DUAL;
```

```
-- get a script of just stale / missing stats
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'STATISTICS') FROM DUAL;

-- Get a script with recommendations about just one SQL statement when we have
-- tuned an entire STS.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:sts_task, 'ALL', 5) FROM DUAL;
```

SELECT_CURSOR_CACHE Function

This function collects SQL statements from the shared SQL area.

> **See Also:** SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_CURSOR_CACHE (
  basic_filter         IN   VARCHAR2 := NULL,
  object_filter        IN   VARCHAR2 := NULL,
  ranking_measure1     IN   VARCHAR2 := NULL,
  ranking_measure2     IN   VARCHAR2 := NULL,
  ranking_measure3     IN   VARCHAR2 := NULL,
  result_percentage    IN   NUMBER   := 1,
  result_limit         IN   NUMBER   := NULL,
  attribute_list       IN   VARCHAR2 := NULL,
  recursive_sql        IN   VARCHAR2 := HAS_RECURSIVE_SQL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 154–41 SELECT_CURSOR_CACHE Function Parameters

Parameter	Description
basic_filter	The SQL predicate to filter the SQL from the shared SQL area defined on attributes of the SQLSET_ROW. If basic_filter is not set by the caller, the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.
object_filter	Currently not supported.
ranking_measure(n)	An order-by clause on the selected SQL.
result_percentage	A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.
result_limit	The top L(imit) SQL from the (filtered) source ranked by the ranking measure
attribute_list	List of SQL statement attributes to return in the result. The possible values are: ■ TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list (default) ■ BASIC - all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result. ■ ALL - return all attributes ■ Comma separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN,SQL_PLAN_STATISTICS: similar to SQL_PLAN + row source statistics
recursive_sql	Filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).

Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the shared SQL area views.

Examples

```
-- Get sql ids and sql text for statements with 500 buffer gets.
SELECT sql_id, sql_text
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;

-- Get all the information we have about a particular statement.
SELECT *
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('sql_id = ''4rm4183czbs7j'''));

-- Notice that some statements can have multiple plans.  The output of the
-- SELECT_XXX table functions is unique by (sql_id, plan_hash_value).  This is
-- because a data source can store multiple plans per sql statement.
SELECT sql_id, plan_hash_value
FROM table(dbms_sqltune.select_cursor_cache('sql_id = ''ay1m3ssvtrh24'''))
ORDER BY sql_id, plan_hash_value;

-- PL/SQL examples: load_sqlset is called after opening a cursor, along the
-- lines given below

-- Select all statements in the shared SQL area.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT value(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;/

-- Look for statements not parsed by SYS.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur for
    SELECT VALUE(P)
    FROM table(
     DBMS_SQLTUNE.SELECT_CURSOR_CACHE('parsing_schema_name <> ''SYS''')) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
end;/
```

```
-- All statements from a particular module/action.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(
      DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
         'module = ''MY_APPLICATION'' and action = ''MY_ACTION''')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;/

-- all statements that ran for at least five seconds
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('elapsed_time > 5000000')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;/

-- select all statements that pass a simple buffer_gets threshold and
-- are coming from an APPS user
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(
      DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
        'buffer_gets > 100 and parsing_schema_name = ''APPS'''))P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;/

-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and binds
-- for performance reasons - in this case the SQL_PLAN attribute of sqlset_row
-- is NULL)
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(dbms_sqltune.select_cursor_cache(
      'elapsed_time > 5000000', NULL, NULL, NULL, NULL, 1, NULL,
```

```
      'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;/

-- Select the top 100 statements in the shared SQL area ordering by elapsed_time.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
                                                NULL,
                                                'ELAPSED_TIME', NULL, NULL,
                                                1,
                                                100)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;/

-- Select the set of statements which cumulatively account for 90% of the
-- buffer gets in the shared SQL area.  This means that the buffer gets of all
-- of these statements added up is approximately 90% of the sum of all
-- statements currently in the cache.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
                                                NULL,
                                                'BUFFER_GETS', NULL, NULL,
                                                .9)) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/
```

SELECT_SQL_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

> **See Also:** SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_SQL_TRACE (
  directory              IN VARCHAR2,
  file_name              IN VARCHAR2 := NULL,
  mapping_table_name     IN VARCHAR2 := NULL,
  mapping_table_owner    IN VARCHAR2 := NULL,,
  select_mode            IN POSITIVE := SINGLE_EXECUTION,
  options                IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
  pattern_start          IN VARCHAR2 := NULL,
  pattern_end            IN VARCHAR2 := NULL,
  result_limit           IN POSITIVE := NULL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 154–42 SELECT_SQL_TRACE Function Parameters

Parameter	Description
`directory`	The directory object containing the trace file(s). This field is mandatory.
`file_name`	All or part of name of the trace file(s) to process. If `NULL` then the current or most recent file in the specified location or path is used. `'%'` wildcards are supported for matching trace file names.
`mapping_table_name`	The mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is `NULL`, the mappings in the current database is used.
`mapping_table_owner`	the mapping table owner. If it is `NULL`, the current user is used.
`select_mode`	the mode for selecting SQL from the trace. By default, it is `SINGLE_EXECUTION`. ■ `SINGLE_EXECUTION` - return one execution of a SQL.(default). ■ `ALL_EXECUTIONS` - return all executions.
`options`	The options. By default, it is `LIMITED_COMMAND_TYPE` which can be specified to include SQL statements from all Oracle command types. ■ `LIMITED_COMMAND_TYPE` - returns the SQL statements with the command types `CREATE`, `INSERT`, `SELECT`, `UPDATE`, `DELETE`, `UPSERT`. It is the default. ■ `ALL_COMMAND_TYPE` - returns the SQL statements with all command types.
`pattern_start`	Opening delimiting pattern of the trace file section(s) to consider. CURRENTLY INOPERABLE.
`pattern_end`	closing delimiting pattern of the trace file section(s) to process. CURRENTLY INOPERABLE.

Table 154–42 (Cont.) SELECT_SQL_TRACE Function Parameters

Parameter	Description
result_limit	Top SQL from the (filtered) source. Default to MAXSB4 if NULL.

Return Values

This function returns a SQLSET_ROW object.

Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
   FROM dba_objects
   WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
                             'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
                             'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
                             'LOB', 'OPERATOR', 'PACKAGE',
                             'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
                             'RESOURCE PLAN', 'TRIGGER', 'TYPE',
                             'TYPE BODY')
UNION ALL
SELECT user_id id, username owner, NULL name
   FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
   cur sys_refcursor;
BEGIN
   OPEN cur FOR
   SELECT value(p)
     FROM TABLE(
        DBMS_SQLTUNE.SELECT_SQL_TRACE(
           directory=>'SQL_TRACE_DIR',
           file_name=>'%trc',
           mapping_table_name=>'mapping')) p;
   DBMS_SQLTUNE.LOAD_SQLSET('my_sts', cur);
   CLOSE cur;
END;
/
```

SELECT_SQLPA_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

See Also:

- SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group
- *Oracle Database Testing Guide*

Syntax

```
DBMS_SQLTUNE.SELECT_SQLPA_TASK(
    task_name         IN VARCHAR2,
    task_owner        IN VARCHAR2 := NULL,
    execution_name    IN VARCHAR2 := NULL,
    level_filter      IN VARCHAR2 := 'REGRESSED',
    basic_filter      IN VARCHAR2 := NULL,
    object_filter     IN VARCHAR2 := NULL,
    attribute_list    IN VARCHAR2 := 'TYPICAL')
  RETURN sys.sqlset PIPELINED;
```

Parameters

Table 154–43 SELECT_SQLPA_TASK Function Parameters

Parameter	Description
task_name	Name of the SQL Performance Analyzer task
task_owner	Owner of the SQL Performance Analyzer task. If NULL, then assume the current user.
execution_name	Name of the SQL Performance Analyzer task execution (type COMPARE PERFORMANCE) from which the provided filters will be applied. If NULL, then assume the most recent COMPARE PERFORMANCE execution.
level_filter	Filter to specify which subset of SQL statements to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed. ■ IMPROVED includes only improved SQL. ■ REGRESSED includes only regressed SQL (default). ■ CHANGED includes only SQL with changed performance. ■ UNCHANGED includes only SQL with unchanged performance. ■ CHANGED_PLANS includes only SQL with plan changes. ■ UNCHANGED_PLANS includes only SQL with unchanged plans. ■ ERRORS includes only SQL with errors only. ■ MISSING_SQL includes only missing SQL statements (across STS). ■ NEW_SQL includes only new SQL statements (across STS).
basic filter	SQL predicate to filter the SQL in addition to the level filters.
object_filter	Currently not supported.

Table 154–43 (Cont.) SELECT_SQLPA_TASK Function Parameters

Parameter	Description
attribute_list	List of SQL statement attributes to return in the result. The possible values are: ■ TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list (default) ■ BASIC - all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result. ■ ALL - return all attributes ■ Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).

Return Values

This function returns a SQL tuning set object.

Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

SELECT_SQLSET Function

This function reads SQLSET contents.

> **See Also:** SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_SQLSET (
  sqlset_name          IN   VARCHAR2,
  basic_filter         IN   VARCHAR2 := NULL,
  object_filter        IN   VARCHAR2 := NULL,
  ranking_measure1     IN   VARCHAR2 := NULL,
  ranking_measure2     IN   VARCHAR2 := NULL,
  ranking_measure3     IN   VARCHAR2 := NULL,
  result_percentage    IN   NUMBER   := 1,
  result_limit         IN   NUMBER   := NULL)
  attribute_list       IN   VARCHAR2 := NULL,
  plan_filter          IN   VARCHAR2 := NULL,
  sqlset_owner         IN   VARCHAR2 := NULL,
  recursive_sql        IN   VARCHAR2 := HAS_RECURSIVE_SQL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 154–44 SELECT_SQLSET Function Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
basic_filter	The SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the SQLSET_ROW
object_filter	Currently not supported.
ranking_measure(n)	An order-by clause on the selected SQL
result_percentage	A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.
result_limit	The top L(imit) SQL from the (filtered) source ranked by the ranking measure
attribute_list	List of SQL statement attributes to return in the result. The possible values are: ■ TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list (default) ■ BASIC - all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result. ■ ALL - return all attributes ■ Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).
plan_filter	The plan filter

Table 154–44 (Cont.) SELECT_SQLSET Function Parameters

Parameter	Description
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner
recursive_sql	Filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).

Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_sqlset('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

SELECT_WORKLOAD_REPOSITORY Function

This function collects SQL statements from the workload repository. The overloaded forms let you:

- Collect SQL statements from all snapshots between `begin_snap` and `end_snap`.
- Collect SQL statements from a workload repository baseline.

> **See Also:** SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
  begin_snap        IN NUMBER,
  end_snap          IN NUMBER,
  basic_filter      IN VARCHAR2 := NULL,
  object_filter     IN VARCHAR2 := NULL,
  ranking_measure1  IN VARCHAR2 := NULL,
  ranking_measure2  IN VARCHAR2 := NULL,
  ranking_measure3  IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := 1,
  result_limit      IN NUMBER   := NULL,
  attribute_list    IN VARCHAR2 := NULL,
  recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL)
 RETURN sys.sqlset PIPELINED;

DBMS_SQLTUNE.SELECT_WORKLOAD REPOSITORY (
  baseline_name     IN VARCHAR2,
  basic_filter      IN VARCHAR2 := NULL,
  object_filter     IN VARCHAR2 := NULL,
  ranking_measure1  IN VARCHAR2 := NULL,
  ranking_measure2  IN VARCHAR2 := NULL,
  ranking_measure3  IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := 1,
  result_limit      IN NUMBER   := NULL,
  attribute_list    IN VARCHAR2 := NULL,
  recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 154–45 SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
`begin_snap`	Begin snapshot (non-inclusive).
`end_snap`	End snapshot (inclusive).
`baseline_name`	The name of the baseline period.
`basic_filter`	The SQL predicate to filter the SQL from the workload repository defined on attributes of the `SQLSET_ROW`. If `basic_filter` is not set by the caller, the subprogram captures only statements of the type `CREATE TABLE`, `INSERT`, `SELECT`, `UPDATE`, `DELETE`, and `MERGE`.
`object_filter`	Currently not supported.
`ranking_measure(n)`	An order-by clause on the selected SQL.

Table 154–45 (Cont.) SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
result_percentage	A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.
result_limit	The top L(imit) SQL from the (filtered) source ranked by the ranking measure.
attribute_list	List of SQL statement attributes to return in the result. The possible values are: ■ TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list (default) ■ BASIC - all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result. ■ ALL - return all attributes ■ Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).
recursive_sql	Filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).

Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_workload_repository(1,2)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

SET_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER`.

> **See Also:** SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (
   task_name    IN  VARCHAR2,
   parameter    IN  VARCHAR2,
   value        IN  VARCHAR2);

DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (
   task_name    IN  VARCHAR2,
   parameter    IN  VARCHAR2,
   value        IN  NUMBER);
```

Parameters

Table 154–46 SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
`task_name`	Identifier of the task to execute

Table 154–46 (Cont.) SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
parameter	Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2: ■ APPLY_CAPTURED_COMPILENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). ■ BASIC_FILTER: basic filter for SQL tuning set ■ DAYS_TO_EXPIRE: number of days until the task is deleted ■ DEFAULT_EXECUTION_TYPE: the task defaults to this type of execution when none is specified by the EXECUTE_TUNING_TASK Function and Procedure ■ EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions is deleted (without deleting the task) ■ LOCAL_TIME_LIMIT: per-statement time out (seconds) ■ MODE: tuning scope (comprehensive, limited) ■ OBJECT_FILTER: object filter for SQL tuning set ■ PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) ■ RANK_MEASURE1: first ranking measure for SQL tuning set ■ RANK_MEASURE2: second possible ranking measure for SQL tuning set ■ RANK_MEASURE3: third possible ranking measure for SQL tuning set ■ RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER ■ SQL_LIMIT: maximum number of SQL statements to tune ■ SQL_PERCENTAGE: percentage filter of SQL tuning set statements ■ TEST_EXECUTE: FULL/AUTO/OFF. * FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set) * AUTO - test-execute for an automatically-chosen time proportional to the tuning time * OFF - do not test-execute ■ TIME_LIMIT: global time out (seconds) ■ USERNAME: username under which the statement is parsed
value	New value of the specified parameter

Usage Notes

When setting automatic tuning task parameters, use the SET_AUTO_TUNING_TASK_PARAMETER Procedures in the DBMS_AUTO_SQLTUNE package.

SQLTEXT_TO_SIGNATURE Function

This function returns a SQL text's signature. The signature can be used to identify SQL text in `dba_sql_profiles`.

> **See Also:** SQL Profile Subprograms on page 154-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SQLTEXT_TO_SIGNATURE (
  sql_text    IN CLOB,  force_match IN BOOLEAN  := FALSE)
 RETURN NUMBER;
```

Parameters

Table 154–47 SQLTEXT_TO_SIGNATURE Function Parameters

Parameter	Description
`sql_text`	SQL text whose signature is required. Required.
`force_match`	If `TRUE`, this returns a signature that supports SQL matching with literal values transformed into bind variables. If `FALSE`, returns the signature based on the text with literals not transformed

Return Values

This function returns the signature of the specified SQL text.

UNPACK_STGTAB_SQLPROF Procedure

This procedure copies profile data stored in the staging table to create profiles on the system.

> **See Also:** SQL Profile Subprograms on page 154-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF (
   profile_name          IN VARCHAR2 := '%',
   profile_category      IN VARCHAR2 := 'DEFAULT',
   replace               IN BOOLEAN,
   staging_table_name    IN VARCHAR2,
   staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 154–48 UNPACK_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
profile_name	The name of the profile to unpack (% wildcards acceptable, case-sensitive)
profile_category	The category from which to unpack profiles (% wildcards acceptable, case-sensitive)
replace	The option to replace profiles if they already exist. Note that profiles cannot be replaced if one in the staging table has the same name as an active profile in a different SQL statement.If FALSE, this function raises errors if you try to create a profile that already exists
staging_table_name	The name of the table on which to perform the remap operation (case-insensitive unless double quoted). Required.
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)

Usage Notes

Using this procedure requires the CREATE ANY SQL PROFILE privilege and the SELECT privilege on staging table.

Examples

```
-- Unpack all profiles stored in a staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(replace            => FALSE, -
                                        staging_table_name => 'PROFILE_STGTAB');

-- If there is a failure during the unpack operation, users can find the profile
-- we failed on and perform a remap_stgtab_sqlprof operation targeting it.  Then
-- they can resume the unpack operation by setting replace to TRUE so that
-- the profiles that were already created are replaced
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(replace            => TRUE, -
                                        staging_table_name => 'PROFILE_STGTAB');
```

UNPACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

> **See Also:** SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET (
   sqlset_name          IN VARCHAR2 := '%',
   sqlset_owner         IN VARCHAR2 := NULL,
   replace              IN BOOLEAN,
   staging_table_name   IN VARCHAR2,
   staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

Table 154–49 UNPACK_STGTAB_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The name of the tuning set to unpack (not NULL). Wildcard characters ('%') are supported to unpack multiple tuning sets in a single call. For example, just specify '%' to unpack all tuning sets from the staging table.
sqlset_owner	The name of tuning set owner, or NULL for current schema owner. Wildcards supported.
replace	Replaces tuning set if they already exist.If FALSE, raises errors if you try to create a tuning set that already exists
staging_table_name	The name of the staging table, moved after a call to the PACK_STGTAB_SQLSET Procedure (case-sensitive)
staging_schema_owner	The name of staging table owner, or NULL for current schema owner (case-sensitive)

Usage Notes

- Users can drop the staging table after this procedure completes successfully.
- The unpack procedure commits after successfully loading each SQL tuning set. If it fails with one tuning set, no part of that tuning set will have been unpacked, but those which the subprogram had already apprehended continue to exist.
- When failures occur due to SQL tuning set name or owner conflicts, users should use the REMAP_STGTAB_SQLSET Procedure to patch the staging table, and then call this procedure again to unpack those tuning sets that remain.

Examples

```
 -- unpack all STS in the staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name         => '%', -
                                       sqlset_owner        => '%', -
                                       replace             => FALSE, -
                                       staging_table_name  => 'STGTAB_SQLSET');

-- errors can arise during STS unpack when a STS in the staging table has the
-- same name/owner as STS on the system.  In this case, users should call
```

```
-- remap_stgtab_sqlset to patch the staging table and with which to call unpack
-- Replace set to TRUE.
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name         => '%', -
                                       sqlset_owner        => '%', -
                                       replace             => TRUE, -
                                       staging_table_name  => 'STGTAB_SQLSET');
```

UPDATE_SQLSET Procedures

This procedure updates selected fields for SQL statement in a SQL tuning set.

> **See Also:** SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UPDATE_SQLSET (
   sqlset_name      IN  VARCHAR2,
   sql_id           IN  VARCHAR2,
   attribute_name   IN  VARCHAR2,
   attribute_value  IN  VARCHAR2 := NULL);

DBMS_SQLTUNE.UPDATE_SQLSET (
   sqlset_name      IN  VARCHAR2,
   sql_id           IN  VARCHAR2,
   attribute_name   IN  VARCHAR2,
   attribute_value IN NUMBER := NULL);
```

Parameters

Table 154–50 UPDATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
sql_id	The identifier of the statement to update
attribute_name	The name of the attribute to modify
attribute_value	The new value of the attribute

155

DBMS_STATS

With the DBMS_STATS package you can view and modify optimizer statistics gathered for database objects.

> **See Also:** *Oracle Database SQL Tuning Guide*

This chapter contains the following topics:

Using DBMS_STATS

This section contains topics which relate to using the `DBMS_STATS` package.

Overview

The Oracle RDBMS allows you to collect statistics of many different kinds as an aid to improving performance. This package is concerned with optimizer statistics only. Given that Oracle sets automatic statistics collection of this kind on by default, this package is intended for only specialized cases.

The statistics of interest to be viewed or modified can reside in the dictionary or in a table created in the user's schema for this purpose. You can also collect and manage user-defined statistics for tables and domain indexes using this package.

For example, if the `DELETE_COLUMN_STATS` procedure is invoked on a column for which an association is defined, user-defined statistics for that column are deleted in addition to deletion of the standard statistics.

Only statistics stored in the dictionary have an impact on the cost-based optimizer. You can also use `DBMS_STATS` to gather statistics in parallel

> **See Also:** *Oracle Database SQL Tuning Guide* for more information about "Managing Optimizer Statistics".

Deprecated Subprograms

> **Note:** Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.

The following subprogram is deprecated with Oracle Database 12*c* and later:

- `GENERATE_STATS`

  This procdure is replaced by the `GATHER_INDEX_STAT` procedure.

  See Also: "GATHER_INDEX_STATS Procedure" on page 155-80

Types

Types for the minimum and maximum values and histogram endpoints include:

```
TYPE numarray  IS VARRAY(2050) OF NUMBER;
TYPE datearray IS VARRAY(2050) OF DATE;
TYPE chararray IS VARRAY(2050) OF VARCHAR2(4000);
TYPE rawarray  IS VARRAY(2050) OF RAW(2000);
TYPE fltarray  IS VARRAY(2050) OF BINARY_FLOAT;
TYPE dblarray  IS VARRAY(2050) OF BINARY_DOUBLE;
```

Types for listing stale tables include:

```
TYPE ObjectElem IS RECORD (
  ownname     VARCHAR2(30),     -- owner
  objtype     VARCHAR2(6),      -- 'TABLE' or 'INDEX'
  objname     VARCHAR2(30),     -- table/index
  partname    VARCHAR2(30),     -- partition
  subpartname VARCHAR2(30));    -- subpartition
type ObjectTab is TABLE of ObjectElem;
```

Type for displaying statistics difference report:

```
TYPE DiffRepElem IS RECORD (
 report     CLOB,              -- stats difference report
 maxdiffpct number);           -- max stats difference (percentage)
type DiffRepTab is table of DiffRepElem;
```

Constants

The DBMS_STATS package uses the constants shown in Table 155–1:

Table 155–1 DBMS_STATS Constants

Name	Type	Description
ADD_GLOBAL_PREFS	NUMBER	Copies global preferences
AUTO_CASCADE	BOOLEAN	Lets Oracle decide whether to collect statistics for indexes or not
AUTO_DEGREE	NUMBER	Lets Oracle select the degree of parallelism based on size of the object, number of CPUs and initialization parameters
AUTO_INVALIDATE	BOOLEAN	Lets Oracle decide when to invalidate dependent cursors
AUTO_SAMPLE_SIZE	NUMBER	Indicates that auto-sample size algorithms should be used
PURGE_ALL	TIMESTAMP WITH TIME ZONE	A flag that can be passed to the PURGE_STATS Procedure and unconditionally deletes all the history statistics. The deletion uses TRUNCATE statements on the various dictionary statistics tables holding the history of statistics.
RECLAIM_SYNOPSIS	TIMESTAMP WITH TIME ZONE	A constant used for reclaiming synopsis table space.

Operational Notes

The DBMS_STATS subprograms perform the following general operations:

- Gathering Optimizer Statistics
- Setting or Getting Statistics
- Deleting Statistics
- Transferring Statistics
- Locking or Unlocking Statistics
- Restoring and Purging Statistics History
- User-Defined Statistics
- Pending Statistics
- Comparing Statistics
- Extended Statistics

Most of the DBMS_STATS procedures include the three parameters statown, stattab, and statid. These parameters allow you to store statistics in your own tables (outside of the dictionary), which does not affect the optimizer. Therefore, you can maintain and experiment with *sets* of statistics.

The stattab parameter specifies the name of a table in which to hold statistics, and it is assumed that it resides in the same schema as the object for which statistics are collected (unless the statown parameter is specified). You can create multiple tables with different stattab identifiers to hold separate sets of statistics.

Additionally, you can maintain different sets of statistics within a single stattab by using the statid parameter, which avoids cluttering the user's schema.

For the SET and GET procedures, if stattab is not provided (that is, NULL), then the operation works directly on the dictionary statistics; therefore, you do not need to create these statistics tables if they only plan to modify the dictionary directly. However, if stattab is not NULL, then the SET or GET operation works on the specified user statistics table, and not the dictionary.

You can change the default values of some of the parameters of DBMS_STATS procedures using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Most of the procedures in this package commit the current transaction, perform the operation, and then commit again.

Most of the procedures have a parameter, force which allows you to override any lock on statistics.Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring.

Gathering Optimizer Statistics

Use the following subprograms to gather certain classes of optimizer statistics, with possible performance improvements over the ANALYZE command:

GATHER_DATABASE_STATS Procedures
GATHER_DICTIONARY_STATS Procedure
GATHER_FIXED_OBJECTS_STATS Procedure
GATHER_INDEX_STATS Procedure
GATHER_SCHEMA_STATS Procedures

GATHER_SYSTEM_STATS Procedure
GATHER_TABLE_STATS Procedure

The GATHER_* procedures also collect user-defined statistics for columns and domain indexes.

The statown, stattab, and statid parameters instruct the package to back up current statistics in the specified table before gathering new statistics.

Oracle also provides the following procedure for generating statistics for derived objects when you have sufficient statistics on related objects:

GENERATE_STATS Procedure

Setting or Getting Statistics

Use the following subprograms to store and retrieve individual column-related, index-related, and table-related statistics:

PREPARE_COLUMN_VALUES Procedures
PREPARE_COLUMN_VALUES_NVARCHAR Procedure
PREPARE_COLUMN_VALUES_ROWID Procedure

SEED_COL_USAGE Procedure
SET_INDEX_STATS Procedures
SET_SYSTEM_STATS Procedure
SET_TABLE_STATS Procedure

GET_COLUMN_STATS Procedures
GET_INDEX_STATS Procedures
GET_SYSTEM_STATS Procedure
GET_TABLE_STATS Procedure

In the special versions of the SET_*_STATS procedures for setting user-defined statistics, the following, if provided, are stored in the dictionary or user statistics table:

- User-defined statistics
- Owner of statistics type
- Name of statistics type

The user-defined statistics and the corresponding statistics type are inserted into the USTATS$ dictionary table. You can specify user-defined statistics without specifying the statistics type name.

The special versions of the GET_*_STATS procedures return user-defined statistics and the statistics type owner and name as OUT arguments corresponding to the schema object specified. If user-defined statistics are not collected, NULL values are returned.

Deleting Statistics

The DELETE_* procedures delete both user-defined statistics and the standard statistics for the given schema object.

DELETE_COLUMN_STATS Procedure
DELETE_DATABASE_STATS Procedure
DELETE_DICTIONARY_STATS Procedure
DELETE_FIXED_OBJECTS_STATS Procedure
DELETE_INDEX_STATS Procedure
DELETE_SCHEMA_STATS Procedure

DELETE_SYSTEM_STATS Procedure
DELETE_TABLE_STATS Procedure

Note that DELETE_TABLE_STATS, DELETE_DICTIONARY_STATS, DELETE_DATABASE_STATS and DELETE_SCHEMA_STATS have a parameter stat_category which specifies which statistics to delete. The parameter accepts multiple values separated by comma. The supported values are 'OBJECT_STATS' (table statistics, column statistics and index statistics) and 'SYNOPSES' (auxiliary statistics created when statistics are incrementally maintained). The default is 'OBJECT_STATS, SYNOPSES'.

Transferring Statistics

Use the following procedures for creating and dropping the user statistics table.

CREATE_STAT_TABLE Procedure
DROP_STAT_TABLE Procedure

Use the following procedures to transfer statistics

- from the dictionary to a user statistics table (EXPORT_*)
- from a user statistics table to the dictionary (IMPORT_*)

EXPORT_COLUMN_STATS Procedure
EXPORT_DATABASE_STATS Procedure
EXPORT_DICTIONARY_STATS Procedure
EXPORT_FIXED_OBJECTS_STATS Procedure
EXPORT_INDEX_STATS Procedure
EXPORT_SCHEMA_STATS Procedure
EXPORT_SYSTEM_STATS Procedure
EXPORT_TABLE_STATS Procedure

IMPORT_COLUMN_STATS Procedure
IMPORT_DATABASE_STATS Procedure
IMPORT_DICTIONARY_STATS Procedure
IMPORT_FIXED_OBJECTS_STATS Procedure
IMPORT_INDEX_STATS Procedure
IMPORT_SCHEMA_STATS Procedure
IMPORT_SYSTEM_STATS Procedure
IMPORT_TABLE_STATS Procedure

Note: Oracle does not support export or import of statistics across databases of different character sets.

Locking or Unlocking Statistics

Use the following procedures to lock and unlock statistics on objects.

LOCK_PARTITION_STATS Procedure
LOCK_SCHEMA_STATS Procedure
LOCK_TABLE_STATS Procedure

UNLOCK_PARTITION_STATS Procedure
UNLOCK_SCHEMA_STATS Procedure
UNLOCK_TABLE_STATS Procedure

The LOCK_* procedures either freeze the current set of the statistics or to keep the statistics untouched.When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

Restoring and Purging Statistics History

Use the following procedures to restore statistics as of a specified timestamp. This is useful in case newly collected statistics leads to some sub-optimal execution plans and the administrator wants to revert to the previous set of statistics.

RESET_GLOBAL_PREF_DEFAULTS Procedure
RESTORE_DATABASE_STATS Procedure
RESTORE_DICTIONARY_STATS Procedure
RESTORE_FIXED_OBJECTS_STATS Procedure
RESTORE_SCHEMA_STATS Procedure
RESTORE_SYSTEM_STATS Procedure
RESTORE_TABLE_STATS Procedure

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring. The old statistics are purged automatically at regular intervals based on the statistics history retention setting and the time of recent statistics gathering performed in the system. Retention is configurable using the ALTER_STATS_HISTORY_RETENTION Procedure.

The other DBMS_STATS procedures related to restoring statistics are:

- PURGE_STATS Procedure: This procedure lets you manually purge old versions beyond a time stamp.
- GET_STATS_HISTORY_RETENTION Function: This function gets the current statistics history retention value.
- GET_STATS_HISTORY_AVAILABILITY Function: This function gets the oldest time stamp where statistics history is available. Users cannot restore statistics to a time stamp older than the oldest time stamp.

RESTORE_* operations are not supported for user defined statistics.

User-Defined Statistics

The DBMS_STATS package supports operations on user-defined statistics. When a domain index or column is associated with a statistics type (using the associate statement), operations on the index or column manipulate user-defined statistics. For example, gathering statistics for a domain index (for which an association with a statistics type exists) using the GET_INDEX_STATS Procedures invokes the user-defined statistics collection method of the associated statistics type. Similarly, delete, transfer, import, and export operations manipulate user-defined statistics.

SET_* and GET_* operations for user-defined statistics are also supported using a special version of the SET and GET interfaces for columns and indexes.

EXPORT_*, IMPORT_* and RESTORE_* operations are not supported for user defined statistics.

Pending Statistics

The package gathers statistics and stores it in the dictionary by default. User's can store these statistics in the system's private area instead of the dictionary by turning the PUBLISH option to FALSE using the SET*PREFS procedures. The default value for

PUBLISH is TRUE.The statistics stored in private area are not used by Cost Based Optimizer unless parameter optimizer_use_pending_statistics is set to TRUE. The default value of this parameter is FALSE and this boolean parameter can be set at the session/system level. Users can verify the impact of the new statistics on query plans by using the pending statistics on a session.

Pending statistics provide a mechanism to verify the impact of the new statistics on query plans before making them available for general use. There are two scenarios to verify the query plans:

- Export the pending statistics (use the EXPORT_PENDING_STATS Procedure) to a test system, then run the query workload and check the performance or plans.
- Set optimizer_use_pending_statistics to TRUE in a session on the system where pending statistics have been gathered, run the workload, and check the performance or plans.

Once the performance or query plans have been verified, the pending statistics can be published (run the PUBLISH_PENDING_STATS Procedure) if the performance is acceptable or delete (run the DELETE_PENDING_STATS Procedure) if not.

Pending statistics can be published, exported, or deleted. The following procedures are provided to manage pending statistics:

- DELETE_PENDING_STATS Procedure
- EXPORT_PENDING_STATS Procedure
- PUBLISH_PENDING_STATS Procedure

Comparing Statistics

The DIFF_TABLE_STATS_* statistics can be used to compare statistics for a table from two different sources. The statistics can be from:

- two different user statistics tables
- a single user statistics table containing two sets of statistics that can be identified using statids
- a user statistics table and dictionary history
- pending statistics

The functions also compare the statistics of the dependent objects (indexes, columns, partitions). They displays statistics of the object(s) from both sources if the difference between those statistics exceeds a certain threshold. The threshold can be specified as an argument to the function, with a default of 10%. The statistics corresponding to the first source (stattab1 or time1) will be used as basis for computing the differential percentage.

Extended Statistics

This package allows you to collect statistics for column groups and expressions. The statistics collected for column groups and expressions are called "extended statistics".

Statistics on column groups are used by optimizer for accounting correlation between columns. For example, if a query has predicates c1=1 and c2=1 and if there are statistics on column group (c1, c2), the optimizer will use this statistics for estimating the combined selectivity of the predicates.The expression statistics are used by optimizer for estimating selectivity of predicates on those expressions. The extended statistics are similar to column statistics and the procedures that take columns names will accept extended statistics names in place of column names.

Related subprograms:

- CREATE_EXTENDED_STATS Function
- DROP_EXTENDED_STATS Procedure
- SHOW_EXTENDED_STATS_NAME Function

Deprecated Subprograms

The following subprograms are obsolete with Oracle Database 11*g* Release 2 (11.2):

- GET_PARAM Function

  Instead, use GET_PREFS Function
- SET_PARAM Procedure

  Instead, use SET_GLOBAL_PREFS Procedure
- RESET_PARAM_DEFAULTS Procedure

  Instead use RESET_GLOBAL_PREF_DEFAULTS Procedure

Data Structures

The DBMS_STATS package defines a RECORD type.

RECORD Types

- STAT_REC Record Type

STAT_REC Record Type

This record type is provided for users in case they want to set column statistics manually. Its fields allow specifying column min/max values, as well as a histogram for a column.

Syntax

```
TYPE STATREC IS RECORD (
  epc    NUMBER,
  minval RAW(2000),
  maxval RAW(2000),
  bkvals NUMARRAY,
  novals NUMARRAY,
  chvals CHARARRAY,
  eavals RAWARRAY,
  rpcnts NUMARRAY,
  eavs   NUMBER);
```

Fields

Table 155–2 STAT_REC Attributes

Field	Description
epc	Number of buckets in histogram
minval	Minimum value
maxval	Maximum value
bkvals	Array of bucket numbers
novals	Array of normalized end point values
chvals	Array of dumped end point values
eavals	Array of end point actual values
rpcnts	Array of end point value frequencies
eavs	A number indicating whether actual end point values are needed in the histogram. If using the PREPARE_COLUMN_VALUES Procedures, this field will be automatically filled.

Summary of DBMS_STATS Subprograms

Table 155–3 DBMS_STATS Package Subprograms

Subprogram	Description
ALTER_STATS_HISTORY_RETENTION Procedure on page 155-22	Changes the statistics history retention value
CONVERT_RAW_VALUE Procedures on page 155-23	Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value
CONVERT_RAW_VALUE_NVARCHAR Procedure on page 155-24	Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value
CONVERT_RAW_VALUE_ROWID Procedure on page 155-25	Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value
COPY_TABLE_STATS Procedure on page 155-26	Copies the statistics of the source [sub] partition to the destination [sub] partition after scaling
CREATE_EXTENDED_STATS Function on page 155-28	Creates a virtual column for a user specified column group or an expression in a table
CREATE_STAT_TABLE Procedure on page 155-30	Creates a table with name `stattab` in `ownname`'s schema which is capable of holding statistics
DELETE_COLUMN_STATS Procedure on page 155-31	Deletes column-related statistics
DELETE_DATABASE_PREFS Procedure on page 155-33	Deletes the statistics preferences of all the tables
DELETE_DATABASE_STATS Procedure on page 155-35	Deletes statistics for the entire database
DELETE_DICTIONARY_STATS Procedure on page 155-36	Deletes statistics for all dictionary schemas ('`SYS`', '`SYSTEM`' and RDBMS component schemas)
DELETE_FIXED_OBJECTS_STATS Procedure on page 155-35	Deletes statistics of all fixed tables
DELETE_INDEX_STATS Procedure on page 155-39	Deletes index-related statistics
DELETE_PENDING_STATS Procedure on page 155-41	Deletes the private statistics that have been collected but have not been published
DELETE_PROCESSING_RATE Procedure on page 155-42	Deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources
DELETE_SCHEMA_PREFS Procedure on page 155-43	Deletes the statistics preferences of all the tables owned by the specified owner name
DELETE_SCHEMA_STATS Procedure on page 155-45	Deletes schema-related statistics
DELETE_SYSTEM_STATS Procedure on page 155-46	Deletes system statistics
DELETE_TABLE_PREFS Procedure on page 155-47	Deletes statistics preferences of the specified table in the specified schema
DELETE_TABLE_STATS Procedure on page 155-49	Deletes table-related statistics

Table 155–3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
DIFF_TABLE_STATS_IN_HISTORY Function on page 155-51	Compares statistics for a table from two timestamps in past and compare the statistics as of that timestamps
DIFF_TABLE_STATS_IN_PENDING Function on page 155-52	Compares pending statistics and statistics as of a timestamp or statistics from dictionary
DIFF_TABLE_STATS_IN_STATTAB Function on page 155-53	Compares statistics for a table from two different sources
DROP_EXTENDED_STATS Procedure on page 155-55	Drops the statistics entry that is created for the user specified extension
DROP_STAT_TABLE Procedure on page 155-56	Drops a user statistics table created by `CREATE_STAT_TABLE`
EXPORT_COLUMN_STATS Procedure on page 155-57	Retrieves statistics for a particular column and stores them in the user statistics table identified by `stattab`
EXPORT_DATABASE_PREFS Procedure on page 155-58	Exports the statistics preferences of all the tables
EXPORT_DATABASE_STATS Procedure on page 155-59	Retrieves statistics for all objects in the database and stores them in the user statistics table identified by `statown.stattab`
EXPORT_DICTIONARY_STATS Procedure on page 155-60	Retrieves statistics for all dictionary schemas ('`SYS`', '`SYSTEM`' and RDBMS component schemas) and stores them in the user statistics table identified by `stattab`
EXPORT_FIXED_OBJECTS_STATS Procedure on page 155-61	Retrieves statistics for fixed tables and stores them in the user statistics table identified by `stattab`
EXPORT_INDEX_STATS Procedure on page 155-62	Retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`
EXPORT_PENDING_STATS Procedure on page 155-63	Exports the statistics gathered and stored as pending
EXPORT_SCHEMA_PREFS Procedure on page 155-64	Exports the statistics preferences of all the tables owned by the specified owner name
EXPORT_SCHEMA_STATS Procedure on page 155-65	Retrieves statistics for all objects in the schema identified by `ownname` and stores them in the user statistics table identified by `stattab`
EXPORT_SYSTEM_STATS Procedure on page 155-66	Retrieves system statistics and stores them in the user statistics table
EXPORT_TABLE_PREFS Procedure on page 155-67	Exports statistics preferences of the specified table in the specified schema into the specified statistics table
EXPORT_TABLE_STATS Procedure on page 155-68	Retrieves statistics for a particular table and stores them in the user statistics table
FLUSH_DATABASE_MONITORING_INFO Procedure on page 155-70	Flushes in-memory monitoring information for all the tables to the dictionary
GATHER_DATABASE_STATS Procedures on page 155-71	Gathers statistics for all objects in the database
GATHER_DICTIONARY_STATS Procedure on page 155-71	Gathers statistics for dictionary schemas '`SYS`', '`SYSTEM`' and schemas of RDBMS components
GATHER_FIXED_OBJECTS_STATS Procedure on page 155-79	Gathers statistics of fixed objects

Table 155–3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
GATHER_INDEX_STATS Procedure on page 155-80	Gathers index statistics
GATHER_PROCESSING_RATE Procedure on page 155-82	Starts the job of gathering the processing rates which end after `interval` defined in minutes
GATHER_SCHEMA_STATS Procedures on page 155-83	Gathers statistics for all objects in a schema
GATHER_SYSTEM_STATS Procedure on page 155-87	Gathers system statistics
GATHER_TABLE_STATS Procedure on page 155-89	Gathers table and column (and index) statistics
GENERATE_STATS Procedure on page 155-93	Generates object statistics from previously collected statistics of related objects
GET_COLUMN_STATS Procedures on page 155-94	Gets all column-related information
GET_INDEX_STATS Procedures on page 155-96	Gets all index-related information
GET_PARAM Function on page 155-99	Gets the default value of parameters of `DBMS_STATS` procedures [see Deprecated Subprograms on page 155-13]
GET_PREFS Function on page 155-100	Gets the default value of the specified preference
GET_STATS_HISTORY_ AVAILABILITY Function on page 155-105	Gets the oldest timestamp where statistics history is available
GET_STATS_HISTORY_ RETENTION Function on page 155-106	Returns the current statistics history retention value
GET_SYSTEM_STATS Procedure on page 155-107	Gets system statistics from `stattab`, or from the dictionary if `stattab` is `NULL`
GET_TABLE_STATS Procedure on page 155-109	Gets all table-related information
IMPORT_COLUMN_STATS Procedure on page 155-111	Retrieves statistics for a particular column from the user statistics table identified by `stattab` and stores them in the dictionary
IMPORT_DATABASE_PREFS Procedure on page 155-113	Imports the statistics preferences of all the tables
IMPORT_DATABASE_STATS Procedure on page 155-114	Retrieves statistics for all objects in the database from the user statistics table and stores them in the dictionary
IMPORT_DICTIONARY_STATS Procedure on page 155-116	Retrieves statistics for all dictionary schemas ('`SYS`', '`SYSTEM`' and RDBMS component schemas) from the user statistics table and stores them in the dictionary
IMPORT_FIXED_OBJECTS_ STATS Procedure on page 155-118	Retrieves statistics for fixed tables from the user statistics table identified by `stattab` and stores them in the dictionary
IMPORT_INDEX_STATS Procedure on page 155-119	Retrieves statistics for a particular index from the user statistics table identified by `stattab` and stores them in the dictionary

Table 155–3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
IMPORT_SCHEMA_PREFS Procedure on page 155-121	Imports the statistics preferences of all the tables owned by the specified owner name
IMPORT_SCHEMA_STATS Procedure on page 155-122	Retrieves statistics for all objects in the schema identified by `ownname` from the user statistics table and stores them in the dictionary
IMPORT_SYSTEM_STATS Procedure on page 155-124	Retrieves system statistics from the user statistics table and stores them in the dictionary
IMPORT_TABLE_PREFS Procedure on page 155-125	Sets the statistics preferences of the specified table in the specified schema
IMPORT_TABLE_STATS Procedure on page 155-126	Retrieves statistics for a particular table from the user statistics table identified by `stattab` and stores them in the dictionary
LOCK_PARTITION_STATS Procedure on page 155-128	Locks statistics for a partition
LOCK_SCHEMA_STATS Procedure on page 155-129	Locks the statistics of all tables of a schema
LOCK_TABLE_STATS Procedure on page 155-130	Locks the statistics on the table
MERGE_COL_USAGE Procedure on page 155-131	Merges column usage information from a source database, by means of a `dblink`, into the local database
PREPARE_COLUMN_VALUES Procedures on page 155-132	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SEED_COL_USAGE Procedure
PREPARE_COLUMN_VALUES_ NVARCHAR Procedure on page 155-135	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SEED_COL_USAGE Procedure
PREPARE_COLUMN_VALUES_ ROWID Procedure on page 155-137	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SEED_COL_USAGE Procedure
PUBLISH_PENDING_STATS Procedure on page 155-139	Publishes the statistics gathered and stored as pending
PURGE_STATS Procedure on page 155-140	Purges old versions of statistics saved in the dictionary
REMAP_STAT_TABLE Procedure on page 155-141	Remaps the names of objects in the user statistics table
REPORT_COL_USAGE Function on page 155-142	Reports the recorded column (group) usage information
REPORT_GATHER_AUTO_ STATS Function on page 155-143	Runs the auto statistics gathering job in reporting mode
REPORT_GATHER_DATABASE_ STATS Functions on page 155-146	Runs the GATHER_DATABASE_STATS Procedures in reporting mode.
REPORT_GATHER_ DICTIONARY_STATS Functions on page 155-152	Runs the GATHER_DICTIONARY_STATS Procedure in reporting mode
REPORT_GATHER_FIXED_OBJ_ STATS Function on page 155-158	Runs the GATHER_FIXED_OBJECTS_STATS Procedure in reporting mode

Table 155–3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
REPORT_GATHER_SCHEMA_ STATS Functions on page 155-161	Runs the GATHER_SCHEMA_STATS Procedures in reporting mode
REPORT_GATHER_TABLE_ STATS Function on page 155-167	Runs the GATHER_TABLE_STATS Procedure in reporting mode
REPORT_SINGLE_STATS_ OPERATION Function on page 155-172	Generates a report for the provided operation optionally in a particular pluggable database (PDB) in a multitenant environment
REPORT_STATS_OPERATIONS Function on page 155-175	Generates a report of all statistics operations that take place between two timestamps which may or may not have been provided
RESET_GLOBAL_PREF_ DEFAULTS Procedure on page 155-177	Resets the default values of all parameters to Oracle recommended values
RESET_PARAM_DEFAULTS Procedure on page 155-178	Resets global preferences to default values [see Deprecated Subprograms on page 155-13]
RESTORE_DICTIONARY_STATS Procedure on page 155-180	Restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp
RESTORE_FIXED_OBJECTS_ STATS Procedure on page 155-181	Restores statistics of all fixed tables as of a specified timestamp
RESTORE_SCHEMA_STATS Procedure on page 155-182	Restores statistics of all tables of a schema as of a specified timestamp
RESTORE_SYSTEM_STATS Procedure on page 155-183	Restores statistics of all tables of a schema as of a specified timestamp
RESTORE_TABLE_STATS Procedure on page 155-184	Restores statistics of a table as of a specified timestamp (as_of_timestamp), as well as statistics of associated indexes and columns
SEED_COL_USAGE Procedure on page 155-185	Iterates over the SQL statements in the specified SQL tuning set, compiles them and seeds column usage information for the columns that appear in these statements
SET_COLUMN_STATS Procedures on page 155-186	Sets column-related information
SET_DATABASE_PREFS Procedure on page 155-188	Sets the statistics preferences of all the tables
SET_GLOBAL_PREFS Procedure on page 155-185	Sets the global statistics preferences
SET_INDEX_STATS Procedures on page 155-196	Sets index-related information
SET_PARAM Procedure on page 155-199	Sets default values for parameters of DBMS_STATS procedures [see Deprecated Subprograms on page 155-13]
SET_PROCESSING_RATE Procedure on page 155-201	Sets the value of rate of processing for a given operation
SET_SCHEMA_PREFS Procedure on page 155-202	Sets the statistics preferences of all the tables owned by the specified owner name
SET_SYSTEM_STATS Procedure on page 155-207	Sets system statistics

Table 155–3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
SET_TABLE_PREFS Procedure on page 155-209	Sets the statistics preferences of the specified table in the specified schema
SET_TABLE_STATS Procedure on page 155-213	Sets table-related information
SHOW_EXTENDED_STATS_ NAME Function on page 155-215	Returns the name of the virtual column that is created for the user-specified extension
TRANSFER_STATS Procedure on page 155-216	Transfers statistics for specified table(s) from a remote database specified by `dblink` to the local database
UNLOCK_PARTITION_STATS Procedure on page 155-217	Unlocks the statistics for a partition
UNLOCK_SCHEMA_STATS Procedure on page 155-218	Unlocks the statistics on all the tables in schema
UNLOCK_TABLE_STATS Procedure on page 155-219	Unlocks the statistics on the table
UPGRADE_STAT_TABLE Procedure on page 155-220	Upgrades user statistics on an older table

ALTER_STATS_HISTORY_RETENTION Procedure

This procedure changes the statistics history retention value. Statistics history retention is used by both the automatic purge and PURGE_STATS Procedure.

Syntax

```
DBMS_STATS.ALTER_STATS_HISTORY_RETENTION (
   retention       IN     NUMBER);
```

Parameters

Table 155–4 ALTER_STATS_HISTORY_RETENTION Procedure Parameters

Parameter	Description
retention	The retention time in days. The statistics history will be retained for at least these many number of days.The valid range is [1,365000]. Also you can use the following values for special purposes: ■ -1: Statistics history is never purged by automatic purge ■ 0: Old statistics are never saved. The automatic purge will delete all statistics history ■ NULL: Change statistics history retention to default value

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Insufficient privileges

CONVERT_RAW_VALUE Procedures

This procedure converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value. The `minval`, `maxval`, and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT BINARY_FLOAT);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT BINARY_DOUBLE);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT DATE);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT NUMBER);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT VARCHAR2);
```

Parameters

Table 155–5 CONVERT_RAW_VALUE Procedure Parameters

Parameter	Description
`rawval`	Raw representation of a column minimum, maximum, histogram end point actual value
`resval`	Converted, type-specific value

Usage Notes

No special privilege or role is needed to invoke this procedure.

CONVERT_RAW_VALUE_NVARCHAR Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value. The `minval`, `maxval` and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_NVARCHAR (
   rawval     RAW,
   resval OUT NVARCHAR2);
```

Parameters

Table 155–6 CONVERT_RAW_VALUE_NVARCHAR Procedure Parameters

Parameter	Description
`rawval`	The raw representation of a column minimum or maximum datatype-specific output parameters
`resval`	The converted, type-specific value

Usage Notes

No special privilege or role is needed to invoke this procedure.

CONVERT_RAW_VALUE_ROWID Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value. The `minval`, `maxval` and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_ROWID (
   rawval     RAW,
   resval OUT ROWID);
```

Pragmas

```
pragma restrict_references(convert_raw_value_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 155–7 CONVERT_RAW_VALUE_ROWID Procedure Parameters

Parameter	Description
`rawval`	The raw representation of a column minimum or maximum datatype-specific output parameters
`resval`	The converted, type-specific value

Usage Notes

No special privilege or role is needed to invoke this procedure.

COPY_TABLE_STATS Procedure

This procedure copies the statistics of the source [sub] partition to the destination [sub] partition. It also copies statistics of all dependent object such as columns and local indexes. If the statistics for source are not available then nothing is copied. It can optionally scale the statistics (such as the number of `blks`, or number of rows) based on the given `scale_factor`.

Syntax

```
DBMS_STATS.COPY_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   srcpartname      VARCHAR2,
   dstpartname      VARCHAR2,
   scale_factor     VARCHAR2 DEFAULT 1,
   flags            NUMBER DEFAULT NULL,
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 155–8 COPY_TABLE_STATS Procedure Parameters

Parameter	Description
`ownname`	Schema of the table of source and destination [sub] partitions
`tabname`	Table name of source and destination [sub] partitions
`srcpartname`	Source [sub] partition
`dtspartname`	Destination [sub] partition
`scale_factor`	Scale factor to scale `nblks`, `nrows` etc. in `dstpartname`
`flags`	For internal Oracle use (should be left as `NULL`)
`force`	When value of this argument is `TRUE` copy statistics even if the destination [sub]partition is locked

Exceptions

`ORA-20000`: Invalid [sub]partition name

`ORA-20001`: Bad input value

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

This procedure updates the minimum and maximum values of destination partition for the first partitioning column as follows:

- If the partitioning type is `HASH` the minimum and maximum values of the destination partition are same as that of the source partition.
- If the partitioning type is `LIST` then
  - If the destination partition is a `NOT DEFAULT` partition then

        * The minimum value of the destination partition is set to the minimum value of the value list that describes the destination partition
        * The maximum value of the destination partition is set to the maximum value of the value list that describes the destination partition.
    - Alternatively, if the destination partition is a `DEFAULT` partition, then
        * The minimum value of the destination partition is set to the minimum value of the source partition
        * The maximum value of the destination partition is set to the maximum value of the source partition
- If the partitioning type is `RANGE` then
    - The minimum value of the destination partition is set to the high bound of previous partition unless the destination partition is the first partition. For the first partition, the minimum value is set to the high bound of the destination partition.
    - The maximum value of the destination partition is set to the high bound of the destination partition unless the high bound of the destination partition is `MAXVALUE`, in which case the maximum value of the destination partition is set to the high bound of the previous partition.
    - If the source partition column's minimum value is equal to its maximum value, and both are equal to the source partition's lower bound, and it has a single distinct value, then the destination partition column's minimum and maximum values are both set to the destination partition's lower bound. This is done for all partitioning columns.

      If the above condition does not apply, second and subsequent partitioning columns are updated as follows. The destination partition column's maximum value is set to the greater of the destination partition upper bound and the source partition column's maximum value, with one exception. If the destination partition is `D` and its preceding partition is `D-1` and the key column to be adjusted is `Cn`, the maximum value for `Cn` is set to the upper bound of `D` (ignoring the maximum value of the source partition column) provided that the upper bounds of the previous key column `Cn-1` are the same in partitions `D` and `D-1`.
- If the minimum and maximum values are different for a column after modifications, and if the number of distinct values is less than 1, the number of distinct values is updated as 2.
- This procedure does not copy statistics of the underlying subpartitions if the source/destination is a partition of a composite partitioned table.

CREATE_EXTENDED_STATS Function

This function creates a column statistics entry in the system for a user specified column group or an expression in a table. Statistics for this extension will be gathered when user or auto statistics gathering job gathers statistics for the table. We call statistics for such an extension, "extended statistics". This function returns the name of this newly created entry for the extension.

This second form creates statistics extension based on the column group usage recorded by the SEED_COL_USAGE Procedure. This function returns a report of extensions created.

Syntax

```
DBMS_STATS.CREATE_EXTENDED_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2,
   extension  VARCHAR2)
 RETURN VARCHAR2;

DBMS_STATS.CREATE_EXTENDED_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2,
   extension  VARCHAR2)
 RETURN CLOB;
```

Parameters

Table 155–9 CREATE_EXTENDED_STATS Function Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

Return Values

This function returns the name of this newly created entry for the extension.

Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported

ORA-20001: Error when processing extension

ORA-20007: Extension already exists

ORA-20008: Reached the upper limit on number of extensions

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

There are nine restrictions on the extension:

- The extension cannot contain a virtual column.
- Extensions cannot be created on tables owned by `SYS`.
- Extensions cannot be created on cluster tables, index organized tables, temporary tables or external tables.
- The total number of extensions in a table cannot be greater than a maximum of (20, 10% of number of non-virtual columns in the table).
- The number of columns in a column group must be in the range [2, 32].
- A column can not appear more than once in a column group.
- A column group can not contain expressions.
- An expression must contain at least one column.
- An expression can not contain a subquery.
- The `COMPATIBLE` parameter needs to be 11.0.0.0.0 or greater

CREATE_STAT_TABLE Procedure

This procedure creates a table with name `stattab` in `ownname`'s schema which is capable of holding statistics. The columns and types that compose this table are not relevant as it should be accessed solely through the procedures in this package.

Syntax

```
DBMS_STATS.CREATE_STAT_TABLE (
   ownname             VARCHAR2,
   stattab             VARCHAR2,
   tblspace            VARCHAR2 DEFAULT NULL,
   global_temporary    BOOLEAN DEFAULT FALSE);
```

Parameters

Table 155–10 CREATE_STAT_TABLE Procedure Parameters

Parameter	Description
`ownname`	Name of the schema
`stattab`	Name of the table to create. This value should be passed as the `stattab` parameter to other procedures when the user does not want to modify the dictionary statistics directly.
`tblspace`	Tablespace in which to create the statistics tables. If none is specified, then they are created in the user's default tablespace.
`global_temporary`	Whether or not the table should be created as a global temporary table

Exceptions

`ORA-20000`: Table already exists or insufficient privileges

`ORA-20001`: Tablespace does not exist

Usage Notes

To invoke this procedure you need whichever privileges are required for creating a table in the specified schema.

DELETE_COLUMN_STATS Procedure

This procedure deletes column-related statistics.

Syntax

```
DBMS_STATS.DELETE_COLUMN_STATS (
   ownname         VARCHAR2,
   tabname         VARCHAR2,
   colname         VARCHAR2,
   partname        VARCHAR2 DEFAULT NULL,
   stattab         VARCHAR2 DEFAULT NULL,
   statid          VARCHAR2 DEFAULT NULL,
   cascade_parts   BOOLEAN  DEFAULT TRUE,
   statown         VARCHAR2 DEFAULT NULL,
   no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type (
                                  get_param('NO_INVALIDATE')),
   force           BOOLEAN  DEFAULT FALSE,
   col_stat_type   VARCHAR2 DEFAULT 'ALL');
```

Parameters

Table 155–11 DELETE_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition for which to delete the statistics. If the table is partitioned and if partname is NULL, then global column statistics are deleted.
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).
cascade_parts	If the table is partitioned and if partname is NULL, then setting this to true causes the deletion of statistics for this column for all underlying partitions as well.
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	When value of this argument is TRUE, deletes column statistics even if locked

Table 155–11 (Cont.) DELETE_COLUMN_STATS Procedure Parameters

Parameter	Description
col_stat_type	Type of column statistics to be deleted.This argument takes the following values: ■ HISTOGRAM - delete column histogram only ■ ALL - delete base column statistics and histogram

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

DELETE_DATABASE_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

```
DBMS_STATS.DELETE_DATABASE_PREFS (
    pname            IN   VARCHAR2,
    add_sys          IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 155–12 DELETE_DATABASE_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The existing value for following preferences can be deleted and default preference values will be used: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ INCREMENTAL_STALENESS ■ INCREMENTAL_LEVEL ■ STALE_PERCENT ■ GLOBAL_TEMP_TABLE_STATS ■ TABLE_CACHED_BLOCKS ■ OPTIONS
.	CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics
.	DEGREE - The value determines degree of parallelism used for gathering statistics
.	ESTIMATE_PERCENT - The value determines the percentage of rows to estimate.
.	METHOD_OPT - The value controls column statistics collection and histogram creation. When setting preference on global, schema, database or dictionary level, only'FOR ALL' syntax is allowed.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned)

Table 155–12 (Cont.) DELETE_DATABASE_PREFS Procedure Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed.
.	INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan.
	INCREMENTAL_LEVEL - This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.
	INCREMENTAL_STALENESS - This value controls how we decide a partition or subpartition as stale.
.	STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.
	GLOBAL_TEMP_TABLE_STATS - This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.
	TABLE_CACHED_BLOCKS - The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor.
	OPTIONS - Determines the options parameter used in the GATHER_TABLE_STATS Procedure. T
add_sys	Determines whether SYS tables will be included.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- All pname arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_DATABASE_PREFS('CASCADE', FALSE);
DBMS_STATS.DELETE_DATABASE_PREFS('ESTIMATE_PERCENT',TRUE);
```

See Also: *Oracle Database SQL Tuning Guide* for more complex examples of how to use this subprogram.

DELETE_DATABASE_STATS Procedure

This procedure deletes statistics for all the tables in a database.

Syntax

```
DBMS_STATS.DELETE_DATABASE_STATS (
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                       get_param('NO_INVALIDATE')),
   force            BOOLEAN  DEFAULT FALSE,
   stat_category    VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 155–13 DELETE_DATABASE_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked
stat_category	Statistics to delete. It accepts multiple values separated by comma: ▪ OBJECT_STATS - table statistics, column statistics and index statistics ▪ SYNOPSES - information to support incremental statistics The default is 'OBJECT_STATS, SYNOPSES'

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

DELETE_DICTIONARY_STATS Procedure

This procedure deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas).

Syntax

```
DBMS_STATS.DELETE_DICTIONARY_STATS (
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   statown        VARCHAR2 DEFAULT NULL,
   no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                 get_param('NO_INVALIDATE')),
   stattype       VARCHAR2 DEFAULT 'ALL',
   force          BOOLEAN  DEFAULT FALSE,
   stat_category  VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 155–14 DELETE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure
stattype	Statistics type
force	When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked
stat_category	Statistics to delete. It accepts multiple values separated by comma: ▪ OBJECT_STATS - table statistics, column statistics and index statistics ▪ SYNOPSES - information to support incremental statistics The default is 'OBJECT_STATS, SYNOPSES'

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

DELETE_FIXED_OBJECTS_STATS Procedure

This procedure deletes statistics of all fixed tables.

Syntax

```
DBMS_STATS.DELETE_FIXED_OBJECTS_STATS (
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   force            BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 155–15 DELETE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
stattab	The user statistics table identifier describing from where to delete the current statistics. If stattab is NULL, the statistics will be deleted directly in the dictionary.
statid	The (optional) identifier to associate with these statistics within stattab. This only applies if stattab is not NULL.
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure
force	Ignores the statistics lock on objects and deletes the statistics if set to TRUE

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

DELETE_INDEX_STATS Procedure

This procedure deletes index-related statistics.

Syntax

```
DBMS_STATS.DELETE_INDEX_STATS (
   ownname          VARCHAR2,
   indname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   cascade_parts    BOOLEAN  DEFAULT TRUE,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   stattype         VARCHAR2 DEFAULT 'ALL',
   force            BOOLEAN  DEFAULT FALSE);
   stat_category    VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 155–16 DELETE_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition for which to delete the statistics. If the index is partitioned and if partname is NULL, then index statistics are deleted at the global level.
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
cascade_parts	If the index is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this index for all underlying partitions as well
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattype	Statistics type
force	When value of this argument is TRUE, deletes index statistics even if locked

Table 155–16 (Cont.) DELETE_INDEX_STATS Procedure Parameters

Parameter	Description
stat_category	Statistics to delete. It accepts multiple values separated by comma: ■ OBJECT_STATS - table statistics, column statistics and index statistics ■ SYNOPSES - information to support incremental statistics The default is 'OBJECT_STATS, SYNOPSES'

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

DELETE_PENDING_STATS Procedure

This procedure is used to delete the pending statistics that have been collected but have not been published.

Syntax

```
DBMS_STATS.DELETE_PENDING_STATS (
    ownname    IN  VARCHAR2  DEFAULT USER,
    tabname    IN  VARCHAR2);
```

Parameters

Table 155–17 DELETE_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter tabname is NULL delete applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Examples

```
DBMS_STATS.DELETE_PENDING_STATS('SH', 'SALES');
```

DELETE_PROCESSING_RATE Procedure

This procedure deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources.

Syntax

```
DBMS_STATS.DELETE_PROCESSING_RATE (
   stat_source      IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155–18 DELETE_PROCESSING_RATE Procedure Parameters

Parameter	Description
stat_source	Source of processing rates: ■ 'MANUAL': values set by the user manually using the SET_PROCESSING_RATE Procedure ■ 'CALIBRATION' : values collected by the calibration GATHER_PROCESSING_RATE Procedure run explicitly by the user ■ 'FEEDBACK': values obtained by time feedback

Usage Notes

You require the OPTIMIZER_PROCESSING_RATE role to run this procedure since AUTO DOP uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

DELETE_SCHEMA_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_PREFS (
    ownname    IN   VARCHAR2,
    pname      IN   VARCHAR2);
```

Parameters

Table 155–19 DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
pname	Preference name. The existing value for following preferences can be deleted and default preference values will be used: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ INCREMENTAL_STALENESS ■ INCREMENTAL_LEVEL ■ STALE_PERCENT ■ GLOBAL_TEMP_TABLE_STATS ■ TABLE_CACHED_BLOCKS ■ OPTIONS
.	CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics
.	DEGREE - The value determines degree of parallelism used for gathering statistics
.	ESTIMATE_PERCENT - The value determines the percentage of rows to estimate.
.	METHOD_OPT - The value controls column statistics collection and histogram creation. When setting preference on global, schema, database or dictionary level, only'FOR ALL' syntax is allowed.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned)

Table 155–19 (Cont.) DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed.
.	INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan.
	INCREMENTAL_LEVEL - This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.
	INCREMENTAL_STALENESS - This value controls how we decide a partition or subpartition as stale.
.	STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.
	GLOBAL_TEMP_TABLE_STATS - This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.
	TABLE_CACHED_BLOCKS - The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor.
	OPTIONS - Determines the options parameter used in the GATHER_TABLE_STATS Procedure. T

Exceptions

ORA-20000: Insufficient privileges / Schema "<schema>" does not exist

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'CASCADE');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'DEGREE');
```

DELETE_SCHEMA_STATS Procedure

This procedure deletes statistics for an entire schema.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_STATS (
   ownname          VARCHAR2,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 155–20 DELETE_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	When value of this argument is TRUE, deletes statistics of tables in a schema even if locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

DELETE_SYSTEM_STATS Procedure

This procedure deletes workload statistics (collected using the 'INTERVAL' or 'START' and 'STOP' options) and resets the default to noworkload statistics (collected using 'NOWORKLOAD' option) if stattab is not specified. If stattab is specified, the subprogram deletes all system statistics with the associated statid from the stattab.

Syntax

```
DBMS_STATS.DELETE_SYSTEM_STATS (
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155–21 DELETE_SYSTEM_STATS Procedure Parameters

Parameter	Description
stattab	Identifier of the user statistics table where the statistics will be saved
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

DELETE_TABLE_PREFS Procedure

This procedure is used to delete the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.DELETE_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    pname      IN  VARCHAR2);
```

Parameters

Table 155–22 DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
pname	Preference name. The existing value for following preferences can be deleted and default preference values will be used: ■ AUTOSTATS_TARGET ■ CASCADE ■ CONCURRENT ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ INCREMENTAL_STALENESS ■ INCREMENTAL_LEVEL ■ STALE_PERCENT ■ GLOBAL_TEMP_TABLE_STATS ■ TABLE_CACHED_BLOCKS ■ OPTIONS AUTOSTATS_TARGET - This preference is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection.
.	CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics CONCURRENT - This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time.
.	DEGREE - The value determines degree of parallelism used for gathering statistics
.	ESTIMATE_PERCENT - The value determines the percentage of rows to estimate.

Table 155–22 (Cont.) DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
.	METHOD_OPT - The value controls column statistics collection and histogram creation. When setting preference on global, schema, database or dictionary level, only'FOR ALL' syntax is allowed.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned)
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed.
.	INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan.
	INCREMENTAL_LEVEL - This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.
	INCREMENTAL_STALENESS - This value controls how we decide a partition or subpartition as stale.
.	STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.
	GLOBAL_TEMP_TABLE_STATS - This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.
	TABLE_CACHED_BLOCKS - The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor.
	OPTIONS - Determines the options parameter used in the GATHER_TABLE_STATS Procedure. T

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to connect as owner of the table, be granted ANALYZE privilege on the table, or ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'CASCADE');
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'DEGREE');
```

DELETE_TABLE_STATS Procedure

This procedure deletes table-related statistics.

Syntax

```
DBMS_STATS.DELETE_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   cascade_parts    BOOLEAN  DEFAULT TRUE,
   cascade_columns  BOOLEAN  DEFAULT TRUE,
   cascade_indexes  BOOLEAN  DEFAULT TRUE,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 155–23 DELETE_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
partname	Name of the table [sub]partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
cascade_parts	If the table is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this table for all underlying partitions as well
cascade_columns	Indicates that DELETE_COLUMN_STATS should be called for all underlying columns (passing the cascade_parts parameter)
cascade_indexes	Indicates that DELETE_INDEX_STATS should be called for all underlying indexes (passing the cascade_parts parameter)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	When value of this argument is TRUE, deletes table statistics even if locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

DIFF_TABLE_STATS_IN_HISTORY Function

This function can be used to compare statistics for a table from two timestamps in past and compare the statistics as of that timestamps.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_HISTORY(
      ownname        IN  VARCHAR2,
      tabname        IN  VARCHAR2,
      time1          IN  TIMESTAMP WITH TIME ZONE,
      time2          IN  TIMESTAMP WITH TIME ZONE DEFAULT NULL,
      pctthreshold   IN  NUMBER  DEFAULT 10)
   RETURN DiffRepTab pipelined;
```

Parameters

Table 155–24 DIFF_TABLE_STATS_IN_HISTORY Function Parameters

Parameter	Description
ownname	Owner of the table. Specify NULL for current schema.
tabname	Table for which statistics are to be compared
time1	First timestamp 1
time2	Second timestamp 2
pctthreshold	The function reports difference in statistics only if it exceeds this limit. The default value is 10.

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- If the second timestamp is NULL, the function compares the current statistics in dictionary with the statistics as of the other timestamp.

DIFF_TABLE_STATS_IN_PENDING Function

This function compares pending statistics and statistics as of a timestamp or statistics from dictionary.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_PENDING(
      ownname        IN  VARCHAR2,
      tabname        IN  VARCHAR2,
      timestamp      IN  TIMESTAMP WITH TIME ZONE,
      pctthreshold   IN  NUMBER  DEFAULT 10)
   RETURN DiffRepTab pipelined;
```

Parameters

Table 155–25 DIFF_TABLE_STATS_IN_PENDING Function Parameters

Parameter	Description
ownname	Owner of the table. Specify NULL for current schema.
tabname	Table for which statistics are to be compared
timestamp	Time stamp to get statistics from the history
pctthreshold	The function reports difference in statistics only if it exceeds this limit. The default value is 10.

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- If the second timestamp is NULL, the function compares the current statistics in dictionary with the statistics as of the other timestamp.

DIFF_TABLE_STATS_IN_STATTAB Function

This function can be used to compare statistics for a table from two different sources. The statistics can be drawn from

- two different user statistics tables
- a single user statistics table containing 2 sets of statistics that can be identified using `statids`
- a user statistics table and dictionary

The function also compares the statistics of the dependent objects (indexes, columns, partitions) as well. It displays statistics of the object(s) from both sources if the difference between those statistics exceeds a certain threshold (%). The threshold can be specified as an argument to the function. The statistics corresponding to the first source (`stattab1` or `time1`) will be used as basis for computing the difference percentage.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_STATTAB(
      ownname         IN  VARCHAR2,
      tabname         IN  VARCHAR2,
      stattab1        IN  VARCHAR2,
      stattab2        IN  VARCHAR2 DEFAULT NULL,
      pctthreshold    IN  NUMBER  DEFAULT 10,
      statid1         IN  VARCHAR2 DEFAULT NULL,
      statid2         IN  VARCHAR2 DEFAULT NULL,
      stattab1own     IN  VARCHAR2 DEFAULT NULL,
      stattab2own     IN  VARCHAR2 DEFAULT NULL)
   RETURN DiffRepTab pipelined;
```

Parameters

Table 155–26 DIFF_TABLE_STATS_IN_STATTAB Function Parameters

Parameter	Description
`ownname`	Owner of the table. Specify `NULL` for current schema.
`tabname`	Table for which statistics are to be compared
`stattab1`	User statistics table 1
`stattab2`	User statistics table 2. If `NULL`, statistics in `stattab1` is compared with current statistics in dictionary. This is the default. Specify same table as `stattab1` to compare two sets within the statistics table (see `statid` below).
`pctthreshold`	The function reports difference in statistics only if it exceeds this limit. The default value is 10.
`stadid1`	(optional) Identifies statistics set within `stattab1`.
`stadid2`	(optional) Identifies statistics set within `stattab2`
`stattab1own`	Schema containing `stattab1` (if other than `ownname`)
`stattab2own`	Schema containing `stattab2` (if other than `ownname`)

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

DROP_EXTENDED_STATS Procedure

This function drops the statistics entry that is created for the user specified extension. This cancels the effects of the CREATE_EXTENDED_STATS Function.

Syntax

```
DBMS_STATS.DROP_EXTENDED_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2,
   extension  VARCHAR2);
```

Parameters

Table 155–27 DROP_EXTENDED_STATS Procedure Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

Exceptions

- ORA-20000: Insufficient privileges or extension does not exist
- ORA-20001: Error when processing extension

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- If no extended statistics set is created for the extension, this function throws an error.

DROP_STAT_TABLE Procedure

This procedure drops a user statistics table.

Syntax

```
DBMS_STATS.DROP_STAT_TABLE (
   ownname VARCHAR2,
   stattab VARCHAR2);
```

Parameters

Table 155–28 DROP_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier

Exceptions

ORA-20000: Table does not exists or insufficient privileges.

Usage Notes

To invoke this procedure you need the privileges for dropping the specified table.

EXPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column and stores them in the user statistics table identified by stattab.

Syntax

```
DBMS_STATS.EXPORT_COLUMN_STATS (
   ownname  VARCHAR2,
   tabname  VARCHAR2,
   colname  VARCHAR2,
   partname VARCHAR2 DEFAULT NULL,
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155–29 EXPORT_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition column statistics are exported.
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_DATABASE_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_PREFS (
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL
    add_sys    IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 155–30 EXPORT_DATABASE_PREFS Procedure Parameters

Parameter	Description
stattab	Statistics table name to where statistics should be exported
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

EXPORT_DATABASE_STATS Procedure

This procedure retrieves statistics for all objects in the database and stores them in the user statistics tables identified by `statown.stattab`.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_STATS (
   stattab         VARCHAR2,
   statid          VARCHAR2 DEFAULT NULL,
   statown         VARCHAR2 DEFAULT NULL,
   stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 155–31 EXPORT_DATABASE_STATS Procedure Parameters

Parameter	Description
`stattab`	User statistics table identifier describing where to store the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different from current schema)
`stat_category`	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: ■ `OBJECT_STATS` - table statistics, column statistics and index statistics (Default) ■ `SYNOPSES` - information to support incremental statistics If `'OBJECT_STATS, SYNOPSES'` is specified, table statistics, column statistics, index statistics and synopses are deleted.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_DICTIONARY_STATS Procedure

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by stattab.

Syntax

```
DBMS_STATS.EXPORT_DICTIONARY_STATS (
   stattab         VARCHAR2,
   statid          VARCHAR2 DEFAULT NULL,
   statown         VARCHAR2 DEFAULT NULL,
   stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 155–32 EXPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: ■ OBJECT_STATS - table statistics, column statistics and index statistics (Default) ■ SYNOPSES - information to support incremental statistics If 'OBJECT_STATS, SYNOPSES' is specified, table statistics, column statistics, index statistics and synopses are deleted.

Usage Notes

- You must have the SYSDBA or ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

EXPORT_FIXED_OBJECTS_STATS Procedure

This procedure retrieves statistics for fixed tables and stores them in the user statistics table identified by stattab.

Syntax

```
DBMS_STATS.EXPORT_FIXED_OBJECTS_STATS (
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155–33 EXPORT_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

- To invoke this subprogram you need to be connected as SYS or have the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege
- Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index and stores them in the user statistics table identified by stattab.

Syntax

```
DBMS_STATS.EXPORT_INDEX_STATS (
   ownname  VARCHAR2,
   indname  VARCHAR2,
   partname VARCHAR2 DEFAULT NULL,
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155–34 EXPORT_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition. If the index is partitioned and if partname is NULL, then global and partition index statistics are exported.
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_PENDING_STATS Procedure

This procedure is used to export the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.EXPORT_PENDING_STATS (
    ownname    IN  VARCHAR2  DEFAULT USER,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT USER);
```

Parameters

Table 155–35 EXPORT_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
stattab	Statistics table name to where to export the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- If the parameter tabname is NULL then export applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_PENDING_STATS(NULL, NULL, 'MY_STAT_TABLE');
```

EXPORT_SCHEMA_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_PREFS (
    ownname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155–36 EXPORT_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
stattab	Statistics table name to where to export the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_SCHEMA_PREFS('SH', 'STAT');
```

EXPORT_SCHEMA_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by ownname and stores them in the user statistics tables identified by stattab.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_STATS (
   ownname         VARCHAR2,
   stattab         VARCHAR2,
   statid          VARCHAR2 DEFAULT NULL,
   statown         VARCHAR2 DEFAULT NULL,
   stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 155–37 EXPORT_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: ■ OBJECT_STATS - table statistics, column statistics and index statistics (Default) ■ SYNOPSES - information to support incremental statistics If 'OBJECT_STATS, SYNOPSES' is specified, table statistics, column statistics, index statistics and synopses are deleted.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics and stores them in the user statistics table, identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_SYSTEM_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155–38 EXPORT_SYSTEM_STATS Procedure Parameters

Parameter	Description
`stattab`	Identifier of the user statistics table that describes where the statistics will be stored
`statid`	Optional identifier associated with the statistics stored from the `stattab`
`statown`	Schema containing `stattab` (if different from current schema)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges

`ORA-20002`: Bad user statistics table; may need to be upgraded

`ORA-20003`: Unable to export system statistics

Usage Notes

To run this procedure, you need the `GATHER_SYSTEM_STATISTICS` role.

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_TABLE_PREFS Procedure

This procedure is used to export the statistics preferences of the specified table in the specified schema into the specified statistics table.

Syntax

```
DBMS_STATS.EXPORT_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155–39 EXPORT_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
stattab	Statistics table name where to export the statistics
statid	Optional identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

EXPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table and stores them in the user statistics table. Cascade results in all index statistics associated with the specified table being exported as well.

Syntax

```
DBMS_STATS.EXPORT_TABLE_STATS (
   ownname         VARCHAR2,
   tabname         VARCHAR2,
   partname        VARCHAR2 DEFAULT NULL,
   stattab         VARCHAR2,
   statid          VARCHAR2 DEFAULT NULL,
   cascade         BOOLEAN  DEFAULT TRUE,
   statown         VARCHAR2 DEFAULT NULL,
   stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 155–40 EXPORT_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table
partname	Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are exported.
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
cascade	If true, then column and index statistics for this table are also exported
statown	Schema containing stattab (if different than ownname)
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: ■ OBJECT_STATS - table statistics, column statistics and index statistics (Default) ■ SYNOPSES - information to support incremental statistics If 'OBJECT_STATS, SYNOPSES' is specified, table statistics, column statistics, index statistics and synopses are deleted.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

- Oracle does not support export or import of statistics across databases of different character sets.

FLUSH_DATABASE_MONITORING_INFO Procedure

This procedure flushes in-memory monitoring information for all tables in the dictionary. Corresponding entries in the *_TAB_MODIFICATIONS, *_TAB_STATISTICS and *_IND_STATISTICS views are updated immediately, without waiting for the Oracle database to flush them periodically. This procedure is useful when you need up-to-date information in those views. Because the GATHER_*_STATS procedures internally flush monitoring information, it is not necessary to run this procedure before gathering the statistics.

Syntax

```
DBMS_STATS.FLUSH_DATABASE_MONITORING_INFO;
```

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

The ANALYZE_ANY system privilege is required to run this procedure.

GATHER_DATABASE_STATS Procedures

This procedure gathers statistics for all objects in the database.

Syntax

```
DBMS_STATS.GATHER_DATABASE_STATS (
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   objlist          OUT      ObjectTab,
   statown          VARCHAR2 DEFAULT NULL,
   gather_sys       BOOLEAN  DEFAULT TRUE,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   obj_filter_list ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DATABASE_STATS (
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   statown          VARCHAR2 DEFAULT NULL,
   gather_sys       BOOLEAN  DEFAULT TRUE,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   obj_filter_list ObjectTab DEFAULT NULL);
```

Parameters

Table 155–41 GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Table 155–41 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

Table 155–41 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the database in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics. The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.
statid	Identifier (optional) to associate with these statistics within stattab.

Table 155–41 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
options	Further specification of which objects to gather statistics for: GATHER: (Default) Gathers statistics on all objects in the schema. GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects. GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale. GATHER EMPTY: Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics. LIST AUTO: Returns a list of objects to be processed with GATHER AUTO LIST STALE: Returns a list of stale objects as determined by looking at the *_tab_modifications views LIST EMPTY: Returns a list of objects which currently have no statistics
objlist	List of objects found to be stale or empty
statown	Schema containing stattab (if different from current schema)
gather_sys	Gathers statistics on the objects owned by the 'SYS' user
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
obj_filter_list	A list of object filters. When provided, GATHER_DATABASE_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

GATHER_DICTIONARY_STATS Procedure

This procedure gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components.

Syntax

```
DBMS_STATS.GATHER_DICTIONARY_STATS (
   comp_id          VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER AUTO',
   objlist    OUT   ObjectTab,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   obj_filter_list ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DICTIONARY_STATS (
   comp_id           VARCHAR2 DEFAULT NULL,
   estimate_percent  NUMBER DEFAULT
                        to_estimate_percent_type(GET_PARAM('ESTIMATE_PERCENT')),
   block_sample      BOOLEAN DEFAULT FALSE,
   method_opt        VARCHAR2 DEFAULT GET_PARAM('METHOD_OPT'),
   degree            NUMBER DEFAULT to_degree_type(GET_PARAM('DEGREE')),
   granularity       VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade           BOOLEAN DEFAULT to_cascade_type(GET_PARAM('CASCADE')),
   stattab           VARCHAR2 DEFAULT NULL,
   statid            VARCHAR2 DEFAULT NULL,
   options           VARCHAR2 DEFAULT 'GATHER AUTO',
   statown           VARCHAR2 DEFAULT NULL,
   no_invalidate     BOOLEAN DEFAULT
                             to_no_invalidate_type(get_param('NO_INVALIDATE')),
   obj_filter_list   ObjectTab DEFAULT NULL);
```

Parameters

Table 155–42 GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
comp_id	Component id of the schema to analyze (NULL will result in analyzing schemas of all RDBMS components).Please refer to comp_id column of DBA_REGISTRY view. The procedure always gather statistics on 'SYS' and 'SYSTEM' schemas regardless of this argument.

Table 155–42 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
estimate_percent	Percentage of rows to estimate (NULL means compute). The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.
method_opt	Accepts: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

Table 155–42 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics
cascade	Gathers statistics on indexes also.Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	The (optional) identifier to associate with these statistics within stattab
options	Further specification of objects for which to gather statistics: ■ 'GATHER' - Gathers statistics on all objects in the schema ■ 'GATHER AUTO' - (Default) Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When 'GATHER AUTO' is specified, the only additional valid parameters are comp_id, stattab, statid and statown; all other parameter settings will be ignored. Also, returns a list of objects processed. ■ 'GATHER STALE' - Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, returns a list of objects found to be stale. ■ 'GATHER EMPTY' - Gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics. ■ 'LIST AUTO' - Returns list of objects to be processed with 'GATHER AUTO' ■ 'LIST STALE' - Returns list of stale objects as determined by looking at the *_tab_modifications views ■ 'LIST EMPTY' - Returns list of objects which currently have no statistics

Table 155–42 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
objlist	The list of objects found to be stale or empty
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
obj_filter_list	A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

GATHER_FIXED_OBJECTS_STATS Procedure

This procedure gathers statistics for all fixed objects (dynamic performance tables).

Syntax

```
DBMS_STATS.GATHER_FIXED_OBJECTS_STATS (
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   statown        VARCHAR2 DEFAULT NULL,
   no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')));
```

Parameters

Table 155–43 GATHER_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier to associate with these statistics within stattab (optional)
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

GATHER_INDEX_STATS Procedure

This procedure gathers index statistics. It attempts to parallelize as much of the work as possible. Restrictions are described in the individual parameters. This operation will not parallelize with certain types of indexes, including cluster indexes, domain indexes, and bitmap join indexes. The `granularity` and `no_invalidate` arguments are not relevant to these types of indexes.

Syntax

```
DBMS_STATS.GATHER_INDEX_STATS (
   ownname          VARCHAR2,
   indname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (GET_PARAM('ESTIMATE_PERCENT')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type
                                          (GET_PARAM('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 155–44 GATHER_INDEX_STATS Procedure Parameters

Parameter	Description
`ownname`	Schema of index to analyze
`indname`	Name of index
`partname`	Name of partition
`estimate_percent`	Percentage of rows to estimate (`NULL` means compute). The valid range is `[0.000001,100]`. Use the constant `DBMS_STATS.AUTO_SAMPLE_SIZE` to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
`stattab`	User statistics table identifier describing where to save the current statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different than `ownname`)

Table 155–44 (Cont.) GATHER_INDEX_STATS Procedure Parameters

Parameter	Description
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Gather statistics on object even if it is locked

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

GATHER_PROCESSING_RATE Procedure

This procedure starts the job of gathering the processing rates which end after an `interval` defined in minutes.

Syntax

```
DBMS_STATS.GATHER_PROCESSING_RATE (
   gathering_mode      IN    VARCHAR2  DEFAULT 'START',
   interval            IN    NUMBER    DEFAULT  NULL);
```

Parameters

Table 155–45 GATHER_PROCESSING_RATE Procedure Parameters

Parameter	Description
`gathering_mode`	Mode: `'START'` or `'END'`. The mode is based on the Active Session History (ASH) data when invoked with `'START'` option. It stops gathering when invoked with `'END'` option. When invoked with `'START'`, 'interval' option can be specified optionally. If `interval` is not specified, its default value is set to 60 minutes.
`interval`	Time interval (number of minutes) for which the processing must be gathered

Usage Notes

- You require the `OPTIMIZER_PROCESSING_RATE` role to run this procedure.
- `AUTO DOP` uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges

`ORA-20001`: Invalid or illegal input value

GATHER_SCHEMA_STATS Procedures

This procedure gathers statistics for all objects in a schema.

Syntax

```
DBMS_STATS.GATHER_SCHEMA_STATS (
   ownname          VARCHAR2,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   objlist          OUT      ObjectTab,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
  force             BOOLEAN DEFAULT FALSE,
  obj_filter_list  ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_SCHEMA_STATS (
   ownname          VARCHAR2,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE'),
   force            BOOLEAN DEFAULT FALSE,
   obj_filter_list  ObjectTab DEFAULT NULL);
```

Parameters

Table 155–46 GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Schema to analyze (NULL means current schema)
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Table 155–46 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	Accepts: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

Table 155–46 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab
options	Further specification of which objects to gather statistics for: GATHER: (Default) Gathers statistics on all objects in the schema. GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are ownname, stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects. GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale. GATHER EMPTY: Gathers statistics on objects which currently have no statistics. also, return a list of objects found to have no statistics. LIST AUTO: Returns a list of objects to be processed with GATHER AUTO. LIST STALE: Returns list of stale objects as determined by looking at the *_tab_modifications views. LIST EMPTY: Returns list of objects which currently have no statistics.
objlist	List of objects found to be stale or empty

Table 155–46 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Gather statistics on objects even if they are locked
obj_filter_list	A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

When you use a specific value for the sampling percentage, DBMS_STATS honors it except for when:

- The result is less than 2500 rows (too small a sample) and
- The specified percentage is more than the certain percentage.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

Applying an Object Filter List

The following example specifies that any table with a "T" prefix in the SAMPLE schema and any table in the SYS schema, if stale, will have statistics gathered upon it.

```
DECLARE
   filter_lst  DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
   filter_lst.extend(2);
   filter_lst(1).ownname := 'SH';
   filter_lst(1).objname := 'SALES';
   filter_lst(2).ownname := 'SH';
   filter_lst(2).objname := 'COSTS';
   DBMS_STATS.GATHER_SCHEMA_STATS(ownname=>'SH',obj_filter_list=>filter_lst);
 END;
```

GATHER_SYSTEM_STATS Procedure

This procedure gathers system statistics.

Syntax

```
DBMS_STATS.GATHER_SYSTEM_STATS (
   gathering_mode   VARCHAR2 DEFAULT 'NOWORKLOAD',
   interval         INTEGER  DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155–47 GATHER_SYSTEM_STATS Procedure Parameters

Parameter	Description
gathering_mode	Mode values are: NOWORKLOAD: Will capture characteristics of the I/O system. Gathering may take a few minutes and depends on the size of the database. During this period Oracle will estimate the average read seek time and transfer speed for the I/O system. This mode is suitable for the all workloads. Oracle recommends to run GATHER_SYSTEM_STATS ('NOWORKLOAD') after creation of the database and tablespaces. To fine tune system statistics for the workload use 'START' and 'STOP' or 'INTERVAL' options. If you gather both 'NOWORKLOAD' and workload specific (statistics collected using 'INTERVAL' or 'START' and 'STOP'), the workload statistics will be used by optimizer. Collected components: cpuspeednw, ioseektim, iotfrspeed. INTERVAL: Captures system activity during a specified interval. This works in combination with the interval parameter. You should provide an interval value in minutes, after which system statistics are created or updated in the dictionary or stattab. You can use GATHER_SYSTEM_STATS (gathering_mode=>'STOP') to stop gathering earlier than scheduled. Collected components: maxthr, slavethr, cpuspeed, sreadtim, mreadtim, mbrc. START | STOP: Captures system activity during specified start and stop times and refreshes the dictionary or stattab with statistics for the elapsed period. Interval value is ignored. Collected components: maxthr, slavethr, cpuspeed, sreadtim, mreadtim, mbrc. EXADATA: In this mode the gathered system statistics take into account the unique capabilities provided by using EXADATA such as large IO size and high IO throughput. The multi-block read count and IO throughput statistics are set along with the CPU speed.
interval	Time, in minutes, to gather statistics. This parameter applies only when gathering_mode='INTERVAL'
stattab	Identifier of the user statistics table where the statistics will be saved
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Error in the INTERVAL mode: system parameter job_queue_processes must be >0

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

Examples

Assume that you want to perform database application processing OLTP transactions during the day and run reports at night.

To collect daytime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
   DBMS_STATS.GATHER_SYSTEM_STATS (
      interval => 720,
      stattab  => 'mystats',
      statid   => 'OLTP');
END;
```

To collect nighttime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
   DBMS_STATS.GATHER_SYSTEM_STATS (
      interval => 720,
      stattab  => 'mystats',
      statid   => 'OLAP');
END;
```

Update the dictionary with the gathered statistics.

```
VARIABLE   jobno   number;
BEGIN
   DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
   (''mystats'',''OLTP'');'
   sysdate, 'sysdate + 1');
   COMMIT;
END;

BEGIN
   DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
   (''mystats'',''OLAP'');'
   sysdate + 0.5, 'sysdate + 1');
   COMMIT;
END;
```

GATHER_TABLE_STATS Procedure

This procedure gathers table and column (and index) statistics. It attempts to parallelize as much of the work as possible, but there are some restrictions as described in the individual parameters.

Syntax

```
DBMS_STATS.GATHER_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT  to_no_invalidate_type (
                                            get_param('NO_INVALIDATE')),
   stattype         VARCHAR2 DEFAULT 'DATA',
   force            BOOLEAN  DEFAULT FALSE,
   context          DBMS_STATS.CCONTEXT DEFAULT NULL, -- non operative
   options          VARCHAR2 DEFAULT 'GATHER');
```

Parameters

Table 155–48 GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Schema of table to analyze
tabname	Name of table
partname	Name of partition
estimate_percent	Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.

Table 155–48 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
method_opt	METHOD_OPT - When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed. Other than that, method_opt accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [column_clause] [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column_clause is defined as column_clause := column_name | extension name | extension - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. - column_name : Name of a column - extension : can be either a column group in the format of (column_name, Colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

Table 155–48 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated.The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if partname is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing). 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
cascade	Gathers statistics on the indexes for this table. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the table's indexes. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattype	Statistics type. The only value allowed is DATA.
force	Gather statistics of table even if it is locked
context	[Non-operative]

Table 155–48 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
options	Further specification of which objects to gather statistics: ■ GATHER - gathers statistics on all objects in the schema ■ GATHER AUTO - gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics.

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Index statistics collection can be parellelized except for cluster, domain and join indexes.

Exceptions

ORA-20000: Table does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

An extension can be either a column group (see Example 1) or an expression (see Example 2).

Example 1

```
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (empno, deptno)');
```

Example 2

```
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (sal+comm)');
```

GENERATE_STATS Procedure

> **Note:** This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, use the GATHER_INDEX_STAT procedure. See "GATHER_INDEX_STATS Procedure" on page 155-80.

This procedure generates object statistics from previously collected statistics of related objects. The currently supported objects are b-tree and bitmap indexes.

Syntax

```
DBMS_STATS.GENERATE_STATS (
   ownname    VARCHAR2,
   objname    VARCHAR2,
   organized  NUMBER DEFAULT 7,
   force      BOOLEAN default FALSE);
```

Parameters

Table 155–49 GENERATE_STATS Procedure Parameters

Parameter	Description
ownname	Schema of object
objname	Name of object
organized	Amount of ordering associated between the index and its underlying table. A heavily organized index would have consecutive index keys referring to consecutive rows on disk for the table (the same block). A heavily disorganized index would have consecutive keys referencing different table blocks on disk. This parameter is only used for b-tree indexes. The number can be in the range of 0-10, with 0 representing a completely organized index and 10 a completely disorganized one.
force	If TRUE, generates statistics for the target object even if it is locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

For fully populated schemas, the gather procedures should be used instead when more accurate statistics are desired.

Exceptions

ORA-20000: Unsupported object type of object does not exist

ORA-20001: Invalid option or invalid statistics

GET_COLUMN_STATS Procedures

These procedures gets all column-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```
DBMS_STATS.GET_COLUMN_STATS (
   ownname     VARCHAR2,
   tabname     VARCHAR2,
   colname     VARCHAR2,
   partname    VARCHAR2 DEFAULT NULL,
   stattab     VARCHAR2 DEFAULT NULL,
   statid      VARCHAR2 DEFAULT NULL,
   distcnt OUT NUMBER,
   density OUT NUMBER,
   nullcnt OUT NUMBER,
   srec    OUT StatRec,
   avgclen OUT NUMBER,
   statown     VARCHAR2 DEFAULT NULL);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_COLUMN_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   colname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   ext_stats   OUT  RAW,
   stattypown  OUT  VARCHAR2 DEFAULT NULL,
   stattypname OUT  VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155–50 GET_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, statistics are retrieved from the global table level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	The user-defined statistics
stattypown	Schema of the statistics type

Table 155–50 (Cont.) GET_COLUMN_STATS Procedure Parameters

Parameter	Description
stattypname	Name of the statistics type
distcnt	Number of distinct values
density	Column density
nullcnt	Number of NULLs
srec	Structure holding internal representation of column minimum, maximum, and histogram values
avgclen	Average length of the column (in bytes)
statown	Schema containing stattab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

Before invoking this procedure, ensure that the table exists.

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

GET_INDEX_STATS Procedures

These procedures get all index-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```
DBMS_STATS.GET_INDEX_STATS (
   ownname        VARCHAR2,
   indname        VARCHAR2,
   partname       VARCHAR2 DEFAULT NULL,
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   numrows    OUT NUMBER,
   numlblks   OUT NUMBER,
   numdist    OUT NUMBER,
   avglblk    OUT NUMBER,
   avgdblk    OUT NUMBER,
   clstfct    OUT NUMBER,
   indlevel   OUT NUMBER,
   statown        VARCHAR2 DEFAULT NULL,
   cachedblk  OUT NUMBER,
   cachehit   OUT NUMBER);

DBMS_STATS.GET_INDEX_STATS (
   ownname        VARCHAR2,
   indname        VARCHAR2,
   partname       VARCHAR2 DEFAULT NULL,
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   numrows    OUT NUMBER,
   numlblks   OUT NUMBER,
   numdist    OUT NUMBER,
   avglblk    OUT NUMBER,
   avgdblk    OUT NUMBER,
   clstfct    OUT NUMBER,
   indlevel   OUT NUMBER,
   statown        VARCHAR2 DEFAULT NULL,
   guessq     OUT NUMBER,
   cachedblk  OUT NUMBER,
   cachehit   OUT NUMBER);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_INDEX_STATS (
   ownname          VARCHAR2,
   indname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   ext_stats   OUT  RAW,
   stattypown  OUT  VARCHAR2 DEFAULT NULL,
   stattypname OUT  VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   cachedblk        OUT NUMBER,
   cachehit         OUT NUMBER);
```

Parameters

Table 155–51 GET_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition for which to get the statistics. If the index is partitioned and if partname is NULL, then the statistics are retrieved for the global index level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	User-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
numrows	Number of rows in the index (partition)
numlblks	Number of leaf blocks in the index (partition)
numdist	Number of distinct keys in the index (partition)
avglblk	Average integral number of leaf blocks in which each distinct key appears for this index (partition)
avgdblk	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition)
clstfct	Clustering factor for the index (partition)
indlevel	Height of the index (partition)
statown	Schema containing stattab (if different than ownname)
guessq	Guess quality for the index (partition)
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

- Before invoking this procedure, ensure that the table exists.

  To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

GET_PARAM Function

> **Note:** This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the GET_PREFS Function.
>
> See also Deprecated Subprograms on page 155-13.

This function returns the default value of parameters of DBMS_STATS procedures.

Syntax

```
DBMS_STATS.GET_PARAM (
   pname      IN    VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 155–52 GET_PARAM Function Parameters

Parameter	Description
pname	Parameter name

Exceptions

ORA-20001: Invalid input values

GET_PREFS Function

This function returns the default value of the specified preference.

Syntax

```
DBMS_STATS.GET_PREFS (
   pname     IN   VARCHAR2,
   ownname   IN   VARCHAR2 DEFAULT NULL,
   tabname   IN   VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 155–53 GET_PREFS Function Parameters

Parameter	Description
pname	Preference name. The existing value for following preferences can be deleted and default preference values will be used: ■ AUTOSTATS_TARGET ■ CASCADE ■ CONCURRENT ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ INCREMENTAL_STALENESS ■ INCREMENTAL_LEVEL ■ STALE_PERCENT ■ GLOBAL_TEMP_TABLE_STATS ■ TABLE_CACHED_BLOCKS ■ OPTIONS AUTOSTATS_TARGET - This preference is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection. It takes the following values: ■ 'ALL' - Statistics collected for all objects in system ■ 'ORACLE' - Statistics collected for all Oracle owned objects ■ 'AUTO' - Oracle decides on which objects to collect statistics
.	CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics

Table 155–53 (Cont.) GET_PREFS Function Parameters

Parameter	Description
	CONCURRENT - This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time: ■ 'MANUAL' - Concurrency will be turned on only for manual statistics gathering. ■ 'AUTOMATIC': Concurrency will be turned on only for the automatic statistics gathering. ■ 'ALL': Concurrency will be turned on for both manual and automatic statistics gathering. ■ 'OFF': Concurrency will be turned off for both manual and automatic statistics See Usage Notes below.
.	DEGREE - The value determines degree of parallelism used for gathering statistics
.	ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.
method_opt	When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.

Table 155–53 (Cont.) GET_PREFS Function Parameters

Parameter	Description
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned) 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.

Table 155–53 (Cont.) GET_PREFS Function Parameters

Parameter	Description
	INCREMENTAL_LEVEL - This value controls what synopses to collect when INCREMENTAL preference is set to TRUE It takes two values: ■ TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures. ■ PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered. INCREMENTAL_STALENESS - This value controls how we decide a partition or subpartition as stale. It takes an enumeration of values which may be multiple, such as 'USE_STALE_PERCENT', 'USE_LOCKED_STATS'. ■ USE_STALE_PERCENT - a partition/subpartition is not considered as stale if DML changes are less than the STALE_PERCENT preference value ■ USE_LOCKED_STATS - locked partitions/subpartitions statistics are not considered as stale, regardless of DML changes ■ NULL - this is the default value, meaning a partition or subpartition is considered as stale as long as it has any DML changes. When the default value is used, statistics gathered in incremental mode are guaranteed to be the same as the statistics gathered in non incremental mode. When a non default value is used, the statistics gathered in incremental mode might be less accurate than those gathered in non-incremental mode
.	STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10, meaning a table having more than 10% of changes is considered as stale. GLOBAL_TEMP_TABLE_STATS - This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. It takes two values: ■ SHARED - All sessions see the same set of statistics ■ SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended. TABLE_CACHED_BLOCKS - The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor.

Table 155–53 (Cont.) GET_PREFS Function Parameters

Parameter	Description
options	Further specification of which objects to gather statistics: ■ GATHER - gathers statistics on all objects in the schema ■ GATHER AUTO - gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics.
ownname	Owner name
tabname	Table name

Exceptions

- ORA-20000: Unable to gather statistics concurrently: Resource Manager is not enabled.
- ORA-20001: Invalid input values

Usage Notes

- No special privilege or role is needed to invoke this procedure, however note the following with regard to CONCURRENT preference.
- The CONCURRENT preference determines whether the statistics of tables or (sub)partitions of tables to be gathered concurrently when user issues GATHER_*_STATS procedures. DBMS_STATS has the ability to collect statistics for a single object (table, (sub)partition) in parallel based on the value of degree parameter. However the parallelism is limited to one object. The CONCURRENT preference extends the scope of parallelization to multiple database objects by enabling users to concurrently gather statistics for multiple tables in a schema or database and multiple (sub)partitions within a table. Note that this is primarily intended for multi CPU systems and it may not be suitable for small databases on single CPU machines.

  To gather statistics concurrently,

  – -The user must have DBA role or have the following privileges in addition to privileges that are required for gathering statistics: CREATE JOB, MANAGE SCHEDULER, MANAGE ANY QUEUE.

  – Resource Manager should be enabled.

  – The setting for the job_queue_processes parameter must be at least 4.
- If the ownname and tabname are provided and a preference has been entered for the table, the function returns the preference as specified for the table. In all other cases it returns the global preference if it has been specified, otherwise the default value is returned.

GET_STATS_HISTORY_AVAILABILITY Function

This function returns oldest timestamp where statistics history is available.Users cannot restore statistics to a timestamp older than this one.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_AVAILABILITY
 RETURN TIMESTAMP WITH TIMEZONE;
```

Usage Notes

No special privilege or role is needed to invoke this procedure.

GET_STATS_HISTORY_RETENTION Function

This function returns the current statistics history retention value.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_RETENTION
 RETURN NUMBER;
```

Usage Notes

No special privilege or role is needed to invoke this procedure.

GET_SYSTEM_STATS Procedure

This procedure gets system statistics from `stattab`, or from the dictionary if `stattab` is `NULL`.

Syntax

```
DBMS_STATS.GET_SYSTEM_STATS (
   status    OUT  VARCHAR2,
   dstart    OUT  DATE,
   dstop     OUT  DATE,
   pname     IN   VARCHAR2,
   pvalue    OUT  NUMBER,
   stattab   IN   VARCHAR2 DEFAULT NULL,
   statid    IN   VARCHAR2 DEFAULT NULL,
   statown   IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155–54 GET_SYSTEM_STATS Procedure Parameters

Parameter	Description
`status`	Output is one of the following: ■ `COMPLETED:` ■ `AUTOGATHERING:` ■ `MANUALGATHERING:` ■ `BADSTATS:`
`dstart`	Date when statistics gathering started. If `status` = `MANUALGATHERING`, the start date is returned.
`dstop`	Date when statistics gathering stopped. ■ If `status` = `COMPLETE`, the finish date is returned. ■ If `status` = `AUTOGATHERING`, the future finish date is returned. ■ If `status` = `BADSTATS`, the must-finished-by date is returned.

Table 155–54 (Cont.) GET_SYSTEM_STATS Procedure Parameters

Parameter	Description
pname	The parameter name to get, which can have one of the following values: ■ iotfrspeed - I/O transfer speed in bytes for each millisecond ■ ioseektim - seek time + latency time + operating system overhead time, in milliseconds ■ sreadtim - average time to read single block (random read), in milliseconds ■ mreadtim - average time to read an mbrc block at once (sequential read), in milliseconds ■ cpuspeed - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) ■ cpuspeednw - average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option. ■ mbrc - average multiblock read count for sequential read, in blocks ■ maxthr - maximum I/O system throughput, in bytes/second ■ slavethr - average slave I/O throughput, in bytes/second
pvalue	Parameter value to get
stattab	Identifier of the user statistics table where the statistics will be obtained. If stattab is NULL, the statistics will be obtained from the dictionary.
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Parameter does not exist

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

GET_TABLE_STATS Procedure

This procedure gets all table-related information.

Syntax

```
DBMS_STATS.GET_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   numrows      OUT NUMBER,
   numblks      OUT NUMBER,
   avgrlen      OUT NUMBER,
   statown          VARCHAR2 DEFAULT NULL,
   cachedblk    OUT NUMBER,
   cachehit     OUT NUMBER);
```

Parameters

Table 155–55 GET_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
partname	Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
numrows	Number of rows in the table (partition)
numblks	Number of blocks the table (partition) occupies
avgrlen	Average row length for the table (partition)
statown	Schema containing stattab (if different than ownname)
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)

Usage Notes

- Before invoking this procedure, ensure that the table exists.

  To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the

I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges or no statistics have been stored for requested object

IMPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column from the user statistics table identified by stattab and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 155–56 IMPORT_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition column statistics are imported.
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier to associate with these statistics within stattab (optional)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	If set to TRUE, imports statistics even if statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_DATABASE_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_PREFS (
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL
    add_sys    IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 155–57 IMPORT_DATABASE_PREFS Procedure Parameters

Parameter	Description
stattab	Statistics table name where to import the statistics
statid	Optional identifier to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges.

Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

IMPORT_DATABASE_STATS Procedure

This procedure retrieves statistics for all objects in the database from the user statistics table(s) and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_STATS (
   stattab         VARCHAR2,
   statid          VARCHAR2 DEFAULT NULL,
   statown         VARCHAR2 DEFAULT NULL,
   no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
                                   get_param('NO_INVALIDATE')),
   force           BOOLEAN DEFAULT FALSE,
   stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 155–58 IMPORT_DATABASE_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Overrides statistics locked at the object (table) level: ■ TRUE - Ignores the statistics lock and imports the statistics ■ FALSE - The statistics will be imported only if they are not locked
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: ■ OBJECT_STATS - table statistics, column statistics and index statistics (Default) ■ SYNOPSES - information to support incremental statistics

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

- To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

- Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_DICTIONARY_STATS Procedure

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_DICTIONARY_STATS (
   stattab         VARCHAR2,
   statid          VARCHAR2 DEFAULT NULL,
   statown         VARCHAR2 DEFAULT NULL,
   no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
                                 get_param('NO_INVALIDATE')),
   force           BOOLEAN DEFAULT FALSE,
   stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 155–59 IMPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	The (optional) identifier to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Overrides statistics lock at the object (table) level: ■ TRUE - Ignores the statistics lock and imports the statistics. ■ FALSE - The statistics will be imported only if there is no lock.
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: ■ OBJECT_STATS - table statistics, column statistics and index statistics (Default) ■ SYNOPSES - information to support incremental statistics

Usage Notes

- You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

IMPORT_FIXED_OBJECTS_STATS Procedure

This procedure retrieves statistics for fixed tables from the user statistics table(s) and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_FIXED_OBJECTS_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                  get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 155–60 IMPORT_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Overrides statistics lock: ■ TRUE - Ignores the statistics lock and imports the statistics ■ FALSE - The statistics will be imported only if there is no lock

Usage Notes

- You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

IMPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index from the user statistics table identified by stattab and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 155–61 IMPORT_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition. If the index is partitioned and if partname is NULL, then global and partition index statistics are imported.
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Imports statistics even if index statistics are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_SCHEMA_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_PREFS (
    ownname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155–62 IMPORT_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
stattab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_SCHEMA_PREFS('SH', 'STAT');
```

IMPORT_SCHEMA_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by ownname from the user statistics table and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_STATS (
   ownname          VARCHAR2,
   stattab          VARCHAR2,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN DEFAULTto_no_invalidate_type(
                                 get_param('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE,
   stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 155–63 IMPORT_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Overrides statistics locked at the object (table) level: ■ TRUE - Ignores the statistics lock and imports the statistics. ■ FALSE - Statistics will be imported only if there is no lock.
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: ■ OBJECT_STATS - table statistics, column statistics and index statistics (Default) ■ SYNOPSES - information to support incremental statistics

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics from the user statistics table, identified by `stattab`, and stores the statistics in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_SYSTEM_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155–64 IMPORT_SYSTEM_STATS Procedure Parameters

Parameter	Description
`stattab`	Identifier of the user statistics table where the statistics will be retrieved
`statid`	Optional identifier associated with the statistics retrieved from the `stattab`
`statown`	Schema containing `stattab` (if different from current schema)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges

`ORA-20001`: Invalid or inconsistent values in the user statistics table

`ORA-20002`: Bad user statistics table; may need to be upgraded

`ORA-20003`: Unable to import system statistics

Usage Notes

To run this procedure, you need the `GATHER_SYSTEM_STATISTICS` role.

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.IMPORT_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155–65 IMPORT_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
stattab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

IMPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table from the user statistics table identified by stattab and stores them in the dictionary. Cascade results in all index statistics associated with the specified table being imported as well.

Syntax

```
DBMS_STATS.IMPORT_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2,
   statid           VARCHAR2 DEFAULT NULL,
   cascade          BOOLEAN  DEFAULT TRUE,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE,
   stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 155–66 IMPORT_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table
partname	Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are imported.
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
cascade	If true, column and index statistics for this table are also imported
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure
force	Imports statistics even if table statistics are locked
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: ■ OBJECT_STATS - table statistics, column statistics and index statistics (Default) ■ SYNOPSES - information to support incremental statistics

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Oracle does not support export or import of statistics across databases of different character sets.

LOCK_PARTITION_STATS Procedure

This procedure enables the user to lock statistics for a partition.

Syntax

```
DBMS_STATS.LOCK_PARTITION_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    partname   VARCHAR2);
```

Parameters

Table 155–67 LOCK_PARTITION_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to lock
tabname	Name of the table
partname	[Sub]Partition name

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

LOCK_SCHEMA_STATS Procedure

This procedure locks the statistics of all tables of a schema.

Syntax

```
DBMS_STATS.LOCK_SCHEMA_STATS (
   ownname     VARCHAR2);
```

Parameters

Table 155–68 LOCK_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to lock

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using EXPORT_*_STATS procedures.
- Neither the UNLOCK_SCHEMA_STATS Procedure nor the UNLOCK_TABLE_STATS Procedure is designed to unlock statistics of corresponding partitions. When you invoke the LOCK_TABLE_STATS Procedure, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the LOCK_PARTITION_STATS Procedure.

LOCK_TABLE_STATS Procedure

This procedure locks the statistics on the table.

Syntax

```
DBMS_STATS.LOCK_TABLE_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2);
```

Parameters

Table 155–69 LOCK_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using EXPORT_*_STATS procedures.
- Neither the UNLOCK_SCHEMA_STATS Procedure nor the UNLOCK_TABLE_STATS Procedure is designed to unlock statistics of corresponding partitions. When you invoke the LOCK_TABLE_STATS Procedure, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the LOCK_PARTITION_STATS Procedure.

MERGE_COL_USAGE Procedure

This procedure merges column usage information from a source database by means of a dblink into the local database. If column usage information already exists for a given table or column MERGE_COL_USAGE will combine both the local and the remote information.

Syntax

```
DBMS_STATS.MERGE_COL_USAGE (
   dblink    IN    VARCHAR2);
```

Parameters

Table 155–70 MERGE_COL_USAGE Procedure Parameters

Parameter	Description
dblink	Name of dblink

Usage Notes

User must be SYS to execute this procedure. addition the user specified during the creation of the dblink is expected to have privileges to select from tables in the SYS schema.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Parameter dblink cannot be NULL

ORA-20002: Unable to create a TEMP table

PREPARE_COLUMN_VALUES Procedures

These procedures convert user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   charvals        CHARARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec      IN OUT StatRec,
   datevals         DATEARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   dblvals         DBLARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   fltvals         FLTARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   numvals         NUMARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   rawvals         RAWARRAY);
```

Parameters

Table 155–71 PREPARE_COLUMN_VALUES Procedure Parameters

Parameter	Description
srec.epc	Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.
srec.bkvals	If you want a frequency or hybrid histogram, this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.

Table 155–71 (Cont.) PREPARE_COLUMN_VALUES Procedure Parameters

Parameter	Description
srec.rpcnts	If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called. As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4. Note: ▪ Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above. ▪ Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.

Datatype-specific input parameters (use one) are shown in Table 155–72.

Table 155–72 Datatype-Specific Input Parameters

Type	Description
charvals	The array of values when the column type is character-based. Up to the first 64 bytes of each string should be provided. Arrays must have between 2 and 2050 entries, inclusive. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.
datevals	Array of values when the column type is date-based
dblvals	Array of values when the column type is double-based
fltvals	Array of values when the column type is float-based
numvals	Array of values when the column type is numeric-based
rawvals	Array of values when the column type is RAW. Up to the first 64 bytes of each value should be provided.
nvmin, nvmax	Minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.
rwmin, rwmax	Minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type.

Output Parameters

Table 155–73 PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS
srec.maxval	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS
srec.bkvals	Array suitable for use in a call to SET_COLUMN_STATS

Table 155–73 (Cont.) PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
srec.novals	Array suitable for use in a call to SET_COLUMN_STATS
srec.eavals	Array suitable for use in a call to SET_COLUMN_STATS
srec.rpcnts	Array suitable for use in a call to SET_COLUMN_STATS

Exceptions

ORA-20001: Invalid or inconsistent input values

Usage Notes

No special privilege or role is needed to invoke this procedure.

PREPARE_COLUMN_VALUES_NVARCHAR Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_NVARCHAR (
   srec     IN OUT StatRec,
   nvmin           NVARCHAR2,
   nvmax           NVARCHAR2);
```

Parameters

Table 155–74 PREPARE_COLUMN_VALUES_NVARCHAR Procedure Parameters

Parameter	Description
srec.epc	Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.
srec.bkvals	If you want a frequency or hybrid histogram, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.
srec.rpcnts	If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called. As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4. Note: ▪ Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above. ▪ Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.

Datatype-specific input parameters (use one) are shown in Table 155–72.

Table 155–75 PREPARE_COLUMN_VALUES_NVARCHAR Datatype-Specific Input Parameters

Type	Description
nvmin, nvmax	The minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.

Output Parameters

Table 155–76 PREPARE_COLUMN_VALUES_NVARCHAR Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS
srec.maxval	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS
srec.bkvals	Array suitable for use in a call to SET_COLUMN_STATS.
srec.novals	Array suitable for use in a call to SET_COLUMN_STATS
srec.eavals	Array suitable for use in a call to SET_COLUMN_STATS
srec.rpcnts	Array suitable for use in a call to SET_COLUMN_STATS

Exceptions

ORA-20001: Invalid or inconsistent input values

Usage Notes

No special privilege or role is needed to invoke this procedure.

PREPARE_COLUMN_VALUES_ROWID Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_ROWID (
   srec  IN OUT StatRec,
   rwmin        ROWID,
   rwmax        ROWID);
```

Pragmas

```
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 155–77 PREPARE_COLUMN_VALUES_ROWID Procedure Parameters

Parameter	Description
srec	Values (IN): ■ epc ■ bkvals ■ rpcnts Values (OUT): ■ minval ■ maxval ■ bkvals ■ novals ■ eavals ■ rpcnts epc (IN) - Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS. bkvals (IN) - If you want a frequency or hybrid histogram, this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.

Table 155–77 (Cont.) PREPARE_COLUMN_VALUES_ROWID Procedure Parameters

Parameter	Description
	rpcnts (IN) -
	If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called.
	As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4.
	Note: ■ Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above. ■ Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.
	minval (OUT) -
	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS.
	maxval (OUT) -
	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS.
	bkvals (OUT) -
	Array suitable for use in a call to SET_COLUMN_STATS.
	novals (OUT) -
	Array suitable for use in a call to SET_COLUMN_STATS.
	eavals (OUT) -
	Array suitable for use in a call to SET_COLUMN_STATS
	rpcnts (OUT) -
	Array suitable for use in a call to SET_COLUMN_STATS

Datatype-specific input parameters (use one) are shown in Table 155–72.

Table 155–78 Datatype-Specific Input Parameters

Type	Description
rwmin, rwmax	Minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type.

Usage Notes

No special privilege or role is needed to invoke this procedure.

PUBLISH_PENDING_STATS Procedure

This procedure is used to publish the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.PUBLISH_PENDING_STATS (
    ownname          IN  VARCHAR2 DEFAULT USER,
    tabname          IN  VARCHAR2,
    no_invalidate    BOOLEAN DEFAULT
       to_no_invalidate_type(get_param('NO_INVALIDATE')),
    force      IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 155–79 PUBLISH_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
no_invalidate	Do not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	If TRUE, will override the lock

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter tabname is NULL then publish applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Examples

```
DBMS_STATS.PUBLISH_PENDING_STATS ('SH', null);
```

PURGE_STATS Procedure

This procedure purges old versions of statistics saved in the dictionary. To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Syntax

```
DBMS_STATS.PURGE_STATS(
    before_timestamp       TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 155–80 PURGE_STATS Procedure Parameters

Parameter	Description
before_timestamp	Versions of statistics saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than the older of (current time - statistics history retention) and (time of recent analyze in the system - 1). The statistics history retention value can be changed using ALTER_STATS_HISTORY_RETENTION Procedure.The default is 31 days.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

REMAP_STAT_TABLE Procedure

This procedure remaps the names of objects in the user statistics table. It allows you to import the statistics to objects with same definition but with different names.

Syntax

```
DBMS_STATS.REMAP_STAT_TABLE (
   ownname    IN    VARCHAR2,
   stattab    IN    VARCHAR2,
   src_own    IN    VARCHAR2,
   src_tab    IN    VARCHAR2,
   tgt_own    IN    VARCHAR2,
   tgt_tab    IN    VARCHAR2);
```

Parameters

Table 155–81 REMAP_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Owner of the statistics table. NULL means the current schema.
stattab	User statistics table identifier
src_own	Owner of the table to be renamed. This argument cannot be NULL.
src_tab	Name of the table to be renamed. If NULL, all tables are owned by src_own.
tgt_own	New name of the owner of the table. The owner name is also updated for the dependent objects such as columns and indexes. Note that an index of src_tab not owned by src_own is not renamed.This argument cannot be NULL.
tgt_tab	New name of the table. This argument is valid only if src_tab is not NULL.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid input

Examples

The following statement remaps all objects of sh to shsave in user statistics table sh.ustat:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', NULL, 'shsave', NULL);
```

The following statement can be used to import statistics into objects of shsave once the preceding remap procedure is completed:

```
DBMS_STATS.IMPORT_SCHEMA_STATS ('shsave', 'ustat', statown => 'sh');
```

The following statement remaps sh.customers to shsave.customers_sav:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', 'customers','shsave',
'customers_sav');
```

REPORT_COL_USAGE Function

This function reports the recorded column (group) usage information.

Syntax

```
DBMS_STATS.REPORT_COL_USAGE (
   ownname    IN    VARCHAR2,
   tabname    IN    VARCHAR2)
RETURN CLOB;
```

Parameters

Table 155–82 REPORT_COL_USAGE Function Parameters

Parameter	Description
ownname	Owner name. If NULL it reports column usage information for tables in all schemas in the database.
tabname	Table name. If NULL it reports column usage information for all tables of ownname.

Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

REPORT_GATHER_AUTO_STATS Function

This function runs the auto statistics gathering job in reporting mode. That is, statistics are not actually collected, but all the objects that will be affected when auto statistics gathering is invoked are reported.

Syntax

```
DBMS_STATS.REPORT_GATHER_AUTO_STATS (
   detail_level      VARCHAR2  DEFAULT 'TYPICAL',
   format            VARCHAR2  DEFAULT 'TEXT')
 RETURN CLOB;
```

Parameters

Table 155–83 REPORT_GATHER_AUTO_STATS Function Parameters

Parameter	Description
`detail_level`	Detail level for the content of the report ■ `BASIC`: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) ■ `TYPICAL`: In addition to the information provided at level `BASIC`, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status ■ `ALL`: In addition to the information provided at level `TYPICAL`, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - reason for including the object in the target list - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (`CONCURRENT` preference is turned on).

Table 155–83 (Cont.) REPORT_GATHER_AUTO_STATS Function Parameters

Parameter	Description
format	Report format: ■ XML ■ HTML ■ TEXT (Default)

Usage Notes

Only user SYS can run the REPORT_GATHER_AUTO_STATS function.

REPORT_GATHER_DATABASE_STATS Functions

This function runs the GATHER_DATABASE_STATS Procedures in reporting mode. That is, statistics are not actually collected, but all the objects that will be affected when GATHER_DATABASE_STATS is invoked are reported. The input set of parameters are exactly the same as in GATHER_DATABASE_STATS with two extra parameters.

Syntax

```
DBMS_STATS.REPORT_GATHER_DATABASE_STATS (
   estimate_percent     IN    NUMBER     DEFAULT to_estimate_percent_type (
                                             GET_PARAM('ESTIMATE_PERCENT')),
   block_sample         IN    BOOLEAN    DEFAULT FALSE,
   method_opt           IN    VARCHAR2   DEFAULT GET_PARAM('METHOD_OPT'),
   degree               IN    NUMBER     DEFAULT TO_DEGREE_TYPE(
                                             GET_PARAM('DEGREE')),
   granularity          IN    VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
   cascade              IN    BOOLEAN    DEFAULT to_cascade_type (
                                             GET_PARAM('CASCADE')),
   stattab              IN    VARCHAR2   DEFAULT NULL,
   statid               IN    VARCHAR2   DEFAULT NULL,
   options              IN    VARCHAR2   DEFAULT 'GATHER',
   objlist              OUT   ObjectTab,
   statown              IN    VARCHAR2   DEFAULT NULL,
   gather_sys           IN    BOOLEAN    DEFAULT TRUE,
   no_invalidate        IN    BOOLEAN    DEFAULT TO_NO_INVALIDATE_TYPE (
                                             GET_PARAM('NO_INVALIDATE')),
   obj_filter_list      IN    ObjectTab  DEFAULT NULL,
   detail_level         IN    VARCHAR2   DEFAULT 'TYPICAL',
   format               IN    VARCHAR2   DEFAULT 'TEXT')
 RETURN CLOB;

DBMS_STATS.REPORT_GATHER_DATABASE_STATS (
   estimate_percent     IN    NUMBER     DEFAULT to_estimate_percent_type (
                                             GET_PARAM('ESTIMATE_PERCENT')),
   block_sample         IN    BOOLEAN    DEFAULT FALSE,
   method_opt           IN    VARCHAR2   DEFAULT GET_PARAM('METHOD_OPT'),
   degree               IN    NUMBER     DEFAULT TO_DEGREE_TYPE(
                                             GET_PARAM('DEGREE')),
   granularity          IN    VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
   cascade              IN    BOOLEAN    DEFAULT to_cascade_type (
                                             GET_PARAM('CASCADE')),
   stattab              IN    VARCHAR2   DEFAULT NULL,
   statid               IN    VARCHAR2   DEFAULT NULL,
   options              IN    VARCHAR2   DEFAULT 'GATHER',
   statown              IN    VARCHAR2   DEFAULT NULL,
   gather_sys           IN    BOOLEAN    DEFAULT TRUE,
   no_invalidate        IN    BOOLEAN    DEFAULT TO_NO_INVALIDATE_TYPE (
                                             GET_PARAM('NO_INVALIDATE')),
   obj_filter_list      IN    ObjectTab  DEFAULT NULL,
   detail_level         IN    VARCHAR2   DEFAULT 'TYPICAL',
   format               IN    VARCHAR2   DEFAULT 'TEXT')
 RETURN CLOB;
```

Parameters

Table 155–84 REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	Accepts: ▪ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

Table 155–84 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the database in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics. The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.
statid	Identifier (optional) to associate with these statistics within stattab.

Table 155–84 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
options	Further specification of which objects to gather statistics for: GATHER: Gathers statistics on all objects in the schema. GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects. GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale. GATHER EMPTY: Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics. LIST AUTO: Returns a list of objects to be processed with GATHER AUTO LIST STALE: Returns a list of stale objects as determined by looking at the *_tab_modifications views LIST EMPTY: Returns a list of objects which currently have no statistics
objlist	List of objects found to be stale or empty
statown	Schema containing stattab (if different from current schema)
gather_sys	Gathers statistics on the objects owned by the 'SYS' user
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
obj_filter_list	A list of object filters. When provided, GATHER_DATABASE_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.

Table 155–84 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
`detail_level`	Detail level for the content of the report ■ `BASIC`: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) ■ `TYPICAL`: In addition to the information provided at level `BASIC`, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status ■ `ALL`: In addition to the information provided at level `TYPICAL`, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (`CONCURRENT` preference is turned on).

Table 155–84 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
format	Report format: ■ XML ■ HTML ■ TEXT (Default)

Return Values

A CLOB object that contains the report

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

REPORT_GATHER_DICTIONARY_STATS Functions

This function runs the GATHER_DICTIONARY_STATS Procedure in reporting mode. That is, statistics are not actually collected, but all objects affected when GATHER_DICTIONARY_STATS is invoked are reported. The input set of parameters are exactly the same as in GATHER_DICTIONARY_STATS with two extra parameters.

Syntax

```
DBMS_STATS.REPORT_GATHER_DICTIONARY_STATS (
   comp_id               IN    VARCHAR2   DEFAULT NULL,
   estimate_percent      IN    NUMBER     DEFAULT TO_ESTIMATE_PERCENT_TYPE
                                             (GET_PARAM('ESTIMATE_PERCENT')),
   block_sample          IN    BOOLEAN    DEFAULT FALSE,
   method_opt            IN    VARCHAR2   DEFAULT GET_PARAM('METHOD_OPT'),
   degree                IN    NUMBER     DEFAULT TO_DEGREE_TYPE
                                             (GET_PARAM('DEGREE')),
   granularity           IN    VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
   cascade               IN    BOOLEAN    DEFAULT TO_CASCADE_TYPE
                                             (GET_PARAM('CASCADE')),
   stattab               IN    VARCHAR2   DEFAULT NULL,
   statid                IN    VARCHAR2   DEFAULT NULL,
   options               IN    VARCHAR2   DEFAULT 'GATHER AUTO',
   objlist               OUT   ObjectTab,
   statown               IN    VARCHAR2   DEFAULT NULL,
   no_invalidate         IN    BOOLEAN    DEFAULT TO_NO_INVALIDATE_TYPE

                                             (GET_PARAM('NO_INVALIDATE')),
   detail_level          IN    VARCHAR2   DEFAULT 'TYPICAL',
   format                IN    VARCHAR2   DEFAULT 'TEXT')
 RETURN CLOB;
```

Parameters

Table 155–85 REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
comp_id	Component id of the schema to analyze (NULL will result in analyzing schemas of all RDBMS components).Please refer to comp_id column of DBA_REGISTRY view. The procedure always gather statistics on 'SYS' and 'SYSTEM' schemas regardless of this argument.
estimate_percent	Percentage of rows to estimate (NULL means compute). The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.
method_opt	Accepts: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

Table 155–85 (Cont.) REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics
cascade	Gathers statistics on indexes also.Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	The (optional) identifier to associate with these statistics within stattab
options	Further specification of objects for which to gather statistics: ■ 'GATHER' - Gathers statistics on all objects in the schema ■ 'GATHER AUTO' - Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When 'GATHER AUTO' is specified, the only additional valid parameters are comp_id, stattab, statid and statown; all other parameter settings will be ignored. Also, returns a list of objects processed. ■ 'GATHER STALE' - Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, returns a list of objects found to be stale. ■ 'GATHER EMPTY' - Gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics. ■ 'LIST AUTO' - Returns list of objects to be processed with 'GATHER AUTO' ■ 'LIST STALE' - Returns list of stale objects as determined by looking at the *_tab_modifications views ■ 'LIST EMPTY' - Returns list of objects which currently have no statistics

Table 155–85 (Cont.) REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
objlist	The list of objects found to be stale or empty
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
obj_filter_list	A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true.

Table 155–85 (Cont.) REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
detail_level	Detail level for the content of the report ■ BASIC: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) ■ TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status ■ ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).

Table 155–85 (Cont.) REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
format	Report format: ■ XML ■ HTML ■ TEXT (Default)

Return Values

A CLOB object that contains the report

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

REPORT_GATHER_FIXED_OBJ_STATS Function

This function runs the GATHER_FIXED_OBJECTS_STATS Procedure in reporting mode. That is, statistics are not actually collected, but all the objects that will be affected when GATHER_FIXED_OBJ_STATS is invoked are reported. The input set of parameters are exactly the same as in GATHER_FIXED_OBJ_STATS with two extra parameters.

Syntax

```
DBMS_STATS.REPORT_GATHER_FIXED_OBJ_STATS (
   stattab          IN  VARCHAR2 DEFAULT NULL,
   statid           IN  VARCHAR2 DEFAULT NULL,
   statown          IN  VARCHAR2 DEFAULT NULL,
   no_invalidate    IN  BOOLEAN  DEFAULT TO_NO_INVALIDATE_TYPE (
                                    GET_PARAM('NO_INVALIDATE')),
   detail_level     IN  VARCHAR2   DEFAULT 'TYPICAL',
   format           IN  VARCHAR2   DEFAULT 'TEXT')
 RETURN CLOB;
```

Parameters

Table 155–86 REPORT_GATHER_FIXED_OBJ_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier to associate with these statistics within stattab (optional)
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

 RETURN CLOB;
```

Parameters

Table 155–87 REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
ownname	Schema to analyze (NULL means current schema)
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	Accepts: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

Table 155–87 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab
options	Further specification of which objects to gather statistics for: GATHER: Gathers statistics on all objects in the schema. GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are ownname, stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects. GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale. GATHER EMPTY: Gathers statistics on objects which currently have no statistics. also, return a list of objects found to have no statistics. LIST AUTO: Returns a list of objects to be processed with GATHER AUTO. LIST STALE: Returns list of stale objects as determined by looking at the *_tab_modifications views. LIST EMPTY: Returns list of objects which currently have no statistics.
objlist	List of objects found to be stale or empty

Table 155–87 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Gather statistics on objects even if they are locked
obj_filter_list	A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.

Table 155–87 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
detail_level	Detail level for the content of the report ■ BASIC: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) ■ TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status ■ ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).

Table 155–87 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
format	Report format: ■ XML ■ HTML ■ TEXT (Default)

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

When you use a specific value for the sampling percentage, DBMS_STATS honors it except for when:

- The result is less than 2500 rows (too small a sample) and
- The specified percentage is more than the certain percentage.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

Applying an Object Filter List

The following example specifies that any table with a "T" prefix in the SAMPLE schema and any table in the SYS schema, if stale, will have statistics gathered upon it.

```
DECLARE
  filter_lst  DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
  filter_lst.extend(2);
  filter_lst(1).ownname := 'SAMPLE';
  filter_lst(1).objname := 'T%';
  filter_lst(2).ownname := 'SYS';
  DBMS_STATS.GATHER_SCHEMA_STATS(NULL, obj_filter_list => filter_lst,
                                 options => 'GATHER STALE');
END;
```

REPORT_GATHER_TABLE_STATS Function

This procedure runs the GATHER_TABLE_STATS Procedure in reporting mode. That is, statistics are not actually collected, but all the objects that will be affected when GATHER_TABLE_STATS is invoked are reported.

Syntax

```
DBMS_STATS.REPORT_GATHER_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                        (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT  to_no_invalidate_type (
                                      get_param('NO_INVALIDATE')),
   stattype         VARCHAR2 DEFAULT 'DATA',
   force            BOOLEAN  DEFAULT FALSE)
   detail_level     VARCHAR2 DEFAULT 'TYPICAL',   format          VARCHAR2
DEFAULT 'TEXT')
 RETURN CLOB;
```

Parameters

Table 155–88 REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
ownname	Schema of table to analyze
tabname	Name of table
partname	Name of partition
estimate_percent	Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.

Table 155–88 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
method_opt	Accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [column_clause] [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column_clause is defined as column_clause := column_name | extension name | extension - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. - column_name : Name of a column - extension : can be either a column group in the format of (column_name, Colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

Table 155–88 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated.The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if partname is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing). 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
cascade	Gathers statistics on the indexes for this table. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the table's indexes. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattype	Statistics type. The only value allowed is DATA.
force	Gather statistics of table even if it is locked

Table 155–88 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
detail_level	Detail level for the content of the report ■ BASIC: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) ■ TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status ■ ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).

Table 155–88 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
format	Report format: ■ XML ■ HTML ■ TEXT (Default)

Return Values

A CLOB object that contains the report

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

REPORT_SINGLE_STATS_OPERATION Function

This function generates a report for the provided operation optionally in a particular pluggable database (PDB) in a multitenant environment.

Syntax

```
DBMS_STATS.REPORT_SINGLE_STATS_OPERATIONS (
   opid              NUMBER,
   detail_level      VARCHAR2  DEFAULT 'TYPICAL',
   format            VARCHAR2  DEFAULT 'TEXT'
   container_id      NUMBER    DEFAULT NULL)
 RETURN CLOB;
```

Parameters

Table 155–89 REPORT_SINGLE_STATS_OPERATION Function Parameters

Parameter	Description
opid	Operation ID

Table 155–89 (Cont.) REPORT_SINGLE_STATS_OPERATION Function Parameters

Parameter	Description
detail_level	Detail level for the content of the report ■ BASIC: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) ■ TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status ■ ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - reason for including the object in the target list (applies to only automatic statistics gathering operation tasks) - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).

Table 155–89 (Cont.) REPORT_SINGLE_STATS_OPERATION Function Parameters

Parameter	Description
format	Report format: ■ XML ■ HTML ■ TEXT (Default)
container_id	ID of the pluggable database (PDB) on which this operation was performed. Note that in a multitenant environment, operation ID does not uniquely identify an operation. That is, different operations from distinct PDBs may have the same operation ID. Hence, in a multitenant environment, if a PDB ID is not provided, then the report may contain multiple operations. In a typical (non-CDB) database environment, operation ID is unique to each operation.

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

REPORT_STATS_OPERATIONS Function

This function generates a report of all statistics operations that take place between two timestamps which may or may not have been provided. It allows the scope of the report to be narrowed down so that report will include only auto statistics gathering runs. Furthermore, in a multitenant environment, users may optionally provide a set of pluggable database (PDB) IDs so that only statistics operations from the specified pluggable databases will be reported.

Syntax

```
DBMS_STATS.REPORT_STATS_OPERATIONS (
   detail_level       VARCHAR2 DEFAULT 'TYPICAL',
   format             VARCHAR2 DEFAULT 'TEXT',
   latestN            NUMBER DEFAULT NULL,
   since              TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   until              TIMESTAMP WITH TIME ZONE DEFAULT NULl,
   auto_only          BOOLEAN DEFAULT FALSE,
   container_ids      DBMS_UTILITY.NUMBER_ARRAY DEFAULT DBMS_STATS.NULL_NUMTAB)
 RETURN CLOB;
```

Parameters

Table 155–90 REPORT_STATS_OPERATIONS Function Parameters

Parameter	Description
detail_level	Detail level for the content of the report ■ BASIC: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) ■ TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed -out objects (applies to only auto statistics gathering) ■ ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name (if the operation was run in a job) - session ID - parameter values - additional error details if the operation has failed

Table 155–90 (Cont.) REPORT_STATS_OPERATIONS Function Parameters

Parameter	Description
format	Report format: ■ XML ■ HTML ■ TEXT (Default)
latestN	Restricts the report to contain only the latest N operations that took place between the provided time points (since and until). The default value is NULL, meaning that all qualifying operations will be reported.
since	The report will include only statistics operations that started after this timestamp.
until	The report will include only statistics operations that before after this timestamp.
auto_only	When TRUE, the report will contain only auto statistics gathering job runs.
container_ids	A multitenant environment contains one or more pluggable databases (PDBs). container_ids represents a set of PDB IDs so that only statistics operations from the specified PDBs are reported (applies to only multitenant environments).

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

Examples

Note that the type for container_ids input parameter is DBMS_UTILITY.NUMBER_ARRAY which is an associative PL/SQL array collection. Although associative array type allows for more flexible harvals table-like organization of entries, this function treats container_ids as a regular table collection with the first ID located at index 1 and the last id located at index container_ids.count without any empty array slot left between any two IDs. An example for 3 container ids is provided.

```
DECLARE
    conid_tab  DBMS_UTILITY.NUMBER_ARRAY;
    report clob;
BEGIN
    conid_tab(1) := 124;
    conid_tab(2) := 63;
    conid_tab(3) := 98;
    report := DBMS_STATS.REPORT_STATS_OPERATIONS (container_ids => conid_tab);
END;
```

RESET_GLOBAL_PREF_DEFAULTS Procedure

This procedures sets global preference, such as CASCADE, ESTIMATE_PERCENT and GRANULARITY, to default values. This reverses the global preferences set by the SET_GLOBAL_PREFS Procedure.

Syntax

```
DBMS_STATS.RESET_GLOBAL_PREF_DEFAULTS;
```

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

RESET_PARAM_DEFAULTS Procedure

Note: This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the RESET_GLOBAL_PREF_DEFAULTS Procedure.

See also Deprecated Subprograms on page 155-13.

This procedure resets the default values of all parameters to Oracle recommended values.

Syntax

```
DBMS_STATS.RESET_PARAM_DEFAULTS;
```

RESTORE_DATABASE_STATS Procedure

This procedure restores statistics of all tables of the database as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_DATABSE_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                              (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 155–91 RESTORE_DATABASE_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

RESTORE_DICTIONARY_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_DICTIONARY_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                                 (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 155–92 RESTORE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	Timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

RESTORE_FIXED_OBJECTS_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                              (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 155–93 RESTORE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Usage Notes

To run this procedure, you must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

RESTORE_SCHEMA_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
   ownname                VARCHAR2,
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                              (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 155–94 RESTORE_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Schema of the tables for which the statistics are to be restored
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

RESTORE_SYSTEM_STATS Procedure

This procedure restores system statistics as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 155–95 RESTORE_SYSTEM_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	The timestamp to which to restore statistics

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

RESTORE_TABLE_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (as_of_timestamp). The procedure will restore statistics of associated indexes and columns as well. If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

Syntax

```
DBMS_STATS.RESTORE_TABLE_STATS (
   ownname                  VARCHAR2,
   tabname                  VARCHAR2,
   as_of_timestamp          TIMESTAMP WITH TIME ZONE,
   restore_cluster_index    BOOLEAN DEFAULT FALSE,
   force                    BOOLEAN DEFAULT FALSE,
   no_invalidate            BOOLEAN DEFAULT to_no_invalidate_type
                                          (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 155–96 RESTORE_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	The schema of the table for which the statistics are to be restored
tabname	The table name
as_of_timestamp	The timestamp to which to restore statistics
restore_cluster_index	If the table is part of a cluster, restore statistics of the cluster index if set to TRUE
force	Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics.
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

SEED_COL_USAGE Procedure

This procedure seeds column usage information from a statements in the specified SQL tuning set. It iterates over the SQL statements in the specified SQL tuning set, compiles them and seeds column usage information for the columns that appear in these statements. You can monitor the workload on the system for given amount of time and seed the and seed the column usage information based on the columns that appear in statements executed during the monitoring window.

Syntax

```
DBMS_STATS.SEED_COL_USAGE (
   sqlset_name     IN    VARCHAR2,
   owner_name      IN    VARCHAR2,
   time_limit      IN    POSITIVE DEFAULT NULL);
```

Parameters

Table 155–97 SEED_COL_USAGE Procedure Parameters

Parameter	Description
sqlset_name	Name of the SQL tuning set
owner_name	Owner of the SQL tuning set
time_limit	Time limit (in seconds)

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

This procedure also records group of columns. Extensions for the recorded group of columns can be created using the CREATE_EXTENDED_STATS Function procedure. If sqlset_name and owner_name are NULL, it records the column (group) usage information for the statements executed in the system in next time_limit seconds.

Examples

The following example turns on monitoring for 5 minutes or 300 seconds.

```
BEGIN
   DBMS_STATS.SEED_COL_USAGE (null,null,300);
END;
```

SET_COLUMN_STATS Procedures

This procedure sets column-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.

Syntax

```
DBMS_STATS.SET_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   distcnt       NUMBER DEFAULT NULL,
   density       NUMBER DEFAULT NULL,
   nullcnt       NUMBER DEFAULT NULL,
   srec          StatRec DEFAULT NULL,
   avgclen       NUMBER DEFAULT NULL,
   flags         NUMBER DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                 get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   ext_stats     RAW,
   stattypown    VARCHAR2 DEFAULT NULL,
   stattypname   VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                 get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 155–98 SET_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema.
tabname	Name of the table to which this column belongs.
colname	Name of the column or extension
partname	Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.

Table 155–98 (Cont.) SET_COLUMN_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	User-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
distcnt	Number of distinct values
density	Column density. If this value is NULL and if distcnt is not NULL, then density is derived from distcnt.
nullcnt	Number of NULLs
srec	StatRec structure filled in by a call to PREPARE_COLUMN_VALUES or GET_COLUMN_STATS
avgclen	Average length for the column (in bytes)
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Sets the values even if statistics of the column are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent input values

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

SET_DATABASE_PREFS Procedure

This procedure is used to set the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

```
DBMS_STATS.SET_DATABASE_PREFS (
    pname            IN   VARCHAR2,
    pvalue           IN   VARCHAR2,
    add_sys          IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 155–99 SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The existing value for following preferences can be deleted and default preference values will be used: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ INCREMENTAL_STALENESS ■ INCREMENTAL_LEVEL ■ STALE_PERCENT ■ GLOBAL_TEMP_TABLE_STATS ■ TABLE_CACHED_BLOCKS ■ OPTIONS
.	CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics
.	DEGREE - The value determines degree of parallelism used for gathering statistics
.	ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 155–99 (Cont.) SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
method_opt	When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.: ▪ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned) 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.

Table 155–99 (Cont.) SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
.	INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables. INCREMENTAL_LEVEL - This value controls what synopses to collect when INCREMENTAL preference is set to TRUE It takes two values: ■ TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures. ■ PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered. INCREMENTAL_STALENESS - This value controls how we decide a partition or subpartition as stale. It takes an enumeration of values which may be multiple, such as 'USE_STALE_PERCENT', 'USE_LOCKED_STATS'. ■ USE_STALE_PERCENT - a partition/subpartition is not considered as stale if DML changes are less than the STALE_PERCENT preference value ■ USE_LOCKED_STATS - locked partitions/subpartitions statistics are not considered as stale, regardless of DML changes ■ NULL - this is the default value, meaning a partition or subpartition is considered as stale as long as it has any DML changes. When the default value is used, statistics gathered in incremental mode are guaranteed to be the same as the statistics gathered in non incremental mode. When a non default value is used, the statistics gathered in incremental mode might be less accurate than those gathered in non-incremental mode

Table 155–99 (Cont.) SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
.	STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10, meaning a table having more than 10% of changes is considered as stale. GLOBAL_TEMP_TABLE_STATS - This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. It takes two values: ▪ SHARED - All sessions see the same set of statistics ▪ SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended. TABLE_CACHED_BLOCKS - The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor. OPTIONS - Determines the options parameter used in the GATHER_TABLE_STATS Procedure. The preference takes two values: ▪ GATHER (default) - Gathers statistics for all objects in the table ▪ GATHER AUTO - Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk loads during which statistics have been gathered. Note that this is is only applicable to tables that do not have INCREMENTAL turned on. The GATHER_TABLE_STATS Procedure on these tables with GATHER AUTO options will skip regathering the already fresh statistics.
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.s
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_DATABASE_PREFS('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_DATABASE_PREFS('ESTIMATE_PERCENT','9');
DBMS_STATS.SET_DATABASE_PREFS('DEGREE','99');
```

SET_GLOBAL_PREFS Procedure

This procedure is used to set the global statistics preferences.

Syntax

```
DBMS_STATS.SET_GLOBAL_PREFS (
    pname     IN   VARCHAR2,
    pvalue    IN   VARCHAR2);
```

Parameters

Table 155–100 SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The default value for the following preferences can be set: ■ AUTOSTATS_TARGET ■ CASCADE ■ CONCURRENT ■ DEGREE ■ ESTIMATE_PERCENT ■ GLOBAL_TEMP_TABLE_STATS ■ GRANULARITY ■ INCREMENTAL ■ INCREMENTAL_LEVEL ■ INCREMENTAL_STALENESS ■ METHOD_OPT ■ NO_INVALIDATE ■ PUBLISH ■ STALE_PERCENT ■ TABLE_CACHED_BLOCKS ■ OPTIONS AUTOSTATS_TARGET - This preference is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection. It takes the following values: ■ 'ALL' - Statistics collected for all objects in system ■ 'ORACLE' - Statistics collected for all Oracle owned objects ■ 'AUTO' - Oracle decides on which objects to collect statistics
.	CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics

Table 155–100 (Cont.) SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
	CONCURRENT - This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time: ■ 'MANUAL' - Concurrency will be turned on only for manual statistics gathering. ■ 'AUTOMATIC': Concurrency will be turned on only for the automatic statistics gathering. ■ 'ALL': Concurrency will be turned on for both manual and automatic statistics gathering. ■ 'OFF': Concurrency will be turned off for both manual and automatic statistics
.	DEGREE - Determines degree of parallelism used for gathering statistics
.	ESTIMATE_PERCENT - Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. GLOBAL_TEMP_TABLE_STATS - This preference takes two values: SHARED or SESSION (default). ■ SHARED - All sessions see the same set of statistics ■ SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.
.	GRANULARITY - Determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 155–100 (Cont.) SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
.	INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ INCREMENTAL value for the partitioned table is set to TRUE ■ PUBLISH value for the partitioned table is set to TRUE; ■ User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.
.	NO_INVALIDATE - Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.

Table 155–100 (Cont.) SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
.	STALE_PERCENT - Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers.The default value is 10%. Note that if you set stale_percent to zero the AUTO STATS gathering job will gather statistics for this table every time a row in the table is modified. TABLE_CACHED_BLOCKS - The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor. OPTIONS - Determines the options parameter used in the GATHER_TABLE_STATS Procedure. The preference takes two values: ■ GATHER (default) - Gathers statistics for all objects in the table ■ GATHER AUTO - Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk loads during which statistics have been gathered. Note that this is is only applicable to tables that do not have INCREMENTAL turned on. The GATHER_TABLE_STATS Procedure on these tables with GATHER AUTO options will skip regathering the already fresh statistics.
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.s

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- This setting is honored only of there is no preference specified for the table to be analyzed.
- To run this procedure, you need to have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_GLOBAL_PREFS('ESTIMATE_PERCENT','9');
DBMS_STATS.SET_GLOBAL_PREFS('DEGREE','99');
```

SET_INDEX_STATS Procedures

These procedures set index-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.

Syntax

```
DBMS_STATS.SET_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2  DEFAULT NULL,
   stattab       VARCHAR2  DEFAULT NULL,
   statid        VARCHAR2  DEFAULT NULL,
   numrows       NUMBER    DEFAULT NULL,
   numlblks      NUMBER    DEFAULT NULL,
   numdist       NUMBER    DEFAULT NULL,
   avglblk       NUMBER    DEFAULT NULL,
   avgdblk       NUMBER    DEFAULT NULL,
   clstfct       NUMBER    DEFAULT NULL,
   indlevel      NUMBER    DEFAULT NULL,
   flags         NUMBER    DEFAULT NULL,
   statown       VARCHAR2  DEFAULT NULL,
   no_invalidate BOOLEAN   DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   guessq        NUMBER    DEFAULT NULL,
   cachedblk     NUMBER    DEFAULT NULL,
   cachehit      NUMBER    DEFUALT NULL,
   force         BOOLEAN   DEFAULT FALSE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2  DEFAULT NULL,
   stattab       VARCHAR2  DEFAULT NULL,
   statid        VARCHAR2  DEFAULT NULL,
   ext_stats     RAW,
   stattypown    VARCHAR2 DEFAULT NULL,
   stattypname   VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   cachedblk     NUMBER    DEFAULT NULL,
   cachehit      NUMBER    DEFUALT NULL,
   force         BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 155–101 SET_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index

Table 155–101 (Cont.) SET_INDEX_STATS Procedure Parameters

Parameter	Description
partname	Name of the index partition in which to store the statistics. If the index is partitioned and if partname is NULL, then the statistics are stored at the global index level.
stattab	User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	User-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
numrows	Number of rows in the index (partition)
numlblks	Number of leaf blocks in the index (partition)
numdist	Number of distinct keys in the index (partition)
avglblk	Average integral number of leaf blocks in which each distinct key appears for this index (partition). If not provided, then this value is derived from numlblks and numdist.
avgdblk	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition). If not provided, then this value is derived from clstfct and numdist.
clstfct	See clustering_factor column of the all_indexes view for a description
indlevel	Height of the index (partition)
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
guessq	Guess quality. See the pct_direct_access column of the all_indexes view for a description.
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)
force	Sets the values even if statistics of the index are locked

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges

`ORA-20001`: Invalid input value

`ORA-20005`: Object statistics are locked

SET_PARAM Procedure

> **Note:** This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the SET_GLOBAL_PREFS Procedure.
>
> See also Deprecated Subprograms on page 155-13.

This procedure sets default values for parameters of DBMS_STATS procedures. You can use the GET_PARAM Function to get the current default value of a parameter.

Syntax

```
DBMS_STATS.SET_PARAM (
   pname      IN    VARCHAR2,
   pval       IN    VARCHAR2);
```

Parameters

Table 155–102 SET_PARAM Procedure Parameters

Parameter	Description
pname	The parameter name The default value for following parameters can be set. ■ CASCADE - The default value for CASCADE set by SET_PARAM is not used by export/import procedures.It is used only by gather procedures. ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ AUTOSTATS_TARGET - This parameter is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection (see pval)
pval	The parameter value. If NULL is specified, it will set the default value determined by Oracle. When pname is AUTOSTATS_TARGET, the following are valid values: ■ 'ALL' - Statistics are collected for all objects in the system ■ 'ORACLE' - Statistics are collected for all Oracle owned objects ■ 'AUTO' - Oracle decides for which objects to collect statistics

Usage Notes

- To run this procedure, you must have the SYSDBA or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Note that both arguments are of type VARCHAR2 and the values need to be enclosed in quotes even when they represent numbers.

- Note also the difference between NULL and 'NULL':
  - When NULL is unquoted, this sets the parameter to the value Oracle recommends.
  - In the case of the quoted 'NULL', this sets the value of the parameter to NULL.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

Examples

```
DBMS_STATS.SET_PARAM('CASCADE','DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_PARAM('ESTIMATE_PERCENT','5');
DBMS_STATS.SET_PARAM('DEGREE','NULL');
```

SET_PROCESSING_RATE Procedure

This procedure sets the value of rate of processing for a given operation.

Syntax

```
DBMS_STATS.SET_PROCESSING_RATE (
   opname      IN    VARCHAR2,
   procrate    IN    NUMBER);
```

Parameters

Table 155–103 SET_PROCESSING_RATE Procedure Parameters

Parameter	Description
opname	Name of the operation
procrate	Processing rate. Valid values are as follows: ALL, CPU, CPU_ACCESS, CPU_AGGR, CPU_BYTES_PER_SEC, CPU_FILTER, CPU_GBY, CPU_HASH_JOIN, CPU_JOIN, CPU_NL_JOIN, CPU_RANDOM_ACCESS, CPU_SEQUENTIAL_ACCESS, CPU_SM_JOIN, CPU_SORT, IO, IO_ACCESS, IO_BYTES_PER_SEC, IO_RANDOM_ACCESS, IO_SEQUENTIAL_ACCESS, HASH, AGGR, MEMCMP, MEMCPY

Usage Notes

- You require the OPTIMIZER_PROCESSING_RATE role to run this procedure.
- AUTO DOP uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

SET_SCHEMA_PREFS Procedure

This procedure is used to set the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.SET_SCHEMA_PREFS (
    ownname    IN   VARCHAR2,
    pname      IN   VARCHAR2,
    pvalue     IN   VARCHAR2);
```

Parameters

Table 155–104 SET_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
pname	Preference name. The default value for the following preferences can be set: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ GLOBAL_TEMP_TABLE_STATS ■ GRANULARITY ■ INCREMENTAL ■ INCREMENTAL_LEVEL ■ INCREMENTAL_STALENESS ■ METHOD_OPT ■ NO_INVALIDATE ■ PUBLISH ■ STALE_PERCENT ■ TABLE_CACHED_BLOCKS ■ OPTIONS
.	CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics
.	DEGREE - Determines degree of parallelism used for gathering statistics
.	ESTIMATE_PERCENT - Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 155–104 (Cont.) SET_SCHEMA_PREFS Procedure Parameters

Parameter	Description
	GLOBAL_TEMP_TABLE_STATS - This preference takes two values: SHARED or SESSION (default). ■ SHARED - All sessions see the same set of statistics ■ SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.
.	GRANULARITY - Determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.
.	INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ INCREMENTAL value for the partitioned table is set to TRUE ■ PUBLISH value for the partitioned table is set to TRUE; ■ User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.

Table 155–104 (Cont.) SET_SCHEMA_PREFS Procedure Parameters

Parameter	Description
	INCREMENTAL_LEVEL - This value controls what synopses to collect when INCREMENTAL preference is set to TRUE It takes two values: ■ TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures. ■ PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered. INCREMENTAL_STALENESS - This value controls how we decide a partition or subpartition as stale. It takes an enumeration of values which may be multiple, such as 'USE_STALE_PERCENT', 'USE_LOCKED_STATS'. ■ USE_STALE_PERCENT - a partition/subpartition is not considered as stale if DML changes are less than the STALE_PERCENT preference value ■ USE_LOCKED_STATS - locked partitions/subpartitions statistics are not considered as stale, regardless of DML changes ■ NULL - this is the default value, meaning a partition or subpartition is considered as stale as long as it has any DML changes. When the default value is used, statistics gathered in incremental mode are guaranteed to be the same as the statistics gathered in non incremental mode. When a non default value is used, the statistics gathered in incremental mode might be less accurate than those gathered in non-incremental mode
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.

Table 155–104 (Cont.) SET_SCHEMA_PREFS Procedure Parameters

Parameter	Description
.	NO_INVALIDATE - Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	STALE_PERCENT - Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers.The default value is 10%. Note that if you set stale_percent to zero the AUTO STATS gathering job will gather statistics for this table every time a row in the table is modified. TABLE_CACHED_BLOCKS - The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor. OPTIONS - Determines the options parameter used in the GATHER_TABLE_STATS Procedure. The preference takes two values: ■ GATHER (default) - Gathers statistics for all objects in the table ■ GATHER AUTO - Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk loads during which statistics have been gathered. Note that this is only applicable to tables that do not have INCREMENTAL turned on. The GATHER_TABLE_STATS Procedure on these tables with GATHER AUTO options will skip regathering the already fresh statistics.
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.s

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_SCHEMA_PREFS('SH','CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_SCHEMA_PREFS('SH' 'ESTIMATE_PERCENT','9');
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'DEGREE','99');
```

SET_SYSTEM_STATS Procedure

This procedure sets systems statistics.

Syntax

```
DBMS_STATS.SET_SYSTEM_STATS (
   pname          VARCHAR2,
   pvalue         NUMBER,
   stattab   IN   VARCHAR2 DEFAULT NULL,
   statid    IN   VARCHAR2 DEFAULT NULL,
   statown   IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155–105 SET_SYSTEM_STATS Procedure Parameters

Parameter	Description
pname	The parameter name to get, which can have one of the following values: ■ iotfrspeed—I/O transfer speed in bytes for each millisecond ■ ioseektim - Seek time + latency time + operating system overhead time, in milliseconds ■ sreadtim - Average time to read single block (random read), in milliseconds ■ mreadtim - Average time to read an mbrc block at once (sequential read), in milliseconds ■ cpuspeed - Average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) ■ cpuspeednw - Average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option. ■ mbrc - Average multiblock read count for sequential read, in blocks ■ maxthr - Maximum I/O system throughput, in bytes/second ■ slavethr - Average slave I/O throughput, in bytes/second
pvalue	Parameter value to get
stattab	Identifier of the user statistics table where the statistics will be obtained. If stattab is null, the statistics will be obtained from the dictionary.
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to set system statistics

ORA-20004: Parameter does not exist

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

SET_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.SET_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    pname      IN  VARCHAR2,
    pvalue     IN  VARCHAR2);
```

Parameters

Table 155–106 SET_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
pname	Preference name. The default value for following preferences can be set: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ GRANULARITY ■ INCREMENTAL ■ INCREMENTAL_LEVEL ■ INCREMENTAL_STALENESS ■ METHOD_OPT ■ NO_INVALIDATE ■ PUBLISH ■ STALE_PERCENT ■ TABLE_CACHED_BLOCKS ■ OPTIONS
.	CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics. CONCURRENT - This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time: ■ 'MANUAL' - Concurrency will be turned on only for manual statistics gathering. ■ 'AUTOMATIC': Concurrency will be turned on only for the automatic statistics gathering. ■ 'ALL': Concurrency will be turned on for both manual and automatic statistics gathering. ■ 'OFF': Concurrency will be turned off for both manual and automatic statistics
.	DEGREE - Determines degree of parallelism used for gathering statistics.

Table 155–106 (Cont.) SET_TABLE_PREFS Procedure Parameters

Parameter	Description
.	ESTIMATE_PERCENT - Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. GLOBAL_TEMP_TABLE_STATS - This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. It takes two values: ■ SHARED - All sessions see the same set of statistics ■ SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.
.	GRANULARITY - Determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
.	INCREMENTAL - Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ INCREMENTAL value for the partitioned table is set to TRUE; ■ PUBLISH value for the partitioned table is set to TRUE; ■ User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.

Table 155–106 (Cont.) SET_TABLE_PREFS Procedure Parameters

Parameter	Description
	INCREMENTAL_LEVEL - This value controls what synopses to collect when INCREMENTAL preference is set to TRUE It takes two values: ■ TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures. ■ PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered. INCREMENTAL_STALENESS - This value controls how we decide a partition or subpartition as stale. It takes an enumeration of values which may be multiple, such as 'USE_STALE_PERCENT', 'USE_LOCKED_STATS'. ■ USE_STALE_PERCENT - a partition/subpartition is not considered as stale if DML changes are less than the STALE_PERCENT preference value ■ USE_LOCKED_STATS - locked partitions/subpartitions statistics are not considered as stale, regardless of DML changes ■ NULL - this is the default value, meaning a partition or subpartition is considered as stale as long as it has any DML changes. When the default value is used, statistics gathered in incremental mode are guaranteed to be the same as the statistics gathered in non incremental mode. When a non default value is used, the statistics gathered in incremental mode might be less accurate than those gathered in non-incremental mode
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.

Table 155–106 (Cont.) SET_TABLE_PREFS Procedure Parameters

Parameter	Description
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	PUBLISH - Determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	STALE_PERCENT - Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10%.
	OPTIONS - Determines the options parameter used in the GATHER_TABLE_STATS Procedure. The preference takes two values: ▪ GATHER (default) - Gathers statistics for all objects in the table ▪ GATHER AUTO - Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk loads during which statistics have been gathered. Note that this is only applicable to tables that do not have INCREMENTAL turned on. The GATHER_TABLE_STATS Procedure on these tables with GATHER AUTO options will skip regathering the already fresh statistics.
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- To run this procedure, you need to connect as owner of the table or should have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES','ESTIMATE_PERCENT','9');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'DEGREE','99');
```

SET_TABLE_STATS Procedure

This procedure sets table-related information.

Syntax

```
DBMS_STATS.SET_TABLE_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   numrows       NUMBER   DEFAULT NULL,
   numblks       NUMBER   DEFAULT NULL,
   avgrlen       NUMBER   DEFAULT NULL,
   flags         NUMBER   DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   cachedblk     NUMBER    DEFAULT NULL,
   cachehit      NUMBER    DEFUALT NULL,
   force         BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 155–107 SET_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table
partname	Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.
stattab	User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
numrows	Number of rows in the table (partition)
numblks	Number of blocks the table (partition) occupies
avgrlen	Average row length for the table (partition)
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)

Table 155–107 (Cont.) SET_TABLE_STATS Procedure Parameters

Parameter	Description
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)
force	Sets the values even if statistics of the table are locked

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains cachedblk and cachehit at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS procedure for auto mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each cachehit and a cachedblk for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20005: Object statistics are locked

SHOW_EXTENDED_STATS_NAME Function

This function returns the name of the statistics entry that is created for the user-specified extension. It raises an error if no extension has been created.

Syntax

```
DBMS_STATS.SHOW_EXTENDED_STATS_NAME (
   ownname    VARCHAR2,
   tabname    VARCHAR2,
   extension  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 155–108 SHOW_EXTENDED_STATS_NAME Function Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Error when processing extension

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

TRANSFER_STATS Procedure

This procedure transfers statistics for specified table(s) from a remote database specified by dblink to the local database. The statistics at the source database are retained. It likewise transfers statistics-related structures such as synopses and DML monitoring information.

Syntax

```
DBMS_STATS.TRANSFER_STATS (
   ownname     IN     VARCHAR2,
   tabname     IN     VARCHAR2,
   dblink      IN     VARCHAR2,
   options     IN     NUMBER DEFAULT NULL);
```

Parameters

Table 155–109 TRANSFER_STATS Procedure Parameters

Parameter	Description
ownname	Owner name of a table. If NULL all schemas in the database. If NULL, the procedure will transfer global preferences as well.
tabname	Name of the table. If NULL, all tables in OWNNAME.
dblink	Database link name
options	By default the procedure does not transfer the global preferences. Specifying ADD_GLOBAL_PREFS copies global preferences.

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

UNLOCK_PARTITION_STATS Procedure

This procedure enables the user to unlock statistics for a partition.

Syntax

```
DBMS_STATS.UNLOCK_PARTITION_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    partname   VARCHAR2);
```

Parameters

Table 155–110 UNLOCK_PARTITION_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to unlock
tabname	Name of the table
partname	[Sub]Partition name

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

UNLOCK_SCHEMA_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

Syntax

```
DBMS_STATS.UNLOCK_SCHEMA_STATS (
   ownname     VARCHAR2);
```

Parameters

Table 155–111 UNLOCK_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the UNLOCK_SCHEMA_STATS Procedure nor the UNLOCK_TABLE_STATS Procedure is designed to unlock statistics of corresponding partitions. When you invoke theLOCK_TABLE_STATS Procedure, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the LOCK_PARTITION_STATS Procedure.

UNLOCK_TABLE_STATS Procedure

This procedure unlocks the statistics on the table.

Syntax

```
DBMS_STATS.UNLOCK_TABLE_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2);
```

Parameters

Table 155–112 UNLOCK_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the UNLOCK_SCHEMA_STATS Procedure nor the UNLOCK_TABLE_STATS Procedure is designed to unlock statistics of corresponding partitions. When you invoke theLOCK_TABLE_STATS Procedure, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the LOCK_PARTITION_STATS Procedure.

UPGRADE_STAT_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

Syntax

```
DBMS_STATS.UPGRADE_STAT_TABLE (
   ownname    VARCHAR2,
   stattab    VARCHAR2);
```

Parameters

Table 155–113 UPGRADE_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	Name of the table

Exceptions

ORA-20000: Unable to upgrade table

Usage Notes

To invoke this procedure you need the privileges to drop and create a table.

156

DBMS_STAT_FUNCS

The DBMS_STAT_FUNCS package provides statistical functions.

This chapter contains the following topic:

Summary of DBMS_STAT_FUNCS Subprograms

Table 156–1 DBMS_STAT_FUNCS Package Subprograms

Subprogram	Description
EXPONENTIAL_DIST_FIT Procedure on page 156-3	Tests how well a sample of values fits an exponential distribution
NORMAL_DIST_FIT Procedure on page 156-4	Tests how well a sample of values fits a normal distribution
POISSON_DIST_FIT Procedure on page 156-5	Tests how well a sample of values fits a Poisson distribution
SUMMARY Procedure on page 156-6	Summarizes a numerical column of a table
UNIFORM_DIST_FIT Procedure on page 156-7	Tests how well a sample of values fits a uniform distribution
WEIBULL_DIST_FIT Procedure on page 156-8	Tests how well a sample of values fits a Weibull distribution

EXPONENTIAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits an exponential distribution.

Syntax

```
DBMS_STAT_FUNCS.EXPONENTIAL_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   lambda       IN    NUMBER,
   mu           IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 156–2 EXPONENTIAL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
lambda	The scale parameter.
mu	The location parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the exponential distribution. A number close to 1 indicates a close match.

NORMAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a normal distribution.

Syntax

```
DBMS_STAT_FUNCS.NORMAL_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'SHAPIRO_WILKS',
   mean         IN    NUMBER,
   stdev        IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 156–3 NORMAL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV', 'ANDERSON_DARLING' or 'SHAPIRO_WILKS'.
mean	The mean of the distribution against which to compare.
stdev	The standard deviation of the distribution against which to compare.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the normal distribution. A number close to 1 indicates a close match.

POISSON_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Poisson distribution.

Syntax

```
DBMS_STAT_FUNCS.POISSON_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   lambda       IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 156–4 POISSON_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
lambda	The lambda parameter is the shape parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Poisson distribution. A number close to 1 indicates a close match.

SUMMARY Procedure

This procedure summarizes the numerical column specified in the `columnname` of `tablename`. The summary is returned as a Summary Type. Note that most of the output of `SUMMARY` can be obtained with currently available SQL.

Syntax

```
DBMS_STAT_FUNCS.SUMMARY (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   sigma_value  IN    NUMBER DEFAULT 3,
   s           OUT    SummaryType);
```

Parameters

Table 156–5 SUMMARY Procedure Parameters

Parameter	Description
`ownername`	The schema where the table resides.
`tablename`	The table where the column resides.
`columnname`	The column of the table to be summarized.
`sigma_value`	The number of sigmas for the set of extreme values, defaults to 3.
`s`	The Record containing summary information about given column.

Definition of SummaryType

```
TYPE n_arr IS VARRAY(5) of NUMBER;
TYPE num_table IS TABLE of NUMBER;
TYPE summaryType IS RECORD (
   count             NUMBER,
   min               NUMBER,
   max               NUMBER,
   range             NUMBER,
   mean              NUMBER,
   cmode             num_table,
   variance          NUMBER,
   stddev            NUMBER,
   quantile_5        NUMBER,
   quantile_25       NUMBER,
   median            NUMBER,
   quantile_75       NUMBER,
   quantile_95       NUMBER,
   plus_x_sigma      NUMBER,
   minus_x_sigma     NUMBER,
   extreme_values    num_table,
   top_5_values      n_arr,
   bottom_5_values   n_arr);
```

UNIFORM_DIST_FIT Procedure

This procedure tests well a sample of values fits a uniform distribution.

Syntax

```
DBMS_STAT_FUNCS.UNIFORM_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   var_type     IN    VARCHAR2 DEFAULT 'CONTINUOUS',
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   paramA       IN    NUMBER,
   paramB       IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 156–6 UNIFORM_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
var_type	The type of distribution: 'CONTINUOUS' (the default) or 'DISCRETE'
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
paramA	Parameter A estimated from the sample (the location parameter).
paramB	Parameter B estimated from the sample (the scale parameter).
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the uniform distribution. A number close to 1 indicates a close match.

WEIBULL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Weibull distribution.

Syntax

```
DBMS_STAT_FUNCS.WEIBULL_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   alpha        IN    NUMBER,
   mu           IN    NUMBER,
   beta         IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 156–7 WEIBULL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
alpha	The scale parameter.
mu	The location parameter.
beta	The slope/shape parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Weibull distribution. A number close to 1 indicates a close match.

157

DBMS_STORAGE_MAP

With the DBMS_STORAGE_MAP package, you can communicate with the Oracle background process FMON to invoke mapping operations that populate mapping views. FMON communicates with operating and storage system vendor-supplied mapping libraries.

This chapter contains the following topics:

Using DBMS_STORAGE_MAP

Overview

The following terminology and descriptions will help you understand the DBMS_STORAGE_MAP API:

- Mapping libraries

  Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in filemap.ora.

- Mapping files

  A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- Mapping elements and sub-elements

  A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack

- Mapping file extents

  A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.

  See Also:

  - *Oracle Database Administrator's Guide* for more information
  - *Oracle Database Reference* for V$MAP views, including V$MAP_FILE, V$MAP_ELEMENT, V$MAP_SUBELEMENT, V$MAP_FILE_EXTENT

Operational Notes

For `MAP_ELEMENT`, `MAP_FILE`, and `MAP_ALL`: Invoking these functions when mapping information already exists will refresh the mapping if configuration IDs are supported. If configuration IDs are not supported, then invoking these functions again will rebuild the mapping.

> **See Also:** *Oracle Database Administrator's Guide* for a discussion of the configuration ID, an attribute of the element or file that is changed.

Summary of DBMS_STORAGE_MAP Subprograms

Table 157–1 DBMS_STORAGE_MAP Package Subprograms

Subprogram	Description
DROP_ALL Function on page 157-6	Drops all mapping information in the shared memory of the instance
DROP_ELEMENT Function on page 157-7	Drops the mapping information for the element defined by `elemname`
DROP_FILE Function on page 157-8	Drops the file mapping information defined by `filename`
LOCK_MAP Procedure on page 157-9	Locks the mapping information in the shared memory of the instance
MAP_ALL Function on page 157-10	Builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements
MAP_ELEMENT Function on page 157-11	Builds mapping information for the element identified by `elemname`
MAP_FILE Function on page 157-12	Builds mapping information for the file identified by `filename`
MAP_OBJECT Function on page 157-13	Builds the mapping information for the Oracle object identified by the object name, owner, and type
RESTORE Function on page 157-14	Loads the entire mapping information from the data dictionary into the shared memory of the instance
SAVE Function on page 157-15	Saves information needed to regenerate the entire mapping into the data dictionary
UNLOCK_MAP Procedure on page 157-16	Unlocks the mapping information in the shared memory of the instance.

DROP_ALL Function

This function drops all mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.DROP_ALL(
      dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 157–2 DROP_ALL Function Parameters

Parameter	Description
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

DROP_ELEMENT Function

This function drops the mapping information for the element defined by `elemname`.

Syntax

```
DBMS_STORAGE_MAP.DROP_ELEMENT(
   elemname          IN VARCHAR2,
   cascade           IN BOOLEAN,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 157–3 DROP_ELEMENT Function Parameters

Parameter	Description
`elemname`	The element for which mapping information is dropped.
`cascade`	If `TRUE`, then `DROP_ELEMENT` is invoked recursively on all elements of the DAG defined by `elemname`, if possible.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

DROP_FILE Function

This function drops the file mapping information defined by `filename`.

Syntax

```
DBMS_STORAGE_MAP.DROP_FILE(
   filename          IN VARCHAR2,
   cascade           IN BOOLEAN,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 157–4 DROP_FILE Function Parameters

Parameter	Description
`filename`	The file for which file mapping information is dropped.
`cascade`	If `TRUE`, then the mapping DAGs for the elements where the file resides are also dropped, if possible.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

LOCK_MAP Procedure

This procedure locks the mapping information in the shared memory of the instance. This is useful when you need a consistent snapshot of the V$MAP tables. Without locking the mapping information, V$MAP_ELEMENT and V$MAP_SUBELEMENT, for example, may be inconsistent.

Syntax

```
DBMS_STORAGE_MAP.LOCK_MAP;
```

MAP_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

Syntax

```
DBMS_STORAGE_MAP.MAP_ALL(
   max_num_fileext   IN NUMBER DEFAULT 100,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 157–5 MAP_ALL Function Parameters

Parameter	Description
max_num_fileext	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

Usage Notes

You must explicitly call MAP_ALL in a cold startup scenario.

MAP_ELEMENT Function

This function builds mapping information for the element identified by `elemname`. It may not obtain the latest mapping information if the element being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

Syntax

```
DBMS_STORAGE_MAP.MAP_ELEMENT(
   elemname          IN VARCHAR2,
   cascade           IN BOOLEAN,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 157–6 MAP_ELEMENT Function Parameters

Parameter	Description
`elemname`	The element for which mapping information is built.
`cascade`	If `TRUE`, all elements within the elemname I/O stack DAG are mapped.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

MAP_FILE Function

This function builds mapping information for the file identified by `filename`. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

Syntax

```
DBMS_STORAGE_MAP.MAP_FILE(
   filename           IN VARCHAR2,
   filetype           IN VARCHAR2,
   cascade            IN BOOLEAN,
   max_num_fileextent IN NUMBER DEFAULT 100,
   dictionary_update  IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 157–7 MAP_FILE Function Parameters

Parameter	Description
`filename`	The file for which mapping information is built.
`filetype`	Defines the type of the file to be mapped. It can be `"DATAFILE"`, `"SPFILE"`, `"TEMPFILE"`, `"CONTROLFILE"`, `"LOGFILE"`, or `"ARCHIVEFILE"`.
`cascade`	Should be `TRUE` only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an `ALTER SYSTEM` command or DML operations on extended files), `cascade` can be set to `FALSE` because the mapping changes are limited to the file extents only. If `TRUE`, mapping DAGs are also built for the elements where the file resides.
`max_num_fileextent`	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is `100`; `max_num_fileextent` is an overloaded argument.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

Usage Notes

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

MAP_OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

Syntax

```
DBMS_STORAGE_MAP.MAP_OBJECT(
   objname  IN  VARCHAR2,
   owner    IN  VARCHAR2,
   objtype  IN  VARCHAR2);
```

Parameters

Table 157–8 MAP_OBJECT Function Parameters

Parameter	Description
objname	The name of the object.
owner	The owner of the object.
objtype	The type of the object.

RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance. You can invoke `RESTORE` only after a `SAVE` operation. You must explicitly call `RESTORE` in a warm startup scenario.

Syntax

```
DBMS_STORAGE_MAP.RESTORE;
```

SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

Syntax

```
DBMS_STORAGE_MAP.SAVE;
```

UNLOCK_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.UNLOCK_MAP;
```

158

DBMS_STREAMS

The DBMS_STREAMS package, one of a set of Oracle Streams packages, provides subprograms to convert ANYDATA objects into logical change record (LCR) objects, to return information about Oracle Streams attributes and Oracle Streams clients, and to annotate redo entries generated by a session with a binary tag. This tag affects the behavior of a capture process, a propagation, or an apply process whose rules include specifications for these binary tags in redo entries or LCRs.

This chapter contains the following topics:

Using DBMS_STREAMS

This section contains topics which relate to using the `DBMS_STREAMS` package.

Overview

This package provides subprograms to convert ANYDATA objects into logical change record (LCR) objects, to return information about Oracle Streams attributes and Oracle Streams clients, and to annotate redo entries generated by a session with a binary tag. This tag affects the behavior of a capture process, a propagation, or an apply process whose rules include specifications for these binary tags in redo entries or LCRs.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and Oracle Streams

Security Model

`PUBLIC` is granted `EXECUTE` privilege on this package.

See Also: *Oracle Database Security Guide* for more information about user group `PUBLIC`

Summary of DBMS_STREAMS Subprograms

Table 158–1 DBMS_STREAMS Package Subprograms

Subprogram	Description
COMPATIBLE_12_1 Function on page 158-6	Returns the `DBMS_STREAMS.COMPATIBLE_12_1` constant
COMPATIBLE_11_2 Function on page 158-7	Returns the `DBMS_STREAMS.COMPATIBLE_11_2` constant
COMPATIBLE_11_1 Function on page 158-8	Returns the `DBMS_STREAMS.COMPATIBLE_11_1` constant
COMPATIBLE_10_2 Function on page 158-9	Returns the `DBMS_STREAMS.COMPATIBLE_10_2` constant
COMPATIBLE_10_1 Function on page 158-10	Returns the `DBMS_STREAMS.COMPATIBLE_10_1` constant
COMPATIBLE_9_2 Function on page 158-11	Returns the `DBMS_STREAMS.COMPATIBLE_9_2` constant
CONVERT_ANYDATA_TO_LCR_DDL Function on page 158-12	Converts a `ANYDATA` object to a `SYS.LCR$_DDL_RECORD` object
CONVERT_ANYDATA_TO_LCR_ROW Function on page 158-13	Converts a `ANYDATA` object to a `SYS.LCR$_ROW_RECORD` object
CONVERT_LCR_TO_XML Function on page 158-14	Converts a logical change record (LCR) encapsulated in a `ANYDATA` object into an XML object that conforms to the XML schema for LCRs
CONVERT_XML_TO_LCR Function on page 158-15	Converts an XML object that conforms to the XML schema for LCRs into a logical change record (LCR) encapsulated in a `ANYDATA` object
GET_INFORMATION Function on page 158-16	Returns information about various Oracle Streams attributes
GET_STREAMS_NAME Function on page 158-17	Returns the name of the invoker
GET_STREAMS_TYPE Function on page 158-18	Returns the type of the invoker
GET_TAG Function on page 158-19	Gets the binary tag for all redo entries generated by the current session
MAX_COMPATIBLE Function on page 158-20	Returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database
SET_TAG Procedure on page 158-21	Sets the binary tag for all redo entries subsequently generated by the current session

Note: The subprograms in this package do not commit.

COMPATIBLE_12_1 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_12_1` constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_12_1
RETURN INTEGER;
```

Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 12.1.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 275-38
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

COMPATIBLE_11_2 Function

This function returns the DBMS_STREAMS.COMPATIBLE_11_2 constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_11_2
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 11.2.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 275-38
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

COMPATIBLE_11_1 Function

This function returns the DBMS_STREAMS.COMPATIBLE_11_1 constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_11_1
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 11.1.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 275-38
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

COMPATIBLE_10_2 Function

This function returns the DBMS_STREAMS.COMPATIBLE_10_2 constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_10_2
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.2.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 275-38
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

COMPATIBLE_10_1 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_10_1` constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_10_1
RETURN INTEGER;
```

Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.1.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 275-38
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

COMPATIBLE_9_2 Function

This function returns the DBMS_STREAMS.COMPATIBLE_9_2 constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_9_2
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 9.2.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 275-38
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

CONVERT_ANYDATA_TO_LCR_DDL Function

This function converts a ANYDATA object into a SYS.LCR$_DDL_RECORD object.

Syntax

```
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_DDL(
   source  IN  ANYDATA)
RETURN SYS.LCR$_DDL_RECORD;
```

Parameters

Table 158–2 CONVERT_ANYDATA_TO_LCR_DDL Function Parameters

Parameter	Description
source	The ANYDATA object to be converted. If this object is not a DDL logical change record (DDL LCR), then the function raises an exception.

Usage Notes

You can use this function in a transformation created by the CREATE_TRANSFORMATION procedure in the DBMS_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of DDL LCRs from a ANYDATA queue to a SYS.LCR$_DDL_RECORD typed queue.

See Also: *Oracle Database Advanced Queuing User's Guide*

CONVERT_ANYDATA_TO_LCR_ROW Function

This function converts a ANYDATA object into a SYS.LCR$_ROW_RECORD object.

Syntax

```
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_ROW(
   source  IN  ANYDATA)
RETURN SYS.LCR$_ROW_RECORD;
```

Parameters

Table 158–3 CONVERT_ANYDATA_TO_LCR_ROW Function Parameters

Parameter	Description
source	The ANYDATA object to be converted. If this object is not a row logical change record (row LCR), then the function raises an exception.

Usage Notes

You can use this function in a transformation created by the CREATE_TRANSFORMATION procedure in the DBMS_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of row LCRs from a ANYDATA queue to a SYS.LCR$_ROW_RECORD typed queue.

See Also: *Oracle Database Advanced Queuing User's Guide*

CONVERT_LCR_TO_XML Function

This function converts a logical change record (LCR) encapsulated in a ANYDATA object into an XML object that conforms to the XML schema for LCRs. The LCR can be a row LCR or a DDL LCR.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about the XML schema for LCRs

Syntax

```
DBMS_STREAMS.CONVERT_LCR_TO_XML(
   anylcr  IN  ANYDATA)
RETURN SYS.XMLTYPE;
```

Parameters

Table 158–4 CONVERT_LCR_TO_XML Function Parameters

Parameter	Description
anylcr	The ANYDATA encapsulated LCR to be converted. If this object is not a ANYDATA encapsulated LCR, then the function raises an exception.

CONVERT_XML_TO_LCR Function

This function converts an XML object that conforms to the XML schema for logical change records (LCRs) into an LCR encapsulated in a `ANYDATA` object. The LCR can be a row or DDL LCR.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about the XML schema for LCRs

Syntax

```
DBMS_STREAMS.CONVERT_XML_TO_LCR(
   xmldat  IN  SYS.XMLTYPE)
RETURN ANYDATA;
```

Parameters

Table 158–5 CONVERT_XML_TO_LCR Function Parameters

Parameter	Description
`xmldat`	The XML LCR object to be converted. If this object does not conform to XML schema for LCRs, then the function raises an exception.

GET_INFORMATION Function

This function returns information about various Oracle Streams attributes.

Syntax

```
DBMS_STREAMS.GET_INFORMATION(
   name  IN  VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 158–6 GET_INFORMATION Function Parameters

Parameter	Description
name	The type of information you want to retrieve. Currently, the following names are available: ■ SENDER: Returns the name of the sender for the current logical change record (LCR) from its AQ message properties. This function is called inside a procedure DML handler, a DDL handler, an error handler, or a message handler. Returns NULL if called outside of an apply handler. The return value is to be interpreted as a VARCHAR2. ■ CONSTRAINT_NAME: Returns the name of the constraint that was violated for an LCR that raised an error. This function is called inside a procedure DML handler or error handler for an apply process. Returns NULL if called outside of a procedure DML handler or error handler. The return value is to be interpreted as a VARCHAR2.

GET_STREAMS_NAME Function

This function gets the Oracle Streams name of the invoker if the invoker is one of the following Oracle Streams types:

- CAPTURE
- APPLY
- ERROR_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```
DBMS_STREAMS.GET_STREAMS_NAME
RETURN VARCHAR2;
```

Usage Notes

You can use this function in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, if you use one error handler for multiple apply processes, then you can use the GET_STREAMS_NAME function to determine the name of the apply process that raised the error.

GET_STREAMS_TYPE Function

This function gets the Oracle Streams type of the invoker and returns one of the following types:

- CAPTURE
- APPLY
- ERROR_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```
DBMS_STREAMS.GET_STREAMS_TYPE
RETURN VARCHAR2;
```

Usage Notes

This function can be used in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, you can use the GET_STREAMS_TYPE function to instruct a procedure DML handler to operate differently if it is processing messages from the error queue (ERROR_EXECUTION type) instead of the apply process's queue (APPLY type).

GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

Note:

- To execute this function, a user must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.
- Instead of using the DBMS_STREAMS.GET_TAG function, Oracle recommends that you use the DBMS_STREAMS_ADM.GET_TAG function. See GET_TAG Function on page 159-86.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
DBMS_STREAMS.GET_TAG
RETURN RAW;
```

Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON
DECLARE
   raw_tag RAW(2000);
BEGIN
   raw_tag := DBMS_STREAMS.GET_TAG();
   DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the DUAL view:

```
SELECT DBMS_STREAMS.GET_TAG FROM DUAL;
```

MAX_COMPATIBLE Function

This function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

Syntax

```
DBMS_STREAMS.MAX_COMPATIBLE
RETURN INTEGER;
```

Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The `MAX_COMPATIBLE` function always returns the maximum compatibility for the release of Oracle Database on which it is run. Therefore, when you use this function in rule conditions, the rule conditions do not need to be changed when you upgrade to a later release of Oracle Database.

See Also:

- GET_COMPATIBLE Member Function on page 275-38
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session. Each redo entry generated by DML or DDL statements in the current session has this tag. This procedure affects only the current session.

Note:

- To execute this procedure, a user must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.
- Instead of using the DBMS_STREAMS.SET_TAG procedure, Oracle recommends that you use the DBMS_STREAMS_ADM.SET_TAG procedure. See SET_TAG Procedure on page 159-170.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
DBMS_STREAMS.SET_TAG(
   tag  IN  RAW  DEFAULT NULL);
```

Parameters

Table 158–7 SET_TAG Procedure Parameters

Parameter	Description
tag	The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_STREAMS.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

See Also: BUILD Procedure on page 34-18

159

DBMS_STREAMS_ADM

The DBMS_STREAMS_ADM package, one of a set of Oracle Streams packages, provides subprograms for configuring Oracle Streams environments. This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level. This package also includes subprograms for configuring and managing XStream outbound servers and inbound servers.

This chapter contains the following topics:

Using DBMS_STREAMS_ADM

This section contains topics that relate to using the `DBMS_STREAMS_ADM` package.

Overview

The DBMS_STREAMS_ADM package, one of a set of Oracle Streams packages, provides subprograms for configuring an Oracle Streams environment. This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level. These rules support logical change records (LCRs), which include row LCRs and data definition language (DDL) LCRs. This package also contains subprograms for creating message rules for specific message types. This package also contains subprograms for creating queues, and for managing Oracle Streams metadata, such as data dictionary information.

If you require more sophisticated rules, then refer to Chapter 138, "DBMS_RULE" package.

See Also:

- *Oracle Streams Concepts and Administration*, *Oracle Streams Replication Administrator's Guide* for more information about this package and Oracle Streams
- Chapter 138, "DBMS_RULE"

Deprecated Subprograms

Note: Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 10*g* Release 2 and later:

- `MAINTAIN_SIMPLE_TABLESPACE`

  This procedure is replaced by the `MAINTAIN_SIMPLE_TTS` procedure.

  See Also: MAINTAIN_SIMPLE_TTS Procedure on page 159-111

- `MAINTAIN_TABLESPACES`

  This procedure is replaced by the `MAINTAIN_TTS` procedure.

  See Also: MAINTAIN_TTS Procedure on page 159-126

Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

A user is associated with each Oracle Streams client. The following sections describe these users:

- Oracle Streams Administrator
- Capture User
- Propagation User
- Apply User for an Oracle Streams Apply Process
- Apply User for an XStream Inbound Server
- Messaging Client User

> **Note:** The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as creating a synchronous capture. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.

Oracle Streams Administrator

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

Capture User

The following procedures can create a capture process:

- ADD_GLOBAL_RULES Procedure
- ADD_SCHEMA_RULES Procedure
- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

The following procedures can create a synchronous capture:

- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

If one of these procedures creates a capture process or a synchronous capture, then it configures the current user as the capture user. The capture user is the user in whose security domain a capture process or synchronous capture captures changes that

satisfy its rule set(s) and runs custom rule-based transformations configured for these rules. This user must have the necessary privileges to capture changes. The procedure grants the capture user `ENQUEUE` privilege on the queue used by the capture process or synchronous capture and configures the user as a secure queue user of the queue.

> **See Also:** CREATE_CAPTURE Procedure on page 34-19 and CREATE_SYNC_CAPTURE Procedure on page 34-29 for information about the privileges required to capture changes (refer to the `capture_user` parameter)

Propagation User

The following procedures can create a propagation:

- ADD_GLOBAL_PROPAGATION_RULES Procedure
- ADD_MESSAGE_PROPAGATION_RULE Procedure
- ADD_SCHEMA_PROPAGATION_RULES Procedure
- ADD_SUBSET_PROPAGATION_RULES Procedure
- ADD_TABLE_PROPAGATION_RULES Procedure

When a propagation is created, a propagation job also might be created. If a propagation job is created when one of these procedures is run, then the user who runs the procedure owns the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

Note:

- The source queue owner performs the propagation, but the propagation job is owned by the user who creates it. These two users might or might not be the same.
- For a propagation to work properly, the owner of the source queue must have the necessary privileges to propagate messages.

See Also:

- CREATE_PROPAGATION Procedure on page 117-8 for more information about the required privileges
- "Propagation Rules for LCRs" on page 159-11 for information about when a propagation job is created

Apply User for an Oracle Streams Apply Process

The following procedures can create an apply process:

- ADD_GLOBAL_RULES Procedure
- ADD_MESSAGE_RULE Procedure
- ADD_SCHEMA_RULES Procedure
- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

If one of these procedures creates an apply process, then it configures the current user as the apply user. For an apply process, the apply user is the user in whose security domain an apply process dequeues messages that satisfy its rule sets.

An apply user applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. This user must have the necessary privileges to apply changes. The procedure grants the apply user `DEQUEUE` privilege on the queue used by the apply process and configures the user as a secure queue user of the queue.

> **See Also:** CREATE_APPLY Procedure on page 23-18 for information about the privileges required to apply changes (refer to the `apply_user` parameter)

Apply User for an XStream Inbound Server

The following procedures can create an XStream inbound server:

- ADD_GLOBAL_RULES Procedure
- ADD_SCHEMA_RULES Procedure
- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

> **Note:**
>
> - Oracle recommends using procedures in the `DBMS_XSTREAM_ADM` package to create or add rules to an XStream inbound server. See Chapter 204, "DBMS_XSTREAM_ADM".
> - These procedures cannot create an outbound server.

If the `streams_name` parameter is set to `NULL` and no relevant apply process, inbound server, or outbound server exists, then the procedure creates an apply process automatically with a system-generated name.

The apply process remains an apply process if it receives captured logical change records (LCRs) from a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives captured LCRs from a capture process. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.

If one of these procedures creates an inbound server, then it configures the current user as the apply user. The apply user is the user in whose security domain an XStream client application attaches to an Oracle database.

An apply user applies changes directly to database objects, runs custom rule-based transformations configured for inbound server rules, and runs apply handlers configured for the inbound server. This user must have the necessary privileges to apply changes. The procedure grants the apply user `DEQUEUE` privilege on the queue used by the inbound server and configures the user as a secure queue user.

Each inbound server must have a unique name. The name cannot be used by an apply process, outbound server, or messaging client in the same database, and the name cannot be used by another inbound server in the same database.

If a relevant apply process, inbound server, or outbound server exists, then the procedure does not create an inbound server. Instead, the procedure uses the relevant

apply process, inbound server, or outbound server. If the `streams_name` parameter specifies an existing apply process, inbound server, or outbound server, then the specified client is used.

When `streams_name` parameter is `NULL` and the `streams_type` parameter is set to `apply`, the relevant apply process, inbound server, or outbound server is identified in one of the following ways:

- If one existing apply process or outbound server has the source database specified in the `source_database` parameter and uses the queue specified in the `queue_name` parameter, then the procedure uses this apply process or outbound server.
- If the `source_database` parameter is set to `NULL` and one existing apply process, inbound server, or outbound server is using the queue specified in the `queue_name` parameter, then the procedure uses this apply process, inbound server, or outbound server.

If the `streams_name` parameter is set to `NULL` and multiple relevant apply processes, inbound servers, or outbound servers exist, then the procedure raises an error.

Note: Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

Messaging Client User

The following procedures can create a messaging client:

- ADD_GLOBAL_RULES Procedure
- ADD_MESSAGE_RULE Procedure
- ADD_SCHEMA_RULES Procedure
- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

If one of these procedures creates a messaging client, then the user who runs this procedure is granted the privileges to dequeue from the queue using the messaging client. The procedure configures this user as a secure queue user of the queue, and only this user can use the messaging client.

Operational Notes

Several procedures in this package create rules for Oracle Streams clients and XStream clients, and several procedures configure an Oracle Streams environment. The following sections provide information about using these procedures:

- Procedures That Create Rules for Oracle Streams Clients and XStream Clients
- Procedures That Configure an Oracle Streams Environment

Procedures That Create Rules for Oracle Streams Clients and XStream Clients

Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. XStream clients include XStream outbound servers and inbound servers. Some of the procedures in the `DBMS_STREAMS_ADM` package add rules to the rule sets of Oracle Streams clients and XStream clients. The rules can pertain to changes in the redo log, to data manipulation language (DML) changes made to a table, to logical change records (LCRs), or to user messages.

An LCR represents either a row change that results from a DML operation or a data definition language (DDL) change. An LCR that represents a row change is a row LCR, and an LCR that represents a DDL change is a DDL LCR. LCRs can either represent changes that were captured by a capture process or a synchronous capture, or they can represent changes created by a user or application. A user message is a custom message that is based on a user-defined type and created by users or applications.

A capture process, propagation, apply process, messaging client, outbound server, or inbound server can have both positive and negative rule sets. A synchronous capture can have only a positive rule set.

For all of the procedures except the ones that create subset rules, and for all clients except for synchronous captures, you use the `inclusion_rule` parameter to specify the type of rule set (either positive or negative) for the created rules. If the client does not have a rule set of the specified type, then a rule set is created automatically, and the rules are added to the rule set. Other rules in an existing rule set for the client are not affected. Additional rules can be added to a rule set using either the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package. If an client has both a positive and a negative rule set, then the negative rule set is always evaluated first.

The following sections describe each type of rule in detail:

- Capture Process Rules for Changes in the Redo Log
- Synchronous Capture Rules for DML Changes to Tables
- Propagation Rules for LCRs
- Propagation Rules for User Messages
- Apply Process Rules for LCRs
- Apply Process Rules for User Messages
- Messaging Client Rules for LCRs
- Messaging Client Rules for User Messages
- XStream Outbound Server Rules for LCRs
- XStream Inbound Server Rules for LCRs

Note: Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

See Also: *Oracle Streams Concepts and Administration* for more information about how rules are used in Oracle Streams

Capture Process Rules for Changes in the Redo Log

The following procedures add rules to a rule set of a capture process when you specify `capture` for the `streams_type` parameter:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all changes made to a source database. See ADD_GLOBAL_RULES Procedure on page 159-34.
- The `ADD_SCHEMA_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for changes made to a specified schema. See ADD_SCHEMA_RULES Procedure on page 159-50.
- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for DML changes made to a subset of rows in a specified table. See ADD_SUBSET_RULES Procedure on page 159-59.
- The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for changes made to a specified table. See ADD_TABLE_RULES Procedure on page 159-70.

If one of these procedures adds rules to the positive rule set for a capture process, then the capture process captures row changes resulting from DML changes, or DDL changes, or both from a source database and enqueues these changes into the specified queue. If one of these procedures adds rules to the negative rule set for a capture process, then the capture process discards row changes, or DDL changes, or both from a source database.

A capture process can capture changes locally at a source database or remotely at a downstream database. Therefore, for capture process rules, you should execute the procedure either at the source database or at a downstream database.

If the capture process is a local capture process, or if the capture process is a downstream capture process that uses a database link to the source database, then these procedures automatically prepare the appropriate database objects for instantiation:

- `ADD_GLOBAL_RULES` invokes the `PREPARE_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.
- `ADD_SCHEMA_RULES` invokes the `PREPARE_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.
- `ADD_SUBSET_RULES` and `ADD_TABLE_RULES` invoke the `PREPARE_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.

These procedures also enable supplemental logging for the primary key, unique key, foreign key, and bitmap index columns in the tables prepared for instantiation. The primary key columns are unconditionally logged. The unique key, foreign key, and bitmap index columns are conditionally logged.

If the capture process is a downstream capture process that does not use a database link to the source database, then you must prepare the appropriate objects for

instantiation and specify the necessary supplemental logging manually at the source database.

If one of these procedures is executed at a downstream database, then you specify the source database using the source_database parameter, and the specified capture process must exist. The procedure cannot create a capture process if it is run at a downstream database. You can create a capture process at a downstream database using the CREATE_CAPTURE procedure in the DBMS_CAPTURE_ADM package.

> **See Also:** Chapter , "Summary of DBMS_CAPTURE_ADM Subprograms" on page 34-5 for more information about the CREATE_CAPTURE procedure and the procedures that prepare database objects for instantiation

Synchronous Capture Rules for DML Changes to Tables

The following procedures add rules to the rule set of a synchronous capture when you specify sync_capture for the streams_type parameter:

- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for DML changes made to a subset of rows in a specified table. See ADD_SUBSET_RULES Procedure on page 159-59.
- The ADD_TABLE_RULES procedure adds a rule whose rule condition evaluates to TRUE for DML changes made to a specified table. See ADD_TABLE_RULES Procedure on page 159-70.

If one of these procedures adds rules to the positive rule set for a synchronous capture, then the synchronous capture captures row changes resulting from DML changes to the table at the source database and enqueues these changes into the specified queue. A synchronous capture cannot have a negative rule set.

A synchronous capture captures changes locally at the database where it is configured. This database is the source database for changes captured by the synchronous capture. Therefore, for synchronous capture rules, you should execute the procedure at the source database.

These procedures automatically prepare the appropriate tables for instantiation by invoking the PREPARE_SYNC_INSTANTIATION function in the DBMS_CAPTURE_ADM package at the source database.

Note:

- A synchronous capture ignores rules in its rule set that were created by a procedure other than ADD_SUBSET_RULES or ADD_TABLE_RULES.
- When the ADD_TABLE_RULES or the ADD_SUBSET_RULES procedure adds rules to a synchronous capture rule set, the procedure must obtain an exclusive lock on the specified table. If there are outstanding transactions on the specified table, then the procedure waits until it can obtain a lock.

Propagation Rules for LCRs

The following procedures add propagation rules for LCRs to a rule set of a propagation:

- The ADD_GLOBAL_PROPAGATION_RULES procedure adds rules whose rule condition evaluates to TRUE for all LCRs in a source queue. See ADD_GLOBAL_

PROPAGATION_RULES Procedure on page 159-30.

- The ADD_SCHEMA_PROPAGATION_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in a source queue containing changes made to a specified schema. See ADD_SCHEMA_PROPAGATION_RULES Procedure on page 159-46.
- The ADD_SUBSET_PROPAGATION_RULES procedure adds rules whose rule condition evaluates to TRUE for row LCRs in a source queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_PROPAGATION_RULES Procedure" on page 159-55.
- The ADD_TABLE_PROPAGATION_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in a source queue containing changes made to a specified table. See "ADD_TABLE_PROPAGATION_RULES Procedure" on page 159-65.

If one of these procedures adds rules to the positive rule set for the propagation, then the rules specify that the propagation propagates LCRs in a source queue to a destination queue. If one of these procedures adds rules to the negative rule set for the propagation, then the rules specify that the propagation discards LCRs in a source queue. When you create rules with one of these procedures, and you specify a value for the source_databse parameter, then the rules include conditions for the specified source database.

Propagation Rules for User Messages

The ADD_MESSAGE_PROPAGATION_RULE procedure adds a message rule to a rule set of a propagation. If this procedure adds a rule to the positive rule set for the propagation, then the rule specifies that the propagation propagates the user messages of a specific message type that evaluate to TRUE for the rule condition from a source queue to a destination queue. If this procedure adds a rule to the negative rule set for the propagation, then the rule specifies that the propagation discards the user messages in a source queue of a specific message type that evaluate to TRUE for the rule condition. This procedure generates a rule name for the rule.

> **See Also:** "ADD_MESSAGE_PROPAGATION_RULE Procedure" on page 159-39

Apply Process Rules for LCRs

The following procedures add rules to a rule set of an apply process when you specify apply for the streams_type parameter and an apply process for the streams_name parameter:

- The ADD_GLOBAL_RULES procedure adds rules whose rule condition evaluates to TRUE for all LCRs in the apply process's queue. See "ADD_GLOBAL_RULES Procedure" on page 159-34.
- The ADD_SCHEMA_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the apply process's queue containing changes made to a specified schema. See "ADD_SCHEMA_RULES Procedure" on page 159-50.
- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for row LCRs in the apply process's queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_RULES Procedure" on page 159-59.
- The ADD_TABLE_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the apply process's queue containing changes made to a specified table. See "ADD_TABLE_RULES Procedure" on page 159-70.

If one of these procedures adds rules to the positive rule set for the apply process, then the rules specify that the apply process applies LCRs in its queue. If one of these procedures adds rules to the negative rule set for the apply process, then the rules specify that the apply process discards LCRs in its queue. For apply process rules, you should execute these procedures at the destination database.

Changes applied by an apply process created by one of these procedures generate tags in the redo log at the destination database with a value of `'00'` (double zero). You can use the `ALTER_APPLY` procedure in the `DBMS_APPLY_ADM` package to alter the tag value after the apply process is created, if necessary.

An apply process can apply captured LCRs from only one source database. If one of these procedures creates an apply process, then specify the source database for the apply process using the `source_database` parameter. If the `source_database` parameter is `NULL`, and one of these procedures creates an apply process, then the source database name of the first LCR received by the apply process is used for the source database.

The rules in the apply process rule sets determine which messages are dequeued by the apply process. When you create rules with one of these procedures, and you specify a value for the `source_database` parameter, then the rules include conditions for the specified source database. If the apply process dequeues an LCR with a source database that is different from the source database for the apply process, then an error is raised. In addition, when adding rules to an existing apply process, the database specified in the `source_database` parameter cannot be different from the source database for the apply process. You can determine the source database for an apply process by querying the `DBA_APPLY_PROGRESS` data dictionary view.

An apply process created by one of these procedures can apply messages only at the local database and can apply only captured messages. To create an apply process that applies messages at a remote database or an apply process that applies user messages, use the `CREATE_APPLY` procedure in the `DBMS_APPLY_ADM` package.

You can also use the `DBMS_APPLY_ADM.CREATE_APPLY` procedure to specify nondefault values for the `apply_captured`, `apply_user`, `apply_database_link`, and `apply_tag` parameters when you run that procedure. You can use one of the procedures in the `DBMS_STREAMS_ADM` package to add rules to a rule set used by the apply process after you create it.

See Also:

- "ALTER_APPLY Procedure" on page 23-10
- "CREATE_APPLY Procedure" on page 23-18

Apply Process Rules for User Messages

The `ADD_MESSAGE_RULE` procedure adds a message rule to a rule set of an apply process when you specify `apply` for the `streams_type` parameter. For an apply process rule, you should execute this procedure at the destination database.

If this procedure adds a rule to the positive rule set for an apply process, then the apply process dequeues user messages of a specific message type that satisfy the apply process rule and sends these messages to its message handler. If no message handler is specified for the apply process, then use the `ALTER_APPLY` procedure in the `DBMS_APPLY_ADM` package to set the message handler. If this procedure adds a rule to the negative rule set for an apply process, then the apply process discards user messages of a specific message type that satisfy the apply process rule.

See Also:

- ADD_MESSAGE_RULE Procedure on page 159-43
- ALTER_APPLY Procedure on page 23-10

Messaging Client Rules for LCRs

The following procedures add rules to a rule set of a messaging client when you specify `dequeue` for the `streams_type` parameter:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all LCRs in the messaging client's queue. See "ADD_GLOBAL_RULES Procedure" on page 159-34.
- The `ADD_SCHEMA_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the messaging client's queue containing changes made to a specified schema. See "ADD_SCHEMA_RULES Procedure" on page 159-50.
- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs in the messaging client's queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_RULES Procedure" on page 159-59.
- The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the messaging client's queue containing changes made to a specified table. See "ADD_TABLE_RULES Procedure" on page 159-70.

If one of these procedures adds rules to the positive rule set for a messaging client, then the messaging client can dequeue persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the `source_database` parameter. If one of these procedures adds rules to the negative rule set for a messaging client, then the messaging client discards persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the `source_database` parameter. You should execute these procedures at the database where you want to dequeue the messages with the messaging client.

Messaging Client Rules for User Messages

The `ADD_MESSAGE_RULE` procedure adds a message rule to a rule set of a messaging client when you specify `dequeue` for the `streams_type` parameter. You should execute this procedure at the database that will dequeue messages.

If this procedure adds a rule to the positive rule set for a messaging client, then the messaging client dequeues user messages of a specific message type that satisfy the message rule. If this procedure adds a rule to the negative rule set for a messaging client, then the messaging client discards user messages of a specific message type that satisfy the message rule.

See Also: "ADD_MESSAGE_RULE Procedure" on page 159-43

XStream Outbound Server Rules for LCRs

When you specify `apply` for the `streams_type` parameter and an XStream outbound server for the `streams_name` parameter, the following procedures add rules to a rule set of the specified outbound server:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule conditions evaluate to `TRUE` for all LCRs.
- The `ADD_SCHEMA_RULES` procedure adds rules whose rule conditions evaluate to `TRUE` for LCRs that contain changes made to a specified schema.

- The ADD_SUBSET_RULES procedure adds rules whose rule conditions evaluate to TRUE for row LCRs that contain the results of DML changes made to a subset of rows in a specified table.
- The ADD_TABLE_RULES procedure adds rules whose rule conditions evaluate to TRUE for LCRs that contain changes made to a specified table.

These rules are evaluated against LCRs in the outbound server's queue.

If one of the preceding procedures adds rules to the positive rule set for the outbound server, then the rules specify that the outbound server sends LCRs in its queue to the XStream client application. If one of these procedures adds rules to the negative rule set for the outbound server, then the rules specify that the outbound server discards LCRs in its queue. For outbound server rules, execute these procedures at the database to which the XStream client application attaches.

An outbound server can process captured LCRs from only one source database. The source database is the database where the changes originated. If one of these procedures adds rules to the rule set of an outbound server, then specify the source database for the outbound server using the source_database parameter.

The rules in the outbound server's rule sets determine which LCRs are dequeued by the outbound server. When you create rules with one of these procedures, and you specify a value for the source_database parameter, then the rules include conditions for the specified source database. If the outbound server dequeues an LCR with a source database that is different from the source database for the outbound server, then an error is raised. In addition, when adding rules to an existing outbound server, the database specified in the source_database parameter cannot be different from the source database for the outbound server. You can determine the source database for an outbound server by querying the DBA_XSTREAM_OUTBOUND data dictionary view.

Note: These procedures cannot create an XStream outbound server. You can use one of the procedures in the DBMS_STREAMS_ADM package to add rules to a rule set used by the outbound server after you create it.

See Also: *Oracle Database XStream Guide* for information about creating an outbound server

XStream Inbound Server Rules for LCRs

When you specify apply for the streams_type parameter and an XStream inbound server for the streams_name parameter, the following procedures add rules to a rule set of the specified inbound server:

- The ADD_GLOBAL_RULES procedure adds rules whose rule conditions evaluate to TRUE for all LCRs sent to the inbound server.
- The ADD_SCHEMA_RULES procedure adds rules whose rule conditions evaluate to TRUE for LCRs sent to the inbound server that contain changes made to a specified schema.
- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for row LCRs sent to the inbound server that contain the results of data definition language (DML) changes made to a subset of rows in a specified table.
- The ADD_TABLE_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs sent to the inbound server that contain changes made to a specified table.

If one of the preceding procedures adds rules to the positive rule set for the inbound server, then the rules specify that the inbound server applies LCRs sent to it by the XStream client application. If one of these procedures adds rules to the negative rule set for the inbound server, then the rules specify that the inbound server discards LCRs sent to it by the XStream client application. For inbound server rules, execute these procedures at the database to which the XStream client application attaches. If an inbound server has no rule sets, then it applies all of the LCRs sent to it by the XStream client application.

Changes applied by an inbound server created by one of these procedures generate tags in the redo log at the destination database with a value of `'00'` (double zero). You can use the `ALTER_APPLY` procedure in the `DBMS_APPLY_ADM` package to alter the tag value after the inbound server is created, if necessary.

The rules in the XStream inbound server rule sets determine which LCRs are either applied or discarded after the LCRs are received from the XStream client application. An inbound server can only process LCRs sent from an XStream client application.

When one of these procedures creates rules for an inbound server, the procedure ignores the `source_database` parameter.

Note: If the name specified in the `streams_name` parameter does not exist, then these procedures always create an apply process. The apply process remains an apply process if it receives captured LCRs from a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives LCRs from a capture process. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.

See Also: *Oracle Database XStream Guide* for information about creating an inbound server

Procedures That Configure an Oracle Streams Environment

The following procedures in this package configure an environment that is maintained by Oracle Streams:

- MAINTAIN_CHANGE_TABLE Procedure configures an Oracle Streams environment that records in a change table the data manipulation language (DML) changes made to a source table. Optionally, this procedure can also configure one-way replication of the table from the source database to the destination database.
- MAINTAIN_GLOBAL Procedure configures an Oracle Streams environment that replicates changes at the database level between two databases.
- MAINTAIN_SCHEMAS Procedure configures an Oracle Streams environment that replicates changes to specified schemas between two databases.
- MAINTAIN_SIMPLE_TTS Procedure clones a simple tablespace from a source database at a destination database and configures an Oracle Streams environment that replicates changes to specified tablespace between these two databases.
- MAINTAIN_TABLES Procedure configures an Oracle Streams environment that replicates changes to specified tables between two databases.

- MAINTAIN_TTS Procedure clones a set of tablespaces from a source database at a destination database and configures an Oracle Streams environment that replicates changes to specified tablespaces between these two databases.
- PRE_INSTANTIATION_SETUP Procedure and POST_INSTANTIATION_SETUP Procedure

The PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures must be used together to complete the Oracle Streams replication configuration. Typically, the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures are used to perform database maintenance operations with little or no down time. See *Oracle Streams Concepts and Administration* for more information.

The following sections contain information about using these procedures:

- Automatic Platform Conversion
- Actions Performed by These Procedures
- Configuration Progress and Recoverability
- Requirements for Running These Procedures
- Common Parameters for the Configuration Procedures

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about using these procedures

Automatic Platform Conversion

If the source and destination databases run on different platforms, then these procedures, or the scripts generated by these procedures, convert transferred datafiles to the appropriate platform automatically.

Actions Performed by These Procedures

To view all of the actions performed by one of these procedures in detail, use the procedure to generate a script, and view the script in a text editor.

Configuration Progress and Recoverability

When one of these procedures is run with the perform_actions parameter set to TRUE, metadata about its configuration actions is recorded in the following data dictionary views: DBA_RECOVERABLE_SCRIPT, DBA_RECOVERABLE_SCRIPT_PARAMS, DBA_RECOVERABLE_SCRIPT_BLOCKS, and DBA_RECOVERABLE_SCRIPT_ERRORS. If the procedure stops because it encounters an error, then you can use the RECOVER_OPERATION procedure to complete the configuration after you correct the conditions that caused the error.

> **Note:** When one of these procedures is run with the perform_actions parameter set to FALSE, these views are not populated. Also, the views are not populated when a script generated by one of these procedures is run.

> **See Also:** "RECOVER_OPERATION Procedure" on page 159-147

Requirements for Running These Procedures

Meet the following requirements when you use one of these procedures:

- Run the procedure at the capture database. The capture database is the database that will contain the capture process that captures changes made to the source database. If the capture database is the same as the source database, then a local capture process is configured. If the capture database is different from the source database, then a downstream capture process is configured. See *Oracle Streams Replication Administrator's Guide* for more information about the capture database.
- The user who runs the procedure must be able to use a database link from the source database to the destination database. This database link should have the same name as the global name of the destination database.
- If the procedure configures downstream capture, then the corresponding user at the capture database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- If the procedure configures downstream capture, and the capture database is different from the destination database, then the corresponding user at the capture database must be able to use a database link to access the destination database. This database link should have the same name as the global name of the destination database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the `destination_database` parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- Grant the user who runs the procedure the `DBA` role. This user must have the necessary privileges to complete the following actions:
  - Create `ANYDATA` queues, capture processes, propagations, and apply processes.
  - Specify supplemental logging
  - Run subprograms in the `DBMS_STREAMS_ADM` and `DBMS_AQADM` packages.
  - Access the database specified in the `destination_database` parameter through a database link. This database link should have the same name as the global name of the destination database.

  Typically, the `DBA` role can be revoked from the user, if necessary, after the configuration is complete.
- The procedure, or the scripts generated by these procedure, must be run at an Oracle Database 10*g* Release 2 or later database.
- If the `perform_actions` parameter is set to `TRUE` in the procedure to configure the Oracle Streams environment directly, then all of the databases configured by the procedure must be Oracle Database 10*g* Release 2 or later databases.
- If the `perform_actions` parameter is set to `FALSE` in the procedure, and the environment is configured with a generated script, then the databases configured by the script must be Oracle Database 10*g* Release 1 or later databases. If the script configures an Oracle Database 10*g* Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10*g* Release 2 or later, such as queue-to-queue propagation.
- Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes the procedure must have `READ` and `WRITE` privilege on each one.
- For procedures that include the `bi_directional` parameter, if the `bi_directional` parameter is set to `TRUE`, or if the source database is not the capture database, then

the source_database parameter must specify a database that contains the database objects to be shared. The database specified in the destination_database parameter might or might not contain these database objects. If the destination database does not contain the shared database objects, then the procedure instantiates the database objects at the destination database (excluding the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures).

- For procedures that include the bi_directional parameter, if the bi_directional parameter is set to TRUE or if a network instantiation will be performed, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.

To ensure that the user who runs these procedures has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be should be created in the Oracle Streams administrator's schema.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

Common Parameters for the Configuration Procedures

Table 159–1 describes the common parameters for the procedures in this package that configure an Oracle Streams environment. Some of the procedures do not include all of the parameters in Table 159–1.

Table 159–1 Common Parameters for Configuration Procedures

Parameter	Description
perform_actions	If TRUE, then the procedure performs the necessary actions to configure the environment directly. If FALSE, then the procedure does not perform the necessary actions to configure the environment directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ■ script_name ■ script_directory_object
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to configure the environment. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to configure the environment directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to configure the environment directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.

Table 159–1 (Cont.) Common Parameters for Configuration Procedures

Parameter	Description
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.
capture_name	The name of each capture process configured to capture changes. Do not specify an owner. If the bi_directional parameter is set to TRUE, then each capture process created by this procedure has the specified name. If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set. If NULL, then the system generates a name for each capture process it creates. **Note:** The capture process name cannot be altered after the capture process is created.
capture_queue_table	The name of the queue table for each queue used by a capture process, specified as [*schema_name.*]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the system generates a name for the queue table of each queue used by a capture process, and the current user is the owner of each queue table.
capture_queue_name	The name of each queue used by a capture process, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If NULL, then the system generates a name for each queue used by a capture process.
capture_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.

Table 159–1 (Cont.) Common Parameters for Configuration Procedures

Parameter	Description
propagation_name	The name of each propagation configured to propagate changes. Do not specify an owner. If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the positive propagation rule set. If NULL, then the system generates a name for each propagation it creates. **Note:** The propagation name cannot be altered after the propagation is created.
apply_name	The name of each apply process configured to apply changes. Do not specify an owner. If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the positive apply process rule set. The specified name must not match the name of an existing messaging client at the destination database. If NULL, then the system generates a name for each apply process it creates. When set to NULL, no apply process that applies changes from the source database can exist on the destination database. If an apply process that applies changes from the source database exists at the destination database, then specify a non-NULL value for this parameter. **Note:** The apply process name cannot be altered after the apply process is created.
apply_queue_table	The name of the queue table for each queue used by an apply process, specified as [*schema_name.*]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the system generates a name for the queue table of each queue used by an apply process, and the current user is the owner of each queue table.
apply_queue_name	The name of each queue used by an apply process, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If NULL, then the system generates a name for each queue used by an apply process.
apply_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.

Table 159–1 (Cont.) Common Parameters for Configuration Procedures

Parameter	Description
bi_directional	Specify TRUE to configure bi-directional replication between the database specified in source_database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured to capture changes to both databases, and propagations are configured to propagate these changes. If TRUE, then a database link from the destination database to the source database with the same global name as the source database must exist. Specify FALSE to configure one way replication from the database specified in source_database and the database specified in destination_database. A capture process is configured at the current database and an apply process is configured at the destination database. A propagation is configured if necessary. **See Also:** *Oracle Streams Replication Administrator's Guide* for information about when propagations are configured
include_ddl	Specify TRUE to configure an Oracle Streams replication environment that maintains both DML and DDL changes. Specify FALSE to configure an Oracle Streams replication environment that maintains DML changes only. When this parameter is set to FALSE, DDL changes, such as ALTER TABLE, are not replicated.

Summary of DBMS_STREAMS_ADM Subprograms

Table 159–2 DBMS_STREAMS_ADM Package Subprograms

Subprogram	Description
ADD_COLUMN Procedure on page 159-27	Either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule
ADD_GLOBAL_PROPAGATION_RULES Procedure on page 159-30	Either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_GLOBAL_RULES Procedure on page 159-34	Adds global rules to either the positive or negative rule set of a capture process, apply process, or messaging client, and creates the specified capture process, apply process, or messaging client if it does not exist
ADD_MESSAGE_PROPAGATION_RULE Procedure on page 159-39	Either adds a message rule to the positive rule set for a propagation, or adds a message rule to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_MESSAGE_RULE Procedure on page 159-43	Adds a message rule to either the positive or negative rule set of an apply process or messaging client, and creates the specified apply process or messaging client if it does not exist
ADD_SCHEMA_PROPAGATION_RULES Procedure on page 159-46	Either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SCHEMA_RULES Procedure on page 159-50	Adds schema rules to either the positive or negative rule set of a capture process, apply process, or messaging client, and creates the specified capture process, apply process, or messaging client if it does not exist
ADD_SUBSET_PROPAGATION_RULES Procedure on page 159-55	Adds subset rules to the positive rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SUBSET_RULES Procedure on page 159-59	Adds subset rules to the positive rule set of a capture process, synchronous capture, apply process, or messaging client, and creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist
ADD_TABLE_PROPAGATION_RULES Procedure on page 159-65	Either adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_TABLE_RULES Procedure on page 159-70	Adds table rules to the rule set of a capture process, synchronous capture, apply process, or messaging client, and creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist

Table 159–2 (Cont.) DBMS_STREAMS_ADM Package Subprograms

Subprogram	Description
CLEANUP_INSTANTIATION_SETUP Procedure on page 159-76	Removes an Oracle Streams replication configuration that was set up by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures in this package
DELETE_COLUMN Procedure on page 159-80	Either adds or removes a declarative rule-based transformation which deletes a column from a row LCR that satisfies the specified rule
GET_MESSAGE_TRACKING Function on page 159-83	Returns the tracking label for the current session
GET_SCN_MAPPING Procedure on page 159-84	Gets information about the system change number (SCN) values to use for Oracle Streams capture and apply processes in an Oracle Streams replication environment
GET_TAG Function on page 159-86	Gets the binary tag for all redo entries generated by the current session
KEEP_COLUMNS Procedure on page 159-87	Either adds or removes a declarative rule-based transformation which keeps a list of columns in a row LCR that satisfies the specified rule
MAINTAIN_CHANGE_TABLE Procedure on page 159-90	Configures an Oracle Streams environment that records in a change table the data manipulation language (DML) changes made to a source table. Optionally, this procedure can also configure one-way replication of the table from the source database to the destination database
MAINTAIN_GLOBAL Procedure on page 159-97	Configures an Oracle Streams environment that replicates changes at the database level between two databases
MAINTAIN_SCHEMAS Procedure on page 159-101	Configures an Oracle Streams environment that replicates changes to specified schemas between two databases
MAINTAIN_SIMPLE_TABLESPACE Procedure on page 159-106	Clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure is deprecated.
MAINTAIN_SIMPLE_TTS Procedure on page 159-111	Clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases
MAINTAIN_TABLES Procedure on page 159-114	Configures an Oracle Streams environment that replicates changes to specified tables between two databases
MAINTAIN_TABLESPACES Procedure on page 159-119	Clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure is deprecated.
MAINTAIN_TTS Procedure on page 159-126	Clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases
MERGE_STREAMS Procedure on page 159-130	Merges a stream flowing from one capture process with a stream flowing from another capture process

Table 159–2 (Cont.) DBMS_STREAMS_ADM Package Subprograms

Subprogram	Description
MERGE_STREAMS_JOB Procedure on page 159-133	Determines whether the original capture process and the cloned capture are within the specified merge threshold and, if they are, runs the MERGE_STREAMS procedure to merge the two streams
POST_INSTANTIATION_SETUP Procedure on page 159-136	Performs the actions required after instantiation to configure an Oracle Streams replication environment
PRE_INSTANTIATION_SETUP Procedure on page 159-141	Performs the actions required before instantiation to configure an Oracle Streams replication environment
PURGE_SOURCE_CATALOG Procedure on page 159-146	Removes all Oracle Streams data dictionary information at the local database for the specified object
RECOVER_OPERATION Procedure on page 159-147	Provides options for an Oracle Streams replication configuration operation that stopped because it encountered an error. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.
REMOVE_QUEUE Procedure on page 159-149	Removes the specified ANYDATA queue
REMOVE_RULE Procedure on page 159-150	Removes the specified rule or all rules from the rule set associated with the specified capture process, synchronous capture, propagation, apply process, or messaging client.
REMOVE_STREAMS_CONFIGURATION Procedure on page 159-152	Removes the Oracle Streams configuration at the local database
RENAME_COLUMN Procedure on page 159-154	Either adds or removes a declarative rule-based transformation which renames a column in a row LCR that satisfies the specified rule
RENAME_SCHEMA Procedure on page 159-157	Either adds or removes a declarative rule-based transformation which renames a schema in a row LCR that satisfies the specified rule
RENAME_TABLE Procedure on page 159-159	Either adds or removes a declarative rule-based transformation which renames a table in a row LCR that satisfies the specified rule
SET_MESSAGE_NOTIFICATION Procedure on page 159-161	Sets a notification for messages that can be dequeued by a specified Oracle Streams messaging client from a specified queue
SET_MESSAGE_TRACKING Procedure on page 159-165	Sets the tracking label for logical change records (LCRs) produced by the current session
SET_RULE_TRANSFORM_FUNCTION Procedure on page 159-166	Sets or removes the transformation function name for a rule-based transformation
SET_TAG Procedure on page 159-170	Sets the binary tag for all redo entries subsequently generated by the current session
SET_UP_QUEUE Procedure on page 159-171	Creates a queue table and a queue for use with the capture, propagate, and apply functionality of Oracle Streams
SPLIT_STREAMS Procedure on page 159-173	Splits one stream flowing from a capture process off from all of the other streams flowing from the capture process

Note: All subprograms commit unless specified otherwise.

ADD_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

This procedure is overloaded. The `column_value` and `column_function` parameters are mutually exclusive.

Note:

- `ADD_COLUMN` transformations cannot add columns of the following data types: `BLOB`, `CLOB`, `NCLOB`, `BFILE`, `LONG`, `LONG RAW`, `ROWID`, user-defined types (including object types, `REF`s, varrays, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

Syntax

```
DBMS_STREAMS_ADM.ADD_COLUMN(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   column_value  IN  ANYDATA,
   value_type    IN  VARCHAR2     DEFAULT 'NEW',
   step_number   IN  NUMBER       DEFAULT 0,
   operation     IN  VARCHAR2     DEFAULT 'ADD');

DBMS_STREAMS_ADM.ADD_COLUMN(
   rule_name        IN  VARCHAR2,
   table_name       IN  VARCHAR2,
   column_name      IN  VARCHAR2,
   column_function  IN  VARCHAR2,
   value_type       IN  VARCHAR2     DEFAULT 'NEW',
   step_number      IN  NUMBER       DEFAULT 0,
   operation        IN  VARCHAR2     DEFAULT 'ADD');
```

Parameters

Table 159–3 ADD_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name*.]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table to which the column is added in the row LCR, specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
column_name	The name of the column added to each row LCR that satisfies the rule.
column_value	The value of the added column. Specify the appropriate ANYDATA function for the column datatype and the column value. For example, if the datatype of the column being added is NUMBER and the value is NULL, then specify the ANYDATA.ConvertNumber(NULL) function. This parameter cannot be specified if the column_function parameter is specified.
column_function	Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function. The 'SYSDATE' SQL function places the current date and time set for the operating system on which the database resides. The datatype of the returned value is DATE, and the format returned depends on the value of the NLS_DATE_FORMAT initialization parameter. The 'SYSTIMESTAMP' SQL function returns the system date, including fractional seconds and time zone, of the system on which the database resides. The return type is TIMESTAMP WITH TIME ZONE. The function executes when the rule evaluates to TRUE. This parameter cannot be specified if the column_value parameter is specified.
value_type	Specify 'NEW' to add the column to the new values in the row LCR. Specify 'OLD' to add the column to the old values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD_COLUMN procedures when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all add column transformations for the specified rule.

table_name	column_name	step_number	Result
NULL	NULL	non-NULL	Remove all add column transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all add column transformations with the specified column_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all add column transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all add column transformations with the specified column_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all add column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all add column transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all add column transformations with the specified table_name, column_name, and step_number for the specified rule.

ADD_GLOBAL_PROPAGATION_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES(
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES(
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 159–4 ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`streams_name`	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If `NULL` and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If `NULL` and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

Table 159–4 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 159–4 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. The source database is where the changes originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 275, "Logical Change Record TYPEs"

Table 159–4 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. The procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

See Also:

- "Operational Notes" on page 159-9 and "Propagation Rules for LCRs" on page 159-11 for more information about the rules created by this procedure
- "Propagation User" on page 159-6

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_GLOBAL_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to an entire database. See "Capture Process Rules for Changes in the Redo Log" on page 159-10 for more information about these rules.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying all logical change records (LCRs) in a queue. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 159-12 for more information about these rules.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing all persistent LCRs from a queue. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 159-14 for more information about these rules.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Caution: If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not support by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_GLOBAL_RULES(
   streams_type        IN   VARCHAR2,
   streams_name        IN   VARCHAR2  DEFAULT NULL,
   queue_name          IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml         IN   BOOLEAN   DEFAULT TRUE,
   include_ddl         IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
   source_database     IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name       OUT  VARCHAR2,
   ddl_rule_name       OUT  VARCHAR2,
   inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
   and_condition       IN   VARCHAR2  DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_GLOBAL_RULES(
   streams_type        IN   VARCHAR2,
```

```
  streams_name        IN   VARCHAR2  DEFAULT NULL,
  queue_name          IN   VARCHAR2  DEFAULT 'streams_queue',
  include_dml         IN   BOOLEAN   DEFAULT TRUE,
  include_ddl         IN   BOOLEAN   DEFAULT FALSE,
  include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
  source_database     IN   VARCHAR2  DEFAULT NULL,
  inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
  and_condition       IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 159–5 ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
streams_type	The type of Oracle Streams client: ■ Specify capture for a capture process. ■ Specify apply for an apply process. ■ Specify dequeue for a messaging client.
streams_name	The name of the capture process, apply process, or messaging client. Do not specify an owner. If NULL, if streams_type is capture or dequeue, and if one relevant capture process or messaging client for the queue exists, then the relevant Oracle Streams client is used. If no relevant Oracle Streams client exists for the queue, then an Oracle Streams client is created automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process and messaging client must have a unique name.
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.

Table 159–5 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.

Table 159–5 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 275, "Logical Change Record TYPEs"

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A capture process, apply process, or messaging client uses the rules for filtering.

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_MESSAGE_PROPAGATION_RULE Procedure

This procedure adds a message rule to the positive rule set for a propagation, or adds a message rule to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains the `OUT` parameter `rule_name`, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE(
   message_type             IN   VARCHAR2,
   rule_condition           IN   VARCHAR2,
   streams_name             IN   VARCHAR2  DEFAULT NULL,
   source_queue_name        IN   VARCHAR2,
   destination_queue_name   IN   VARCHAR2,
   inclusion_rule           IN   BOOLEAN   DEFAULT TRUE,
   rule_name                OUT  VARCHAR2,
   queue_to_queue           IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE(
   message_type             IN   VARCHAR2,
   rule_condition           IN   VARCHAR2,
   streams_name             IN   VARCHAR2  DEFAULT NULL,
   source_queue_name        IN   VARCHAR2,
   destination_queue_name   IN   VARCHAR2,
   inclusion_rule           IN   BOOLEAN   DEFAULT TRUE,
   queue_to_queue           IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 159–6 ADD_MESSAGE_PROPAGATION_RULE Procedure Parameters

Parameter	Description
`message_type`	The type of the message. The type can be an Oracle built-in type, such as `VARCHAR2` or `NUMBER`, or it can be a user-defined type. If the type is not an Oracle built-in type, then it is specified as `[`*`schema_name`*`.]`*`type_name`*. If the schema is not specified, then the current user is the default. For example, to specify `VARCHAR2`, enter `VARCHAR2(`*`n`*`)`, where *`n`* is the size specification. To specify a type named `usr_msg` in the `strmadmin` schema, enter `strmadmin.usr_msg` for this parameter. The following data types require a size specification: `VARCHAR2`, `NVARCHAR2`, and `RAW`. **See Also:** *Oracle Database SQL Language Reference* for more information about data types
`rule_condition`	The rule condition for this message type. The rule variable name specified in the rule condition must be the following: `:msg` **See Also:** "Examples" on page 159-41

Table 159–6 (Cont.) ADD_MESSAGE_PROPAGATION_RULE Procedure Parameters

Parameter	Description
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as [*schema_name*.]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name*.]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rule to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rule to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.
rule_name	Contains the rule name

Table 159–6 (Cont.) ADD_MESSAGE_PROPAGATION_RULE Procedure Parameters

Parameter	Description
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ▪ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ▪ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ▪ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.

See Also:

- "Operational Notes" on page 159-9 and "Propagation Rules for User Messages" on page 159-12 for more information about the rules created by this procedure
- "Propagation User" on page 159-6

Examples

Suppose the message type is VARCHAR2(128). Given this type, the following rule condition can be specified:

```
':msg = ''HQ'''
```

This rule condition evaluates to TRUE if a user message of type VARCHAR2(128) has HQ for its value.

Suppose the message type is usr_msg, and that this type has the following attributes: source_dbname, owner, name, and message. Given this type, the following rule condition can be specified:

```
':msg.source_dbname = ''DBS1.NET'' AND ' || ':msg.owner = ''HR'' AND  ' ||
':msg.name = ''EMPLOYEES'''
```

This rule condition evaluates to `TRUE` if a user message of type `usr_msg` has `DBS1.NET` for its `source_dbname` attribute, `HR` for its `owner` attribute, and `EMPLOYEES` for its `name` attribute.

Note: The quotation marks in the preceding examples are all single quotation marks.

ADD_MESSAGE_RULE Procedure

This procedure adds a message rule to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `apply`, this procedure adds an apply process rule for dequeuing user messages of a specific message type from a queue. See "Apply Process Rules for User Messages" on page 159-13 for more information about such rules.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds a messaging client rule for dequeuing user messages of a specific message type from a queue. See "Messaging Client Rules for User Messages" on page 159-14 for more information about such rules.

This procedure also creates the specified Oracle Streams client if it does not exist.

This procedure is overloaded. One version of this procedure contains the `OUT` parameter `rule_name`, and the other does not.

> **Note:** Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_MESSAGE_RULE(
   message_type    IN   VARCHAR2,
   rule_condition  IN   VARCHAR2,
   streams_type    IN   VARCHAR2,
   streams_name    IN   VARCHAR2  DEFAULT NULL,
   queue_name      IN   VARCHAR2  DEFAULT 'streams_queue',
   inclusion_rule  IN   BOOLEAN   DEFAULT TRUE,
   rule_name       OUT  VARCHAR2);

DBMS_STREAMS_ADM.ADD_MESSAGE_RULE(
   message_type    IN   VARCHAR2,
   rule_condition  IN   VARCHAR2,
   streams_type    IN   VARCHAR2,
   streams_name    IN   VARCHAR2  DEFAULT NULL,
   queue_name      IN   VARCHAR2  DEFAULT 'streams_queue',
   inclusion_rule  IN   BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 159–7 ADD_MESSAGE_RULE Procedure Parameters

Parameter	Description
message_type	The type of the message. The type can be an Oracle built-in type, such as VARCHAR2 or NUMBER, or it can be a user-defined type. If the type is not an Oracle built-in type, then it is specified as [*schema_name*.]*type_name*. If the schema is not specified, then the current user is the default. For example, to specify VARCHAR2, enter VARCHAR2(*n*), where *n* is the size specification. To specify a type named usr_msg in the strmadmin schema, enter strmadmin.usr_msg for this parameter. The following data types require a size specification: VARCHAR2, NVARCHAR2, and RAW. **See Also:** *Oracle Database SQL Language Reference* for more information about data types
rule_condition	The rule condition for this message type. The rule variable name specified in the rule condition must be the following: :msg **See Also:** "Examples" on page 159-45
streams_type	The type of message consumer, either apply for apply process or dequeue for messaging client
streams_name	The name of the Oracle Streams apply process or messaging client. If the specified streams_type is apply, then specify the name of the apply process. Do not specify an owner. If the specified apply process does not exist, then the procedure creates it automatically with a system-generated name. If the specified streams_type is dequeue, then specify the messaging client. For example, if the user strmadmin is the messaging client, then specify strmadmin. If NULL and a relevant apply process or messaging client for the queue exists, then the procedure uses the relevant apply process or messaging client. If NULL and multiple relevant apply processes or messaging clients for the queue exist, then the procedure raises an error. If NULL and no Oracle Streams client of the specified streams_type exists for the queue, then the procedure creates an apply process or messaging client automatically with a system-generated name. An apply process and a messaging client cannot have the same name.
queue_name	The name of the local queue from which messages will be dequeued, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rule to the positive rule set for the apply process or messaging client. If inclusion_rule is FALSE, then the procedure adds the rule to the negative rule set for the apply process or messaging client. In either case, the system creates the rule set if it does not exist.
rule_name	Contains the rule name

Usage Notes

If an apply process rule is added, then this procedure creates the apply process if it does not exist. An apply process created by this procedure can apply only user messages, and dequeued messages are sent to the message handler for the apply process. If a messaging client rule is added, then this procedure creates a messaging client if it does not exist.

When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.

See Also:

- "Operational Notes" on page 159-9
- "Security Model" on page 159-5
- ALTER_APPLY Procedure on page 23-10 for more information about setting a message handler for an apply process

Examples

Suppose the message type is `VARCHAR2(128)`. Given this type, the following rule condition can be specified:

```
':msg = ''HQ'''
```

This rule condition evaluates to `TRUE` if a user message of type `VARCHAR2(128)` has `HQ` for its value.

Suppose the message type is `usr_msg`, and that this type has the following attributes: `source_dbname`, `owner`, `name`, and `message`. Given this type, the following rule condition can be specified:

```
':msg.source_dbname = ''DBS1.NET'' AND ' || ':msg.owner = ''HR'' AND  ' ||
':msg.name = ''EMPLOYEES'''
```

This rule condition evaluates to `TRUE` if a user message of type `usr_msg` has `DBS1.NET` for its `source_dbname` attribute, `HR` for its `owner` attribute, and `EMPLOYEES` for its `name` attribute.

Note: The quotation marks in the preceding examples are all single quotation marks.

ADD_SCHEMA_PROPAGATION_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_SCHEMA_PROPAGATION_RULES(
   schema_name             IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_SCHEMA_PROPAGATION_RULES(
   schema_name             IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 159–8 ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema. For example, `hr`.
`streams_name`	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If `NULL` and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If `NULL` and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

Table 159–8 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 159–8 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 275, "Logical Change Record TYPEs"

Table 159–8 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

See Also:

- "Operational Notes" on page 159-9 and "Propagation Rules for LCRs" on page 159-11 for more information about the rules created by this procedure
- "Propagation User" on page 159-6

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_SCHEMA_RULES Procedure

This procedures adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified schema. See "Capture Process Rules for Changes in the Redo Log" on page 159-10 for more information about these rules.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 159-12 for more information about these rules.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 159-14 for more information about these rules.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Caution: If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not support by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_SCHEMA_RULES(
   schema_name          IN   VARCHAR2,
   streams_type         IN   VARCHAR2,
   streams_name         IN   VARCHAR2  DEFAULT NULL,
   queue_name           IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml          IN   BOOLEAN   DEFAULT TRUE,
   include_ddl          IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr   IN   BOOLEAN   DEFAULT FALSE,
   source_database      IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name        OUT  VARCHAR2,
   ddl_rule_name        OUT  VARCHAR2,
   inclusion_rule       IN   BOOLEAN   DEFAULT TRUE,
   and_condition        IN   VARCHAR2  DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_SCHEMA_RULES(
   schema_name          IN   VARCHAR2,
   streams_type         IN   VARCHAR2,
   streams_name         IN   VARCHAR2  DEFAULT NULL,
   queue_name           IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml          IN   BOOLEAN   DEFAULT TRUE,
   include_ddl          IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr   IN   BOOLEAN   DEFAULT FALSE,
   source_database      IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule       IN   BOOLEAN   DEFAULT TRUE,
   and_condition        IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 159–9 ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
schema_name	The name of the schema. For example, hr. You can specify a schema that does not yet exist, because Oracle Streams does not validate the existence of the schema.
streams_type	The type of Oracle Streams client: ■ Specify capture for a capture process. ■ Specify apply for an apply process. ■ Specify dequeue for a messaging client.
streams_name	The name of the capture process, apply process, or messaging client. Do not specify an owner. If NULL, if streams_type is capture or dequeue, and if one relevant capture process or messaging client for the queue exists, then the relevant Oracle Streams client is used. If no relevant Oracle Streams client exists for the queue, then an Oracle Streams client is created automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process and messaging client must have a unique name.

Table 159–9 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 159–9 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client. In either case, the system creates the rule set if it does not exist.

Table 159–9 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 275, "Logical Change Record TYPEs"

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A capture process, apply process, or messaging client uses the rules for filtering.

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_SUBSET_PROPAGATION_RULES Procedure

This procedures adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES(
   table_name                IN   VARCHAR2,
   dml_condition             IN   VARCHAR2,
   streams_name              IN   VARCHAR2  DEFAULT NULL,
   source_queue_name         IN   VARCHAR2,
   destination_queue_name    IN   VARCHAR2,
   include_tagged_lcr        IN   BOOLEAN   DEFAULT FALSE,
   source_database           IN   VARCHAR2  DEFAULT NULL,
   insert_rule_name          OUT  VARCHAR2,
   update_rule_name          OUT  VARCHAR2,
   delete_rule_name          OUT  VARCHAR2,
   queue_to_queue            IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES(
   table_name                IN   VARCHAR2,
   dml_condition             IN   VARCHAR2,
   streams_name              IN   VARCHAR2  DEFAULT NULL,
   source_queue_name         IN   VARCHAR2,
   destination_queue_name    IN   VARCHAR2,
   include_tagged_lcr        IN   BOOLEAN   DEFAULT FALSE,
   source_database           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue            IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 159–10 ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, `LONG`, `LONG RAW`, or `XMLType` columns currently or in the future.
`dml_condition`	The subset condition. Specify this condition similar to the way you specify conditions in a `WHERE` clause in SQL. For example, to specify rows in the `hr.employees` table where the `salary` is greater than `4000` and the `job_id` is `SA_MAN`, enter the following as the condition: `' salary > 4000 and job_id = ''SA_MAN'' '` **Note:** The quotation marks in the preceding example are all single quotation marks.

Table 159–10 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_tagged_lcr	If TRUE, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database. If FALSE, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.

Table 159–10 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts.
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only row LCRs that satisfy the condition specified for the dml_condition parameter are propagated. For UPDATE statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified dml_condition, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified dml_condition, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified dml_condition, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified dml_condition, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the propagation are not affected. Additional rules can be added using either the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package.

Rules for `INSERT`, `UPDATE`, and `DELETE` statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The `ADD_SUBSET_RULES` procedure is overloaded, and the system-generated rule names for `INSERT`, `UPDATE`, and `DELETE` statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

Attention: Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

See Also:

- "Operational Notes" on page 159-9 and "Propagation Rules for LCRs" on page 159-11 for more information about the rules created by this procedure
- "Propagation User" on page 159-6

Examples

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

ADD_SUBSET_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table. See "Capture Process Rules for Changes in the Redo Log" on page 159-10 for more information about these rules.
- When the `streams_type` parameter is set to `sync_capture`, this procedure adds rules for capturing changes to a subset of rows in a specified table. See "Synchronous Capture Rules for DML Changes to Tables" on page 159-11 for more information about these rules.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 159-12 for more information about these rules.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 159-14 for more information about these rules.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

Note:

- Currently, messaging clients cannot dequeue buffered messages.
- The invoking user must be granted the `DBA` role to create a synchronous capture.

Syntax

```
DBMS_STREAMS_ADM.ADD_SUBSET_RULES(
   table_name          IN   VARCHAR2,
   dml_condition       IN   VARCHAR2,
   streams_type        IN   VARCHAR2 DEFAULT 'apply',
   streams_name        IN   VARCHAR2 DEFAULT NULL,
   queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
   include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
   source_database     IN   VARCHAR2 DEFAULT NULL,
   insert_rule_name    OUT  VARCHAR2,
   update_rule_name    OUT  VARCHAR2,
   delete_rule_name    OUT  VARCHAR2);

DBMS_STREAMS_ADM.ADD_SUBSET_RULES(
   table_name          IN   VARCHAR2,
   dml_condition       IN   VARCHAR2,
   streams_type        IN   VARCHAR2 DEFAULT 'apply',
```

```
   streams_name        IN   VARCHAR2 DEFAULT NULL,
   queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
   include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
   source_database     IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 159–11 ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the capture process, synchronous capture, apply process, or messaging client. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.
dml_condition	The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition: ' salary > 4000 and job_id = ''SA_MAN'' ' **Note:** The quotation marks in the preceding example are all single quotation marks.
streams_type	The type of Oracle Streams client: ■ Specify capture for a capture process. ■ Specify sync_capture for a synchronous capture. ■ Specify apply for an apply process. ■ Specify dequeue for a messaging client.

Table 159–11 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
streams_name	The name of the capture process, synchronous capture, apply process, or messaging client. Do not specify an owner. If NULL, if streams_type is capture, sync_capture, or dequeue, and if one relevant capture process, synchronous capture, or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process and messaging client must have a unique name.
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.

Table 159–11 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	If TRUE, then the Oracle Streams client performs its action regardless of the tag: ■ A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag. ■ A change is always considered for capture by a synchronous capture, regardless of whether the session that makes the change has a non-NULL tag. ■ An LCR is always considered for apply by an apply process or dequeue by a messaging client, regardless of whether redo entry or LCR has a non-NULL tag. If FALSE, then an Oracle Streams client performs its action only when the tag is NULL: ■ A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag. ■ A change is considered for capture by a synchronous capture only when the session that makes the change has a NULL tag. ■ An LCR is considered for apply by an apply process or dequeue by a messaging client only if the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For synchronous capture rules, specify the name of the local database. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts.

Table 159–11 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes

Usage Notes

Running this procedure generates three rules for the specified capture process, synchronous capture, apply process, or messaging client: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the dml_condition parameter are captured, applied, or dequeued. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified dml_condition, then the DML change is captured, applied, or dequeued without any changes.
- If neither the new or old values in a DML change satisfy the specified dml_condition, then the DML change is not captured, applied, or dequeued.
- If the old values for a DML change satisfy the specified dml_condition, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified dml_condition, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process, synchronous capture, apply process, or messaging client uses the rules for filtering. If the Oracle Streams client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

Attention: Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

See Also:

- "Operational Notes" on page 159-9
- "Security Model" on page 159-5

Examples

The following is an example of a rule condition created for filtering DML changes containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

ADD_TABLE_PROPAGATION_RULES Procedure

This procedures adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_TABLE_PROPAGATION_RULES(
   table_name              IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_TABLE_PROPAGATION_RULES(
   table_name              IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 159–12 ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[`*`schema_name`*`.]`*`table_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`streams_name`	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If `NULL` and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If `NULL` and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

Table 159–12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	The name of the source queue, specified as [*schema_name*.]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name*.]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.

Table 159–12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.

Table 159–12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 275, "Logical Change Record TYPEs"
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The

sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

See Also:

- "Operational Notes" on page 159-9 and "Propagation Rules for LCRs" on page 159-11 for more information about the rules created by this procedure
- "Security Model" on page 159-5

Examples

The following is an example of a table rule condition created for filtering DML statements:

```
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_TABLE_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified table. See "Capture Process Rules for Changes in the Redo Log" on page 159-10 for more information about these rules.
- When the `streams_type` parameter is set to `sync_capture`, this procedure adds rules for capturing changes to a specified table. See "Synchronous Capture Rules for DML Changes to Tables" on page 159-11 for more information about these rules.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 159-12 for more information about these rules.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 159-14 for more information about these rules.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Note:

- Currently, messaging clients cannot dequeue buffered messages.
- The invoking user must be granted the `DBA` role to create a synchronous capture.

Syntax

```
DBMS_STREAMS_ADM.ADD_TABLE_RULES(
   table_name          IN   VARCHAR2,
   streams_type        IN   VARCHAR2,
   streams_name        IN   VARCHAR2 DEFAULT NULL,
   queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
   include_dml         IN   BOOLEAN  DEFAULT TRUE,
   include_ddl         IN   BOOLEAN  DEFAULT FALSE,
   include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
   source_database     IN   VARCHAR2 DEFAULT NULL,
   dml_rule_name       OUT  VARCHAR2,
   ddl_rule_name       OUT  VARCHAR2,
   inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
   and_condition       IN   VARCHAR2  DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_TABLE_RULES(
   table_name          IN   VARCHAR2,
```

```
  streams_type        IN   VARCHAR2,
  streams_name        IN   VARCHAR2 DEFAULT NULL,
  queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
  include_dml         IN   BOOLEAN  DEFAULT TRUE,
  include_ddl         IN   BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
  source_database     IN   VARCHAR2 DEFAULT NULL,
  inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
  and_condition       IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 159–13 ADD_TABLE_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. You can specify a table that does not yet exist, because Oracle Streams does not validate the existence of the table.
streams_type	The type of Oracle Streams client: ■ Specify capture for a capture process. ■ Specify sync_capture for a synchronous capture. ■ Specify apply for an apply process. ■ Specify dequeue for a messaging client.
streams_name	The name of the capture process, synchronous capture, apply process, or messaging client. Do not specify an owner. If NULL, if streams_type is capture, sync_capture, or dequeue, and if one relevant capture process, synchronous capture, or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process and messaging client must have a unique name.

Table 159–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.
include_dml	If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.

Table 159–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry, session, or LCR has a non-NULL tag. If the rules are added to the positive rule set for the Oracle Streams client, then the Oracle Streams client performs its action regardless of the tag: ■ A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag. ■ A change is always considered for capture by a synchronous capture, regardless of whether the session that makes the change has a non-NULL tag. ■ An LCR is always considered for apply by an apply process or dequeue by a messaging client, regardless of whether redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the Oracle Streams client, then whether a database change is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry, session, or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for an Oracle Streams client, then the Oracle Streams client performs its action only when the tag is NULL: ■ A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag. ■ A change is considered for capture by a synchronous capture only when the session that makes the change has a NULL tag. ■ An LCR is considered for apply by an apply process or dequeue by a messaging client only if the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the Oracle Streams client, then a database change can be discarded only if it has a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 159–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For synchronous capture rules, specify the name of the local database. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client. A synchronous capture cannot have a negative rule set. Specifying FALSE for a synchronous capture raises an error. In either case, the system creates the rule set if it does not exist.

Table 159–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 275, "Logical Change Record TYPEs"

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process, synchronous capture, apply process, or messaging client uses the rules for filtering.

See Also:

- "Operational Notes" on page 159-9
- "Security Model" on page 159-5

Examples

The following is an example of a table rule condition created for DML changes:

```
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

CLEANUP_INSTANTIATION_SETUP Procedure

This procedure removes an Oracle Streams replication configuration that was set up by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures in this package. This procedure either remove the configuration directly, or it can generate a script that removes the configuration.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Attention: When the CLEANUP_INSTANTIATION_SETUP procedure is run, the parameter values must match the parameter values specified when the corresponding PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures were run, except for the values of the following parameters: perform_actions, script_name, and script_directory_object.

See Also:

- "PRE_INSTANTIATION_SETUP Procedure" on page 159-141
- "POST_INSTANTIATION_SETUP Procedure" on page 159-136
- "Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.CLEANUP_INSTANTIATION_SETUP(
   maintain_mode           IN VARCHAR2,
   tablespace_names        IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
   source_database         IN VARCHAR2,
   destination_database    IN VARCHAR2,
   perform_actions         IN BOOLEAN   DEFAULT TRUE,
   script_name             IN VARCHAR2  DEFAULT NULL,
   script_directory_object IN VARCHAR2  DEFAULT NULL,
   capture_name            IN VARCHAR2  DEFAULT NULL,
   capture_queue_table     IN VARCHAR2  DEFAULT NULL,
   capture_queue_name      IN VARCHAR2  DEFAULT NULL,
   capture_queue_user      IN VARCHAR2  DEFAULT NULL,
   propagation_name        IN VARCHAR2  DEFAULT NULL,
   apply_name              IN VARCHAR2  DEFAULT NULL,
   apply_queue_table       IN VARCHAR2  DEFAULT NULL,
   apply_queue_name        IN VARCHAR2  DEFAULT NULL,
   apply_queue_user        IN VARCHAR2  DEFAULT NULL,
   bi_directional          IN BOOLEAN   DEFAULT FALSE,
   change_global_name      IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 159–14 CLEANUP_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
maintain_mode	Specify one of the following: ■ GLOBAL to clean up the Oracle Streams configuration that maintained the entire database in both the source and destination databases ■ TRANSPORTABLE TABLESPACES to cleanup the Oracle Streams configuration that maintained a set of tablespaces at both the source and destination database
tablespace_names	If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. If maintain_mode is set to GLOBAL, then specify an empty tablespace set. Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL. **See Also:** TABLESPACE_SET Table Type on page 164-9
source_database	The global name of the source database. If NULL, then the procedure uses the global name of the local database.
destination_database	The global name of the destination database. A database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
perform_actions	If TRUE, then this procedure performs the necessary actions to clean up the Oracle Streams configuration directly. If FALSE, then the procedure does not perform the necessary actions to clean up the Oracle Streams configuration directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ■ script_name ■ script_directory_object

Table 159–14 (Cont.) CLEANUP_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to clean up the Oracle Streams configuration. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the statements are appended to the existing file. If non-NULL and the perform_actions parameter is TRUE, then this procedure generates the specified script and performs the actions to clean up the Oracle Streams configuration directly. If NULL and the perform_actions parameter is TRUE, then this procedure directly performs the actions to clean up the Oracle Streams configuration without generating a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then this parameter is ignored, and this procedure does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.
capture_name	The name of the capture processes configured to capture changes in the Oracle Streams configuration. Do not specify an owner. If NULL, then the procedure automatically identifies the capture processes with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
capture_queue_table	The name of the queue table for each queue used by a capture process, specified as [*schema_name*.]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the procedure automatically identifies the capture queue tables with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
capture_queue_name	The name of each queue used by a capture process, specified as [*schema_name*.]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If NULL, then the procedure automatically identifies the capture queues with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
capture_queue_user	The name of the user who has ENQUEUE and DEQUEUE privileges for the queue at the source database. This user is a secure queue user of the queue.

Table 159–14 (Cont.) CLEANUP_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
propagation_name	The name of the propagations configured to propagate changes in the Oracle Streams configuration. Do not specify an owner. If NULL, then the procedure automatically identifies the propagations with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
apply_name	The name of the apply processes configured to apply changes in the Oracle Streams configuration. Do not specify an owner. If NULL, then the procedure automatically identifies the apply processes with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
apply_queue_table	The name of the queue table for each queue used by an apply process, specified as [*schema_name*.]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the procedure automatically identifies the apply queue tables with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
apply_queue_name	The name of each queue used by an apply process, specified as [*schema_name*.]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If NULL, then the procedure automatically identifies the apply queues with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
apply_queue_user	The name of the user who has ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user is a secure queue user of the queue.
bi_directional	Specify TRUE if the Oracle Streams replication configuration is bi-directional between the database specified in source_database and the database specified in destination_database. Specify FALSE if the Oracle Streams replication configuration is one way replication from the current database to the database specified in destination_database.
change_global_name	If TRUE, then the procedure changes the global name of the database specified in destination_database to match the global name of the current database. If FALSE, then the procedure does not change the global name of the database specified in destination_database.

DELETE_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note:

- The `DELETE_COLUMN` procedure supports the same data types supported by Oracle Streams capture processes.
- The `DELETE_COLUMN` procedure is useful when you want to delete a relatively small number of columns in a row LCR. To delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the `KEEP_COLUMNS` procedure in this package.
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also:

- *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes
- "KEEP_COLUMNS Procedure" on page 159-87

Syntax

```
DBMS_STREAMS_ADM.DELETE_COLUMN(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   value_type    IN  VARCHAR2   DEFAULT '*',
   step_number   IN  NUMBER     DEFAULT 0,
   operation     IN  VARCHAR2   DEFAULT 'ADD');
```

Parameters

Table 159–15 DELETE_COLUMN Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[`*`schema_name`*`.]`*`rule_name`*. If `NULL`, then the procedure raises an error. For example, to specify a rule in the `hr` schema named `employees12`, enter `hr.employees12`. If the schema is not specified, then the current user is the default.

Table 159–15 (Cont.) DELETE_COLUMN Procedure Parameters

Parameter	Description
table_name	The name of the table from which the column is deleted in the row LCR, specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
column_name	The name of the column deleted from each row LCR that satisfies the rule.
value_type	Specify 'NEW' to delete the column from the new values in the row LCR. Specify 'OLD' to delete the column from the old values in the row LCR. Specify '*' to delete the column from both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule. See "Usage Notes" on page 159-81 for more information about this parameter.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the DELETE_COLUMN procedure when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all delete column transformations for the specified rule.
NULL	NULL	non-NULL	Remove all delete column transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified column_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all delete column transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all delete column transformations with the specified column_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all delete column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all delete column transformations with the specified table_name for the specified rule.

table_name	column_name	step_number	Result
non-NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified table_name, column_name, and step_number for the specified rule.

GET_MESSAGE_TRACKING Function

Returns the tracking label for the current session.

See Also: SET_MESSAGE_TRACKING Procedure on page 159-165

Syntax

```
DBMS_STREAMS_ADM.GET_MESSAGE_TRACKING
RETURN VARCHAR2;
```

GET_SCN_MAPPING Procedure

This procedure gets information about the system change number (SCN) values to use for Oracle Streams capture and apply processes in an Oracle Streams replication environment. This information can be used for the following purposes:

- To recover transactions after point-in-time recovery is performed on a source database in a multiple source Oracle Streams environment
- To run flashback queries for the corresponding SCN at a source database and destination database in an Oracle Streams single source replication environment

> **See Also:** *Oracle Streams Replication Administrator's Guide* for information about point-in-time recovery and flashback queries in an Oracle Streams replication environment

Syntax

```
DBMS_STREAMS_ADM.GET_SCN_MAPPING(
   apply_name             IN  VARCHAR2,
   src_pit_scn            IN  NUMBER,
   dest_instantiation_scn OUT NUMBER,
   dest_start_scn         OUT NUMBER,
   dest_skip_txn_ids      OUT DBMS_UTILITY.NAME_ARRAY);
```

Parameters

Table 159–16 GET_SCN_MAPPING Procedure Parameters

Parameter	Description
apply_name	Name of the apply process which applies logical change records (LCRs) from the source database. The procedure raises an error if the specified apply process does not exist.
src_pit_scn	The SCN at the source database. For point-in-time recovery, specify the point-in-time recovery SCN at the source database. If the specified SCN is greater than the source commit SCN of the last applied transaction, then NULL is returned for both dest_start_scn and dest_instantiation_scn. In this case, no values can be returned for these parameters because the corresponding transaction has not been applied at the destination database yet.
dest_instantiation_scn	The SCN at the destination database that corresponds to the specified src_pit_scn at the source database. For point-in-time recovery, use this value for the instantiation SCNs at the source database during recovery.
dest_start_scn	For point in time recovery, the SCN to use for the start_scn parameter for the recovery capture process.

Table 159–16 (Cont.) GET_SCN_MAPPING Procedure Parameters

Parameter	Description
dest_skip_txn_ids	Transaction IDs of transactions that were skipped at the dest_instantiation_scn because the apply process was applying nondependent transactions out of order. For point in time recovery, these transaction IDs should be ignored by the recovery apply process. This parameter is relevant only if the commit_serialization for the apply process that applied these transactions was set to DEPENDENT_TRANSACTIONS, and the transactions were applied out of order.

GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

See Also:

- "SET_TAG Procedure" on page 159-170
- *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
DBMS_STREAMS_ADM.GET_TAG
RETURN RAW;
```

Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON
DECLARE
   raw_tag RAW(2000);
BEGIN
   raw_tag := DBMS_STREAMS_ADM.GET_TAG();
   DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the `DUAL` view:

```
SELECT DBMS_STREAMS_ADM.GET_TAG FROM DUAL;
```

KEEP_COLUMNS Procedure

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

This procedure is overloaded. The `column_list` parameter is type `VARCHAR2` and the `column_table` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

Note:

- The `KEEP_COLUMNS` procedure supports the same data types supported by Oracle Streams capture processes.
- The `KEEP_COLUMNS` procedure is useful when you want to keep a relatively small number of columns in a row LCR. To keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the `DELETE_COLUMN` procedure in this package.
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also:

- *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes
- "DELETE_COLUMN Procedure" on page 159-80

Syntax

```
DBMS_STREAMS_ADM.KEEP_COLUMNS(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_list   IN  VARCHAR2,
   value_type    IN  VARCHAR2 DEFAULT '*',
   step_number   IN  NUMBER DEFAULT 0,
   operation     IN  VARCHAR2 DEFAULT 'ADD');

DBMS_STREAMS_ADM.KEEP_COLUMNS(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_table  IN  DBMS_UTILITY.LNAME_ARRAY,
   value_type    IN  VARCHAR2 DEFAULT '*',
   step_number   IN  NUMBER DEFAULT 0,
   operation     IN  VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 159–17 KEEP_COLUMNS Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name*.]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table for which the columns are kept in the row LCR, specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
column_list	The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type VARCHAR2. The transformation removes columns that are not in the list from the row LCR. If this parameter is set to NULL, and the column_table parameter is also set to NULL, then the procedure raises an error.
column_table	The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY, where each element is the name of a column. The first schema should be in position 1. The last position must be NULL. The transformation removes columns that are not in the table from the row LCR. If this parameter is set to NULL, and the column_list parameter is also set to NULL, then the procedure raises an error.
value_type	Specify 'NEW' to keep the columns in the new values in the row LCR. Specify 'OLD' to keep the columns in the old values in the row LCR. Specify '*' to keep the columns in both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule. See "Usage Notes" on page 159-88 for more information about this parameter.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_list, column_table, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the KEEP_COLUMNS procedure when one or more of these parameters is NULL:

table_name	column_list/column_table	step_number	Result
NULL	NULL	NULL	Remove all keep columns transformations for the specified rule.
NULL	NULL	non-NULL	Remove all keep columns transformations with the specified step_number for the specified rule.

table_name	column_list/column_table	step_number	Result
NULL	non-NULL	non-NULL	Remove all keep columns transformations wi the specified column_list/column_table and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all keep columns transformations wi the specified table_name and step_number fo the specified rule.
NULL	non-NULL	NULL	Remove all keep columns transformations wi the specified column_list/column_table for the specified rule.
non-NULL	non-NULL	NULL	Remove all keep columns transformations wi the specified table_name and column_ list/column_table for the specified rule.
non-NULL	NULL	NULL	Remove all keep columns transformations wi the specified table_name for the specified rul
non-NULL	non-NULL	non-NULL	Remove all keep columns transformations wi the specified table_name, column_ list/column_table, and step_number for the specified rule.

MAINTAIN_CHANGE_TABLE Procedure

This procedure configures an Oracle Streams environment that uses change handlers to record in a change table the data manipulation language (DML) changes made to a source table. Optionally, this procedure can also configure one-way replication of the table from the source database to the destination database. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

A change handler is a special type of statement DML handler that tracks table changes and was created by either this `MAINTAIN_CHANGE_TABLE` procedure or the `DBMS_APPLY_ADM.SET_CHANGE_HANDLER` procedure. Information about change handlers is stored in the `ALL_APPLY_CHANGE_HANDLERS` and `DBA_APPLY_CHANGE_HANDLERS` views.

The change table can reside in the same database as the source table or in a different database.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note: The environment configured by this procedure does not record or replicate data definition language (DDL) changes made to the source table.

See Also: "Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_CHANGE_TABLE(
   change_table_name        IN VARCHAR2,
   source_table_name        IN VARCHAR2,
   column_type_list         IN VARCHAR2,
   extra_column_list        IN VARCHAR2  DEFAULT 'command_type, value_type',
   capture_values           IN VARCHAR2,
   options_string           IN VARCHAR2  DEFAULT NULL,
   script_name              IN VARCHAR2  DEFAULT NULL,
   script_directory_object  IN VARCHAR2  DEFAULT NULL,
   perform_actions          IN BOOLEAN   DEFAULT TRUE,
   capture_name             IN VARCHAR2  DEFAULT NULL,
   propagation_name         IN VARCHAR2  DEFAULT NULL,
   apply_name               IN VARCHAR2  DEFAULT NULL,
   source_database          IN VARCHAR2  DEFAULT NULL,
   destination_database     IN VARCHAR2  DEFAULT NULL,
   keep_change_columns_only IN BOOLEAN   DEFAULT TRUE,
   execute_lcr              IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 159–18 MAINTAIN_CHANGE_TABLE Procedure Parameters

Parameter	Description
change_table_name	The table that records changes to the source table. This table is maintained by Oracle Streams after configuration. Specify the table as [*schema_name*.]*table_name*. For example, hr.jobs_change_table. If the schema is not specified, then the current user is the default. If NULL, then the procedure raises an error. If the specified table exists at the database specified in the destination_database parameter, then the procedure raises an error.
source_table_name	The table at the source database for which changes are recorded. Specify the table as [*schema_name*.]*table_name*. For example, hr.jobs. If the schema is not specified, then the current user is the default. If NULL, then the procedure raises an error.
column_type_list	A list of the columns in the source table for which changes are recorded. Specify a comma-delimited list of each column and its datatype. For example, specify the following for the hr.jobs table: job_id VARCHAR2(10), job_title VARCHAR2(35), min_salary NUMBER(6), max_salary NUMBER(6) The procedure automatically places columns with names that match the source database columns into an unconditional supplemental log group. If NULL, then the procedure raises an error.

Table 159–18 (Cont.) MAINTAIN_CHANGE_TABLE Procedure Parameters

Parameter	Description
extra_column_list	A comma-delimited list of metadata attributes to include in the change table. The column name for a metadata attribute is in the format of attribute name followed by a $ symbol. For example, the source_database_name attribute is stored in the source_database_name$ column in the change table. The following metadata attributes can be included: ■ value_type ■ source_database_name ■ command_type ■ object_owner ■ object_name ■ tag ■ transaction_id ■ scn ■ commit_scn ■ compatible ■ instance_number ■ message_number ■ row_text ■ row_id ■ serial# ■ session# ■ source_time ■ thread# ■ tx_name ■ username All of these metadata attributes, except for value_type and message_number, are row LCR attributes that can be stored in row LCRs. For information about LCR attributes, see *Oracle Streams Concepts and Administration*. The value_type$ column in the change table contains either OLD or NEW, depending on whether the column value is the original column value or the new column value, respectively. The message_number$ column in the change table contains the identification number of each row LCR within a transaction. The message number increases incrementally for each row LCR within a transaction and shows the order of the row LCRs within a transaction. The procedure automatically configures the source database to place information about extra attributes, such as serial#, into the redo log so that the information can be captured and recorded.

Table 159–18 (Cont.) MAINTAIN_CHANGE_TABLE Procedure Parameters

Parameter	Description
capture_values	Specify which values to capture when update operations are performed on the source table: ■ old - To capture the original values for an updated column in the source table ■ new - To capture the new values for an updated column in the source table ■ * - To capture both the original and the new values for an updated column in the source table If NULL, then the procedure raises an error. **Note:** For insert operations, only new column values can be captured. For delete operations, only old column values can be captured.
options_string	String of options passed to the CREATE TABLE statement that creates the change table. The string is appended to the generated CREATE TABLE statement after the closing parenthesis that defines the columns of the table. The string must be syntactically correct.
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to configure the environment. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to configure the replication environment directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to configure the replication environment directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.
perform_actions	If TRUE, then the procedure performs the necessary actions to configure the environment directly. If FALSE, then the procedure does not perform the necessary actions to configure the environment directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ■ script_name ■ script_directory_object

Table 159–18 (Cont.) MAINTAIN_CHANGE_TABLE Procedure Parameters

Parameter	Description
capture_name	The name of each capture process configured to capture changes. Do not specify an owner. If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set. If NULL, then the system generates a name for each capture process it creates. **Note:** The capture process name cannot be altered after the capture process is created.
propagation_name	The name of the propagation configured to propagate changes from the source database to the destination database. Do not specify an owner. If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the positive propagation rule set. If NULL, then the system generates a name for the propagation. If non-NULL and the source_database and destination_database are set to the same value, then this procedure raises an error. When the capture process and apply process are in the same database, they can use the same queue, and a propagation is not needed. **Note:** The propagation name cannot be altered after the propagation is created.
apply_name	The name of each apply process configured to apply changes. Do not specify an owner. If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the positive apply process rule set. The specified name must not match the name of an existing messaging client at the destination database. If NULL, then the system generates a name for the apply process. When set to NULL, no apply process that applies changes from the source database can exist on the destination database. If an apply process that applies changes from the source database exists at the destination database, then specify a non-NULL value for this parameter. **Note:** The apply process name cannot be altered after the apply process is created.
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.

Table 159–18 (Cont.) MAINTAIN_CHANGE_TABLE Procedure Parameters

Parameter	Description
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.
keep_change_columns_only	If TRUE, then this procedure adds a declarative rule-based transformation which keeps the list of columns specified in the column_type_list parameter. The columns that are not specified in the column_type_list parameter are removed from each row LCR captured by the capture process. If FALSE, then this procedure does not create a declarative rule-based transformation, and all of the columns in the row LCRs are kept. Specify FALSE when information about columns that are not included in the column_type_list parameter is needed at the destination database. For example, if the execute_lcr parameter is set to TRUE and the configuration will replicate all of the columns in a source table, but the column_type_list parameter includes a subset of these columns, then the keep_change_columns_only parameter should be set to FALSE. **Note:** When this parameter is set to TRUE, a declarative rule-based transformation is always created, even if the column_type_list includes all of the columns in the source table.
execute_lcr	If TRUE, then this procedure creates a change handler that executes each row LCR at the destination database. If FALSE, then the row LCRs are not executed at the destination database.

Usage Notes

The following are usage notes for this procedure:

Types of Oracle Streams Environments Configured by the Procedure

This procedure can configure the following types of Oracle Streams environments:

- **Local capture and apply on one database:** Specify the same global name for the source_database and the destination_database parameter.
- **Local capture and remote apply:** Specify the global name of the local database for the source_database parameter and a remote database for the destination_database parameter.
- **Downstream capture and local apply:** Specify a remote database for the source_database parameter and the local database for the destination_database parameter.
- **Downstream capture and remote apply:** Specify a remote database for the source_database parameter and a remote database for the destination_database parameter.

Optional One-Way Replication With This Procedure

To configure one-way replication of the table, in addition to recording changes to the table, set the `execute_lcr` parameter to `TRUE`. The apply process executes each row LCR and applies the change in the row LCR to the replica table at the destination database. In this case, ensure that the source table is instantiated at the destination database before running the procedure. Specifically, the source table must be prepared for instantiation, the instantiation SCN must be set for the replica table at the destination database, and, usually, the source table replica table should be consistent.

See Also: *Oracle Streams Replication Administrator's Guide*

Statement DML Handlers, the Change Table, and Row LCR Execution

This procedure configures one or more statement DML handlers that perform the following actions:

- Record changes in the change table using the information in row LCRs.
- Execute row LCRs if the `execute_lcr` parameter is set to `TRUE`.

The procedure ensures that the row LCRs contain the required attributes to record the changes specified in the `capture_type_list`, `extra_column_list`, and `capture_values` parameters. The procedure adds the statement DML handlers to the apply process specified in the `apply_name` parameter.

See Also: Chapter 162, "DBMS_STREAMS_HANDLER_ADM"

MAINTAIN_GLOBAL Procedure

This procedure configures an Oracle Streams environment that replicates changes at the database level between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the DBA_STREAMS_UNSUPPORTED data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- If the bi_directional parameter is set to TRUE, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the destination database while the MAINTAIN_GLOBAL procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.
- A capture process never captures changes in the SYS, SYSTEM, or CTXSYS schemas. This procedure does not configure replication for these schemas.

See Also: "Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_GLOBAL(
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   source_database              IN VARCHAR2,
   destination_database         IN VARCHAR2,
   perform_actions              IN BOOLEAN   DEFAULT TRUE,
   script_name                  IN VARCHAR2  DEFAULT NULL,
   script_directory_object      IN VARCHAR2  DEFAULT NULL,
   dump_file_name               IN VARCHAR2  DEFAULT NULL,
   capture_name                 IN VARCHAR2  DEFAULT NULL,
   capture_queue_table          IN VARCHAR2  DEFAULT NULL,
   capture_queue_name           IN VARCHAR2  DEFAULT NULL,
   capture_queue_user           IN VARCHAR2  DEFAULT NULL,

   instantiation                IN INTEGER   DEFAULT
```

```
                                                    DBMS_STREAMS_ADM.INSTANTIATION_FULL);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 159-19 for descriptions of the procedure parameters

Table 159–19 MAINTAIN_GLOBAL Procedure Parameters

Parameter	Description
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remains in this directory after the procedure completes. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the source_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred. If the source database and destination database run on the same computer system, then the source and destination directories must be different. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In these cases, specify NULL for the destination_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.

Table 159–19 (Cont.) MAINTAIN_GLOBAL Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
dump_file_name	The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the export dump file name is generated by the system. In this case, the export dump file name is expat*nn*.dmp, where *nn* is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.
log_file	The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the log file name is the same name as the export dump file name with an extension of .clg.

Table 159–19 (Cont.) MAINTAIN_GLOBAL Procedure Parameters

Parameter	Description
instantiation	Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation: DBMS_STREAMS_ADM.INSTANTIATION_FULL performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package. DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. DBMS_STREAMS_ADM.INSTANTIATION_NONE does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly. If you use the RMAN DUPLICATE or CONVERT DATABASE command for database instantiation, then the destination database cannot be the capture database. If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL or DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK, then the database objects being instantiated must exist at the source database. If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.

MAINTAIN_SCHEMAS Procedure

This procedure configures an Oracle Streams environment that replicates changes to specified schemas between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of schemas in different ways and are mutually exclusive.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the schemas from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the `MAINTAIN_SCHEMAS` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.

See Also: "Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_SCHEMAS(
   schema_names                 IN VARCHAR2,
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   source_database              IN VARCHAR2,

   apply_name                  IN VARCHAR2  DEFAULT NULL,
   apply_queue_table           IN VARCHAR2  DEFAULT NULL,
   apply_queue_name            IN VARCHAR2  DEFAULT NULL,
   apply_queue_user            IN VARCHAR2  DEFAULT NULL,
   log_file                    IN VARCHAR2  DEFAULT NULL,
   bi_directional              IN BOOLEAN   DEFAULT FALSE,
   include_ddl                 IN BOOLEAN   DEFAULT FALSE,
   instantiation               IN INTEGER   DEFAULT
                                            DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 159-19 for descriptions of the procedure parameters that are not in Table 159–20

Table 159–20 MAINTAIN_SCHEMAS Procedure Parameters

Parameter	Description
schema_names	The schemas to be configured for replication and maintained by Oracle Streams after configuration. The schemas can be specified in the following ways: ■ Comma-delimited list of type VARCHAR2 ■ A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. The first schema should be in position 1. The last position must be NULL. This procedure raises an error in any of the following cases: ■ When a specified schema does not exist at the source database ■ When the schema_names parameter is set to NULL

Table 159–20 (Cont.) MAINTAIN_SCHEMAS Procedure Parameters

Parameter	Description
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remains in this directory after the procedure completes. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the source_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred. If the source database and destination database run on the same computer system, then the source and destination directories must be different. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the destination_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.

Table 159–20 (Cont.) MAINTAIN_SCHEMAS Procedure Parameters

Parameter	Description
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
dump_file_name	The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the export dump file name is generated by the system. In this case, the export dump file name is expat*nn*.dmp, where *nn* is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.
capture_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
log_file	The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the log file name is the same name as the export dump file name with an extension of .clg.

Table 159–20 (Cont.) MAINTAIN_SCHEMAS Procedure Parameters

Parameter	Description
instantiation	Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation: DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package. DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. DBMS_STREAMS_ADM.INSTANTIATION_NONE does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly. If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA or DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK, then the database objects being instantiated must exist at the source database, and the tablespaces that contain the schemas must exist at the destination database. If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.

MAINTAIN_SIMPLE_TABLESPACE Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

Note: This procedure is deprecated. It is replaced by the `MAINTAIN_SIMPLE_TTS` procedure.

See Also:

- "Deprecated Subprograms" on page 159-4
- MAINTAIN_SIMPLE_TTS Procedure on page 159-111

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TABLESPACE(
   tablespace_name              IN VARCHAR2,
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   destination_database         IN VARCHAR2,
   setup_streams                IN BOOLEAN   DEFAULT TRUE,
   script_name                  IN VARCHAR2  DEFAULT NULL,
   script_directory_object      IN VARCHAR2  DEFAULT NULL,
   bi_directional               IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 159–21 MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
`tablespace_name`	The local simple tablespace to be cloned at the destination database and maintained by Oracle Streams. The tablespace must exist at the source database, but it must not exist at the destination database. A directory object must exist for the directory that contains the datafile for the tablespace. The user who invokes this procedure must have `READ` privilege on this directory object. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group. If `NULL`, then the procedure raises an error.
`source_directory_object`	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are placed. These files remain in this directory after the procedure completes. If `NULL`, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.

Table 159–21 (Cont.) MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are transferred. If the source database and destination database run on the same computer system, then the source and destination directories must be different. If NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
destination_database	The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist. If NULL, then the procedure raises an error.
setup_streams	If TRUE, then the procedure performs the necessary actions to maintain the tablespace directly. If FALSE, then the procedure does not perform the necessary actions to maintain the tablespace directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ■ script_name ■ script_directory_object
script_name	If non-NULL and the setup_streams parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the setup_streams parameter is TRUE, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is TRUE, then this procedure does not generate a script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.

Table 159–21 (Cont.) MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
bi_directional	Specify TRUE to configure bi-directional replication between the current database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages. Specify FALSE to configure one way replication from the current database to the database specified in destination_database. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.

Usage Notes

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

DDL Changes Not Maintained

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate ALTER TABLESPACE statements on the tablespace, nor is it configured to replicate ALTER TABLE statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

Additional Documentation for this Procedure

The following documentation applies to the MAINTAIN_SIMPLE_TABLESPACE procedure:

- Automatic Platform Conversion on page 159-17
- *Oracle Streams Replication Administrator's Guide*

Requirements for Running this Procedure

Meet the following requirements when run the MAINTAIN_SIMPLE_TABLESPACE procedure:

- Run the procedure at the source database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the destination_database parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- Grant the user who runs this procedure the DBA role. This user must have the necessary privileges to complete the following actions:
  - Create ANYDATA queues, capture processes, propagations, and apply processes.
  - Specify supplemental logging

  - Run subprograms in the DBMS_STREAMS_ADM and DBMS_AQADM packages.
  - Access the database specified in the destination_database parameter through a database link. This database link should have the same name as the global name of the destination database.
  - Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
  - The necessary privileges to run the CLONE_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_SIMPLE_TABLESPACE Procedure on page 164-18 for the list of required privileges.
  - The necessary privileges to run the ATTACH_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_SIMPLE_TABLESPACE Procedure on page 164-11 for the list of required privileges.

  To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be should be created in the Oracle Streams administrator's schema.

  Typically, the DBA role can be revoked from the user, if necessary, after the configuration is complete.

- If the bi_directional parameter is set to TRUE, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- Each specified directory object must be created using the SQL statement CREATE DIRECTORY, and the user who invokes this procedure must have READ and WRITE privilege on each one.
- The databases configured by this procedure must be Oracle Database 10*g* Release 2 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10*g* Release 2 or later database.
  - The setup_streams parameter is set to TRUE to configure the Oracle Streams replication environment directly.
- The databases configured by this procedure must be Oracle Database 10*g* Release 1 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10*g* Release 2 or later database.
  - The setup_streams parameter is set to FALSE in this procedure, and the replication environment is configured with a generated script.

  If the script configures an Oracle Database 10*g* Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10*g* Release 2 or later, such as queue-to-queue propagation.
- If the procedure is run at an Oracle Database 10*g* Release 1 database, then the databases configured by the procedure must be Oracle Database 10*g* Release 1 or later databases.

See Also: *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

Default Values for Parameters Excluded From the MAINTAIN_SIMPLE_TABLESPACE Procedure

This procedure uses the default values for the parameters in the MAINTAIN_TABLESPACES procedure that do not exist in the MAINTAIN_SIMPLE_TABLESPACE procedure. For example, this procedure creates a capture process at the source database named capture, because that is the default value for the capture_name parameter in the MAINTAIN_TABLESPACES procedure.

> **See Also:** MAINTAIN_TABLESPACES Procedure on page 159-119

Configuration Progress and Recoverability

When this procedure is run with the setup_streams parameter set to TRUE, metadata about its configuration actions is recorded in the following data dictionary views: DBA_RECOVERABLE_SCRIPT, DBA_RECOVERABLE_SCRIPT_PARAMS, DBA_RECOVERABLE_SCRIPT_BLOCKS, and DBA_RECOVERABLE_SCRIPT_ERRORS. If the procedure stops because it encounters an error, then you can use the RECOVER_OPERATION procedure to complete the configuration after you correct the conditions that caused the error.

Note: When this procedure is run with the setup_streams parameter set to FALSE, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

> **See Also:** "RECOVER_OPERATION Procedure" on page 159-147

MAINTAIN_SIMPLE_TTS Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespace from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- This procedure replaces the deprecated `MAINTAIN_SIMPLE_TABLESPACE` procedure.

See Also: "Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TTS(
   tablespace_name              IN VARCHAR2,
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   source_database              IN VARCHAR2,
   destination_database         IN VARCHAR2,
   perform_actions              IN BOOLEAN   DEFAULT TRUE,
   script_name                  IN VARCHAR2  DEFAULT NULL,
   script_directory_object      IN VARCHAR2  DEFAULT NULL,
   bi_directional               IN BOOLEAN   DEFAULT FALSE);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 159-19 for descriptions of the procedure parameters that are not in Table 159–22

Table 159–22 MAINTAIN_SIMPLE_TTS Procedure Parameters

Parameter	Description
tablespace_name	The local simple tablespace to be cloned at the destination database and maintained by Oracle Streams. The tablespace must exist at the source database, but it must not exist at the destination database. A directory object must exist for the directory that contains the datafile for the tablespace. The user who invokes this procedure must have READ privilege on this directory object. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group. If NULL, then the procedure raises an error.
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are placed. These files remain in this directory after the procedure completes. If NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are transferred. If the source database and destination database run on the same computer system, then the source and destination directories must be different. If NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.

Table 159–22 (Cont.) MAINTAIN_SIMPLE_TTS Procedure Parameters

Parameter	Description
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.

Usage Notes

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

DDL Changes Not Maintained

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate ALTER TABLESPACE statements on the tablespace, nor is it configured to replicate ALTER TABLE statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

Additional Privileges Required by the MAINTAIN_SIMPLE_TTS Procedure

In addition to the required privileges described in "Requirements for Running These Procedures" on page 159-17, the user who runs the MAINTAIN_SIMPLE_TTS procedure must have the necessary privileges to complete the following actions:

- Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
- The necessary privileges to run the CLONE_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_SIMPLE_TABLESPACE Procedure on page 164-18 for the list of required privileges.
- The necessary privileges to run the ATTACH_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_SIMPLE_TABLESPACE Procedure on page 164-11 for the list of required privileges.

Default Values for Parameters Excluded From the MAINTAIN_SIMPLE_TTS Procedure

This procedure uses the default values for the parameters in the MAINTAIN_TTS procedure that do not exist in the MAINTAIN_SIMPLE_TTS procedure. For example, this procedure automatically generates the capture process name, because NULL is the default value for the capture_name parameter in the MAINTAIN_TTS procedure, and the procedure generates the capture process name when NULL is specified for capture_name.

See Also: MAINTAIN_TTS Procedure on page 159-126

MAINTAIN_TABLES Procedure

This procedure configures an Oracle Streams environment that replicates changes to specified tables between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables in different ways and are mutually exclusive.

Note: If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the `MAINTAIN_TABLES` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.

See Also: "Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_TABLES(
   table_names                  IN VARCHAR2,
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,

                                          DBMS_STREAMS_ADM.INSTANTIATION_TABLE);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 159-19 for descriptions of the procedure parameters that are not in Table 159–23

Table 159–23 MAINTAIN_TABLES Procedure Parameters

Parameter	Description
table_names	The tables to be configured for replication and maintained by Oracle Streams after configuration. The tables can be specified in the following ways: ■ Comma-delimited list of type VARCHAR2 ■ A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. The first table should be in position 1. The last position must be NULL. Each table should be specified as [*schema_name*.]*table_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. This procedure raises an error in any of the following cases: ■ When a specified table does not exist at the source database ■ When the table_names parameter is set to NULL

Table 159–23 (Cont.) MAINTAIN_TABLES Procedure Parameters

Parameter	Description
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remain in this directory after the procedure completes. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the source_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred. If the source database and destination database run on the same computer system, then the source and destination directories must be different. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the destination_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.

Table 159–23 (Cont.) MAINTAIN_TABLES Procedure Parameters

Parameter	Description
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
dump_file_name	The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the export dump file name is generated by the system. In this case, the export dump file name is expat*nn*.dmp, where *nn* is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.
capture_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
log_file	The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the log file name is the same name as the export dump file name with an extension of .clg.

Table 159–23 (Cont.) MAINTAIN_TABLES Procedure Parameters

Parameter	Description
instantiation	Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation: DBMS_STREAMS_ADM.INSTANTIATION_TABLE performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package. DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. DBMS_STREAMS_ADM.INSTANTIATION_NONE does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly. If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE or DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK, then the tables being instantiated must exist at the source database, and the tablespaces that contain the tables must exist at the destination database. If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported. Also, if an instantiated table does not exist at the destination database, then this procedure sets the instantiation SCN for the table. However, if an instantiated table exist at the destination database before instantiation, then this procedure does not set the instantiation SCN for the table. In this case, you must set the instantiation SCN for the table manually after the procedure completes.

MAINTAIN_TABLESPACES Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

Note: This procedure is deprecated. It is replaced by the `MAINTAIN_TTS` procedure.

See Also:

- "Deprecated Subprograms" on page 159-4
- MAINTAIN_TTS Procedure on page 159-126

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_TABLESPACES(
   tablespace_names              IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
   source_directory_object       IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   destination_database          IN VARCHAR2,
   setup_streams                 IN BOOLEAN   DEFAULT TRUE,
   script_name                   IN VARCHAR2  DEFAULT NULL,
   script_directory_object       IN VARCHAR2  DEFAULT NULL,
   dump_file_name                IN VARCHAR2  DEFAULT NULL,
   source_queue_table            IN VARCHAR2  DEFAULT 'streams_queue_table',
   source_queue_name             IN VARCHAR2  DEFAULT 'streams_queue',
   source_queue_user             IN VARCHAR2  DEFAULT NULL,
   destination_queue_table       IN VARCHAR2  DEFAULT 'streams_queue_table',
   destination_queue_name        IN VARCHAR2  DEFAULT 'streams_queue',
   destination_queue_user        IN VARCHAR2  DEFAULT NULL,
   capture_name                  IN VARCHAR2  DEFAULT 'capture',
   propagation_name              IN VARCHAR2  DEFAULT NULL,
   apply_name                    IN VARCHAR2  DEFAULT NULL,
   log_file                      IN VARCHAR2  DEFAULT NULL,
   bi_directional                IN BOOLEAN   DEFAULT FALSE,
   include_ddl                   IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 159–24 MAINTAIN_TABLESPACES Procedure Parameters

Parameter	Description
tablespace_names	The local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group. If NULL, then the procedure raises an error. **See Also:** TABLESPACE_SET Table Type on page 164-9
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are placed. These files remain in this directory after the procedure completes. If NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are transferred. If the source database and destination database run on the same computer system, then the source and destination directories must be different. If NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
destination_database	The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.

Table 159–24 (Cont.) MAINTAIN_TABLESPACES Procedure Parameters

Parameter	Description
setup_streams	If TRUE, then the procedure performs the necessary actions to maintain the tablespaces directly. If FALSE, then the procedure does not perform the necessary actions to maintain the tablespaces directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ■ script_name ■ script_directory_object
script_name	If non-NULL and the setup_streams parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace set. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the setup_streams parameter is TRUE, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is TRUE, then this procedure does not generate a script and performs the actions to maintain the specified tablespace set directly. If NULL and the setup_streams parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
dump_file_name	The name of the Data Pump export dump file that contains the specified tablespace set. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. If NULL, then the export dump file name is generated by the system. In this case, the export dump file name is expat*nn*.dmp, where *nn* is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.
source_queue_table	The name of the queue table for the queue at the source database, specified as [*schema_name*.]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default.

Table 159–24 (Cont.) MAINTAIN_TABLESPACES Procedure Parameters

Parameter	Description
source_queue_name	The name of the queue at the source database that will function as the ANYDATA queue, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.
source_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
destination_queue_table	The name of the queue table for the queue at the destination database, specified as [*schema_name.*]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the queue at the destination database that will function as the ANYDATA queue, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.
destination_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
capture_name	The name of each capture process configured to capture changes to the database objects in the tablespace set. Do not specify an owner. If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database objects in the tablespace set to the positive capture process rule set. **Note:** The capture process name cannot be altered after the capture process is created.

Table 159–24 (Cont.) MAINTAIN_TABLESPACES Procedure Parameters

Parameter	Description
propagation_name	The name of each propagation configured to propagate changes to the database objects in the tablespace set. Do not specify an owner. If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the database objects in the tablespace set to the positive propagation rule set. If NULL, then the system generates a name for each propagation it creates. **Note:** The propagation name cannot be altered after the propagation is created.
apply_name	The name of each apply process configured to apply changes to the database objects in the tablespace set. Do not specify an owner. If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the database objects in the tablespace set to the positive apply process rule set. The specified name must not match the name of an existing messaging client at the destination database. If NULL, then the system generates a name for each apply process it creates. **Note:** The apply process name cannot be altered after the apply process is created.
log_file	The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. If NULL, then the log file name is the same name as the export dump file name with an extension of .clg.
bi_directional	Specify TRUE to configure bi-directional replication between the current database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages. Specify FALSE to configure one way replication from the current database to the database specified in destination_database. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.
include_ddl	Specify TRUE to configure an Oracle Streams replication environment that maintains both DML and DDL changes. Specify FALSE to configure an Oracle Streams replication environment that maintains DML changes only. When this parameter is set to FALSE, DDL changes, such as ALTER TABLE, will not be replicated.

Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

> **See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

Additional Documentation for this Procedure

The following documentation applies to the `MAINTAIN_TABLESPACES` procedure:

- Automatic Platform Conversion on page 159-17
- *Oracle Streams Replication Administrator's Guide*

Requirements for Running this Procedure

Meet the following requirements when run the `MAINTAIN_TABLESPACES` procedure:

- Run the procedure at the source database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the `destination_database` parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- The user who runs this procedure should be granted the `DBA` role. This user must have the necessary privileges to complete the following actions:
  - Create `ANYDATA` queues, capture processes, propagations, and apply processes.
  - Specify supplemental logging
  - Run subprograms in the `DBMS_STREAMS_ADM` and `DBMS_AQADM` packages.
  - Access the database specified in the `destination_database` parameter through a database link. This database link should have the same name as the global name of the destination database.
  - Run subprograms in the `DBMS_STREAMS_TABLESPACES_ADM` package
  - The necessary privileges to run the `CLONE_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the source database. See CLONE_TABLESPACES Procedure on page 164-20 for the list of required privileges.
  - The necessary privileges to run the `ATTACH_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the destination database. See ATTACH_TABLESPACES Procedure on page 164-13 for the list of required privileges.

  To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be should be created in the Oracle Streams administrator's schema.
- If the `bi_directional` parameter is set to `TRUE`, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.

- Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes this procedure must have `READ` and `WRITE` privilege on each one.
- The databases configured by this procedure must be Oracle Database 10*g* Release 2 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10*g* Release 2 or later database.
  - The `setup_streams` parameter is set to `TRUE` to configure the Oracle Streams replication environment directly.
- The databases configured by this procedure must be Oracle Database 10*g* Release 1 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10*g* Release 2 or later database.
  - The `setup_streams` parameter is set to `FALSE` in this procedure, and the replication environment is configured with a generated script.

  If the script configures an Oracle Database 10*g* Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10*g* Release 2 or later, such as queue-to-queue propagation.
- If the procedure is run at an Oracle Database 10*g* Release 1 database, then the databases configured by the procedure must be Oracle Database 10*g* Release 1 or later databases.

See Also: *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

Configuration Progress and Recoverability

When this procedure is run with the `setup_streams` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

Note: When this procedure is run with the `setup_streams` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

See Also: "RECOVER_OPERATION Procedure" on page 159-147

MAINTAIN_TTS Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespaces from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- This procedure replaces the deprecated `MAINTAIN_TABLESPACES` procedure.

See Also: "Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_TTS(
   tablespace_names             IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   source_database              IN VARCHAR2,
   destination_database         IN VARCHAR2,
   perform_actions              IN BOOLEAN   DEFAULT TRUE,
   script_name                  IN VARCHAR2  DEFAULT NULL,
   script_directory_object      IN VARCHAR2  DEFAULT NULL,
   dump_file_name               IN VARCHAR2  DEFAULT NULL,
   capture_name                 IN VARCHAR2  DEFAULT NULL,
   capture_queue_table          IN VARCHAR2  DEFAULT NULL,
   capture_queue_name           IN VARCHAR2  DEFAULT NULL,
   capture_queue_user           IN VARCHAR2  DEFAULT NULL,
   propagation_name             IN VARCHAR2  DEFAULT NULL,
   apply_name                   IN VARCHAR2  DEFAULT NULL,
   apply_queue_table            IN VARCHAR2  DEFAULT NULL,
   apply_queue_name             IN VARCHAR2  DEFAULT NULL,
   apply_queue_user             IN VARCHAR2  DEFAULT NULL,
   log_file                     IN VARCHAR2  DEFAULT NULL,
   bi_directional               IN BOOLEAN   DEFAULT FALSE,
   include_ddl                  IN BOOLEAN   DEFAULT FALSE);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 159-19 for descriptions of the procedure parameters that are not in Table 159–25

Table 159–25 MAINTAIN_TTS Procedure Parameters

Parameter	Description
tablespace_names	The local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group. If NULL, then the procedure raises an error. **See Also:** TABLESPACE_SET Table Type on page 164-9
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are placed. These files remain in this directory after the procedure completes. If NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are transferred. If the source database and destination database run on the same computer system, then the source and destination directories must be different. If NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.

Table 159–25 (Cont.) MAINTAIN_TTS Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
dump_file_name	The name of the Data Pump export dump file that contains the specified tablespace set. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. If NULL, then the export dump file name is generated by the system. In this case, the export dump file name is expat*nn*.dmp, where *nn* is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.
log_file	The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. If NULL, then the log file name is the same name as the export dump file name with an extension of .clg.

Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

> **See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

Additional Privileges Required by the MAINTAIN_TTS Procedure

In addition to the required privileges described in "Requirements for Running These Procedures" on page 159-17, the user who runs the MAINTAIN_TTS procedure must have the necessary privileges to complete the following actions:

- Run subprograms in the `DBMS_STREAMS_TABLESPACES_ADM` package
- The necessary privileges to run the `CLONE_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the source database. See CLONE_TABLESPACES Procedure on page 164-20 for the list of required privileges.
- The necessary privileges to run the `ATTACH_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the destination database. See ATTACH_TABLESPACES Procedure on page 164-13 for the list of required privileges.

MERGE_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the MERGE_STREAMS_JOB procedure. The MERGE_STREAMS_JOB procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the MERGE_STREAMS_JOB procedure does nothing. Typically, it is best to run the MERGE_STREAMS_JOB procedure instead of running the MERGE_STREAMS procedure directly.

However, you can choose to run the MERGE_STREAMS procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The CAPTURE_MESSAGE_CREATE_TIME in the GV$STREAMS_CAPTURE view of the cloned capture process has caught up to, or nearly caught up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The MERGE_STREAMS procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
   - The acknowledged SCN of the cloned propagation.
   - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

   When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.

5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

See Also:

- MERGE_STREAMS_JOB Procedure on page 159-133
- SPLIT_STREAMS Procedure on page 159-173

Syntax

```
DBMS_STREAMS_ADM.MERGE_STREAMS(
   cloned_propagation_name  IN  VARCHAR2,
   propagation_name         IN  VARCHAR2  DEFAULT NULL,
   queue_name               IN  VARCHAR2  DEFAULT NULL,
   perform_actions          IN  BOOLEAN   DEFAULT TRUE,
   script_name              IN  VARCHAR2  DEFAULT NULL,
   script_directory_object  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 159–26 MERGE_STREAMS Procedure Parameters

Parameter	Description
cloned_propagation_name	The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.
propagation_name	The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. See "Usage Notes" on page 159-132 for more information. If a non-NULL value is specified, then an error is raised under either of the following conditions: ■ The queue specified in the queue_name parameter does not exist. ■ The queue specified in the queue_name parameter exists but is not used by a capture process.

Table 159–26 (Cont.) MERGE_STREAMS Procedure Parameters

Parameter	Description
queue_name	The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream. See "Usage Notes" on page 159-132 for more information.
perform_actions	If TRUE, then the procedure performs the necessary actions to merge the streams directly. If FALSE, then the procedure does not perform the necessary actions to merge the streams directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ■ script_name ■ script_directory_object
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.

Usage Notes

You can use the MERGE_STREAMS procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

The DBA_STREAMS_SPLIT_MERGE view contains information about split and merge operations.

MERGE_STREAMS_JOB Procedure

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the MERGE_STREAMS procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

If the auto_merge_threshold parameter was set to a positive number in the SPLIT_STREAMS procedure that split the streams, then a merge job runs the MERGE_STREAMS_JOB procedure automatically according to its schedule. The schedule name is specified for the schedule_name parameter, and the merge job name is specified for the merge_job_name parameter when the MERGE_STREAMS_JOB procedure is run automatically. The merge job and its schedule were created by the SPLIT_STREAMS procedure.

If the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams, then you can run the MERGE_STREAMS_JOB procedure manually. In this case, it is not run automatically.

See Also:

- MERGE_STREAMS Procedure on page 159-130
- SPLIT_STREAMS Procedure on page 159-173
- *Oracle Streams Replication Administrator's Guide* for instructions on using the MERGE_STREAMS_JOB procedure

Syntax

```
DBMS_STREAMS_ADM.MERGE_STREAMS_JOB(
   cloned_propagation_name        IN VARCHAR2,
   propagation_name               IN VARCHAR2 DEFAULT NULL,
   queue_name                     IN VARCHAR2 DEFAULT NULL,
   merge_threshold                IN NUMBER,
   schedule_name                  IN VARCHAR2 DEFAULT NULL,
   merge_job_name                 IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 159–27 MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
cloned_propagation_name	The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.

Table 159–27 (Cont.) MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. See "Usage Notes" on page 159-134 for more information. If a non-NULL value is specified, then an error is raised under either of the following conditions: ▪ The queue specified in the queue_name parameter does not exist. ▪ The queue specified in the queue_name parameter exists but is not used by a capture process.
queue_name	The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream. See "Usage Notes" on page 159-134 for more information.
merge_threshold	The merge threshold in seconds. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$STREAMS_CAPTURE dynamic performance view determines whether the streams are merged. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the MERGE_STREAMS procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing.
schedule_name	The name of the schedule for the merge job. If NULL, then no schedule name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams. Specify NULL if you run this procedure manually.
merge_job_name	The name of the job that merges the streams. If NULL, then no merge job name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams. Specify NULL if you run this procedure manually.

Usage Notes

You can use the MERGE_STREAMS_JOB procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save

resources and improve performance when a single database is running two or more capture processes.

After the MERGE_STREAMS_JOB procedure completes, you can query the DBA_CAPTURE and DBA_PROPAGATION views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the schedule_name and merge_job_name parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

The DBA_STREAMS_SPLIT_MERGE view contains information about split and merge operations.

POST_INSTANTIATION_SETUP Procedure

This procedure performs the actions required after instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the `PRE_INSTANTIATION_SETUP` procedure at the source database.
2. Perform any necessary instantiation actions.
3. Run the `POST_INSTANTIATION_SETUP` procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.
- Replicates changes to database objects during a database maintenance operation, such migrating a database to a different platform. In this case, use the `CLEANUP_INSTANTIATION_SETUP` procedure to remove the replication environment after the maintenance operation is complete.

Attention: When the `POST_INSTANTIATION_SETUP` procedure is run, the parameter values must match the parameter values specified when the corresponding `PRE_INSTANTIATION_SETUP` procedure was run, except for the values of the following parameters: `perform_actions`, `script_name`, `script_directory_object`, and `start_processes`.

Note: A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.

See Also:

- "PRE_INSTANTIATION_SETUP Procedure" on page 159-141
- "CLEANUP_INSTANTIATION_SETUP Procedure" on page 159-76
- "Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure
- *Oracle Streams Replication Administrator's Guide* for information about setting up an Oracle Streams replication environment
- *Oracle Streams Concepts and Administration* for information about completing database maintenance operations

Syntax

```
DBMS_STREAMS_ADM.POST_INSTANTIATION_SETUP(
   maintain_mode           IN VARCHAR2,
   tablespace_names        IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
```

```
  source_database         IN VARCHAR2,
  destination_database    IN VARCHAR2,
  perform_actions         IN BOOLEAN         DEFAULT TRUE,
  script_name             IN VARCHAR2        DEFAULT NULL,
  script_directory_object IN VARCHAR2        DEFAULT NULL,
  capture_name            IN VARCHAR2        DEFAULT NULL,
  capture_queue_table     IN VARCHAR2        DEFAULT NULL,
  capture_queue_name      IN VARCHAR2        DEFAULT NULL,
  capture_queue_user      IN VARCHAR2        DEFAULT NULL,
  propagation_name        IN VARCHAR2        DEFAULT NULL,
  apply_name              IN VARCHAR2        DEFAULT NULL,
  apply_queue_table       IN VARCHAR2        DEFAULT NULL,
  apply_queue_name        IN VARCHAR2        DEFAULT NULL,
  apply_queue_user        IN VARCHAR2        DEFAULT NULL,
  bi_directional          IN BOOLEAN         DEFAULT FALSE,
  include_ddl             IN BOOLEAN         DEFAULT FALSE,
  start_processes         IN BOOLEAN         DEFAULT FALSE,
  instantiation_scn       IN NUMBER          DEFAULT NULL,
  exclude_schemas         IN VARCHAR2        DEFAULT NULL,
  exclude_flags           IN BINARY_INTEGER  DEFAULT NULL);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 159-19 for descriptions of the procedure parameters that are not in Table 159–28

Table 159–28 POST_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
maintain_mode	Specify one of the following: ■ GLOBAL to maintain the entire database by configuring replication between the local database and the database specified in the destination_database parameter ■ TRANSPORTABLE TABLESPACES to maintain a set of tablespaces by configuring replication between the local database and the database specified in the destination_database parameter
tablespace_names	If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. Also, a directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. If maintain_mode is set to GLOBAL, then specify an empty tablespace set. Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL. **See Also:** TABLESPACE_SET Table Type on page 164-9

Table 159–28 (Cont.) POST_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
start_processes	If TRUE, then the procedure starts each capture process and apply process. Any disabled capture or apply process created by the PRE_INSTANTITAION_SETUP procedure also is started. If FALSE, then the procedure does not start any capture processes or apply processes.
instantiation_scn	Specify the instantiation SCN for the database objects at the destination database if the instantiation SCN was not set during instantiation. The instantiation SCN is not set automatically during RMAN instantiations, but the correct instantiation SCN value should be determined during an RMAN instantiation. See the *Oracle Streams Replication Administrator's Guide* for more information. Specify NULL if the instantiation SCN was set for the database objects at the destination database during instantiation. The instantiation SCN can be set during export/import instantiations.
exclude_schemas	A comma-delimited list of schemas to exclude from the Oracle Streams configuration. Schema rules are added to the negative rule sets of each capture process to exclude these schemas. Specify an asterisk (*) to exclude all of the schemas in the database. If NULL, then the procedure does not exclude any schemas in the database. This parameter is valid only if the MAINTAIN_MODE parameter is set to GLOBAL. If the MAINTAIN_MODE parameter is set to TRANSPORTABLE TABLESPACES, then the procedure ignores this parameter.
exclude_flags	Specify what is excluded from the replication configuration in the schemas specified by the exclude_schemas parameter. This parameter works the same way in the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures. See "Usage Notes" on page 159-143 for the PRE_INSTANTIATION_SETUP procedure for more information.

Usage Notes

The following sections contain usage notes for this procedure.

Self-Contained Tablespace Sets

If the maintain_mode parameter is set to TRANSPORTABLE TABLESPACES, then the specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

> **See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

Destination Database Renamed During RMAN Database Instantiation

If the maintain_mode parameter is set to GLOBAL, then database instantiation is required before running the POST_INSTANTIATION_SETUP procedure. If the RMAN DUPLICATE or RMAN CONVERT DATABASE command is used for database instantiation, then the global name of the destination database can be renamed to the global name of the source database during instantiation. In this case, before you run the POST_INSTANTIATION_SETUP procedure, complete the following steps:

1. Rename the global name of the destination database back to the name specified in the destination_database parameter.
2. At the destination database, drop and re-create any loopback database links that existed on the source and were cloned on the destination database. For example, suppose the source database dbs1.net has a database link that refers to itself. Suppose the destination database is dbs2.net. At the destination database, drop and re-create this database link as a loopback database link that refers to itself (dbs2.net).
3. At the destination database, drop any database links that were cloned from the source database and are from the source database to the destination database. For example, if the source database is dbs1.net and the destination database is dbs2.net, then drop any database links on the destination database that are from dbs1.net to dbs2.net.
4. Create a database link from the destination database to the source database with the same name as the global name of the source database. The database link must be accessible to the Oracle Streams administrator at the destination database.

   This database link is required because the POST_INSTANTIATION_SETUP procedure runs the SET_GLOBAL_INSTANTIATION_SCN procedure in the DBMS_APPLY_ADM package at the destination database, and the SET_GLOBAL_INSTANTIATION_SCN procedure requires the database link. The instantiation SCN is set to the value specified in the instantiation_scn parameter of the POST_INSTANTIATION_SETUP procedure.

> **Note:** When the RMAN DUPLICATE or CONVERT DATABASE command is used for database instantiation, the destination database cannot be the capture database.

Oracle Streams Components Removed From the Destination Database

If the maintain_mode parameter is set to GLOBAL, then database instantiation is required before running the POST_INSTANTIATION_SETUP procedure. During database

instantiation, Oracle Streams components created by the PRE_INSTANTIATION_SETUP procedure, such as Oracle Streams clients and queues, can be copied from the source database to the destination database. The POST_INSTANTIATION_SETUP procedure removes the Stream components created by the PRE_INSTANTIATION_SETUP procedure from the destination database.

In some cases, rule sets and rules created by the PRE_INSTANTIATION_SETUP procedure might not be removed from the destination database. The POST_INSTANTIATION_SETUP procedure does not associate these rule sets and rules with any Stream clients in the destination database. Optionally, you can remove these rule sets and rules from the destination database after the POST_INSTANTIATION_SETUP procedure, or the script generated by the procedure, completes.

Note: The POST_INSTANTIATION_SETUP procedure only removes Oracle Streams components that were created by the PRE_INSTANTIATION_SETUP procedure. It does not remove Oracle Streams components that were created in a different way.

PRE_INSTANTIATION_SETUP Procedure

This procedure performs the actions required before instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the `PRE_INSTANTIATION_SETUP` procedure at the database that will be the source database in the Stream replication environment.
2. Perform any necessary instantiation actions.
3. Run the `POST_INSTANTIATION_SETUP` procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.
- Replicates changes to database objects during a database maintenance operation, such migrating a database to a different platform. In this case, use the `CLEANUP_INSTANTIATION_SETUP` procedure to remove the replication environment after the maintenance operation is complete.

Note:

- A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.
- When the RMAN `DUPLICATE` or `CONVERT DATABASE` command is used for database instantiation, the destination database cannot be the capture database.

Syntax

```
DBMS_STREAMS_ADM.PRE_INSTANTIATION_SETUP(
   maintain_mode           IN VARCHAR2,
   tablespace_names        IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
   source_database         IN VARCHAR2,
   destination_database    IN VARCHAR2,
```

```
  perform_actions         IN BOOLEAN         DEFAULT TRUE,
  script_name             IN VARCHAR2        DEFAULT NULL,
  script_directory_object IN VARCHAR2        DEFAULT NULL,
  capture_name            IN VARCHAR2        DEFAULT NULL,
  capture_queue_table     IN VARCHAR2        DEFAULT NULL,
  capture_queue_name      IN VARCHAR2        DEFAULT NULL,
  capture_queue_user      IN VARCHAR2        DEFAULT NULL,
  propagation_name        IN VARCHAR2        DEFAULT NULL,
  apply_name              IN VARCHAR2        DEFAULT NULL,
  apply_queue_table       IN VARCHAR2        DEFAULT NULL,
  apply_queue_name        IN VARCHAR2        DEFAULT NULL,
  apply_queue_user        IN VARCHAR2        DEFAULT NULL,
  bi_directional          IN BOOLEAN         DEFAULT FALSE,
  include_ddl             IN BOOLEAN         DEFAULT FALSE,
  start_processes         IN BOOLEAN         DEFAULT FALSE,
  exclude_schemas         IN VARCHAR2        DEFAULT NULL,
  exclude_flags           IN BINARY_INTEGER  DEFAULT NULL);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 159-19 for descriptions of the procedure parameters that are not in Table 159–29

Table 159–29 PRE_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
maintain_mode	Specify one of the following: ■ GLOBAL to maintain the entire database by configuring replication between the local database and the database specified in the destination_database parameter ■ TRANSPORTABLE TABLESPACES to maintain a set of tablespaces by configuring replication between the local database and the database specified in the destination_database parameter
tablespace_names	If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. Also, a directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. If maintain_mode is set to GLOBAL, then specify an empty tablespace set. Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL. **See Also:** TABLESPACE_SET Table Type on page 164-9

Table 159–29 (Cont.) PRE_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
capture_queue_table	The name of the queue table for each queue used by a capture process, specified as [*schema_name*.]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the system generates a name for the queue table of each queue used by a capture process, and the current user is the owner of each queue table.
start_processes	If TRUE, then the procedure starts each capture process and apply process. If FALSE, then the procedure does not start any capture processes or apply processes.
exclude_schemas	A comma-delimited list of schemas to exclude from the Oracle Streams configuration. Schema rules are added to the negative rule sets of each capture process to exclude these schemas. Specify an asterisk (*) to exclude all of the schemas in the database. If NULL, then the procedure does not exclude any schemas in the database. This parameter is valid only if the MAINTAIN_MODE parameter is set to GLOBAL. If the MAINTAIN_MODE parameter is set to TRANSPORTABLE TABLESPACES, then the procedure ignores this parameter.
exclude_flags	Specify what to exclude from the replication configuration in the schemas specified by the exclude_schemas parameter. See "Usage Notes" on page 159-143 for more information.

Usage Notes

The following sections contain usage notes for this procedure.

Self-Contained Tablespace Sets

If the maintain_mode parameter is set to TRANSPORTABLE TABLESPACES, then the specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

> **See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

The exclude_flags Parameter

Specify one of the following values:

- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL to exclude changes to the schemas and all of the database objects in the schemas
- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED to exclude changes to the database objects that are not supported by Oracle Streams in the schemas

If both of these values are specified, then the procedure raises an error.

In addition to DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL or DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED, specify one or both of the following values:

- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML to exclude data manipulation language (DML) changes made to the excluded database objects
- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL to exclude data definition language (DDL) changes made to the excluded database objects

Use the plus sign (+) to specify more than one of these values. For example, to maintain DML changes to the tables in a schemas specified by the exclude_schemas parameter but exclude DDL changes to these schemas and the database objects in these schemas, specify the following for this parameter:

```
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL
```

To exclude DML and DDL changes made to unsupported database objects in the schemas specified by the exclude_schemas parameter, specify the following for this parameter:

```
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL
```

Rules for the excluded database objects are added to the negative rule set of each capture process. Therefore, changes to the excluded database objects will not be captured and replicated.

This parameter is valid only if the maintain_mode parameter is set to GLOBAL and the exclude_schemas parameter is set to a non-NULL value. If the maintain_mode parameter is set to GLOBAL and the exclude_schemas parameter is set to a NULL, then the procedure ignores this parameter. If the maintain_mode parameter is set to TRANSPORTABLE TABLESPACES, then this the procedure ignores this parameter and excludes any database objects in the specified tablespace set that are not supported by Oracle Streams from the Oracle Streams configuration automatically.

Also, if schemas are specified in the exclude_schemas parameter, but the exclude_flags parameter is set to NULL, then the procedure does not add any rules to the

negative rule set of any capture process, and the procedure includes the schemas specified in the `exclude_schemas` parameter in the replication environment.

PURGE_SOURCE_CATALOG Procedure

This procedure removes all Oracle Streams data dictionary information at the local database for the specified object. You can use this procedure to remove Oracle Streams metadata that is not needed currently and will not be needed in the future.

Syntax

```
DBMS_STREAMS_ADM.PURGE_SOURCE_CATALOG(
   source_database     IN  VARCHAR2,
   source_object_name  IN  VARCHAR2,
   source_object_type  IN  VARCHAR2);
```

Parameters

Table 159–30 PURGE_SOURCE_CATALOG Procedure Parameters

Parameter	Description
source_database	The global name of the source database containing the object. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
source_object_name	The name of the object specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
source_object_type	Type of the object. Currently, TABLE is the only possible object type.

Usage Notes

The global name of the source database containing the object must be specified for the source_database parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the hr.employees table at the dbs1.net source database are being applied to the hr.employees table at the dbs2.net destination database. Also, suppose hr.employees at dbs2.net is not a source at all. In this case, specifying dbs2.net as the source_database for this table results in an error. However, specifying dbs1.net as the source_database for this table while running the PURGE_SOURCE_CATALOG procedure at the dbs2.net database removes data dictionary information about the table at dbs2.net.

Do not run this procedure at a database if either of the following conditions are true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

> **Note:** These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.

RECOVER_OPERATION Procedure

This procedure provides options for operations that stopped because they encountered an errors. These operations include split and merge operations, Oracle Streams replication configuration operations, and Oracle Streams change table configuration operations. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.

This procedure only can perform these actions for the following operations:

- Split and merge operations using:
  - The `split_threshold` and `merge_threshold` capture process parameters set to non-`NULL` values to enable automatic split and merge
  - SPLIT_STREAMS Procedure
  - MERGE_STREAMS_JOB Procedure
- Change table configuration operations performed by the MAINTAIN_CHANGE_TABLE Procedure
- Replication configuration operations performed by the following procedures:
  - MAINTAIN_GLOBAL Procedure
  - MAINTAIN_SCHEMAS Procedure
  - MAINTAIN_SIMPLE_TABLESPACE Procedure
  - MAINTAIN_SIMPLE_TTS Procedure
  - MAINTAIN_TABLES Procedure
  - MAINTAIN_TABLESPACES Procedure
  - MAINTAIN_TTS Procedure
  - PRE_INSTANTIATION_SETUP Procedure
  - POST_INSTANTIATION_SETUP Procedure

Information about the operation is stored in the following data dictionary views when the operation is in process:

- `DBA_RECOVERABLE_SCRIPT`
- `DBA_RECOVERABLE_SCRIPT_PARAMS`
- `DBA_RECOVERABLE_SCRIPT_BLOCKS`
- `DBA_RECOVERABLE_SCRIPT_ERRORS`

For split and merge operations, the data dictionary views are populated at the database that contains the capture process. For the configuration operations, the data dictionary views are populated at the database where the replication configuration procedure was run.

When the operation completes successfully, metadata about the operation is moved from the `DBA_RECOVERABLE_SCRIPT` view to the `DBA_RECOVERABLE_SCRIPT_HIST` view. The other views, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or

purge the metadata about the operation using the RECOVER_OPERATION procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in DBA_RECOVERABLE_SCRIPT_ERRORS before proceeding.

For split and merge operations, run the RECOVER_OPERATION procedure at the database that contains the capture process. For the configuration operations, run the RECOVER_OPERATION procedure at the database where the replication configuration procedure was run.

Note:

- Regarding the configuration operations, the procedure must configure the environment directly (perform_actions => TRUE), not by generating a script, for information about the operation to be stored in the recoverable views and for the operation to be managed by the RECOVER_OPERATION procedure.
- To run the RECOVER_OPERATION procedure, both databases must be Oracle Database 10*g* Release 2 or later databases.

See Also: *Oracle Streams Replication Administrator's Guide*

Syntax

```
DBMS_STREAMS_ADM.RECOVER_OPERATION(
   script_id       IN  RAW,
   operation_mode  IN  VARCHAR2  DEFAULT 'FORWARD');
```

Parameters

Table 159–31 RECOVER_OPERATION Procedure Parameters

Parameter	Description
script_id	The operation id of the operation that is being rolled forward, rolled back, or purged. Query the SCRIPT_ID column of the DBA_RECOVERABLE_SCRIPT data dictionary view to determine the operation id.
operation_mode	If FORWARD, then the procedure rolls forward the operation. Specify FORWARD to try to complete the operation. If ROLLBACK, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view. The other views retain information about the operation for 30 days. If PURGE, then the procedure moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view without rolling the operation back. The other views retain information about the operation for 30 days.

REMOVE_QUEUE Procedure

This procedure removes the specified ANYDATA queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the drop_unused_queue_table parameter is set to TRUE, then drops the queue table if it is empty and no other queues are using it.
5. If the cascade parameter is set to TRUE, then drops all of the Oracle Streams clients that are using the queue.

Note: The specified queue must be a ANYDATA queue.

Syntax

```
DBMS_STREAMS_ADM.REMOVE_QUEUE(
   queue_name                IN  VARCHAR2,
   cascade                   IN  BOOLEAN  DEFAULT FALSE,
   drop_unused_queue_table   IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 159–32 REMOVE_QUEUE Procedure Parameters

Parameter	Description
queue_name	The name of the queue to remove, specified as [*schema_name*.]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the current user is the default.
cascade	If TRUE, then the procedure drops any Oracle Streams clients that use the queue. If FALSE, then the procedure raises an error if there are any Oracle Streams clients that use the queue. Before you run this procedure with the cascade parameter set to FALSE, make sure no Oracle Streams clients are using the queue currently.
drop_unused_queue_table	If TRUE and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue. If FALSE, then the procedure does not drop the queue table.

REMOVE_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, synchronous capture, apply process, propagation, or messaging client.

If this procedure results in an empty positive rule set for a messaging client, then the procedure drops the messaging client automatically.

> **Note:** If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the `DBMS_RULE_ADM.DROP_RULE` procedure. If you use the `DBMS_RULE_ADM.DROP_RULE` procedure, then some metadata about the rule might remain.

Syntax

```
DBMS_STREAMS_ADM.REMOVE_RULE(
   rule_name         IN  VARCHAR2,
   streams_type      IN  VARCHAR2,
   streams_name      IN  VARCHAR2,
   drop_unused_rule  IN  BOOLEAN  DEFAULT TRUE,
   inclusion_rule    IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 159–33 REMOVE_RULE Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule to remove, specified as `[`*`schema_name`*`.]`*`rule_name`*. If `NULL`, then the procedure removes all rules from the specified capture process, synchronous capture, apply process, propagation, or messaging client rule set. For example, to specify a rule in the `hr` schema named `prop_rule1`, enter `hr.prop_rule1`. If the schema is not specified, then the current user is the default.
`streams_type`	The type of Oracle Streams client: ■ Specify `capture` for a capture process. ■ Specify `sync_capture` for a synchronous capture. ■ Specify `propagation` for a propagation. ■ Specify `apply` for an apply process. ■ Specify `dequeue` for a messaging client.
`streams_name`	The name of the Oracle Streams client, which can be a capture process, synchronous capture, propagation, apply process, or messaging client. Do not specify an owner. If the specified Oracle Streams client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata. If the specified Oracle Streams client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.

Table 159–33 (Cont.) REMOVE_RULE Procedure Parameters

Parameter	Description
drop_unused_rule	If TRUE and the rule is not in any rule set, then the procedure drops the rule from the database. If TRUE and the rule exists in any rule set, then the procedure does not drop the rule from the database. If FALSE, then the procedure does not drop the rule from the database.
inclusion_rule	If inclusion_rule is TRUE, then the procedure removes the rule from the positive rule set for the Oracle Streams client. If inclusion_rule is FALSE, then the procedure removes the rule from the negative rule set for the Oracle Streams client.

REMOVE_STREAMS_CONFIGURATION Procedure

This procedure removes the Oracle Streams configuration at the local database.

Syntax

```
DBMS_STREAMS_ADM.REMOVE_STREAMS_CONFIGURATION;
```

Usage Notes

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes
- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the `ABORT_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the `ABORT_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the `ABORT_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- Drops propagations that were created using either the `DBMS_STREAMS_ADM` package or the `DBMS_PROPAGATION_ADM` package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the `DBMS_AQADM` package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the `SET_MESSAGE_NOTIFICATION` procedure in the `DBMS_STREAMS_ADM` package
- Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rule sets and rules that were created using the `DBMS_STREAMS_ADM` package.

- Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

This procedure stops capture processes and apply processes before it drops them.

This procedure does not drop rule sets or rules if they meet both of the following conditions:

- The rule sets or rules were created using the DBMS_RULE_ADM package.
- The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.

Attention: Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire Oracle Streams configuration at a database.

Note:

- Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
- This procedure commits multiple times.

RENAME_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note:

- The RENAME_COLUMN procedure supports the same data types supported by Oracle Streams capture processes.
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes

Syntax

```
DBMS_STREAMS_ADM.RENAME_COLUMN(
   rule_name         IN  VARCHAR2,
   table_name        IN  VARCHAR2,
   from_column_name  IN  VARCHAR2,
   to_column_name    IN  VARCHAR2,
   value_type        IN  VARCHAR2  DEFAULT '*',
   step_number       IN  NUMBER    DEFAULT 0,
   operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 159–34 RENAME_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table in which the column is renamed in the row LCR, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
from_column_name	The name of the column to be renamed in each row LCR that satisfies the rule.
to_column_name	The new name of the column in each row LCR that satisfies the rule.

Table 159–34 (Cont.) RENAME_COLUMN Procedure Parameters

Parameter	Description
value_type	Specify 'NEW' to rename the column in the new values in the row LCR. Specify 'OLD' to rename the column in the old values in the row LCR. Specify '*' to rename the column in both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_COLUMN procedure when one or more of these parameters is NULL:

table_name	from_column_name	to_column_name	step_number	Result
NULL	NULL	NULL	NULL	Remove all rename column transformations for the specified rule.
NULL	NULL	NULL	non-NULL	Remove all rename column transformations with the specified step_number for the specified rule.
NULL	NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified to_column_name and step_number for the specified rule.
NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified table_name and step_number for the specified rule.
NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified column_name for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name and column_name for the specified rule.
NULL	non-NULL	NULL	NULL	Remove all rename column transformations with the specified table_name for the specified rule.

table_name	from_column_name	to_column_name	step_number	Result
NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.

RENAME_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note: Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

Syntax

```
DBMS_STREAMS_ADM.RENAME_SCHEMA(
   rule_name          IN  VARCHAR2,
   from_schema_name   IN  VARCHAR2,
   to_schema_name     IN  VARCHAR2,
   step_number        IN  NUMBER    DEFAULT 0,
   operation          IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 159–35 RENAME_SCHEMA Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
from_schema_name	The name of the schema to be renamed in each row LCR that satisfies the rule.
to_schema_name	The new name of the schema in each row LCR that satisfies the rule.
step_number	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified from_schema_name, to_schema_name, and step_number parameters. Nulls

specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_SCHEMA procedure when one or more of these parameters is NULL:

from_schema_name	to_schema_name	step_number	Result
NULL	NULL	NULL	Remove all rename schema transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename schema transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified to_schema_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all rename schema transformations with the specified to_schema_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename schema transformations with the specified from_schema_name and to_schema_name for the specified rule.
non-NULL	NULL	NULL	Remove all rename schema transformations with the specified from_schema_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name, to_schema_name, and step_number for the specified rule.

RENAME_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note: Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

Syntax

```
DBMS_STREAMS_ADM.RENAME_TABLE(
   rule_name        IN  VARCHAR2,
   from_table_name  IN  VARCHAR2,
   to_table_name    IN  VARCHAR2,
   step_number      IN  NUMBER    DEFAULT 0,
   operation        IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 159–36 RENAME_TABLE Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
from_table_name	The name of the table to be renamed in each row LCR that satisfies the rule, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
to_table_name	The new name of the table in each row LCR that satisfies the rule, specified as [*schema_name.*]*object_name*. For example, humres.staff. The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default.
step_number	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified from_table_name, to_table_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_TABLE procedure when one or more of these parameters is NULL:

from_table_name	to_table_name	step_number	Result
NULL	NULL	NULL	Remove all rename table transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename table transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified to_table_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename table transformations with the specified from_table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all rename table transformations with the specified to_table_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename table transformations with the specified from_table_name and to_table_name for the specified rule.
non-NULL	NULL	NULL	Remove all rename table transformations with the specified from_table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified from_table_name, to_table_name, and step_number for the specified rule.

SET_MESSAGE_NOTIFICATION Procedure

This procedure sets a notification for messages that can be dequeued by a specified Oracle Streams messaging client from a specified queue. A notification is sent when a message is enqueued into the specified queue and the specified messaging client can dequeue the message because the message satisfies its rule sets.

Note:

- Currently, messaging clients cannot dequeue buffered messages.
- The DBMS_AQ package can also configure notifications. The DBMS_AQ package provides some notification features that are not available in DBMS_STREAMS_ADM package, such as buffered message notifications and notification grouping by time.

Syntax

```
DBMS_STREAMS_ADM.SET_MESSAGE_NOTIFICATION(
   streams_name          IN  VARCHAR2,
   notification_action   IN  VARCHAR2,
   notification_type     IN  VARCHAR2     DEFAULT 'PROCEDURE',
   notification_context  IN  ANYDATA      DEFAULT NULL,
   include_notification  IN  BOOLEAN      DEFAULT TRUE,
   queue_name            IN  VARCHAR2     DEFAULT 'streams_queue');
```

Parameters

Table 159–37 SET_MESSAGE_NOTIFICATION Procedure Parameters

Parameter	Description
streams_name	The name of the Oracle Streams messaging client. Do not specify an owner. For example, if the user strmadmin is the messaging client, then specify strmadmin.

Table 159–37 (Cont.) SET_MESSAGE_NOTIFICATION Procedure Parameters

Parameter	Description
notification_action	The action to be performed on message notification. Specify one of the following: ■ For URL notifications, specify a URL without the prefix http://. For example, to specify the URL http://www.company.com:8080, enter the following: www.company.com:8080 ■ For email notifications, specify an email address. For example, to specify an the email address xyz@company.com, enter the following: xyz@company.com ■ For PL/SQL procedure notifications, specify an existing user-defined PL/SQL procedure in the form [*schema_name*.]*procedure_name*. If the *schema_name* is not specified, then the user who invokes the SET_MESSAGE_NOTIFICATION procedure is the default. The procedure must be a PLSQLCALLBACK data structure. For example, to specify a procedure named notify_orders in the oe schema, enter the following: oe.notify_orders **See Also:** Examples on page 159-164 for more information about message notification procedures
notification_type	The type of notification. Specify one of the following: ■ HTTP if you specified a URL for notification_action ■ MAIL if you specified an email address for notification_action ■ PROCEDURE if you specified a user-defined procedure for notification_action The type must match the specification for the notification_action parameter.
notification_context	The context of the notification. The context must be specified using RAW datatype information. For example, to specify the hexidecimal equivalent of 'FF', enter the following: ANYDATA.ConvertRaw(HEXTORAW('FF')) The notification context is passed the PL/SQL procedure in procedure notifications and is not relevant for mail or HTTP notifications.
include_notification	If TRUE, then the procedure adds this notification for the specified streams_name and queue_name. That is, specifying TRUE turns on the notification for the streams_name and queue_name. If FALSE, then the procedure removes this notification for the specified streams_name and queue_name. That is, specifying FALSE turns off the notification for the streams_name and queue_name. If you specify FALSE, then this procedure ignores any specified values for the notification_action or notification_context parameters.

Table 159–37 (Cont.) SET_MESSAGE_NOTIFICATION Procedure Parameters

Parameter	Description
queue_name	The name of a local ANYDATA queue, specified as [*schema_name.*]*queue_name*. The current database must contain the queue. The specified queue must be a ANYDATA queue. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.

Usage Notes

You can specify one of the following types of notifications:

- An email address to which message notifications are sent. When a relevant message is enqueued into the queue, an email with the message properties is mailed to the specified email address.
- A PL/SQL procedure to be invoked on a notification. When a relevant message is enqueued into the queue, the specified PL/SQL procedure is invoked with the message properties. This PL/SQL procedure can dequeue the message.
- An HTTP URL to which the notification is posted. When a relevant message is enqueued into the queue, a notification with the message properties is posted to the specified URL specified.

A client does not need to be connected to the database to receive a notification.

If you register for email notifications, then you should use the DBMS_AQELM package to set the host name and port name for the SMTP server that will be used by the database to send email notifications. If required, then you should set the send-from email address, which is set by the database as the sent from field. You need a Java-enabled database to use this feature.

If you register for HTTP notifications, you might want to use the DBMS_AQELM package to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

Each notification is an AQXmlNotification, which includes of the following:

- notification_options, which includes the following:
  - destination - The destination queue from which the message was dequeued
  - consumer_name - The name of the messaging client that dequeued the message
- message_set - The set of message properties

See Also:

- The documentation for the DBMS_AQELM package for more information on email notifications and HTTP notifications
- *Oracle Database Advanced Queuing User's Guide* and *Oracle XML DB Developer's Guide* for more information about message notifications and XML
- *Oracle Streams Concepts and Administration* for more information about how rules are used in Oracle Streams

Examples

If you use a message notification procedure, then this PL/SQL procedure must have the following signature:

```
PROCEDURE procedure_name(
  context  IN  ANYDATA,
  reginfo  IN  SYS.AQ$_REG_INFO,
  descr    IN  SYS.AQ$_DESCRIPTOR);
```

Here, *procedure_name* stands for the name of the procedure. The procedure is a `PLSQLCALLBACK` data structure that specifies the user-defined PL/SQL procedure to be invoked on message notification.

The following is a simple example of a notification procedure that dequeues a message of type `oe.user_msg` using the message identifier and consumer name sent by the notification. To complete the example, first create the type:

```
CREATE TYPE oe.user_msg AS OBJECT(
  object_name    VARCHAR2(30),
  object_owner   VARCHAR2(30),
  message        VARCHAR2(50));
/
```

Next, create the procedure:

```
CREATE OR REPLACE PROCEDURE oe.notification_dequeue(
  context  ANYDATA,
  reginfo  SYS.AQ$_REG_INFO,
  descr    SYS.AQ$_DESCRIPTOR)
AS
  dequeue_options     DBMS_AQ.DEQUEUE_OPTIONS_T;
  message_properties  DBMS_AQ.MESSAGE_PROPERTIES_T;
  message_handle      RAW(16);
  message             ANYDATA;
  oe_message          oe.user_msg;
  rc                  PLS_INTEGER;
BEGIN
  -- Get the message identifier and consumer name from the descriptor
  dequeue_options.msgid := descr.msg_id;
  dequeue_options.consumer_name := descr.consumer_name;
  -- Dequeue the message
  DBMS_AQ.DEQUEUE(
    queue_name         => descr.queue_name,
    dequeue_options    => dequeue_options,
    message_properties => message_properties,
    payload            => message,
    msgid              => message_handle);
  rc := message.getobject(oe_message);
  COMMIT;
END;
/
```

> **See Also:** *Oracle Database PL/SQL Packages and Types Reference* for more information about `PLSQLCALLBACK` data structures

SET_MESSAGE_TRACKING Procedure

Sets the tracking label for logical change records (LCRs) produced by the current session. This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

Note: The tracking label set by this procedure does not track non-LCR messages.

See Also: GET_MESSAGE_TRACKING Function on page 159-83

Syntax

```
DBMS_STREAMS_ADM.SET_MESSAGE_TRACKING(
   tracking_label IN VARCHAR2  DEFAULT 'Streams_tracking',
   actions        IN NUMBER    DEFAULT DBMS_STREAMS_ADM.ACTION_MEMORY);
```

Parameters

Table 159–38 SET_MESSAGE_TRACKING Procedure Parameters

Parameter	Description
tracking_label	The label used to track the LCRs produced by the session. Set this parameter to NULL to stop message tracking in the current session. The size limit for a label is 4,000 bytes.
actions	When DBMS_STREAMS_ADM.ACTION_MEMORY is specified, the LCRs are tracked in memory, and the V$STREAMS_MESSAGE_TRACKING dynamic performance view is populated with information about the LCRs. Currently, DBMS_STREAMS_ADM.ACTION_MEMORY is the only valid setting for this parameter. The value specified for this parameter is an enumerated constant. Enumerated constants must be prefixed with the package name.

SET_RULE_TRANSFORM_FUNCTION Procedure

This procedure sets or removes the transformation function name for a custom rule-based transformation.

Syntax

```
DBMS_STREAMS_ADM.SET_RULE_TRANSFORM_FUNCTION(
   rule_name           IN  VARCHAR2,
   transform_function  IN  VARCHAR2);
```

Parameters

Table 159–39 SET_RULE_TRANSFORM_FUNCTION Procedure Parameters

Parameter	Description
rule_name	The name of the rule whose rule-based transformation function you are setting or removing, specified as [*schema_name.*]*rule_name*. For example, to specify a rule in the hr schema named prop_rule1, enter hr.prop_rule1. If the schema is not specified, then the current user is the default.
transform_function	Either the name of the transformation function to be used in the rule-based transformation for the rule or NULL. If you specify a transformation function name, then specify an existing function in one of the following forms: ■ [*schema_name.*]*function_name* ■ [*schema_name.*]*package_name.function_name* If the function is in a package, then you must specify the *package_name*. For example, to specify a function in the transform_pkg package in the hr schema named executive_to_management, enter hr.transform_pkg.executive_to_management. An error is returned if the specified procedure does not exist. If the *schema_name* is not specified, then the user who invokes the rule-based transformation function is the default. If you specify NULL, then the SET_RULE_TRANSFORM_FUNCTION procedure removes the current custom rule-based transformation from the rule.

Usage Notes

The following sections contain usage notes for this procedure:

- Transformation Function Signature
- Rule Action Context
- User Who Calls the Transformation Function
- Function Verification

Transformation Function Signature

A custom rule-based transformation function always operates on one message, but it can return one message or many messages. A custom rule-based transformation function that returns one message is a one-to-one transformation function. A one-to-one transformation function must have the following signature:

```
FUNCTION user_function (
```

```
   parameter_name   IN  ANYDATA)
RETURN ANYDATA;
```

Here, *user_function* stands for the name of the function and *parameter_name* stands for the name of the parameter passed to the function. The parameter passed to the function is an ANYDATA encapsulation of a message, and the function must return an ANYDATA encapsulation of a message.

A custom rule-based transformation function that can return multiple messages is a one-to-many transformation function. A one-to-many transformation function must have the following signature:

```
FUNCTION user_function (
   parameter_name  IN  ANYDATA)
RETURN STREAMS$_ANYDATA_ARRAY;
```

Here, *user_function* stands for the name of the function and *parameter_name* stands for the name of the parameter passed to the function. The parameter passed to the function is an ANYDATA encapsulation of a message, and the function must return an array that contains zero or more ANYDATA encapsulations of a message. If the array contains zero ANYDATA encapsulations of a message, then the original message is discarded.

The STREAMS$_ANYDATA_ARRAY type is an Oracle-supplied type that has the following definition:

```
CREATE OR REPLACE TYPE SYS.STREAMS$_ANYDATA_ARRAY
   AS VARRAY(2147483647) of ANYDATA
/
```

The following restrictions apply to custom rule-based transformations that use one-to-many functions:

- Rules that are associated with one-to-many functions are supported for Oracle Streams capture processes only. These rules must not be added to rule sets used by other Oracle Streams clients, including propagations, apply processes, and messaging clients.
- One-to-many functions only can operate on row logical change records (row LCRs). They cannot operate on DDL LCRs.
- Row LCRs returned by a one-to-many function cannot contain piecewise LOB, LONG, or LONG RAW operations.
- The one-to-many function must return row LCRs in the correct order. The order of row LCRs in the array (starting from index 1) is the order that the row LCRs will be executed in the transaction.

When an apply process dequeues row LCRs that are the result of a transformation by a one-to-many function, the apply process uses the instantiation SCN of the LCR passed to the one-to-many function for all of row LCRs.

Note:

- An error is raised if a one-to-one or one-to-many transformation function returns `NULL`.
- Only one custom rule-based transformation can be specified for a particular rule. You cannot specify both a one-to-one and a one-to-many transformation function for the same rule.
- For any LCR constructed and returned by a custom rule-based transformation, the `source_database_name`, `transaction_id`, and `scn` parameter values must match the values in the original LCR. Oracle automatically specifies the values in the original LCR for these parameters, even if an attempt is made to construct LCRs with different values.

Rule Action Context

This procedure modifies the specified rule's action context to specify the transformation. A rule's action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to `TRUE` for a message. The client of the rules engine can be a user-created application or an internal feature of Oracle, such as Oracle Streams. The Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. The information in an action context is an object of type `SYS.RE$NV_LIST`, which consists of a list of name-value pairs.

A custom rule-based transformation in Oracle Streams always consists of the following name-value pair in an action context:

- If the function is a one-to-one transformation function, then the name is `STREAMS$_TRANSFORM_FUNCTION`. If the function is a one-to-many transformation function, then the name is `STREAMS$_ARRAY_TRANS_FUNCTION`.
- The value is a `ANYDATA` instance containing a PL/SQL function name specified as a `VARCHAR2`. This function performs the transformation.

User Who Calls the Transformation Function

The user that calls the transformation function must have `EXECUTE` privilege on the function. The following list describes which user calls the transformation function:

- If a transformation is specified for a rule used by a capture process, then the user who calls the transformation function is the capture user for the capture process.
- If a transformation is specified for a rule used by a synchronous capture, then the user who calls the transformation function is the capture user for the synchronous capture.
- If a transformation is specified for a rule used by a propagation, then the user who calls the transformation function is the owner of the source queue for the propagation.
- If a transformation is specified on a rule used by an apply process, then the user who calls the transformation function is the apply user for the apply process.
- If a transformation is specified on a rule used by a messaging client, then the user who calls the transformation function is the user who invokes the messaging client.

Function Verification

This procedure does not verify that the specified transformation function exists. If the function does not exist, then an error is raised when an Oracle Streams client tries to invoke the transformation function.

SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session. Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

See Also:

- "GET_TAG Function" on page 159-86
- *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
DBMS_STREAMS_ADM.SET_TAG(
   tag  IN RAW  DEFAULT NULL);
```

Parameters

Table 159–40 SET_TAG Procedure Parameters

Parameter	Description
tag	The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_STREAMS_ADM.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

See Also: BUILD Procedure on page 34-18

SET_UP_QUEUE Procedure

This procedure creates a queue table and a ANYDATA queue.

Syntax

```
DBMS_STREAMS_ADM.SET_UP_QUEUE(
   queue_table     IN  VARCHAR2  DEFAULT 'streams_queue_table',
   storage_clause  IN  VARCHAR2  DEFAULT NULL,
   queue_name      IN  VARCHAR2  DEFAULT 'streams_queue',
   queue_user      IN  VARCHAR2  DEFAULT NULL,
   comment         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 159–41 SET_UP_QUEUE Procedure Parameters

Parameter	Description
queue_table	The name of the queue table specified as [*schema_name.*]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner. Queue table names can be a maximum of 24 bytes.
storage_clause	The storage clause for queue table The storage parameter is included in the CREATE TABLE statement when the queue table is created. You can specify any valid table storage clause. If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause. If NULL, then the procedure uses the storage characteristics of the tablespace in which the queue table is created. **See Also:** *Oracle Database SQL Language Reference* for more information about storage clauses
queue_name	The name of the queue that will function as the ANYDATA queue, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue. If the schema is not specified for this parameter, and the queue table owner is not specified in queue_table, then the current user is the default. Queue names can be a maximum of 24 bytes.

Table 159–41 (Cont.) SET_UP_QUEUE Procedure Parameters

Parameter	Description
queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
comment	The comment for the queue

Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the CREATE_QUEUE_TABLE procedure in the DBMS_AQADM package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer ANYDATA queue that is both a secure queue and a transactional queue.

  Also, if the database is Oracle Database 10*g* release 2 or later, the sort_list setting in CREATE_QUEUE_TABLE is set to commit_time. If the database is a release before Oracle Database 10*g* release 2, the sort_list setting in CREATE_QUEUE_TABLE is set to enq_time.
- If the specified queue table exists, then the queue uses the properties of the existing queue table.
- If the specified queue name does not exist, then this procedure runs the CREATE_QUEUE procedure in the DBMS_AQADM package to create the queue.
- This procedure starts the queue.
- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants ENQUEUE and DEQUEUE privileges on the queue to the specified queue user.

  To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not exist. If an agent with this name exists and is associated with the queue user only, then it is used. SET_UP_QUEUE then runs the ENABLE_DB_ACCESS procedure in the DBMS_AQADM package, specifying the agent and the user.

Note:

- To enqueue messages into and dequeue messages from a queue, a queue user must have EXECUTE privilege on the DBMS_STREAMS_MESSAGING package or the DBMS_AQ package. The SET_UP_QUEUE procedure does not grant this privilege.
- If the agent that SET_UP_QUEUE tries to create exists and is associated with a user other than the user specified by queue_user, then the procedure raises an error. In this case, rename or remove the existing agent, and retry SET_UP_QUEUE.

See Also: *Oracle Streams Concepts and Administration* for more information about secure queue users

SPLIT_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Streams replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill messages to the hard disk, degrading the performance of the Oracle Streams environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.
2. Creates a new propagation that propagates messages from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.
3. Stops the capture process.
4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.
5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the acknowledged SCN queried in Step 4. The cloned capture process uses the same rule set as the original capture process.
6. Drops the original propagation.
7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.
8. If the `auto_merge_threshold` parameter is set to a positive number, then creates an Oracle Scheduler job to run the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the `MERGE_STREAMS_JOB` procedure runs the `MERGE_STREAMS` procedure to merge the streams automatically.

After the `SPLIT_STREAMS` procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the `START_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

The `DBA_STREAMS_SPLIT_MERGE` view contains the name of each cloned component and information about the split and merge operation.

Note: If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

See Also:

- "MERGE_STREAMS Procedure" on page 159-130
- "MERGE_STREAMS_JOB Procedure" on page 159-133
- *Oracle Streams Replication Administrator's Guide* for instructions on using the `SPLIT_STREAMS` procedure

Syntax

```
DBMS_STREAMS_ADM.SPLIT_STREAMS(
   propagation_name         IN      VARCHAR2,
   cloned_propagation_name  IN      VARCHAR2  DEFAULT NULL,
   cloned_queue_name        IN      VARCHAR2  DEFAULT NULL,
   cloned_capture_name      IN      VARCHAR2  DEFAULT NULL,
   perform_actions          IN      BOOLEAN   DEFAULT TRUE,
   script_name              IN      VARCHAR2  DEFAULT NULL,
   script_directory_object  IN      VARCHAR2  DEFAULT NULL,
   auto_merge_threshold     IN      NUMBER    DEFAULT NULL,
   schedule_name            IN OUT  VARCHAR2,
   merge_job_name           IN OUT  VARCHAR2);
```

Parameters

Table 159–42 SPLIT_STREAMS Procedure Parameters

Parameter	Description
`propagation_name`	The name of the propagation that cannot send messages to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.
`cloned_propagation_name`	The name of the new propagation created by this procedure for the stream that is split off. If `NULL`, then the system generates a propagation name.
`cloned_queue_name`	The name of the new queue created by this procedure for the stream that is split off. If `NULL`, then the system generates a queue name.
`cloned_capture_name`	The name of the new capture process created by this procedure for the stream that is split off. If `NULL`, then the system generates a capture process name.

Table 159–42 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
perform_actions	If TRUE, then the procedure performs the necessary actions to split the stream directly. If FALSE, then the procedure does not perform the necessary actions to split the stream directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ■ script_name ■ script_directory_object
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to split the stream directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.

Table 159–42 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
auto_merge_threshold	If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the MERGE_STREAMS_JOB procedure at set intervals according to its schedule. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$STREAMS_CAPTURE dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for the auto_merge_threshold parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream. If NULL or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the MERGE_STREAM procedure manually when the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process catches up to, or nearly catches up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process. The CAPTURE_MESSAGE_CREATE_TIME records the time when a captured change was recorded in the redo log.
schedule_name	The Oracle Scheduler schedule name, specified as [*schema_name*.]*schedule_name*. For example, strmadmin.merge_schedule. If the schema is not specified, then the current user is the default. If auto_merge_threshold is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name to adhere to naming conventions or to track the schedule more easily. If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a schedule name. If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL. If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run. If an existing schedule name is specified, an error is raised.
merge_job_name	The Oracle Scheduler job name, specified as [*schema_name*.]*merge_job_name*. For example, strmadmin.merge_job. If the schema is not specified, then the current user is the default. If auto_merge_threshold is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name to adhere to naming conventions or to track the job more easily. If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a job name. If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL. If an existing job name is specified, an error is raised.

DBMS_STREAMS_ADVISOR_ADM

The DBMS_STREAMS_ADVISOR_ADM package, one of a set of Oracle Streams packages, provides an interface to gather information about an Oracle Streams environment and advise database administrators based on the information gathered. This package is part of the Oracle Streams Performance Advisor.

This chapter contains the following topics:

> **See Also:** *Oracle Streams Concepts and Administration* for instructions about using this package

Using DBMS_STREAMS_ADVISOR_ADM

This section contains topics which relate to using the `DBMS_STREAMS_ADVISOR_ADM` package.

Overview

The DBMS_STREAMS_ADVISOR_ADM package enables you to gather and analyze information about an Oracle Streams environment. You can use this information in the following ways:

- To populate data dictionary views with an Oracle Streams topology that contains information about the Oracle Streams components at one or more databases
- To examine the Oracle Streams components at one or more databases in your environment and the ways in which information flows through streams that include these components
- To analyze the performance of the Oracle Streams components in your environment
- To detect performance problems with Oracle Streams components and correct these problems

> **See Also:** *Oracle Streams Concepts and Administration* for instructions about using this package

Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

Constants

The DBMS_STREAMS_ADVISOR_ADM package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_DBMS_ADVISOR_ADM.CAPTURE_TYPE.

Table 160–1 DBMS_STREAMS_ADVISOR_ADM Parameters With Enumerated Constants

Parameter	Option	Type	Description
component_type	■ CAPTURE_TYPE ■ PROPAGATION_SENDER_TYPE ■ PROPAGATION_RECEIVER_TYPE ■ APPLY_TYPE ■ QUEUE_TYPE	NUMBER	CAPTURE_TYPE indicates that the Oracle Streams component is a capture process. The constant number for this option is 1. PROPAGATION_SENDER_TYPE indicates that the Oracle Streams component is a propagation sender. The constant number for this option is 2. PROPAGATION_RECEIVER_TYPE indicates that the Oracle Streams component is a propagation receiver. The constant number for this option is 3. APPLY_TYPE indicates that the Oracle Streams component is an apply process. The constant number for this option is 4. QUEUE_TYPE indicates that the Oracle Streams component is a queue. The constant number for this option is 5.

Views

The DBMS_STREAMS_ADVISOR_ADM package uses the following views:

- DBA_STREAMS_TP_COMPONENT contains information about each Oracle Streams component at each database.
- DBA_STREAMS_TP_COMPONENT_LINK contains information about how messages flow between Oracle Streams components.
- DBA_STREAMS_TP_COMPONENT_STAT contains temporary performance statistics about each Oracle Streams component.
- DBA_STREAMS_TP_DATABASE contains information about each database that contains Oracle Streams components.
- DBA_STREAMS_TP_PATH_BOTTLENECK contains temporary information about Oracle Streams components that might be slowing down the flow of a stream.
- DBA_STREAMS_TP_PATH_STAT contains temporary performance statistics about each stream path that exists in the Oracle Streams topology.

The topology information is stored permanently in the following data dictionary views: DBA_STREAMS_TP_DATABASE, DBA_STREAMS_TP_COMPONENT, and DBA_STREAMS_TP_COMPONENT_LINK.

However, the following views contain temporary information: DBA_STREAMS_TP_COMPONENT_STAT, DBA_STREAMS_TP_PATH_BOTTLENECK, and DBA_STREAMS_TP_PATH_STAT. Some of the data in these views is retained only for the user session that runs the ANALYZE_CURRENT_PERFORMANCE procedure. When this user session ends, this temporary information is purged.

See Also:

- *Oracle Database Reference*
- *Oracle Streams Concepts and Administration* for sample queries that use these views

Operational Notes

This section contains the following operational notes for the DBMS_STREAMS_ADVISOR_ADM package:

- Oracle Streams Components Analyzed by the DBMS_STREAMS_ADVISOR_ADM Package
- General Steps for Running the Oracle Streams Performance Advisor and Analyzing the Information

Oracle Streams Components Analyzed by the DBMS_STREAMS_ADVISOR_ADM Package

The DBMS_STREAMS_ADVISOR_ADM analyzes the following Oracle Streams components at the specified databases:

- Capture processes
- Propagations
- Apply processes
- Queues

The DBMS_STREAMS_ADVISOR_ADM package does not analyze the following Oracle Streams components:

- Synchronous captures
- Messaging clients

General Steps for Running the Oracle Streams Performance Advisor and Analyzing the Information

To use the DBMS_STREAMS_ADVISOR_ADM package, complete the following general steps:

1. Identify the database that you will use to gather the information.

   An administrative user at this database must meet the following requirements:

   - The user must have access to a database link to each database that contains Oracle Streams components.
   - The user must have been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure, and each database link must connect to a user at the remote database that has been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure.

   In an Oracle Streams environment, the Oracle Streams administrator uses this package.

   If no database in your environment meets these requirements, then choose a database, configure the necessary database links, and grant the necessary privileges to the users before proceeding.
2. Connect as the administrative user to the database you identified in Step 1, and remain connected to the session while you complete the remaining steps.
3. Run the ANALYZE_CURRENT_PERFORMACE procedure.
4. Optionally, allow messages to flow in the environment for some time.
5. Optionally, rerun the ANALYZE_CURRENT_PERFORMACE procedure one or more times.
6. Query the data dictionary views listed in "Views" on page 160-6 to analyze the Oracle Streams environment.

7. If you want to update the information in the data dictionary views or if you add new Oracle Streams components to any database in the environment, repeat Steps 2-6.

Note: When you exit the user session, the rate, bandwidth, event, and flow control statistics are purged from the data dictionary views.

Summary of DBMS_STREAMS_ADVISOR_ADM Subprograms

Table 160–2 DBMS_STREAMS_ADVISOR_ADM Package Subprograms

Subprogram	Description
ANALYZE_CURRENT_PERFORMANCE Procedure on page 160-10	Gathers information about the Oracle Streams components at one or more databases in your environment and analyzes Oracle Streams performance based on the information gathered

ANALYZE_CURRENT_PERFORMANCE Procedure

This procedure gathers information about the Oracle Streams components at one or more databases in your environment and analyzes Oracle Streams performance based on the information gathered.

The performance analyses includes:

- Calculating bottleneck components for each separate stream
- Calculating the throughput of each Oracle Streams component
- Calculating the latency of each Oracle Streams component
- Calculating the top wait event of each Oracle Streams component
- Calculating the message rate of each stream
- Calculating the transaction rate of each stream

The procedure places the gathered information in data dictionary views.

Note: The parameters in this procedure must all be either non-`NULL` or `NULL`.

See Also:

- *Oracle Streams Concepts and Administration* for instructions on using this procedure
- "Views" on page 160-6

Syntax

```
DBMS_STREAMS_ADVISOR_ADM.ANALYZE_CURRENT_PERFORMANCE(
   component_name  IN  VARCHAR2  DEFAULT NULL,
   component_db    IN  VARCHAR2  DEFAULT NULL,
   component_type  IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 160–3 ANALYZE_CURRENT_PERFORMANCE Procedure Parameters

Parameter	Description
`component_name`	The name of the Oracle Streams component to analyze. For example, to analyze a capture process named `capture01`, then specify `capture01`. If `NULL`, then all of the Oracle Streams components are analyzed, and the other two parameters must also be `NULL`.
`component_db`	The global name of the database that contains the component specified in the `component_name` parameter. For example, if the `db.net` database contains the component, then specify `db.net`. If `NULL`, then all of the Oracle Streams components are analyzed, and the other two parameters must also be `NULL`.

Table 160–3 (Cont.) ANALYZE_CURRENT_PERFORMANCE Procedure Parameters

Parameter	Description
component_type	The type of the component specified in the component_name parameter. If the component_name parameter is non-NULL, then specify one of the following: ■ DBMS_STREAMS_ADVISOR_ADM.CAPTURE_TYPE ■ DBMS_STREAMS_ADVISOR_ADM.PROPAGATION_SENDER_TYPE ■ DBMS_STREAMS_ADVISOR_ADM.PROPAGATION_RECEIVER_TYPE ■ DBMS_STREAMS_ADVISOR_ADM.APPLY_TYPE ■ DBMS_STREAMS_ADVISOR_ADM.QUEUE_TYPE See "Constants" on page 160-5 for information about these constants. If NULL, then all of the Oracle Streams components are analyzed, and the other two parameters must also be NULL.

161

DBMS_STREAMS_AUTH

The DBMS_STREAMS_AUTH package, one of a set of Oracle Streams packages, provides subprograms for granting privileges to Oracle Streams administrators and revoking privileges from Oracle Streams administrators.

This chapter contains the following topics:

Using DBMS_STREAMS_AUTH

This section contains topics which relate to using the `DBMS_STREAMS_AUTH` package.

Overview

This package provides subprograms for granting privileges to Oracle Streams administrators and revoking privileges from Oracle Streams administrators.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and Oracle Streams administrators

Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

Summary of DBMS_STREAMS_AUTH Subprograms

Table 161–1 DBMS_STREAMS_AUTH Package Subprograms

Subprogram	Description
GRANT_ADMIN_PRIVILEGE Procedure on page 161-6	Either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that you can use to grant these privileges
GRANT_REMOTE_ADMIN_ACCESS Procedure on page 161-9	Enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link
REVOKE_ADMIN_PRIVILEGE Procedure on page 161-10	Either revokes Oracle Streams administrator privileges from a user directly, or generates a script that you can use to revoke these privileges
REVOKE_REMOTE_ADMIN_ACCESS Procedure on page 161-12	Disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link

Note: All subprograms commit unless specified otherwise.

GRANT_ADMIN_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that you can use to grant these privileges.

Syntax

```
DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE(
   grantee           IN  VARCHAR2,
   grant_privileges  IN  BOOLEAN   DEFAULT TRUE,
   file_name         IN  VARCHAR2  DEFAULT NULL,
   directory_name    IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 161–2 GRANT_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
grantee	The user to whom privileges are granted
grant_privileges	If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column. If the user has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fail, then the procedure raises an error. If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error.
file_name	The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file. If NULL, then the procedure does not generate a file.
directory_name	The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The RESTRICTED SESSION system privilege

- EXECUTE on the following packages:
  - DBMS_APPLY_ADM
  - DBMS_AQ
  - DBMS_AQADM
  - DBMS_AQIN
  - DBMS_AQELM
  - DBMS_CAPTURE_ADM
  - DBMS_FLASHBACK
  - DBMS_LOCK
  - DBMS_PROPAGATION_ADM
  - DBMS_RULE_ADM
  - DBMS_STREAMS_ADM
  - DBMS_STREAMS_ADVISOR_ADM
  - DBMS_STREAMS_HANDLER_ADM
  - DBMS_STREAMS_MESSAGING
  - DBMS_TRANSFORM
- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  - Evaluation contexts
  - Rule sets
  - Rules

  In addition, the grantee can grant these privileges to other users.
- SELECT_CATALOG_ROLE
- SELECT or READ privilege on data dictionary views related to Oracle Streams
- The ability to allow a remote Oracle Streams administrator to perform administrative actions through a database link by connecting to the grantee. This ability is enabled by running the GRANT_REMOTE_ADMIN_ACCESS procedure in this package.

Note:

- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- This procedure does not grant any roles to the grantee.
- This procedure grants only the privileges necessary to configure and administer an Oracle Streams environment. You can grant more privileges to the grantee if necessary.

See Also:

- GRANT_REMOTE_ADMIN_ACCESS Procedure on page 161-9
- *Oracle Streams Replication Administrator's Guide* for more information about configuring an Oracle Streams administrator

GRANT_REMOTE_ADMIN_ACCESS Procedure

This procedure enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

Syntax

```
DBMS_STREAMS_AUTH.GRANT_REMOTE_ADMIN_ACCESS(
   grantee  IN  VARCHAR2);
```

Parameters

Table 161–3 GRANT_REMOTE_ADMIN_ACCESS Procedure Parameter

Parameter	Description
grantee	The user who allows remote access. The procedure adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES.

Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The Oracle Streams administrator at a downstream capture database administers the source database using this connection. You can also run the procedure at a database running an apply process so that a remote Oracle Streams administrator can set instantiation SCNs at the local database.

Note: The GRANT_ADMIN_PRIVILEGE procedure runs this procedure.

See Also: GRANT_ADMIN_PRIVILEGE Procedure on page 161-6

REVOKE_ADMIN_PRIVILEGE Procedure

This procedure either revokes Oracle Streams administrator privileges from a user directly, or generates a script that you can use to revoke these privileges.

Syntax

```
DBMS_STREAMS_AUTH.REVOKE_ADMIN_PRIVILEGE(
   grantee            IN  VARCHAR2,
   revoke_privileges  IN  BOOLEAN   DEFAULT TRUE,
   file_name          IN  VARCHAR2  DEFAULT NULL,
   directory_name     IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 161–4 REVOKE_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
grantee	The user from whom privileges are revoked
revoke_privileges	If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fail, then the procedure raises an error. A revoke statement will fail if the user is not granted the privilege that is being revoked. If FALSE, then the procedure does not revoke the privileges to the specified user directly, and does not remove the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.
file_name	The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then the procedure does not generate a file.
directory_name	The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT_ADMIN_PRIVILEGE procedure in this package.

Note: To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

See Also: GRANT_ADMIN_PRIVILEGE Procedure on page 161-6

REVOKE_REMOTE_ADMIN_ACCESS Procedure

This procedure disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link.

Note: The REVOKE_ADMIN_PRIVILEGE procedure runs this procedure.

See Also: REVOKE_ADMIN_PRIVILEGE Procedure on page 161-10

Syntax

```
DBMS_STREAMS_AUTH.REVOKE_REMOTE_ADMIN_ACCESS(
   grantee  IN  VARCHAR2);
```

Parameters

Table 161–5 REVOKE_REMOTE_ADMIN_ACCESS Procedure Parameter

Parameter	Description
grantee	The user for whom access from a remote Oracle Streams administrator is disabled. If a row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure updates the ACCESS_FROM_REMOTE column for the grantee to NO. If, after this update, both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column are NO for the grantee, then the procedure removes the grantee from the view. If no row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure does not update the view and does not raise an error.

162

DBMS_STREAMS_HANDLER_ADM

The DBMS_STREAMS_HANDLER_ADM package, one of a set of Oracle Streams packages, provides interfaces to manage statement DML handlers.

This chapter contains the following topics:

Using DBMS_STREAMS_HANDLER_ADM

This section contains topics that relate to using the `DBMS_STREAMS_HANDLER_ADM` package.

Overview

A statement DML handler runs one or more data manipulation language (DML) statements on row logical change records (row LCRs) that are dequeued by an apply process. A single statement DML handler can include multiple statements, and you control the execution order of the statements.

Statement DML handlers are similar to procedure DML handlers for apply processes. Both statement DML handlers and procedure DML handlers provide custom processing of row changes that are encapsulated in row LCRs. Statement DML handlers and procedure DML handlers both run when an apply process dequeues a row LCR. However, statement DML handlers have the following advantages over procedure DML handlers:

- Statement DML handlers typically perform better than procedure DML handlers because statement DML handlers do not require PL/SQL processing.
- The syntax for statement DML handlers is same as DML syntax. Statement DML handlers do not require PL/SQL programming. Procedure DML handlers require PL/SQL programming.
- Statement DML handlers do not require the manipulation of `ANYDATA` values to access the information in row LCRs. Typically, procedure DML handlers must manipulate `ANYDATA` values.
- A statement DML handler can coexist with an error handler for same operation on the same database object. In contrast, you cannot specify both a procedure DML handler and an error handler for the same operation on the same database object.

Note: You can specify multiple statement DML handlers for the same operation on the database object. In this case, the statement DML handlers can execute in any order, and each statement DML handler receives a copy of the original row LCR that was dequeued by the apply process.

See Also: *Oracle Streams Concepts and Administration*

Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

Views

The DBMS_STREAMS_HANDLER_ADM package uses the views listed in the *Oracle Database Reference*.

- DBA_APPLY_DML_HANDLERS
- DBA_STREAMS_STMTS
- DBA_STREAMS_STMT_HANDLERS

Operational Notes

The following sections contain operational notes about the DBMS_STREAMS_HANDLER_ADM package:

- Statement Execution Order
- Supported SQL Statements
- Supported Row LCR Column Attributes
- Supported Row LCR Attributes
- Supported Row LCR Extra Attributes
- Supported Row LCR Method

Statement Execution Order

Each statement in a statement DML handler has a unique execution sequence number. When a statement DML handler is invoked, it executes its statements in order from the statement with the lowest execution sequence number to the statement with the highest execution sequence number.

Supported SQL Statements

You can use statement DML handlers for any valid DML operation on a row logical change record (row LCR). For example, a statement DML handler can audit the DML changes made to a table.

The following SQL statements are supported in statement DML handlers:

- INSERT
- UPDATE
- DELETE
- MERGE

In addition, define variables are not supported in the SQL statements in a statement DML handler.

However, the SQL statements in a statement DML handler can include calls to member subprograms for the row LCR type (LCR$_ROW_RECORD), such as ADD_COLUMN, DELETE_COLUMN, KEEP_COLUMNS, and RENAME_COLUMN.

Note: A statement DML handler cannot modify the value of a column in a row LCR.

See Also: "LCR$_ROW_RECORD Type" on page 275-15

Supported Row LCR Column Attributes

Statements in statement DML handlers can contain the row LCR column attributes described in Table 162–1.

Table 162–1 Row LCR Column Attributes

Attribute	Description
new	Returns the new column value in a row LCR. If the new value does not exist, then this attribute returns the old value.
new_exists	Returns TRUE if a new column value exists in a row LCR. Returns FALSE is a new column value does not exist in a row LCR.
new_only	Returns the new column value in a row LCR. If the new value does not exist, then this attribute returns NULL and does not return the old column value.
old	Returns the old column value in a row LCR.
old_exists	Returns TRUE if an old column value exists in a row LCR. Returns FALSE is an old column value does not exist in a row LCR.

Specify these attributes in the following way in a statement:

```
:attribute.column_name
```

For example, to specify the new_only attribute for the salary column, enter the following in a statement:

```
:new_only.salary
```

Supported Row LCR Attributes

Statements in statement DML handlers can contain the row LCR attributes described in Table 162–2.

Table 162–2 Row LCR Attributes

Attribute	Description
command_type	Returns the type of DML statement that produced the change, either INSERT, UPDATE, or DELETE. DBMS_LOB piecewise LOB operations are not supported by statement DML handlers.
commit_scn	Returns the commit system change number (SCN) of the transaction to which the LCR belongs.
compatible	Returns the minimal database compatibility required to support the LCR.
instance_number	Returns the instance number of the database instance that made the change that is encapsulated in the LCR. Typically, the instance number is relevant in an Oracle Real Application Clusters (Oracle RAC) configuration.
object_owner	Returns the schema name that contains the table with the changed row.
object_name	Returns the name of the table that contains the changed row.
scn	Returns the SCN at the time when the change was made.
source_database_name	Returns the name of the source database where the row change occurred.
source_time	Returns the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.
tag	Returns a raw tag that can be used to track the LCR.

Table 162–2 (Cont.) Row LCR Attributes

Attribute	Description
transaction_id	Returns the identifier of the transaction in which the DML statement was run.

Specify these attributes in the following way in a statement:

```
:attribute_name
```

For example, to specify the source_database_name attribute for a row LCR, enter the following in a statement:

```
:source_database_name
```

Supported Row LCR Extra Attributes

Statements in statement DML handlers can contain the row LCR extra attributes described in Table 162–3.

Table 162–3 Row LCR Extra Attributes

Attribute	Description
row_id	Returns the rowid of the row changed in a row LCR.
serial#	Returns the serial number of the session that performed the change captured in the LCR.
session#	Returns the identifier of the session that performed the change captured in the LCR.
thread#	Returns the thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle RAC configuration.
tx_name	Returns the name of the transaction that includes the LCR.
username	Returns the name of the current user who performed the change captured in the LCR.

Specify these attributes in the following way in a statement:

```
:extra_attribute.attribute_name
```

For example, to specify the row_id extra attribute for a row LCR, enter the following in a statement:

```
:extra_attribute.row_id
```

Supported Row LCR Method

A statement in a statement DML handler can include a call to the EXECUTE member procedure for row LCRs. The EXECUTE member procedure executes the row LCR under the security domain of the current user.

A statement that runs the EXECUTE member procedure can be placed anywhere in the execution sequence order of the statement DML handler. It is not necessary to execute a row LCR unless the goal is to apply the changes in the row LCR to a table in addition to performing any other SQL statements in the statement DML handler.

When you call the EXECUTE member procedure in a statement, the conflict_ resolution parameter controls whether any conflict resolution defined for the table

using the SET_UPDATE_CONFLICT_HANDLER procedure in the DBMS_APPLY_ADM package is used to resolve conflicts resulting from the execution of the LCR:

```
:lcr.execute TRUE|FALSE
```

A TRUE argument indicates that conflict resolution is used. A FALSE argument indicates that conflict resolution is not used.

For example, to use conflict resolution, enter the following in a statement:

```
:lcr.execute TRUE
```

An error is raised if this parameter is not specified or is set to NULL.

Summary of DBMS_STREAMS_HANDLER_ADM Subprograms

Table 162–4 DBMS_STREAMS_HANDLER_ADM Package Subprograms

Subprogram	Description
ADD_STMT_TO_HANDLER Procedure on page 162-11	Adds a statement to a statement DML handler
CREATE_STMT_HANDLER Procedure on page 162-12	Creates a statement DML handler
DROP_STMT_HANDLER Procedure on page 162-13	Drops a statement DML handler
REMOVE_STMT_FROM_HANDLER Procedure on page 162-14	Removes a statement from a statement DML handler

Note: The subprograms in this package do not commit.

ADD_STMT_TO_HANDLER Procedure

This procedure adds a statement to a statement DML handler.

Syntax

```
DBMS_STREAMS_HANDLER_ADM.ADD_STMT_TO_HANDLER(
   handler_name       IN VARCHAR2,
   statement          IN CLOB,
   execution_sequence IN NUMBER  DEFAULT NULL);
```

Parameters

Table 162–5 ADD_STMT_TO_HANDLER Procedure Parameters

Parameter	Description
handler_name	The name of the statement DML handler.
statement	The text of the SQL statement to add to the statement DML handler. If NULL, then the procedure raises an error.
execution_sequence	The position of the statement in the statement DML handler at which a SQL statement is to be set to execute. Statements are executed in order from the lowest execution sequence number to the highest execution sequence number. You can specify a positive or negative integer or decimal, or you can specify 0 (zero). If you specify an execution sequence number that is used by an existing statement in the statement DML handler, then the statement in the statement parameter replaces the existing statement. If NULL, then the statement is added to the statement DML handler with an execution sequence number that is larger than the execution sequence number for any statement in the statement DML handler.

CREATE_STMT_HANDLER Procedure

This procedure creates a statement DML handler.

Syntax

```
DBMS_STREAMS_HANDLER_ADM.CREATE_STMT_HANDLER(
   handler_name IN VARCHAR2,
   comment      IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 162–6 CREATE_STMT_HANDLER Procedure Parameters

Parameter	Description
handler_name	The name of the statement DML handler.
comment	A comment for the statement DML handler. If NULL, then no comment is recorded for the statement DML handler.

DROP_STMT_HANDLER Procedure

This procedure drops a statement DML handler.

Syntax

```
DBMS_STREAMS_HANDLER_ADM.DROP_STMT_HANDLER(
   handler_name IN VARCHAR2);
```

Parameters

Table 162–7 DROP_STMT_HANDLER Procedure Parameters

Parameter	Description
handler_name	The name of the statement DML handler.

REMOVE_STMT_FROM_HANDLER Procedure

This procedure removes a statement from a statement DML handler.

Syntax

```
DBMS_STREAMS_HANDLER_ADM.REMOVE_STMT_FROM_HANDLER(
   handler_name       IN VARCHAR2,
   execution_sequence IN NUMBER  DEFAULT NULL);
```

Parameters

Table 162–8 REMOVE_STMT_FROM_HANDLER Procedure Parameters

Parameter	Description
handler_name	The name of the statement DML handler.
execution_sequence	The position of the statement to remove. You can specify a positive or negative integer or decimal, or you can specify 0 (zero). If NULL, the procedure removes the last statement in the statement DML handler. If the specified execution sequence number does not exist for the statement DML handler, then the procedure raises an error.

163

DBMS_STREAMS_MESSAGING

The DBMS_STREAMS_MESSAGING package, one of a set of Oracle Streams packages, provides interfaces to enqueue messages into and dequeue messages from a ANYDATA queue.

This chapter contains the following topics:

Using DBMS_STREAMS_MESSAGING

This section contains topics which relate to using the `DBMS_CAPTURE_ADM` package.

Overview

This package provides interfaces to enqueue messages into and dequeue messages from a ANYDATA queue.

Note: Currently, messaging clients cannot dequeue buffered messages. In addition, the DBMS_STREAMS_MESSAGING package cannot be used to enqueue messages into or dequeue messages from a buffered queue. However, you can use the DBMS_AQ package to enqueue and dequeue buffered messages.

See Also: *Oracle Database Advanced Queuing User's Guide* for more information about queues, messaging, and the DBMS_AQ package

Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

Summary of DBMS_STREAMS_MESSAGING Subprograms

Table 163–1 DBMS_STREAMS_MESSAGING Package Subprograms

Subprogram	Description
DEQUEUE Procedure on page 163-6	Uses the specified Oracle Streams messaging client to dequeue a message from the specified queue
ENQUEUE Procedure on page 163-8	The current user enqueues a message into the specified queue

Note: The subprograms in this package do not commit.

DEQUEUE Procedure

This procedure uses the specified Oracle Streams messaging client to dequeue a message from the specified queue.

This procedure is overloaded. One version of this procedure contains the `msgid OUT` parameter, and the other does not.

Syntax

```
DBMS_STREAMS_MESSAGING.DEQUEUE(
   queue_name    IN   VARCHAR2,
   streams_name  IN   VARCHAR2,
   payload       OUT  ANYDATA,
   dequeue_mode  IN   VARCHAR2        DEFAULT 'REMOVE',
   navigation    IN   VARCHAR2        DEFAULT 'NEXT MESSAGE',
   wait          IN   BINARY_INTEGER  DEFAULT FOREVER,
   msgid         OUT  RAW);

DBMS_STREAMS_MESSAGING.DEQUEUE(
   queue_name    IN   VARCHAR2,
   streams_name  IN   VARCHAR2,
   payload       OUT  ANYDATA,
   dequeue_mode  IN   VARCHAR2        DEFAULT 'REMOVE',
   navigation    IN   VARCHAR2        DEFAULT 'NEXT MESSAGE',
   wait          IN   BINARY_INTEGER  DEFAULT FOREVER);
```

Parameters

Table 163–2 DEQUEUE Procedure Parameters

Parameter	Description
`queue_name`	The name of the local queue from which messages will be dequeued, specified as `[`*`schema_name`*`.]`*`queue_name`*. The current database must contain the queue, and the queue must be a secure queue of `ANYDATA` type. For example, to specify a queue named `streams_queue` in the `strmadmin` schema, enter `strmadmin.streams_queue` for this parameter. If the schema is not specified, then the current user is the default.
`streams_name`	The name of the Oracle Streams messaging client. For example, if the user `strmadmin` is the messaging client, then specify `strmadmin`. If `NULL` and a relevant messaging client for the queue exists, then the procedure uses the relevant messaging client. If `NULL` and multiple relevant messaging clients for the queue exist, then the procedure raises an error.
`payload`	The payload that is dequeued
`dequeue_mode`	Specify one of the following settings: `REMOVE`: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties. `LOCKED`: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement. `BROWSE`: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement.

Table 163–2 (Cont.) DEQUEUE Procedure Parameters

Parameter	Description
navigation	The position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Specify one of the following settings: NEXT MESSAGE: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then retrieve the next available message that matches the search criteria and belongs to the message group. This setting is the default. NEXT TRANSACTION: Skip the remainder of the current message group (if any) and retrieve the first message of the next message group. This setting can only be used if message grouping is enabled for the current queue. FIRST MESSAGE: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue. **Note:** Each message group contains the messages in a single transaction. **See Also:** *Oracle Database Advanced Queuing User's Guide* for more information about dequeue options
wait	Either FOREVER or NO_WAIT If FOREVER, then the dequeue call is blocked without a time out until a message is available in the queue. If NO_WAIT, then a wait time of zero seconds is used. In this case, the dequeue will return immediately even if there are no messages in the queue.
msgid	The message identifier of the message that is dequeued

Exceptions

Table 163–3 DEQUEUE Procedure Exceptions

Exception	Description
ENDOFCURTRANS	Dequeue has reached the end of the messages in the current transaction. Specify this exception in the following way: SYS.DBMS_STREAMS_MESSAGING.ENDOFCURTRANS Every dequeue procedure should include an exception handler that handles this exception.
NOMOREMSGS	There are no more messages in the queue for the dequeue operation. Specify this exception in the following way: SYS.DBMS_STREAMS_MESSAGING.NOMOREMSGS A dequeue procedure that specifies NO_WAIT for the wait parameter should include an exception handler that handles this exception.

ENQUEUE Procedure

This procedure enables the current user to enqueue a message into the specified queue.

This procedure is overloaded. One version of this procedure contains the `msgid OUT` parameter, and the other does not.

Syntax

```
DBMS_STREAMS_MESSAGING.ENQUEUE(
   queue_name  IN   VARCHAR2,
   payload     IN   ANYDATA,
   msgid       OUT  RAW);

DBMS_STREAMS_MESSAGING.ENQUEUE(
   queue_name  IN   VARCHAR2,
   payload     IN   ANYDATA);
```

Parameters

Table 163–4 ENQUEUE Procedure Parameters

Parameter	Description
`queue_name`	The name of the local queue into which messages will be enqueued, specified as `[`*`schema_name`*`.]`*`queue_name`*. The current database must contain the queue, and the queue must be a secure queue of `ANYDATA` type. For example, to specify a queue named `streams_queue` in the `strmadmin` schema, enter `strmadmin.streams_queue` for this parameter. If the schema is not specified, then the current user is the default.
`payload`	The payload that is enqueued
`msgid`	The message identifier of the message that is enqueued

Usage Notes

To successfully enqueue messages into a queue, the current user must be mapped to a unique Advanced Queuing agent with the same name as the current user. You can run the `DBMS_STREAMS_ADM.SET_UP_QUEUE` procedure and specify a user as the queue user to grant the necessary privileges to the user to perform enqueues. The Advanced Queuing agent is created automatically when you run `SET_UP_QUEUE` and specify a queue user.

See Also: SET_UP_QUEUE Procedure on page 159-171

164

DBMS_STREAMS_TABLESPACE_ADM

The DBMS_STREAMS_TABLESPACE_ADM package, one of a set of Oracle Streams packages, provides administrative interfaces for copying tablespaces between databases and moving tablespaces from one database to another. This package uses transportable tablespaces, Data Pump, the DBMS_FILE_TRANSFER package, and the DBMS_FILE_GROUP package.

This chapter contains the following topics:

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and Oracle Streams

Using DBMS_STREAMS_TABLESPACE_ADM

This section contains topics which relate to using the `DBMS_STREAMS_TABLESPACE_ADM` package.

Overview

Either a simple tablespace or a self-contained tablespace set must be specified in each procedure in this package.

A **self-contained tablespace** has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. A **simple tablespace** is a self-contained tablespace that uses only one datafile.

A simple tablespace must be specified in the following procedures:

- ATTACH_SIMPLE_TABLESPACE Procedure
- CLONE_SIMPLE_TABLESPACE Procedure
- DETACH_SIMPLE_TABLESPACE Procedure
- PULL_SIMPLE_TABLESPACE Procedure

A **self-contained tablespace set** has no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

A self-contained tablespace set must be specified in the following procedures:

- ATTACH_TABLESPACES Procedure
- CLONE_TABLESPACES Procedure
- DETACH_TABLESPACES Procedure
- PULL_TABLESPACES Procedure

To determine whether a set of tablespaces is self-contained, use the `TRANSPORT_SET_CHECK` procedure in the Oracle supplied package `DBMS_TTS`.

> **See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespaces and tablespace sets

Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

Data Structures

The DBMS_STREAMS_TABLESPACE_ADM package defines RECORD types and TABLE types.

RECORD Types

- FILE Record Type

TABLE Types

- DIRECTORY_OBJECT_SET Table Type
- FILE_SET Table Type
- TABLESPACE_SET Table Type

DIRECTORY_OBJECT_SET Table Type

Contains the names of one or more directory objects. Each name must be a directory object created using the SQL statement `CREATE DIRECTORY`.

Syntax

```
TYPE DIRECTORY_OBJECT_SET IS TABLE OF VARCHAR2(32)
  INDEX BY BINARY_INTEGER;
```

FILE Record Type

Contains the directory object associated with a directory and the name of the file in the directory.

Syntax

```
TYPE FILE IS RECORD(
   directory_object VARCHAR2(32),
   file_name        VARCHAR2(4000));
```

Fields

Table 164–1 FILE Fields

Field	Description
`directory_object`	The name of a directory object. You must specify the name of a directory object created using the SQL statement `CREATE DIRECTORY`.
`file_name`	The name of the file in the corresponding directory associated with the directory object

FILE_SET Table Type

Contains one or more files.

Syntax

```
TYPE FILE_SET IS TABLE OF FILE
   INDEX BY BINARY_INTEGER;
```

TABLESPACE_SET Table Type

Contains the names of one or more tablespaces.

Syntax

```
TYPE TABLESPACE_SET IS TABLE OF VARCHAR2(32)
   INDEX BY BINARY_INTEGER;
```

Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms

Table 164–2 DBMS_STREAMS_TABLESPACE_ADM Package Subprograms

Subprogram	Description
ATTACH_SIMPLE_TABLESPACE Procedure on page 164-11	Uses Data Pump to import a simple tablespace previously exported using the DBMS_STREAMS_TABLESPACE_ADM package or Data Pump export
ATTACH_TABLESPACES Procedure on page 164-13	Uses Data Pump to import a self-contained tablespace set previously exported using the DBMS_STREAMS_TABLESPACE_ADM package, Data Pump export, or the Recovery Manager (RMAN) TRANSPORT TABLESPACE command
CLONE_SIMPLE_TABLESPACE Procedure on page 164-18	Clones a simple tablespace. The tablespace can later be attached to a database.
CLONE_TABLESPACES Procedure on page 164-20	Clones a set of self-contained tablespaces. The tablespaces can later be attached to a database.
DETACH_SIMPLE_TABLESPACE Procedure on page 164-24	Detaches a simple tablespace. The tablespace can later be attached to a database.
DETACH_TABLESPACES Procedure on page 164-26	Detaches a set of self-contained tablespaces. The tablespaces can later be attached to a database.
PULL_SIMPLE_TABLESPACE Procedure on page 164-30	Copies a simple tablespace from a remote database and attaches it to the current database
PULL_TABLESPACES Procedure on page 164-32	Copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database

Note: All subprograms commit unless specified otherwise.

ATTACH_SIMPLE_TABLESPACE Procedure

This procedure uses Data Pump to import a simple tablespace previously exported using the DBMS_STREAMS_TABLESPACE_ADM package, Data Pump export, or the Recovery Manager (RMAN) TRANSPORT TABLESPACE command.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_SIMPLE_TABLESPACE(
   directory_object      IN  VARCHAR2,
   tablespace_file_name  IN  VARCHAR2,
   converted_file_name   IN  VARCHAR2  DEFAULT NULL,
   datafile_platform     IN  VARCHAR2  DEFAULT NULL,
   tablespace_name       OUT VARCHAR2);
```

Parameters

Table 164–3 ATTACH_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
directory_object	The directory that contains the Data Pump dump file and the datafile for the tablespace. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY. The name of the Data Pump export dump file must be the same as the data file name for the tablespace, except with a .dmp extension. If the converted_file_name is non-NULL, specify the dump file produced by the export database, not the file name after conversion. The Data Pump import log file is written to this directory. The name of the log file is the same as the data file name for the tablespace, except with an .alg extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file. If NULL, then the procedure raises an error.
tablespace_file_name	The name of the datafile for the tablespace being imported. If NULL, then the procedure raises an error.
converted_file_name	If the datafile_platform parameter is non-NULL and is different from the platform of the local import database, then specify a file name for the converted datafile. The datafile is converted to the platform of the local import database and copied to the new file name. The existing datafile is not modified nor deleted. If non-NULL and the datafile_platform parameter is NULL, then the procedure ignores this parameter. If non-NULL and the datafile_platform parameter specifies the same platform as the local import database, then the procedure ignores this parameter. If NULL and the datafile_platform parameter is non-NULL, then the procedure raises an error.

Table 164–3 (Cont.) ATTACH_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
datafile_platform	Specify NULL if the platform is the same for the export database and the current import database. Specify the platform for the export database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.
tablespace_name	Contains the name of the attached tablespace. The attached tablespace is read-only. Use an ALTER TABLESPACE statement to make the tablespace read/write if necessary.

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have IMP_FULL_DATABASE role
- Have READ and WRITE privilege on the directory object that contains the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the directory_object parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.

See Also: Overview on page 164-3

ATTACH_TABLESPACES Procedure

This procedure uses Data Pump to import a self-contained tablespace set previously exported using the DBMS_STREAMS_TABLESPACE_ADM package, Data Pump export, or the Recovery Manager (RMAN) TRANSPORT TABLESPACE command.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the datapump_job_name parameter. This job performs the Data Pump import to complete the attach operation. In addition, if the platform at the export database is different than the local database platform, then this procedure optionally can create datafiles for the tablespace set that can be used with the local platform.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump import is performed. This version of the procedure uses the files in a file group version and can copy the export dump file, export log file, and the datafiles that comprise the tablespace set into the specified directories. The file group and version are specified using the file_group_name and version_name parameters, respectively. This version of the procedure does not require a datafiles platform specification if the platform at the export database is different than the local database platform. Instead, the tablespace set is migrated automatically to the correct platform when it is attached.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES(
   datapump_job_name          IN OUT VARCHAR2,
   dump_file                  IN     FILE,
   tablespace_files           IN     FILE_SET,
   converted_files            IN     FILE_SET,
   datafiles_platform         IN     VARCHAR2  DEFAULT NULL,
   log_file                   IN     FILE      DEFAULT NULL,
   tablespace_names           OUT    TABLESPACE_SET);

DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES(
   file_group_name            IN   VARCHAR2,
   version_name               IN   VARCHAR2  DEFAULT NULL,
   datafiles_directory_object IN   VARCHAR2  DEFAULT NULL,
   logfile_directory_object   IN   VARCHAR2  DEFAULT NULL,
   repository_db_link         IN   VARCHAR2  DEFAULT NULL,
   tablespace_names           OUT  TABLESPACE_SET);
```

Parameters

Table 164–4 ATTACH_TABLESPACES Procedure Parameters

Parameter	Description
data_pump_job_name	The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily. If NULL, then the system generates a Data Pump job name.

Table 164–4 (Cont.) ATTACH_TABLESPACES Procedure Parameters

Parameter	Description
dump_file	The file name of the Data Pump dump file to import. If NULL or if a file attribute is NULL, then the procedure raises an error.
tablespace_files	The file set that contains the datafiles for the tablespace set being imported. If NULL, then the procedure raises an error.
converted_files	If the datafiles_platform parameter is non-NULL and is different from the platform for the local import database, then specify a file set with the names of the converted datafiles. The datafiles are converted to the platform of the local import database and copied to the new file names. In this case, the number of files in the specified file set must match the number of files in the file set specified for the tablespace_files parameter. The existing datafiles are not modified nor deleted. If non-NULL and the datafiles_platform parameter is NULL, then the procedure ignores this parameter. If non-NULL and the datafiles_platform parameter specifies the same platform as the local import database, then the procedure ignores this parameter. If NULL and the datafiles_platform parameter is non-NULL, then the procedure raises an error.
datafiles_platform	Specify NULL if the platform is the same for the export database and the current import database. Specify the platform for the export database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.
log_file	Specify the log file name for the Data Pump import. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .alg and places it in the Data Pump export dump file directory. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.
file_group_name	The name of the file group, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default.
version_name	The name of the file group version to attach. If NULL, then the procedure uses the version with the latest creation time for the file group.

Table 164–4 (Cont.) ATTACH_TABLESPACES Procedure Parameters

Parameter	Description
datafiles_directory_object	The directory object into which the datafiles and Data Pump export dump file are copied. The files are copied from the tablespace repository directories to this directory. If non-NULL, the attached tablespaces use the files in specified directory. However, the file group version specified in the version_name parameter consists of the files in the original directory, not in the directory specified by this datafiles_directory_object parameter. If NULL, then the procedure does not copy the datafiles and dump file.
logfile_directory_object	The directory object into which the Data Pump import log file is placed. The system generates a log file name with the extension .alg. If NULL, then the procedure places the import log file in the same directory as the dump file.
repository_db_link	If the file group is in a different database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure. If this parameter is non-NULL, then meet the following requirements: ▪ Each directory object that contains files in the version being attached must exist on both databases. ▪ The corresponding directory objects must have the same names on both databases. If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.
tablespace_names	Contains the names of the attached tablespaces. The attached tablespaces are read-only. Use ALTER TABLESPACE statements to make the tablespaces read/write if necessary.

Usage Notes

The following sections contain usage notes for this procedure:

- User Requirements
- Procedures Used to Clone or Detach a Tablespace Set
- When the Attach Database Is Different Than the Clone or Detach Database
- Automatic Storage Management Directories

See Also:

- Overview on page 164-3
- *Oracle Streams Concepts and Administration*

User Requirements

To run either version of this procedure, a user must meet the following requirements:

- Have IMP_FULL_DATABASE role

- Have READ and WRITE privilege on the directory objects that contain the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the dump_file and tablespace_files parameters, or by the datafiles_directory_object parameter
- Have WRITE privilege on the directory object that will hold the Data Pump import log file, specified by the log_file parameter or logfile_directory_object parameter if it is non-NULL

If the Data Pump job version of the procedure is run, then the user must have WRITE privilege on the directory objects that will hold the converted datafiles for the tablespaces in the set if platform conversion is necessary. These directory objects are specified by the converted_files parameter if it is non-NULL.

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Procedures Used to Clone or Detach a Tablespace Set

After a tablespace set is cloned or detached using the CLONE_TABLESPACES or DETACH_TABLESPACES procedure, respectively, the tablespace set can be attached to a database using the ATTACH_TABLESPACES procedure. If the Data Pump job version of the CLONE_TABLESPACES or DETACH_TABLESPACES procedure was used, then use the Data Pump job version of the ATTACH_TABLESPACES procedure. If the file group version of the CLONE_TABLESPACES or DETACH_TABLESPACES procedure was used, then use the file group version of the ATTACH_TABLESPACES procedure.

See Also:

- CLONE_TABLESPACES Procedure on page 164-20
- DETACH_TABLESPACES Procedure on page 164-26

When the Attach Database Is Different Than the Clone or Detach Database

You can attach a tablespace set to a different database than the database from which the tablespace set was cloned or detached. The two databases might or might not share a file system. If the two databases do not share a file system, then you must transfer the dump file and datafiles to the remote system using the DBMS_FILE_TRANSFER package, FTP, or some other method. You can attach the tablespace set in one of the following ways depending on the version of the ATTACH_TABLESPACES procedure you use:

- If you use the Data Pump job version of the procedure, then specify the relevant files on the file system. The directory object names can be different in the databases.
- If you use the file group version of the procedure, then you can use the repository_db_link parameter to specify the database where tablespace repository resides. The directory objects for the files must exist and must match in the databases.

- CLONE_TABLESPACES Procedure on page 164-20
- DETACH_TABLESPACES Procedure on page 164-26
- Chapter 68, "DBMS_FILE_GROUP" for more information about file groups

Automatic Storage Management Directories

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

> **See Also:** *Oracle Database Utilities* for information about specifying ASM directories for directory objects

CLONE_SIMPLE_TABLESPACE Procedure

This procedure clones a simple tablespace. The specified tablespace must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the specified directory
3. Places the datafile for the specified tablespace in the specified directory
4. If this procedure made the tablespace read-only, then makes the tablespace read/write

In addition, this procedure optionally can create a datafile for the tablespace that can be used with a platform that is different than the local database platform.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.CLONE_SIMPLE_TABLESPACE(
   tablespace_name      IN  VARCHAR2,
   directory_object     IN  VARCHAR2,
   destination_platform IN  VARCHAR2  DEFAULT NULL,
   tablespace_file_name OUT VARCHAR2);
```

Parameters

Table 164–5 CLONE_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
tablespace_name	The tablespace to be cloned. If NULL, then the procedure raises an error.
directory_object	The directory where the Data Pump export dump file, the Data Pump export log file, and the datafile for the tablespace are placed. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY. The name of the Data Pump export dump file is the same as the data file name for the tablespace, except with a .dmp extension. If a file exists with the same name as the dump file in the directory, then the procedure raises an error. The name of the log file is the same as the data file name for the tablespace, except with a .clg extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file. If NULL, then the procedure raises an error.
destination_platform	Specify NULL if the platform is the same for the current export database and the intended import database. Specify the platform for the intended import database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.

Table 164–5 (Cont.) CLONE_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
tablespace_file_name	Contains the name of the cloned tablespace datafile. This datafile is placed in the directory specified by the parameter directory_object.

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the tablespace_name parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.
- Have READ and WRITE privilege on the directory object that will contain the Data Pump export dump file, specified by the directory_object parameter
- If the file group version of the procedure is run, then the user must have the necessary privileges to manage file group.

After cloning a tablespace using this procedure, you can add the tablespace to a different database using the ATTACH_SIMPLE_TABLESPACE procedure. If the database is a remote database and you want to use the ATTACH_SIMPLE_TABLESPACE procedure, then you can transfer the dump file and datafile to the remote system using the DBMS_FILE_TRANSFER package, FTP, or some other method.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

See Also:

- Overview on page 164-3
- ATTACH_SIMPLE_TABLESPACE Procedure on page 164-11 and PULL_SIMPLE_TABLESPACE Procedure on page 164-30

CLONE_TABLESPACES Procedure

This procedure clones a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set and places the dump file in the specified directory
3. Places the datafiles that comprise the specified tablespace set in the specified directory
4. If this procedure made a tablespace read-only, then makes the tablespace read/write

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump export. This version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the specified directories, but the files are not added to a file group version. In addition, this version of the procedure optionally can create datafiles for the tablespace set that can be used with a platform that is different than the local database platform.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the appropriate file group version. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. This version of the procedure does not require a destination platform specification if the destination platform is different. Instead, the tablespace set is migrated automatically to the correct platform when it is attached at the destination database using the file group version of the `ATTACH_TABLESPACES` procedure.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES(
   datapump_job_name            IN OUT VARCHAR2,
   tablespace_names             IN     TABLESPACE_SET,
   dump_file                    IN     FILE,
   tablespace_directory_objects IN     DIRECTORY_OBJECT_SET,
   destination_platform         IN     VARCHAR2  DEFAULT NULL,
   log_file                     IN     FILE      DEFAULT NULL,
   tablespace_files             OUT    FILE_SET);

DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES(
   tablespace_names             IN  TABLESPACE_SET,
   tablespace_directory_object  IN  VARCHAR2  DEFAULT NULL,
   log_file_directory_object    IN  VARCHAR2  DEFAULT NULL,
   file_group_name              IN  VARCHAR2,
   version_name                 IN  VARCHAR2  DEFAULT NULL,
   repository_db_link           IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 164–6 CLONE_TABLESPACES Procedure Parameters

Parameter	Description
data_pump_job_name	The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily. If NULL, then the system generates a Data Pump job name.
tablespace_names	The tablespace set to be cloned. If NULL, then the procedure raises an error.
dump_file	The file name of the Data Pump dump file that is exported. If NULL or if a file attribute is NULL, then the procedure raises an error. If the specified file exists, then the procedure raises an error.
tablespace_directory_objects	The set of directory objects into which the datafiles for the tablespaces are copied. If multiple directory objects are in the set, then the procedure copies a datafile to each directory object in the set in sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set. If NULL, then the procedure copies datafiles for the tablespace set to the dump file directory.
destination_platform	Specify NULL if the platform is the same for the current export database and the intended import database. Specify the platform for the intended import database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.
log_file	Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .clg and places it in the dump file directory. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.

Table 164–6 (Cont.) CLONE_TABLESPACES Procedure Parameters

Parameter	Description
tablespace_directory_object	The directory object into which the data files are copied and Data Pump export dump file is placed. The system generates a dump file name with the extension .dmp. If NULL, then the procedure copies the datafiles to and places the dump file in the default directory object for the version. If the version does not have a default directory object, then the procedure uses the default directory object for the file group. If NULL and no default directory object exists for the version or file group, then the procedure raises an error.
log_file_directory_object	The directory object into which the Data Pump export log file is placed. The system generates a log file name with the extension .clg. If NULL, then the procedure uses the directory object specified in tablespace_directory_object.
file_group_name	The name of the file group, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default. If the specified file group does not exist, then the procedure creates it.
version_name	The name of the version into which the cloned tablespace set is placed. The specified version name cannot be a positive integer. If the specified version does not exist, then the procedure creates it. If the specified version exists, then the procedure adds the tablespace set to the version. Only one Data Pump export dump file can exist in a version. If NULL, then the procedure creates a new version, and the version number can be used to manage the version.
repository_db_link	If the file group is in a remote database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure. If this parameter is non-NULL, then the directory object specified in tablespace_directory_object must exist on the local database and on the remote database. If tablespace_directory_object is NULL, then the default directory object must exist on both databases. The directory object must have the same name on each database and must correspond to the same directory on a shared file system. If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.
tablespace_files	Contains the datafiles for the cloned tablespace set. These datafiles are placed in the directories specified by the directory objects in the parameter tablespace_directory_objects.

Usage Notes

To run either version of this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the tablespace_names parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have READ and WRITE privilege on the directory object that will contain the Data Pump export dump file, specified by the dump_file parameter or the tablespace_directory_object parameter
- Have WRITE privilege on the directory objects that will contain the copied datafiles for the tablespaces in the set, specified by the tablespace_directory_objects parameter if non-NULL or the tablespace_directory_object parameter
- Have WRITE privilege on the directory object that will contain the Data Pump export log file, specified by the log_file parameter if non-NULL or the log_file_directory_object parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After cloning a tablespace set using this procedure, you can attach the tablespaces to a different database using the ATTACH_TABLESPACES procedure.

See Also:

- Overview on page 164-3
- ATTACH_TABLESPACES Procedure on page 164-13
- Chapter 68, "DBMS_FILE_GROUP" for more information about file groups
- *Oracle Streams Concepts and Administration*

DETACH_SIMPLE_TABLESPACE Procedure

This procedure detaches a simple tablespace. The specified tablespace must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the directory that contains the tablespace datafile
3. Drops the tablespace and its contents from the database

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.DETACH_SIMPLE_TABLESPACE(
   tablespace_name       IN  VARCHAR2,
   directory_object      OUT VARCHAR2,
   tablespace_file_name  OUT VARCHAR2);
```

Parameters

Table 164–7 DETACH_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
data_pump_job_name	The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily. If NULL, then the system generates a Data Pump job name.
directory_object	Contains the directory where the Data Pump export dump file and the Data Pump export log file are placed. The procedure uses the directory of the datafile for the tablespace. Therefore, make sure a directory object created using the SQL statement CREATE DIRECTORY exists for this directory. The name of the Data Pump export dump file is the same as the data file name for the tablespace, except with a .dmp extension. If a file exists with the same name as the dump file in the directory, then the procedure raises an error. The name of the log file is the same as the data file name for the tablespace, except with a .dlg extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.
tablespace_file_name	Contains the name of the detached tablespace datafile.

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have DROP TABLESPACE privilege
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only
- Have READ and WRITE privilege on the directory object for the directory that contains the tablespace datafile. The name of this tablespace is specified by the tablespace_name parameter. If a directory object does not exist for this directory,

then create the directory object and grant the necessary privileges before you run this procedure. This directory also will contain the Data Pump export dump file generated by this procedure.

After detaching a tablespace using this procedure, you can add the tablespace to a different database using the ATTACH_SIMPLE_TABLESPACE procedure. If the database is a remote database and you want to use the ATTACH_SIMPLE_TABLESPACE procedure, then you can transfer the dump file and datafile to the remote system using the DBMS_FILE_TRANSFER package, FTP, or some other method. You can use the two OUT parameters in this procedure to accomplish the attach or pull operation.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

Note: Do not use the DETACH_SIMPLE_TABLESPACE procedure on a tablespace if the tablespace is using the Oracle-managed files feature. If you do, then the datafile for the tablespace is dropped automatically when the tablespace is dropped.

See Also:

- Overview on page 164-3
- ATTACH_SIMPLE_TABLESPACE Procedure on page 164-11 and PULL_SIMPLE_TABLESPACE Procedure on page 164-30
- *Oracle Database Administrator's Guide* for more information about the Oracle-managed files feature

DETACH_TABLESPACES Procedure

This procedure detaches a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online and any table partitions must not span tablespaces in the tablespace set.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespace set and places the dump file in the specified directory
3. Drops the tablespaces in the specified tablespace set and their contents from the database

This procedure does not move or copy the datafiles that comprise the specified tablespace set.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump export. This version of the procedure completes the detach operation by placing the export dump file and export log file in the specified directories, but the files are not added to a file group version.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the detach operation by placing the export dump file and export log file in the appropriate file group version. The datafiles that comprise the tablespace set are not moved or copied, but they are referenced in the version that is detached. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. Also, if the destination platform is different, then the tablespace set is migrated automatically to the correct platform when it is attached at the destination database using the file group version of the `ATTACH_TABLESPACES` procedure.

> **Note:** Do not use the `DETACH_TABLESPACES` procedure if any of the tablespaces in the tablespace set are using the Oracle-managed files feature. If you do, then the datafiles for these tablespaces are dropped automatically when the tablespaces are dropped.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES(
   datapump_job_name         IN OUT VARCHAR2,
   tablespace_names          IN     TABLESPACE_SET,
   dump_file                 IN     FILE,
   log_file                  IN     FILE  DEFAULT NULL,
   tablespace_files          OUT    FILE_SET);

DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES(
   tablespace_names          IN TABLESPACE_SET,
   export_directory_object   IN VARCHAR2  DEFAULT NULL,
   log_file_directory_object IN VARCHAR2  DEFAULT NULL,
   file_group_name           IN VARCHAR2,
```

```
   version_name              IN VARCHAR2  DEFAULT NULL,
   repository_db_link        IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 164–8 DETACH_TABLESPACES Procedure Parameters

Parameter	Description
data_pump_job_name	The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily. If NULL, then the system generates a Data Pump job name.
tablespace_names	The tablespace set to be detached. If NULL, then the procedure raises an error.
dump_file	The file name of the Data Pump dump file that is exported. If NULL or if a file attribute is NULL, then the procedure raises an error. If the specified file exists, then the procedure raises an error.
log_file	Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .dlg and places it in the dump file directory. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.
tablespace_files	Contains the names of the datafiles for the detached tablespace set.
export_directory_object	The directory object into which the Data Pump export dump file is placed. The system generates a dump file name with the extension .dmp. If NULL, then procedure places the dump file in the default directory object for the version. If the version does not have a default directory object, then the procedure uses the default directory object for the file group. If NULL and no default directory object exists for the version or file group, then the procedure raises an error.
log_file_directory_object	The directory object into which the Data Pump export log file is placed. The system generates a log file name with the extension .dlg. If NULL, then the procedure places the export log file in the same directory as the export dump file.
file_group_name	The name of the file group, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default. If the specified file group does not exist, then the procedure creates it.

Table 164–8 (Cont.) DETACH_TABLESPACES Procedure Parameters

Parameter	Description
version_name	The name of the version into which the detached tablespace set is placed. The specified version name cannot be a positive integer. If the specified version does not exist, then the procedure creates it. If the specified version exists, then procedure adds the tablespace set to the version. Only one Data Pump export dump file can exist in a version. If NULL, then the procedure creates a new version, and the version number can be used to manage the version.
repository_db_link	If the file group is in a remote database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure. If this parameter is non-NULL, then the directory object specified in export_directory_object must exist on the local database and on the remote database. If export_directory_object is NULL, then the default directory object must exist on both databases. The directory object must have the same name on each database and must correspond to the same directory on a shared file system. If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.

Usage Notes

To run this either version of this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have DROP TABLESPACE privilege
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the tablespace_names parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have READ and WRITE privilege on the directory object that will contain the Data Pump export dump file, specified by the dump_file parameter or the export_directory_object parameter
- Have WRITE privilege on the directory object that will contain the Data Pump export the log file, specified by the log_file parameter if non-NULL or by the log_file_directory_object parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After detaching a tablespace set using this procedure, you can attach the tablespaces to a different database using the `ATTACH_TABLESPACES` procedure.

PULL_SIMPLE_TABLESPACE Procedure

This procedure copies a simple tablespace from a remote database and attaches it to the current database. The specified tablespace at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only at the remote database if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace
3. Uses a database link and the `DBMS_FILE_TRANSFER` package to transfer the datafile for the tablespace and the log file for the Data Pump export to the current database
4. Places the datafile for the specified tablespace and the log file for the Data Pump export in the specified directory at the local database
5. If this procedure made the tablespace read-only, then makes the tablespace read/write
6. Uses Data Pump to import the metadata for the tablespace in the local database

In addition, this procedure optionally can create a datafile for the tablespace that can be used with the local platform, if the platform at the remote database is different than the local database platform.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.PULL_SIMPLE_TABLESPACE(
   tablespace_name          IN VARCHAR2,
   database_link            IN VARCHAR2,
   directory_object         IN VARCHAR2  DEFAULT NULL,
   conversion_extension     IN VARCHAR2  DEFAULT NULL,
   convert_directory_object IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 164–9 PULL_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
`tablespace_name`	The tablespace to be pulled. If `NULL`, then the procedure raises an error.
`database_link`	The name of the database link to the database that contains the tablespace to pull. The database link must be accessible to the user who runs the procedure. If `NULL`, then the procedure raises an error.
`directory_object`	The directory object to which the datafile for the tablespace is copied on the local database. You must specify the name of a directory object created using the SQL statement `CREATE DIRECTORY`. The Data Pump import log file is written to this directory. The name of the log file is the same as the data file name for the tablespace, except with a `.plg` extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file. If `NULL`, then the procedure raises an error.

Table 164–9 (Cont.) PULL_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
conversion_extension	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify an extension for the tablespace datafile that is different than the extension for the tablespace datafile at the remote database. In this case, the procedure transfers the datafile to the import database and converts it to be compatible with the current import database platform automatically. After conversion is complete, the original datafile is deleted at the import database.
convert_directory_object	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify a directory object in the local export database. The procedure uses the directory object for platform conversion before it transfers the files to the remote database. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.

Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- Have the EXP_FULL_DATABASE role
- Have EXECUTE privilege on the DBMS_STREAMS_TABLESPACE_ADM package
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have MANAGE TABLESPACE or ALTER TABLESPACE privilege on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the tablespace_name parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local database:

- Have the roles IMP_FULL_DATABASE and EXECUTE_CATALOG_ROLE
- Have WRITE privilege on the directory object that will contain the Data Pump export the log file, specified by the log_file parameter if non-NULL
- Have WRITE privilege on the directory object that will hold the datafile for the tablespace, specified by the directory_object parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.

See Also: Overview on page 164-3

PULL_TABLESPACES Procedure

This procedure copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database. All of the tablespaces in the specified tablespace set at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set at the remote database read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set
3. Uses a database link and the `DBMS_FILE_TRANSFER` package to transfer the datafiles for the tablespace set and the log file for the Data Pump export to the current database
4. Places the datafiles that comprise the specified tablespace set in the specified directories at the local database
5. Places the log file for the Data Pump export in the specified directory at the local database
6. If this procedure made a tablespace read-only, then makes the tablespace read/write
7. Uses Data Pump to import the metadata for the tablespaces in the tablespace set at the local database

In addition, this procedure optionally can create datafiles for the tablespace set that can be used with the local platform, if the platform at the remote database is different than the local database platform.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.PULL_TABLESPACES(
   datapump_job_name            IN OUT VARCHAR2,
   database_link                IN     VARCHAR2,
   tablespace_names             IN     TABLESPACE_SET,
   tablespace_directory_objects IN     DIRECTORY_OBJECT_SET,
   log_file                     IN     FILE,
   conversion_extension         IN     VARCHAR2  DEFAULT NULL,
   convert_directory_object     IN     VARCHAR2  DEFAULT NULL);
```

Parameters

Table 164–10 PULL_TABLESPACES Procedure Parameters

Parameter	Description
`data_pump_job_name`	The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily. If `NULL`, then the system generates a Data Pump job name.
`database_link`	The name of the database link to the database that contains the tablespace set to pull. The database link must be accessible to the user who runs the procedure. If `NULL`, then the procedure raises an error.

Table 164–10 (Cont.) PULL_TABLESPACES Procedure Parameters

Parameter	Description
tablespace_names	The tablespace set to be pulled. If NULL, then the procedure raises an error.
tablespace_directory_objects	The set of directory objects to which the datafiles for the tablespaces are copied. If multiple directory objects are in the set, then the procedure copies a datafile to each directory object in the set in sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set. If NULL, then the procedure raises an error.
log_file	Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .plg and places it in one of the data file directories. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.
conversion_extension	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify an extension for the tablespace datafiles that is different than the extension for the tablespace datafiles at the remote database. In this case, the procedure transfers the datafiles to the import database and converts them to be compatible with the current import database platform automatically. After conversion is complete, the original datafiles are deleted at the import database.
convert_directory_object	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify a directory object in the local export database. The procedure uses the directory object for platform conversion before it transfers the files to the remote database. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.

Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- Have the EXP_FULL_DATABASE role
- Have EXECUTE privilege on the DBMS_STREAMS_TABLESPACE_ADM package
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have MANAGE TABLESPACE or ALTER TABLESPACE privilege on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the tablespace_names parameter. If a directory object does not exist for one or more of

these directories, then create the directory objects and grant the necessary privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local database:

- Have the roles `IMP_FULL_DATABASE` and `EXECUTE_CATALOG_ROLE`
- Have `WRITE` privilege on the directory object that will contain the Data Pump export the log file, specified by the `log_file` parameter if non-`NULL`
- Have `WRITE` privilege on the directory objects that will hold the datafiles for the tablespaces in the set, specified by the `tablespace_directory_objects` parameter

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

DBMS_SYNC_REFRESH

The DBMS_SYNC_REFRESH package provides an interface to perform a synchronous refresh of materialized views.

> **See Also:** *Oracle Database Data Warehousing Guide* for more information on using DBMS_SYNC_REFRESH

This chapter contains the following topics:

Using DBMS_SYNC_REFRESH

Overview

Synchronous refresh is a refresh method introduced in Oracle Database Release 12*c*, which enables you to keep a set of tables and the materialized views defined on them to be always in sync.

> **See Also:** *Oracle Database Data Warehousing Guide* for more information about using synchronous refresh

Security Model

The execute privilege for this package is granted to PUBLIC, so all users can execute the procedures in this package to perform synchronous refresh on objects owned by them. The database administrator can perform synchronous refresh operations on all tables and materialized views in the database.

In general, if a user without the DBA privilege wants to use synchronous refresh on another user's table, he must complete privileges to read from and write to that table, that it, the user must have the SELECT or READ, INSERT, UPDATE, and DELETE privileges on that table or materialized view. A couple of exceptions are:

- PURGE_REFRESH_STATS and ALTER_REFRESH_STATS_RETENTION Functions

  These two functions implement the purge policy and can be used to change the default retention period. These functions can be only be executed by the database administrator.

- The CAN_SYNCREF_TABLE Function

  This is an advisory function which examines the eligibility for sync refresh of all the materialized views associated with a specified table. Hence, this function requires the SELECT or READ privilege on all materialized views associated with the specified table.

Summary of DBMS_SYNC_REFRESH Subprograms

Table 165–1 DBMS_SYNC_REFRESH Package Subprograms

Subprogram	Description
ABORT_REFRESH Procedure on page 165-6	Aborts a refresh.
ALTER_REFRESH_STATS_RETENTION Procedure on page 165-7	Alters the refresh history retention value, specified in days.
CAN_SYNCREF_TABLE Procedure on page 165-8	Advises on whether a table and its dependent materialized views are eligible for synchronous refresh.
EXECUTE_REFRESH Procedure on page 165-10	Executes synchronous refresh on the synchronous refresh groups.
GET_ALL_GROUP_IDS Function on page 165-10	Returns the group IDs of all the synchronous refresh groups in the database.
GET_GROUP_ID Function on page 165-12	Returns the group ID of a table or materialized view.
GET_GROUP_ID_LIST Function on page 165-12	Returns the group IDs of the tables in a given list of objects (tables or materialized views).
PREPARE_REFRESH Procedure on page 165-14	Prepares the sync refresh groups for refresh.
PREPARE_STAGING_LOG Procedure on page 165-16	Validates and collects statistics on the data in the staging log.
PURGE_REFRESH_STATS Procedure on page 165-18	Purges the refresh history of sync refreshes that took place within a time specified by a timestamp parameter.
REGISTER_MVIEWS on page 165-19	Registers materialized views for synchronous refresh.
REGISTER_PARTITION_OPERATION Procedure on page 165-20	Registers a partition maintenance operation on a partition of a base table.
UNREGISTER_MVIEWS on page 165-21	Unregisters materialized views from synchronous refresh.
UNREGISTER_PARTITION_OPERATION Procedure on page 165-22	Unregisters a partition maintenance operation on a partition of a base table.

ABORT_REFRESH Procedure

This procedure undoes all the changes made by PREPARE_REFRESH or EXECUTE_REFRESH for the specified sync refresh groups. It helps you to recover to a state where the tables and materialized views are usable and consistent in case they encounter unexpected errors.

This procedure is overloaded.

Syntax

```
DBMS_SYNC_REFRESH.ABORT_REFRESH (
   group_id      IN NUMBER);

DBMS_SYNC_REFRESH.ABORT_REFRESH (
   group_id_list IN DBMS_UTILITY.NUMBER_ARRAY);
```

Parameters

Table 165–2 ABORT_REFRESH Procedure Parameters

Parameter	Description
group_id	The group ID of a sync refresh group.
group_id_list	An array of group IDs of the sync refresh groups to be aborted for sync refresh.

Usage Notes

If called after PREPARE_REFRESH, this procedure drops the outside tables created by it and unlocks the tables and materialized views in the sync refresh group.

If called after EXECUTE_REFRESH fails, this procedure restores the state of tables to before EXECUTE_REFRESH by undoing any partition exchanges which successfully finished.

This procedure releases the locks placed on the tables in the sync refresh group which were placed on them by the PREPARE_REFRESH procedure. See "PREPARE_REFRESH Procedure" on page 165-14 for a description of these locks.

ABORT_REFRESH will work only if a PREPARE_REFRESH or EXECUTE_REFRESH statement has failed. It cannot be used after successful runs of those commands, and throws an error in such cases.

ALTER_REFRESH_STATS_RETENTION Procedure

This procedure alters the refresh history retention value, specified in days. It is intended for use in conjunction with PURGE_REFRESH_HISTORY. It also requires the SYSDBA privilege in addition to the privilege to execute it.

Syntax

```
DBMS_SYNC_REFRESH.ALTER_REFRESH_STATS_RETENTION (
   retention   IN NUMBER);
```

Parameters

Table 165–3 ALTER_REFRESH_STATS_RETENTION Procedure Parameters

Parameter	Description
retention	The retention time in days. The refresh history will be retained for at least these many number of days. The valid range is 1 to 365,000. You can use the following values for special purposes: ■ -1 - Refresh history is never purged by PREPARE_REFRESH. ■ 0 - Old refresh history is never saved. PREPARE_REFRESH will delete all refresh history. ■ NULL - Change refresh history retention to default value.

CAN_SYNCREF_TABLE Procedure

This procedure advises on whether a table and its dependent materialized views are eligible for sync refresh. It provides an explanation of its analysis. If not eligible, you can examine the reasons and take appropriate action if possible.

This procedure lists all of the table's dependent materialized views and whether they qualify for sync refresh. Note that a materialized view may qualify for sync refresh even though the base table may not.

The eligibility rules for materialized views for synchronous refresh are discussed in detail in *Oracle Database Data Warehousing Guide.*

You can invoke CAN_SYNCREF_TABLE in two ways. The first is to use a table, while the second is to create a VARRAY.

Syntax

```
DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
    schema_name    IN VARCHAR2,
    table_name     IN VARCHAR2,
    statement_id   IN VARCHAR2);

DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
    schema_name    IN VARCHAR2,
    table_name     IN VARCHAR2,
    output_array   IN OUT Sys.CanSyncRefTypeArray);
```

Note that only one of statement_id or output_array need be provided to CAN_SYNCREF_TABLE.

Parameters

Table 165–4 CAN_SYNCREF_TABLE Procedure Parameters

Parameter	Description
schema_name	The name of the schema of the base table.
table_name	The name of the base table.
statement_id	A string (VARCHAR2(30)) to identify the rows pertaining to an invocation of CAN_SYNCREF_TABLE when the output is directed to a table named SYNCREF_TABLE in the user's schema.
output_array	The output array into which CAN_SYNCREF_TABLE records the information on the eligibility of the base table and its dependent materialized views for synchronous refresh.

Using SYNCREF_TABLE

The output of CAN_SYNCREF_TABLE can be directed to a table named SYNCREF_TABLE. The user is responsible for creating the SYNCREF_TABLE; it can be dropped when it is no longer needed. Its structure is as follows:

```
CREATE TABLE SYNCREF_TABLE (
   statement_id    VARCHAR2(30),
   schema_name     VARCHAR2(30),
   table_name      VARCHAR2(30),
   mv_schema_name  VARCHAR2(30),
   mv_name         VARCHAR2(30),
```

```
   eligible        VARCHAR2(1),
   seq_num         NUMBER,
   msg_number      NUMBER,
   message         VARCHAR2(4000));
```

Using a VARRAY

You can save the output of CAN_SYNCREF_TABLE in a PL/SQL VARRAY. The elements of this array are of type CanSyncRefMessage, which is predefined in the SYS schema, as shown in the following:

```
TYPE CanSyncRefMessage IS OBJECT (
   schema_name     VARCHAR2(30),
   table_name      VARCHAR2(30),
   mv_schema_name  VARCHAR2(30),
   mv_name         VARCHAR2(30),
   eligible        VARCHAR2(1),
   seq_num         NUMBER,
   msg_number      NUMBER,
   message         VARCHAR2(4000));
```

The array type CanSyncRefArrayType, which is a varray of CanSyncRefMessage objects, is predefined in the SYS schema as follows:

```
TYPE CanSyncRefArrayType AS VARRAY(256) OF CanSyncRefMessage;
```

Each CanSyncRefMessage record provides a message concerning the eligibility of the base table or a dependent materialized view for synchronous refresh. The semantics of the fields is the same as that of the corresponding fields in the SYNCREF_TABLE. However, the SYNCREF_TABLE has a statement_id field which is absent in CanSyncRefMessage because no statement_id is supplied (because it is not required) when CAN_SYNCREF_TABLE is called with a VARRAY parameter.

EXECUTE_REFRESH Procedure

This procedure executes sync refresh on the sync refresh groups prepared by DBMS_SYNC_REFRESH.PREPARE_REFRESH. These groups are identified by their group IDs. Note this procedure will only perform the refresh on those materialized views that have been registered for synch refresh; any other materialized views will become stale once this procedure completes.

For more information on how to monitor the status of the two synchronous refresh operations, PREPARE_REFRESH and EXECUTE_REFRESH and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide.*

This procedure is overloaded.

Syntax

```
DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
   group_id   IN NUMBER);

DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
   group_id_list  IN DBMS_UTILITY.NUMBER_ARRAY);
```

Parameters

Table 165–5 EXECUTE_REFRESH Procedure Parameters

Parameter	Description
group_id	The group ID of a sync refresh group.
group_id_list	An array of group IDs of the sync refresh groups to be executed for sync refresh.

Usage Notes

This procedure also releases the locks placed on the tables in the sync refresh group that were placed on them by the PREPARE_REFRESH procedure. See "PREPARE_REFRESH Procedure" on page 165-14 for a description of these locks and *Oracle Database Reference* for information regarding the status of the refresh operation after DBMS_SYNC_REFRESH.EXECUTE_REFRESH.

GET_ALL_GROUP_IDS Function

This function returns the group IDs of all the sync refresh groups in the database.

Syntax

```
FUNCTION DBMS_SYNC_REFRESH.GET_ALL_GROUP_IDS
           RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 165–6 GET_ALL_GROUP_IDS Function Parameter

Parameter	Description
get_all_group_ids	Returns the group IDs of all the sync refresh groups in the database.

GET_GROUP_ID Function

This function returns the group ID of a materialized view. The group ID identifies the sync refresh group the table belongs to. A sync refresh group is a group of related tables and their dependent materialized views which must be all refreshed together jointly to ensure consistency and correctness.

Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID (
   object_name_list   IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 165–7 GET_GROUP_ID Function Parameter

Parameter	Description
object_name_list	The name of the materialized view. The name can be schema-qualified.

GET_GROUP_ID_LIST Function

This function returns the group IDs of the tables in a given list of objects (materialized views).

Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID_LIST (
   object_name_list   IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 165–8 GET_GROUP_ID_LIST Function Parameter

Parameter	Description
object_name_list	A comma-separated list of object names (materialized views). Each name can be schema-qualified.

PREPARE_REFRESH Procedure

This procedure prepares for refresh the sync refresh groups identified by the group ID in the input. A sync refresh group consists of a set of related tables and all materialized views dependent on those base tables. Note this procedure will only prepare for refresh those dependent materialized views that have been registered for synchronous refresh.

For more information on how to monitor the status of the two synchronous refresh operations, PREPARE_REFRESH and EXECUTE_REFRESH and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide.*

Syntax

```
DBMS_SYNC_REFRESH.PREPARE_REFRESH (
   group_id   IN NUMBER)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 165–9 PREPARE_REFRESH Procedure Parameters

Parameter	Description
group_id	The group ID of the sync refresh group to be prepared for sync refresh.

Usage Notes

This procedure plans the three phases of the sync refresh operation and executes the steps associated with the prepare phase itself. These steps include identifying the partitions of the fact tables and materialized views that have been changed, and computing their new values as a result of the changes. The new values of the partitions are stored in tables called outside tables that are exchanged into their corresponding partitions at the time of the EXECUTE_REFRESH.

Before running this procedure, the user must run PREPARE_STAGING_LOG on all tables in the group. This is required even for staging logs that do not have changes in them. The user must also register any partition operations on the tables in the group using the REGISTER_PARTITION_OPERATION.

One of the side effects of this procedure is that the tables being prepared are locked in this sense: the staging logs of the tables will be locked to prevent any DMLs from occurring and the registration of partition operations will be disabled. These locks will be in effect until you issue an EXECUTE_REFRESH statement. Alternatively, you can issue an ABORT_REFRESH operation to release these locks. Another side effect of this procedure is that it purges from the catalog records of earlier sync refresh operations; if they are older than the retention period, they are purged.

The degree of parallelism of the prepare refresh job is inherited from the session parameters which you can control with an ALTER SESSION statement.

The group ID of a table can be found using GET_GROUP_ID(table_name). The group IDs of a list of tables can be found with GET_GROUP_ID_LIST(table_name_list). The group IDs of all the lists of tables can be retrieved with GET_ALL_GROUP_IDS.

By default, synchronous refresh does not maintain global indexes belonging to the tables and materialized views in the sync refresh group. If you wish to do so, you can

set event 31904, level 64 before executing PREPARE_REFRESH. This will cause the partition exchange DDL statements generated by PREPARE_REFRESH to have the UPDATE INDEXES clause appended to them, and when they are executed by EXECUTE_REFRESH, the global indexes will be maintained.

PREPARE_STAGING_LOG Procedure

This procedure collects statistics on the data in the staging log of the base table and validates the data in the log. It can be run in several different modes ranging from the enforced mode in which strict checking of the data is done to trusted mode in which no checking is done. You should run this procedure after loading the staging log and before running `PREPARE_REFRESH`.

In the enforced mode, which is the default, this procedure will fill in the missing values of the columns of the rows being deleted or updated. An error is thrown if any violations of the staging-log rules are found. You can query the view `USER_SR_STLOG_EXCEPTIONS` to get details on the exceptions.

The notion of the staging log key is described in *Oracle Database Data Warehousing Guide.*

In the enforced mode, this procedure processes each delete/update row in the staging log as follows:

- It verifies the existence of the row in the base table using the key.
- For the rows being deleted (`DMLTYPE$$` is `'D'`), it verifies a row with this key exists in the base table; if non-null non-key values are supplied in the staging log, it verifies the values match the corresponding columns in the base table; else an exception is logged in the exceptions table. If the values of any of the non-key columns are missing, it fills in those values from the row in the base table.
- For the rows being updated (`DMLTYPE$$` is `'UO'` or `'UN'`), it verifies a row with this key exists in the base table. In the old values row (`DMLTYPE$$` is `'UO'`), it makes the same check and does the same processing as with rows being deleted. In the new values row (`DMLTYPE$$` is `'UN'`), it checks that at least the value of one the columns differs from its old value; else an exception is logged.
- In the new values row (`DMLTYPE$$` is `'UN'`), a null value in a column is interpreted as having the same value as the old value of the column except if the old value is non-null and the new value is null in which case, the new value of the column is interpreted as being null. This requires that the user must provide the old value of columns which are being updated to `NULL`.

In the default enforced mode, this procedure verifies that each key is specified for at most once for a delete or update operation. This means that the user, when doing the change consolidation, must consolidate delete-insert of the same row into an update operation with rows `'UO'` and `'UN`;' multiple updates must be consolidated into a single update; and null changes such as an insert-update-delete of the same row must not appear in the staging log.

The checking done in the enforced mode can be time-consuming. If you are confident in the integrity of the data, you can choose a lower level of checking. You can choose to:

- trust all the insert rows (`DMLTYPE$$` is `'I'`) by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.INSERT_TRUSTED`
- trust all the delete rows (`DMLTYPE$$` is `'D'`) by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.DELETE_TRUSTED`
- trust all the update rows (`DMLTYPE$$` is `'UO'` or `'UN'`) by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.UPDATE_TRUSTED`
- trust all three types of DMLs by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.TRUSTED`.

In addition, you can specify the psl_mode as a bitmask of the flags described above. For example, DBMS_SYNC_REFRESH.INSERT_TRUSTED + DBMS_SYNC_REFRESH_DELETE_TRUSTED will treat inserts and deletes to be trusted but not updates.

Syntax

```
DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG (
   schema_name      IN VARCHAR2,
   base_table_name  IN VARCHAR2,
   psl_mode         IN NUMBER DEFAULT
   DBMS_SYNC_REFRESH.ENFORCED);
```

Parameters

Table 165–10 PREPARE_STAGING_LOG Procedure Parameters

Parameter	Description
schema_name	The name of the schema of the base table.
base_table_name	The name of the base table.
psl_mode	The mode in which staging log preparation should be done. The possible values are: ■ DBMS_SYNC_REFRESH.ENFORCED (the default) ■ DBMS_SYNC_REFRESH.INSERT_TRUSTED ■ DBMS_SYNC_REFRESH.DELETE_TRUSTED ■ DBMS_SYNC_REFRESH.UPDATE_TRUSTED ■ DBMS_SYNC_REFRESH.TRUSTED

PURGE_REFRESH_STATS Procedure

This procedure purges the refresh history of sync refreshes that took place before the value specified by the BEFORE_TIMESTAMP parameter. This procedure requires the SYSDBA privilege in addition to the privilege to execute it.

Syntax

```
DBMS_SYNC_REFRESH.PURGE_REFRESH_STATS (
   before_timestamp IN TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 165–11 PURGE_REFRESH_STATS Procedure Parameter

Parameter	Description
before_timestamp	Records of sync refreshes saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than (current time - refresh - history retention). The refresh history retention value can be changed using ALTER_REFRESH_STATS_RETENTION. The default is 31 days.

REGISTER_MVIEWS

This procedure registers a list of materialized views for synchronous refresh. It checks each materialized view in the list for eligibility and places it in the sync refresh group it belongs to. A sync refresh group is a set of related tables and materialized views defined on top of them. Two tables are considered related if there is a referential constraint between them.

The eligibility rules of materialized views for synchronous refresh are described in detail in *Oracle Database Data Warehousing Guide.* The principal requirements are that the materialized view must be partitioned and its partition key must be derivable from the partition key of its fact table. The materialized view definition must specify the `USING TRUSTED CONSTRAINTS` clause because sync refresh trusts the foreign key and primary key relationships to perform various refresh optimizations. The materialized view's refresh policy must be specified as `ON DEMAND`.

You have an option to register only some of the materialized views associated with a table, and leave some unregistered. Oracle Corporation does not recommend this, and in such a case, the user has to maintain the unregistered ones using the PCT or complete refresh methods.

A staging table must have been created for each base table of each materialized view in the materialized view list (`mv_list`), or else an error is thrown.

If any of the materialized views are not eligible for sync refresh, an error is thrown and the registration of all materialized views in the materialized view list fails.

Syntax

```
DBMS_SYNC_REFRESH.REGISTER_MVIEWS (
   mv_list   IN VARCHAR2);
```

Parameter

Table 165–12 REGISTER_MVIEWS Procedure Parameter

Parameter	Description
`mv_list`	A comma-delimited list of materialized views to register. These names are optionally schema-qualified.

REGISTER_PARTITION_OPERATION Procedure

This procedure registers a partition-maintenance operation (PMOP) on a partition of a base table.

Syntax

```
DBMS_SYNC_REFRESH.REGISTER_PARTITION_OPERATION (
   partition_op                IN VARCHAR2,
   schema_name                 IN VARCHAR2,
   base_table_name             IN VARCHAR2,
   partition_name              IN VARCHAR2,
   outside_partn_table_schema  IN VARCHAR2,
   outside_partn_table_name    IN VARCHAR2);
```

Parameters

Table 165–13 REGISTER_PARTITION_OPERATION Procedure Parameters

Parameter	Description
partition_op	The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).
schema_name	The name of the schema of the base table.
base_table_name	The name of the base table.
partition_name	The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated.
outside_partn_table_ schema	The name of the schema of the outside partition table (required for EXCHANGE only).
outside_partn_table_name	The name of the outside partition table (required for EXCHANGE only).

Usage Notes

The three kinds of change operations that may be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

If DROP is specified, then the partition will be dropped from the base table at the time of EXECUTE_REFRESH. If TRUNCATE is specified, then the data from the partition will be deleted but the partition itself will not be dropped. These operations provide a more efficient way of specifying the deletes of all the rows in a partition than specifying them individually in the staging log.

If EXCHANGE is specified, then the contents of the outside table is exchanged with contents of the specified partition of EXECUTE_REFRESH. This provides an alternative method to the user of providing the changes to the base tables instead of populating the staging log.

UNREGISTER_MVIEWS

This procedure unregisters a list of materialized views from synchronous refresh. Once a materialized view is unregistered, it can be maintained by the user with any of the traditional refresh methods, such as complete or PCT, refresh.

Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_MVIEWS (
   mv_list   IN VARCHAR20;
```

Parameter

Table 165–14 UNREGISTER_MVIEWS Parameter

Parameter	Description
mv_list	A comma-delimited list of materialized views to unregister. These names are optionally schema-qualified.

UNREGISTER_PARTITION_OPERATION Procedure

This procedure unregisters a partition-maintenance operation (PMOP) that had been previously registered with REGISTER_PARTITION_OPERATION on a base table. The three kinds of change operations that can be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_PARTITION_OPERATION (
   partition_op     IN VARCHAR2,
   schema_name      IN VARCHAR2,
   base_table_name  IN VARCHAR2,
   partition_name   IN VARCHAR2);
```

Parameters

Table 165–15 UNREGISTER_PARTITION_OPERATION Procedure Parameters

Parameter	Description
partition_op	The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).
schema_name	The name of the schema of the base table.
base_table_name	The name of the base table.
partition_name	The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated.

166

DBMS_TDB

The DBMS_TDB package reports whether a database can be transported between platforms using the RMAN CONVERT DATABASE command. The package verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.

> **See Also:** *Oracle Database Backup and Recovery User's Guide* regarding database transport using CONVERT DATABASE

This chapter contains the following topics:

Using DBMS_TDB

This section contains topics which relate to using `DBMS_TDB`.

Overview

In many cases, Oracle supports transporting databases between platforms which have the same endian format. However, even when the endian formats are the same, a database must undergo a conversion process to move from one platform to another. There are also preconditions required for the process of transporting a database, such as having the database to be transported open read-only.

The `DBMS_TDB` package serves two purposes:

- Confirming that Oracle supports transporting a database from a given source platform to a given target platform
- Determining whether a database to be transported has been properly prepared for transport, and if not, identifying the condition that prevents database transport

The actual conversion is performed using the Recovery Manager `CONVERT DATABASE` command. For a complete discussion of the requirements for transporting a database, the process of converting a database for transport across platforms, and examples of the use of the `DBMS_TDB` subprograms in the conversion process, see *Oracle Database Backup and Recovery User's Guide*.

Security Model

Use of this package requires the `DBA` privilege.

Constants

The DBMS_TDB package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_TDB.SKIP_NONE.

The DBMS_TDB package uses the constants shown in Table 166–1.

Table 166–1 DBMS_TDB Constants

Name	Type	Value	Description
SKIP_NONE	NUMBER	0	Check all files when checking whether a database is ready for transport.
SKIP_OFFLINE	NUMBER	2	Skip files in offline tablespaces when checking whether a database is ready for transport.
SKIP_READONLY	NUMBER	3	Skip files in read-only tablespaces when checking whether a database is ready for transport.

Views

The DBMS_TDB package uses the following view listed in *Oracle Database Reference*:

- V$DB_TRANSPORTABLE_PLATFORM, which specifies which combinations of source and target platforms support database transport

Operational Notes

- The subprograms in this package are useful both in determining whether the desired cross-platform database conversion is possible, and in checking whether the database is ready for conversion. See *Oracle Database Backup and Recovery User's Guide* for details on the different uses of these subprograms are used in the conversion process.
- The subprograms in this package return simple `TRUE` or `FALSE` results to indicate whether database transport is possible. Use the subprograms with `SERVEROUTPUT ON` for informative messages about why transport is not possible.

Summary of DBMS_TDB Subprograms

Table 166–2 DBMS_TDB Package Subprograms

Subprogram	Description
CHECK_DB Function on page 166-9	Checks whether a database can be transported to a target platform
CHECK_EXTERNAL Function on page 166-9	Checks whether a database has external tables, directory or BFILEs

CHECK_DB Function

This function checks whether a database can be transported to a target platform. It tests whether transport is supported at all for a given source and destination platform, and whether the database is currently in the correct state for transport.

You can specify whether to skip checking parts of the database that are read-only or offline, if you do not plan to transport them.

The function is overloaded. The different functionality of each form of syntax is presented along with the definition.

Syntax

```
DBMS_TDB.CHECK_DB (
     target_platform_name   IN VARCHAR2,
     skip_option            IN  NUMBER)
   RETURN BOOLEAN;

DBMS_TDB.CHECK_DB (
     target_platform_name   IN VARCHAR2)
   RETURN BOOLEAN;

DBMS_TDB.CHECK_DB
   RETURN BOOLEAN;
```

Parameters

Table 166–3 CHECK_DB Function Parameters

Parameter	Description
target_platform_name	The name of the destination platform, as it appears in V$DB_TRANSPORTABLE_PLATFORM.
skip_option	Specifies which, if any, parts of the database to skip when checking whether the database can be transported. Supported values are listed in Table 166–1, " DBMS_TDB Constants" on page 166-5.

Return Values

If the database cannot be transported to the target platform or is not ready to be transported, returns FALSE. If the database is ready for transport, returns TRUE.

Usage Notes

- If SERVEROUTPUT is ON, then the output will contain the reasons why the database cannot be transported and how to fix the problems. For details on possible reasons and fixes, see Table 166–4, " Reasons for CHECK_DB Function to Return FALSE" on page 166-9.

Table 166–4 Reasons for CHECK_DB Function to Return FALSE

Cause	Action
Unrecognized target platform name.	Check V$DB_TRANSPORTABLE_PLATFORM for recognized platform names.

Table 166–4 (Cont.) Reasons for CHECK_DB Function to Return FALSE

Cause	Action
Target platform has a different endian format.	Conversion is not supported.
Database is not open read-only.	Open database read-only and retry.
There are active or in-doubt transactions in the database.	Open the database read-write. After the active transactions are rolled back, open the database read-only and retry the operation. This situation can occur if users flash back the database and open it read only. The active transactions will be rolled back when the database is opened read-write.
Deferred transaction rollback needs to be done.	Open the database read-write and bring online the necessary tablespaces. Once the deferred transaction rollback is complete, open the database read-only and retry the operation.
Database compatibility version is below 10.0.0.	Change the `COMPATIBLE` initialization parameter to 10.0.0 or higher, open the database read-only, and retry the operation.
Some tablespaces have not been open read-write with compatibility version is 10.0.0 or higher.	Change the `COMPATIBLE` initialization parameter to 10.0.0 or higher, then open the affected tablespaces read-write. Shut down the database, open it read-only, and retry the operation.

Examples

This example illustrates the use of `CHECK_DB` with a database that is open read-write:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
       db_ready BOOLEAN;
     BEGIN
       db_ready := DBMS_TDB.CHECK_DB('Microsoft Windows IA (32-bit)');
     END;
     /

Database is not open READ ONLY. Please open database READ ONLY and retry.

PL/SQL procedure successfully completed.
```

CHECK_EXTERNAL Function

This function determines whether a database has external tables, directories, or BFILEs.

Syntax

```
DBMS_TDB.CHECK_EXTERNAL
   RETURN BOOLEAN;
```

Return Values

If the database has external tables, directories, or BFILEs, return `TRUE`. Otherwise, return `FALSE`.

Usage Notes

- If `SERVEROUTPUT` is `ON`, then the function will output the names of the external tables, directories, and BFILEs in the database.
- The database must be open read-write.

Examples

This example illustrates the use of `CHECK_EXTERNAL` with a database that has several external tables, directories, and BFILEs:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
        external BOOLEAN;
     BEGIN
       external := DBMS_TDB.CHECK_EXTERNAL;
     END;
     /
The following external tables exist in the database:
SH.SALES_TRANSACTIONS_EXT
The following directories exist in the database:
SYS.MEDIA_DIR, SYS.DATA_FILE_DIR, SYS.LOG_FILE_DIR, SYS.DATA_PUMP_DIR
The following BFILEs exist in the database:
PM.PRINT_MEDIA

PL/SQL procedure successfully completed.
```

167

DBMS_TRACE

The DBMS_TRACE package contains the interface to trace PL/SQL functions, procedures, and exceptions.

This chapter contains the following topics:

Using DBMS_TRACE

Overview

DBMS_TRACE provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:

- Starting PL/SQL tracing in session (DBMS_TRACE.SET_PLSQL_TRACE).
- Running an application to be traced.
- Stopping PL/SQL tracing in session (DBMS_TRACE.CLEAR_PLSQL_TRACE).

Security Model

This package must be created under `SYS`.

Constants

The DBMS_TRACE package uses the constants shown in Table 167–1, " DBMS_TRACE Event Constants":

Table 167–1 DBMS_TRACE Event Constants

Name	Type	Value	Description
TRACE_ALL_CALLS	INTEGER	1	Traces calls or returns
TRACE_ENABLED_CALLS	INTEGER	2	
TRACE_ALL_EXCEPTIONS	INTEGER	4	Traces exceptions
TRACE_ENABLED_EXCEPTIONS	INTEGER	8	Traces exceptions and handlers
TRACE_LIMIT	INTEGER	16	Save only the last few records. This allows tracing up to a problem area, without filling the database up with masses of irrelevant information. If event 10940 is set, the limit is 1023*(the value of event 10940). This can be overridden by the use of "TRACE_LIMIT" flag.
TRACE_ALL_SQL	INTEGER	32	Traces SQL statements
TRACE_ENABLED_SQL	INTEGER	64	Traces SQL statements at PL/SQL level. This does not invoke SQL Trace
TRACE_ALL_LINES	INTEGER	128	Traces each line
TRACE_ENABLED_LINES	INTEGER	256	
TRACE_PAUSE	INTEGER	4096	Pauses tracing
TRACE_RESUME	INTEGER	8192	Resume tracing
TRACE_STOP	INTEGER	16384	Stops tracing
NO_TRACE_ADMINISTRATIVE	INTEGER	32768	Prevents tracing of 'administrative events such as ■ PL/SQL Trace Tool started ■ Trace flags changed ■ PL/SQL Virtual Machine started ■ PL/SQL Virtual Machine stopped
NO_TRACE_HANDLED_EXCEPTIONS	INTEGER	65536	Prevents tracing of handled exceptions

Table 167–2 DBMS_TRACE Version Constants

Name	Type	Value	Description
TRACE_MINOR_VERSION	INTEGER	0	
TRACE_MAJOR_VERSION	INTEGER	1	

Oracle recommends using the symbolic form for all these constants.

Restrictions

You cannot use PL/SQL tracing in a shared server environment.

Operational Notes

Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by *enabling* specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be
generated */
```

or:

```
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY]  <libunit-name> compile debug;
```

Note: You cannot use the second method for anonymous blocks.

You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including `TRACE_LIMIT` in the `TRACE_LEVEL` parameter of the `SET_PLSQL_TRACE` procedure.

Creating Database Tables to Collect DBMS_TRACE Output

You must create database tables into which the `DBMS_TRACE` package writes output. Otherwise, the data is not collected. To create these tables, run the script `TRACETAB.SQL`. The tables this script creates are owned by SYS.

Collecting Trace Data

The PL/SQL features you can trace are described in the script `DBMSPBT.SQL`. Some of the key tracing features are:

- Tracing Calls
- Tracing Exceptions
- Tracing SQL
- Tracing Lines

Additional features of DBMS_TRACE also allow pausing and resuming trace, and limiting the output.

Tracing Calls

Two levels of call tracing are available:

- Level 1: Trace all calls. This corresponds to the constant `TRACE_ALL_CALLS`.

- Level 2: Trace calls to enabled program units only. This corresponds to the constant TRACE_ENABLED_CALLS.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

Tracing Exceptions

Two levels of exception tracing are available:

- Level 1: Trace all exceptions. This corresponds to TRACE_ALL_EXCEPTIONS.
- Level 2: Trace exceptions raised in enabled program units only. This corresponds to TRACE_ENABLED_EXCEPTIONS.

Tracing SQL

Two levels of SQL tracing are available:

- Level 1: Trace all SQL. This corresponds to the constant TRACE_ALL_SQL.
- Level 2: Trace SQL in enabled program units only. This corresponds to the constant TRACE_ENABLED_SQL.

Tracing Lines

Two levels of line tracing are available:

- Level 1: Trace all lines. This corresponds to the constant TRACE_ALL_LINES.
- Level 2: Trace lines in enabled program units only. This corresponds to the constant TRACE_ENABLED_LINES.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

Note: For all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.

Collected Data

If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller is enabled, the caller's name will also be output. If the callee is enabled, the callee's name will also be output.

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled. Enabling NO_TRACE_HANDLED_EXCEPTIONS limits data collection to unhandled exceptions

All calls to DBMS_TRACE.SET_PLSQL_TRACE and DBMS_TRACE.CLEAR_PLSQL_TRACE place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.

Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants TRACE_PAUSE and TRACE_RESUME are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant TRACE_LIMIT. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. The 8,192 record limit can be changed. Setting event 10940 to level *n* changes the record limit to 1024 * *n*.

Enabling NO_TRACE_ADMINISTRATIVE prevents the generation of such administrative event records as PL/SQL Trace Tool started, Trace flags changed, PL/SQL Virtual Machine started, and PL/SQL Virtual Machine stopped.

Summary of DBMS_TRACE Subprograms

Table 167–3 DBMS_TRACE Package Subprograms

Subprogram	Description
CLEAR_PLSQL_TRACE Procedure on page 167-11	Stops trace data dumping in session
GET_PLSQL_TRACE_LEVEL Function on page 167-12	Gets the trace level
PLSQL_TRACE_VERSION Procedure on page 167-13	Gets the version number of the trace package
SET_PLSQL_TRACE Procedure on page 167-14	Starts tracing in the current session

CLEAR_PLSQL_TRACE Procedure

This procedure disables trace data collection.

Syntax

```
DBMS_TRACE.CLEAR_PLSQL_TRACE;
```

GET_PLSQL_TRACE_LEVEL Function

This procedure returns the current trace level as the sum of one or more of the constants as listed in Table 167–1, " DBMS_TRACE Event Constants".

Syntax

```
DBMS_TRACE.GET_PLSQL_TRACE_LEVEL
  RETURN BINARY_INTEGER;
```

PLSQL_TRACE_VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the DBMS_TRACE package.

Syntax

```
DBMS_TRACE.PLSQL_TRACE_VERSION (
   major OUT BINARY_INTEGER,
   minor OUT BINARY_INTEGER);
```

Parameters

Table 167–4 PLSQL_TRACE_VERSION Procedure Parameters

Parameter	Description
major	Major version number of DBMS_TRACE.
minor	Minor version number of DBMS_TRACE.

SET_PLSQL_TRACE Procedure

This procedure enables PL/SQL trace data collection.

Syntax

```
DBMS_TRACE.SET_PLSQL_TRACE (
   trace_level INTEGER);
```

Parameters

Table 167–5 SET_PLSQL_TRACE Procedure Parameters

Parameter	Description
`trace_level`	You must supply one or more of the constants as listed in Table 167–1, " DBMS_TRACE Event Constants". By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants "`TRACE_PAUSE`", "`TRACE_RESUME`" and "`TRACE_STOP`" should not be used in combination with other constants. Also see "Collecting Trace Data" on page 167-7 for more information.

168

DBMS_TRANSACTION

The DBMS_TRANSACTION package provides access to SQL transaction statements from stored procedures.

> **See Also:** *Oracle Database SQL Language Reference*

This chapter contains the following topics:

Using DBMS_TRANSACTION

Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

Summary of DBMS_TRANSACTION Subprograms

Table 168–1 DBMS_TRANSACTION Package Subprograms

Subprogram	Description
ADVISE_COMMIT Procedure on page 168-5	Equivalent to the SQL statement: `ALTER SESSION ADVISE COMMIT`
ADVISE_NOTHING Procedure on page 168-6	Equivalent to the SQL statement: `ALTER SESSION ADVISE NOTHING`
ADVISE_ROLLBACK Procedure on page 168-7	Equivalent to the SQL statement: `ALTER SESSION ADVISE ROLLBACK`
COMMIT Procedure on page 168-8	Equivalent to the SQL statement: `COMMIT`
COMMIT_COMMENT Procedure on page 168-9	Equivalent to the SQL statement: `COMMIT COMMENT <text>`
COMMIT_FORCE Procedure on page 168-10	Equivalent to the SQL statement: `COMMIT FORCE <text>, <number>"`
LOCAL_TRANSACTION_ID Function on page 168-11	Returns the local (to instance) unique identifier for the current transaction
PURGE_LOST_DB_ENTRY Procedure on page 168-12	Enables removal of incomplete transactions from the local site when the remote database is destroyed or re-created before recovery completes
PURGE_MIXED Procedure on page 168-14	Deletes information about a given mixed outcome transaction
READ_ONLY Procedure on page 168-15	Equivalent to the SQL statement: `SET TRANSACTION READ ONLY`
READ_WRITE Procedure on page 168-16	equivalent to the SQL statement: `SET TRANSACTION READ WRITE`
ROLLBACK Procedure on page 168-17	Equivalent to the SQL statement: `ROLLBACK`
ROLLBACK_FORCE Procedure on page 168-18	Equivalent to the SQL statement: `ROLLBACK FORCE <text>`
ROLLBACK_SAVEPOINT Procedure on page 168-19	Equivalent to the SQL statement: `ROLLBACK TO SAVEPOINT <savepoint_name>`
SAVEPOINT Procedure on page 168-20	Equivalent to the SQL statement: `SAVEPOINT <savepoint_name>`
STEP_ID Function on page 168-21	Returns local (to local transaction) unique positive integer that orders the DML operations of a transaction
USE_ROLLBACK_SEGMENT Procedure on page 168-22	Equivalent to the SQL statement: `SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>`

ADVISE_COMMIT Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE COMMIT
```

Syntax

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```

ADVISE_NOTHING Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE NOTHING
```

Syntax

```
DBMS_TRANSACTION.ADVISE_NOTHING;
```

ADVISE_ROLLBACK Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE ROLLBACK
```

Syntax

```
DBMS_TRANSACTION.ADVISE_ROLLBACK;
```

COMMIT Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.COMMIT;
```

COMMIT_COMMENT Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT COMMENT <text>
```

Syntax

```
DBMS_TRANSACTION.COMMIT_COMMENT (
   cmnt VARCHAR2);
```

Parameters

Table 168–2 COMMIT_COMMENT Procedure Parameters

Parameter	Description
cmnt	Comment to associate with this commit.

COMMIT_FORCE Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT FORCE <text>, <number>"
```

Syntax

```
DBMS_TRANSACTION.COMMIT_FORCE (
   xid VARCHAR2,
   scn VARCHAR2 DEFAULT NULL);
```

Parameters

Table 168–3 COMMIT_FORCE Procedure Parameters

Parameter	Description
xid	Local or global transaction ID.
scn	System change number.

LOCAL_TRANSACTION_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

Syntax

```
DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (
   create_transaction BOOLEAN := FALSE)
  RETURN VARCHAR2;
```

Parameters

Table 168–4 LOCAL_TRANSACTION_ID Function Parameters

Parameter	Description
create_transaction	If true, then start a transaction if one is not currently active.

PURGE_LOST_DB_ENTRY Procedure

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in DBA_2PC_PENDING and associated tables are never removed, and recovery will periodically retry. Procedure PURGE_LOST_DB_ENTRY enables removal of such transactions from the local site.

Syntax

```
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (
   xid VARCHAR2);
```

Parameters

Table 168–5 PURGE_LOST_DB_ENTRY Procedure Parameters

Parameter	Description
xid	Must be set to the value of the LOCAL_TRAN_ID column in the DBA_2PC_PENDING table.

Usage Notes

WARNING: PURGE_LOST_DB_ENTRY should *only* be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.

Before automatic recovery runs, the transaction may show up in DBA_2PC_PENDING as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the MIXED column has the value 'yes'.

However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is ORA-02062). In this case, the DBA may use the procedure PURGE_LOST_DB_ENTRY to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:

Table 168–6 PURGE_LOST_DB_ENTRY Procedure States

State of Column	State of Global Transaction	State of Local Transaction	Normal DBA Action	Alternative DBA Action
Collecting	Rolled back	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Committed	Committed	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Prepared	Unknown	Prepared	None	FORCE COMMIT or ROLLBACK
Forced commit	Unknown	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced rollback	Unknown	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced commit (mixed)	Mixed	Committed	(See Note 2)	
Forced rollback (mixed)	Mixed	Rolled back	(See Note 2)	

NOTE 1: Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.

NOTE 2: Examine and take any manual action to remove inconsistencies; then use the procedure PURGE_MIXED.

PURGE_MIXED Procedure

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome: Some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle; however, Oracle flags entries in `DBA_2PC_PENDING` by setting the `MIXED` column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

Syntax

```
DBMS_TRANSACTION.PURGE_MIXED (
   xid VARCHAR2);
```

Parameters

Table 168–7 PURGE_MIXED Procedure Parameters

Parameter	Description
`xid`	Must be set to the value of the `LOCAL_TRAN_ID` column in the `DBA_2PC_PENDING` table.

READ_ONLY Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ ONLY
```

Syntax

```
DBMS_TRANSACTION.READ_ONLY;
```

READ_WRITE Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ WRITE
```

Syntax

```
DBMS_TRANSACTION.READ_WRITE;
```

ROLLBACK Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK;
```

ROLLBACK_FORCE Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK FORCE <text>
```

Syntax

```
DBMS_TRANSACTION.ROLLBACK_FORCE (
   xid VARCHAR2);
```

Parameters

Table 168–8 ROLLBACK_FORCE Procedure Parameters

Parameter	Description
xid	Local or global transaction ID.

ROLLBACK_SAVEPOINT Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK TO SAVEPOINT <savepoint_name>
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_SAVEPOINT (
   savept VARCHAR2);
```

Parameters

Table 168–9 ROLLBACK_SAVEPOINT Procedure Parameters

Parameter	Description
savept	Savepoint identifier.

SAVEPOINT Procedure

This procedure is equivalent to the SQL statement:

```
SAVEPOINT <savepoint_name>
```

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.SAVEPOINT (
   savept VARCHAR2);
```

Parameters

Table 168–10 SAVEPOINT Procedure Parameters

Parameter	Description
savept	Savepoint identifier.

STEP_ID Function

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

Syntax

```
DBMS_TRANSACTION.STEP_ID
   RETURN NUMBER;
```

USE_ROLLBACK_SEGMENT Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>
```

Syntax

```
DBMS_TRANSACTION.USE_ROLLBACK_SEGMENT (
   rb_name VARCHAR2);
```

Parameters

Table 168–11 USE_ROLLBACK_SEGMENT Procedure Parameters

Parameter	Description
rb_name	Name of rollback segment to use.

169

DBMS_TRANSFORM

The DBMS_TRANSFORM package provides an interface to the message format transformation features of Oracle Advanced Queuing.

> **See Also:** *Oracle Database Advanced Queuing User's Guide* for more on message format transformations.

This chapter contains the following topic:

- Summary of DBMS_TRANSFORM Subprograms

Summary of DBMS_TRANSFORM Subprograms

Table 169–1 DBMS_TRANSFORM Package Subprograms

Subprograms	Description
CREATE_ TRANSFORMATION Procedure on page 169-3	Creates a transformation that maps an object of the source type to an object of the destination type
DROP_ TRANSFORMATION Procedure on page 169-5	Drops the given transformation
MODIFY_ TRANSFORMATION Procedure on page 169-6	Modifies an existing transformation

CREATE_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

Syntax

```
DBMS_TRANSFORM.CREATE_TRANSFORMATION (
    schema               VARCHAR2(30),
    name                 VARCHAR2(30),
    from_schema          VARCHAR2(30),
    from_type            VARCHAR2(30),
    to_schema            VARCHAR2(30),
    to_type              VARCHAR2(30),
    transformation       VARCHAR2(4000));
```

Parameters

Table 169–2 CREATE_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
from_schema	Specifies the schema of the source type.
from_type	Specifies the source type.
to_schema	Specifies the target type schema.
to_type	Specifies the target type.
transformation	Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using MODIFY_TRANSFORMATION.

Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
- To create, modify or drop transformations, a user must be granted execute privileges on DBMS_TRANSFORM. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PLSQL function being used in the transformation function.
- The transformation cannot write database state (perform DML) or commit or rollback the current transaction.
- The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form *source.user_data*.

- Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PLSQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.

DROP_TRANSFORMATION Procedure

This procedure drops the given transformation.

Syntax

```
DBMS_TRANSFORM.DROP_TRANSFORMATION (
schema VARCHAR2(30),
    name        VARCHAR2(30));
```

Parameters

Table 169–3 DROP_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.

MODIFY_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

Syntax

```
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (
   schema             VARCHAR2(30),
   name               VARCHAR2(30),
   attribute_number   INTEGER,
   transformation     VARCHAR2(4000));
```

Parameters

Table 169–4 MODIFY_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
attribute_number	The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0.
transformation	The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type.

Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an attribute_number of 0. The new transformation may also be specified for each attribute of the target type.
- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.

170

DBMS_TSDP_MANAGE

The DBMS_TSDP_MANAGE package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the DBMS_TSDP_PROTECT package with regard to transparent sensitive data protection (TSDP) policies. DBMS_TSDP_MANAGE is available with the Enterprise Edition only.

See Also: *Oracle Database Security Guide*

This chapter contains the following topics:

Using DBMS_TSDP_MANAGE

Overview

The DBMS_TSDP_MANAGE package lets you manage sensitive columns and sensitive types in the Oracle database. The identified sensitive columns are classified based on the sensitive types. By Using the DBMS_TSDP_PROTECT package to create a policy that protects data for a given class based on a column type rather than the data itself, you can then manage security for these types in a uniform fashion and modify the settings to accommodate changing compliance regulations.

You also can export the policies to other databases, when you perform a full export using Data Pump. You cannot export the policy itself, but an export of the database will include the TSDP policies.

Security Model

All procedures are executed with invoker's rights. The `DBMS_TSDP_MANAGE` package is owned by `SYS`. The `EXECUTE` privilege on this package should be granted as appropriate. Typically, an application database administrator should be granted the `EXECUTE` privilege for this package, while the DBMS_TSDP_PROTECT package would be governed by a security administrator.

Summary of DBMS_TSDP_MANAGE Subprograms

Table 170–1 DBMS_TSDP_MANAGE Package Subprograms

Subprogram	Description
ADD_SENSITIVE_COLUMN Procedure on page 170-6	Adds a column to the sensitive column list
ADD_SENSITIVE_TYPE Procedure on page 170-8	Creates and adds a sensitive column type to the list of sensitive column types in the database
ALTER_SENSITIVE_COLUMN Procedure on page 170-7	Alters the sensitive type and/or the comment of a column in the sensitive column list.
DROP_SENSITIVE_COLUMN Procedure on page 170-9	Removes columns from the sensitive column list
DROP_SENSITIVE_TYPE Procedure on page 170-10	Drops a sensitive column type from the list sensitive column types in the database
DROP_SENSITIVE_TYPE_SOURCE Procedure on page 170-11	Drops sensitive column types corresponding to a source from the list sensitive column types in the database
IMPORT_DISCOVERY_RESULT Procedure on page 170-12	Imports sensitive columns from an external source. This can be an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance
IMPORT_SENSITIVE_TYPES Procedure on page 170-13	Imports a list of sensitive column types from a source
REMOVE_DISCOVERY_RESULT Procedure on page 170-14	Removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.

ADD_SENSITIVE_COLUMN Procedure

This procedure adds a column to the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
   schema_name        IN VARCHAR2,
   table_name         IN VARCAHR2,
   column_name        IN VARCAHR2,
   sensitive_type     IN VARCAHR2,
   user_comment       IN VARCAHR2 DEFAULT NULL);
```

Parameters

Table 170–2 ADD_SENSITIVE_COLUMN Procedure Parameters

Parameter	Description
schema_name	Schema to which the column belongs
table_name	Table containing the column
column_name	Sensitive column name
sensitive_type	Identifier of the sensitive column type
user_comment	User comment regarding the sensitive column

Examples

Add a column SAL in SCOTT.EMP:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
  schema_name        => 'SCOTT',
  table_name         => 'EMP',
  column_name        => 'SAL',
  sensitive_type     => 'SALARY_TYPE',
  user_comment       => 'Salary column');
```

ALTER_SENSITIVE_COLUMN Procedure

This procedure alters the Sensitive Type and/or the Comment of a Column in the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
   schema_name        IN VARCHAR2,
   table_name         IN VARCAHR2,
   column_name        IN VARCAHR2,
   sensitive_type     IN VARCAHR2,
   user_comment       IN VARCAHR2 DEFAULT NULL);
```

Parameters

Table 170–3 ALTER_SENSITIVE_COLUMN Procedure Parameters

Parameter	Description
schema_name	Schema to which the column belongs
table_name	Table containing the column
column_name	Sensitive column name
sensitive_type	Identifier of the sensitive column type
user_comment	User comment regarding the sensitive column

Examples

Alter the column SAL in SCOTT.EMP that is listed in the sensitive column list:

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
   schema_name        => 'SCOTT',
   table_name         => 'EMP',
   column_name        => 'SAL',
   sensitive_type     => 'FINANCE_Type',
   user_comment       => 'Finance Type. Earlier categorized as Salary Type');
```

ADD_SENSITIVE_TYPE Procedure

This procedure creates and adds a sensitive column type to the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
   sensitive_type     IN  VARCHAR2,
   user_comment       IN  VARCAHR2 DEFAULT NULL);
```

Parameters

Table 170–4 ADD_SENSITIVE_TYPE Procedure Parameters

Parameter	Description
sensitive_type	Name of the sensitive column type
user_comment	User comment regarding the sensitive column

Examples

Add a sensitive column type called SALARY_TYPE that is intended to be associated with columns containing salary data:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
  sensitive_type     => 'SALARY_TYPE',
  user_comment       => 'Salary data');
```

DROP_SENSITIVE_COLUMN Procedure

This procedure removes columns from the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
   schema_name        IN VARCHAR2 DEFAULT '%',
   table_name         IN VARCAHR2 DEFAULT '%',
   column_name        IN VARCAHR2 DEFAULT '%');
```

Parameters

Table 170–5 DROP_SENSITIVE_COLUMN Procedure Parameters

Parameter	Description
schema_name	Schema to which the column belongs
table_name	Table containing the column
column_name	Sensitive column name

Examples

Remove column SAL in SCOTT.EMP from the sensitive column list:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
  schema_name        => 'SCOTT',
  table_name         => 'EMP',
  column_name        => 'SAL');
```

DROP_SENSITIVE_TYPE Procedure

This procedure drops a sensitive column type from the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
   sensitive_type     IN VARCHAR2);
```

Parameters

Table 170–6 DROP_SENSITIVE_TYPE Procedure Parameters

Parameter	Description
sensitive_type	Name of the sensitive column type to be dropped

Examples

To drop SALARY_TYPE:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
  sensitive_type     => 'SALARY_TYPE');
```

DROP_SENSITIVE_TYPE_SOURCE Procedure

This procedure drops sensitive column types corresponding to a source from the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
   source      IN VARCHAR2);
```

Parameters

Table 170–7 DROP_SENSITIVE_TYPE_SOURCE Procedure Parameters

Parameter	Description
source	Name of the source

Examples

To drop all sensitive column types corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, ADM_DEMO:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
   source      =>  'ADM_DEMO');
```

IMPORT_DISCOVERY_RESULT Procedure

This procedure can be used to import sensitive columns, along with the associated sensitive types, from an external source. The external source can be an Application Data Model (ADM) instance from Oracle Enterprise Manager Cloud Control.

Syntax

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
  discovery_result         IN  CLOB,
  discovery_source         IN  VARCHAR2,
  force                    IN  FORCE DEFAULT FALSE);

DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
  discovery_result         IN  XMLTYPE,
  discovery_source         IN  VARCHAR2,
  force                    IN  FORCE DEFAULT FALSE);
```

Parameters

Table 170–8 IMPORT_DISCOVERY_RESULT Procedure Parameters

Parameter	Description
discovery_result	List of sensitive columns, along with the optional list of (the definitions of) the sensitive column types in XML format (possibly as a CLOB).
discovery_source	Source of the import. The discovery_sourcename identifies the list of imported sensitive columns. In case of ADM, this should be the ADM name.
force	Specifies if the discovery result should be imported or not when the discovery result contains columns sensitive columns that are already identified as sensitive by another source. ■ FALSE (default) - the discovery result will not be imported in case of conflicting columns. None of the columns and the sensitive types are imported. ■ TRUE - the discovery result is imported and the attributes of the conflicting columns is set based on the incoming discovery result

Examples

Import the list of sensitive columns of ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
  discovery_results        =>  xml_adm_result,
  discovery_source         => 'ADM_Demo');
```

IMPORT_SENSITIVE_TYPES Procedure

This procedure imports a list of sensitive column types from a source.

Syntax

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
  sensitive_types        IN CLOB,
  source                 IN VARCHAR2);

DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
  sensitive_types        IN XMLTYPE,
  source                 IN VARCHAR2);
```

Parameters

Table 170–9 IMPORT_SENSITIVE_TYPES Procedure Parameters

Parameter	Description
sensitive_types	List of sensitive column types in XML Format (possibly as a CLOB)
source	Source of the import. The source identifies the list of imported sensitive column types. In case of Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, this should be the ADM name.

Examples

Import the list of sensitive column types of ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
  sensitive_types        =>  xml_adm_result,
  source                 => 'ADM_Demo');
```

REMOVE_DISCOVERY_RESULT Procedure

This procedure removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.

Syntax

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (
  discovery_source     IN  VARCHAR2);
```

Parameters

Table 170–10 REMOVE_DISCOVERY_RESULT Procedure Parameters

Parameter	Description
`discovery_source`	Source of the import. In case of ADM, this should be the ADM name, the results of which is to be removed.

Examples

Remove the sensitive columns corresponding to ADM instance, `ADM_Demo`:

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (
  discovery_source    => 'ADM_Demo');
```

171

DBMS_TSDP_PROTECT

The DBMS_TSDP_PROTECT package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the DBMS_TSDP_MANAGE package. DBMS_TSDP_PROTECT is available with the Enterprise Edition only.

See Also: *Oracle Database Security Guide*

This chapter contains the following topics:

- Using DBMS_TSDP_PROTECT
  - Overview
  - Security Model
  - Constants
- Data Structures
- Summary of DBMS_TSDP_PROTECT Subprograms

Using DBMS_TSDP_PROTECT

Overview

Use the `DBMS_TSDP_PROTECT` package to create transparent sensitive data protection policies, configure protection by associating the policies with sensitive types, and to enable and disable the configured protection. Sensitive types can be added using the DBMS_TSDP_MANAGE package.

Security Model

All procedures are executed with invoker's rights. Typically, a security administrator should have the `EXECUTE` privilege for this package.

Constants

The DBMS_TSDP_PROTECT package uses the constants shown in Table 171–1, " DBMS_TDSP_PROTECT Constants - Compression Types":

Table 171–1 DBMS_TDSP_PROTECT Constants - Compression Types

Constant	Type	Value	Description
TSDP_PARAM_MAX	INTEGER	4000	Maximum length of the parameter value that can be specified in FEATURE_OPTIONS

Data Structures

The DBMS_COMPRESSION package defines the following TABLE type.

Table Types

- FEATURE_OPTIONS Table Type
- POLICY_CONDITION Table Type

FEATURE_OPTIONS Table Type

The following type is an associative array of `VARCHAR2(TSDP_PARAM_MAX)` that is indexed by `VARCHAR2(M_IDEN)`.

Syntax

```
TYPE FEATURE_OPTIONS IS TABLE OF VARCHAR2(TSDP_PARAM_MAX)
INDEX BY VARCHAR2(M_IDEN);
```

POLICY_CONDITION Table Type

The following type is an associative array of `VARCHAR2(TSDP_PARAM_MAX)` that is indexed by `PLS_INTEGER`.

Syntax

```
TYPE POLICY_CONDITION IS TABLE OF VARCHAR2(TSDP_PARAM_MAX)
INDEX BY PLS_INTEGER;
```

Summary of DBMS_TSDP_PROTECT Subprograms

Table 171–2 DBMS_TSDP_PROTECT Package Subprograms

Subprogram	Description
ADD_POLICY Procedure on page 171-10	Creates a TSDP policy
ALTER_POLICY Procedure on page 171-12	Alters a TDSP policy
ASSOCIATE_POLICY Procedure on page 171-14	Associates or disassociates a TSDP policy with a sensitive column type
DISABLE_PROTECTION_COLUMN Procedure on page 171-15	Disables protection for columns
DISABLE_PROTECTION_SOURCE Procedure on page 171-16	Disables protection based on the source of truth for the sensitive columns
DISABLE_PROTECTION_TYPE Procedure on page 171-17	Disables protection for a sensitive column type
DROP_POLICY Procedure on page 171-18	Removes a TDSP policy
ENABLE_PROTECTION_COLUMN Procedure on page 171-20	Enables protection for columns
ENABLE_PROTECTION_SOURCE Procedure on page 171-21	Enables protection based on the source of truth for the sensitive columns
ENABLE_PROTECTION_TYPE Procedure on page 171-22	Enables protection for a sensitive column type

ADD_POLICY Procedure

This procedure creates a TDSP policy.

Syntax

```
DBMS_TSDP_PROTECT.ADD_POLICY (
   policy_name              IN VARCHAR2,
   security_feature         IN PLS_INTEGER,
   policy_enable_options    IN FEATURE_OPTIONS,
   policy_apply_condition   IN POLICY_CONDITION DEFAULT TSDP$null_condition);
```

Parameters

Table 171–3 ADD_POLICY Procedure Parameters

Parameter	Description
`policy_name`	Name of the policy being created. The maximum length for this identifier is `M_IDEN`. This follows the Oracle naming convention.
`security_feature`	Oracle security feature with which the policy is associated. Allowed values: ■ `DBMS_TSDP_PROTECT.REDACT`
`policy_enable_options`	Initialized with the parameter-value pairs corresponding to the security feature
`policy_apply_condition`	Initialized with the property-value pairs that must be satisfied in order to apply the corresponding `policy_enable_options`. This is an associative array with Property as the key (`PLS_INTEGER`). Example: `example_policy_condition(`*`Property`*`)= `*`property_value`*. Permissible values for Property: ■ `DBMS_TSDP_PROPERTY.DATATYPE` ■ `DBMS_TSDP_PROPERTY.LENGTH` ■ `DBMS_TSDP_PROPERTY.PARENT_SCHEMA` ■ `DBMS_TSDP_PROPERTY.PARENT_TABLE`

Usage Notes

To create the TDSP policy, you must include the procedure in an anonymous block that defines the type of security feature that will use the policy and conditions to test when the policy is enabled. For more information, see *Oracle Database Security Guide*.

Examples

Create a policy `PARTIAL_MASK_POLICY`:

```
DECLARE
  redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  redact_feature_options ('expression') :=
   'SYS_CONTEXT(''USERENV'',''SESSION_USER'')      =''APPUSER''';
  redact_feature_options ('function_type')        := 'DBMS_REDACT.PARTIAL';
  redact_feature_options ('function_parameters')  := 'STR, VVVVVVVVV,VVVVVVVVV, *,
1, 6';
```

```
  policy_conditions(DBMS_TSDP_PROTECT.DATATYPE)   := 'VARCHAR2';
 DBMS_TSDP_PROTECT.ADD_POLICY
  ('PARTIAL_MASK_POLICY',  DBMS_TSDP_PROTECT.REDACT, redact_feature_options,
policy_conditions);
END;
```

ALTER_POLICY Procedure

This procedure alters an existing TDSP policy

Syntax

```
DBMS_TSDP_PROTECT.ALTER_POLICY (
   policy_name              IN VARCHAR2,
   policy_enable_options    IN FEATURE_OPTIONS,
   policy_apply_condition   IN POLICY_CONDITION default TSDP$null_condition);
```

Parameters

Table 171–4 ALTER_POLICY Procedure Parameters

Parameter	Description
policy_name	Name of the policy to alter
policy_enable_options	Initialized with the parameter-value pairs corresponding to the security feature
policy_apply_condition	Initialized with the property-value pairs that must be satisfied in order to apply the corresponding policy_enable_options. This is an associative array with Property as the key (PLS_INTEGER). Example: example_policy_condition(*Property*)= *property_value*. Permissible values for Property: ■ DBMS_TSDP_PROPERTY.DATATYPE ■ DBMS_TSDP_PROPERTY.LENGTH ■ DBMS_TSDP_PROPERTY.PARENT_SCHEMA ■ DBMS_TSDP_PROPERTY.PARENT_TABLE

Usage Notes

- If the policy_apply_condition matches an existing condition for the policy, then the corresponding enable options are updated with policy_enable_options.
- If the policy_apply_condition does not match any existing condition for the policy, the combination of policy_enable_options and policy_apply_condition is added to the policy.

Examples

Add a new combination of policy_apply_condition and policy_enable_options to an existing policy PARTIAL_MASK_POLICY:

```
DECLARE
  redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
   redact_feature_options ('expression') :=
       'SYS_CONTEXT(''USERENV'',''SESSION_USER'')=''APPUSER''';
   redact_feature_options ('function_type') := 'DBMS_REDACT.PARTIAL';
   redact_feature_options ('function_parameters') := 'STR, VVVVVVVVV,VVVVVVVVV, *,
        1, 6';
   policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
   DBMS_TSDP_PROTECT.ALTER_POLICY ('PARTIAL_MASK_POLICY',  redact_feature_options,
policy_conditions);
```

```
END;
```

ASSOCIATE_POLICY Procedure

This procedure associates or disassociates a TSDP policy with a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY (
   policy_name        IN  VARCHAR2,
   sensitive_type     IN  VARCHAR2,
   associate          IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 171–5 ASSOCIATE_POLICY Procedure Parameters

Parameter	Description
policy_name	Name of the TDSP policy
sensitive_type	Name of the sensitive column type:
associate	Associate or Disassociate. TRUE implies Associate

Usage Notes

Both the policy and the sensitive column type should exist in the database.

Examples

Associate PARTIAL_MASK_POLICY with SSN_TYPE:

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY ('PARTIAL_MASK_POLICY', 'SSN_TYPE');
```

DISABLE_PROTECTION_COLUMN Procedure

This procedure disables protection for columns.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN (
   schema_name        IN  VARCHAR2 DEFAULT '%',
   table_name         IN  VARCHAR2 DEFAULT '%',
   column_name        IN  VARCHAR2 DEFAULT '%',
   policy_name        IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 171–6 DISABLE_PROTECTION_COLUMN Procedure Parameters

Parameter	Description
schema_name	Name of the schema containing the column
table_name	Table containing the column
column_name	Column name
policy_name	Optional policy name. If given, only this policy is disabled.

Examples

Disable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
EXEC DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

DISABLE_PROTECTION_SOURCE Procedure

This procedure disables protection based on the source of truth for the sensitive columns.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE (
   discovery_sourcename      IN  VARCHAR2);
```

Parameters

Table 171–7 DISABLE_PROTECTION_SOURCE Procedure Parameters

Parameter	Description
`discovery_sourcename`	Name of the discovery source. This could be the Application Data Model (ADM) name or the database user.

Examples

Disable protection for all columns corresponding to `ADM_Demo`:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE ('ADM_Demo');
```

DISABLE_PROTECTION_TYPE Procedure

This procedure disables protection for a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE (
   sensitive_type         IN VARCHAR2);
```

Parameters

Table 171–8 DISABLE_PROTECTION_TYPE Procedure Parameters

Parameter	Description
sensitive_type	Name of the sensitive column type

Examples

Disable protection for all columns identified by `SSN_TYPE`:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE ('SSN_TYPE');
```

DROP_POLICY Procedure

This procedure removes a TDSP policy or one of its condition-enable_options combinations.

Syntax

```
DBMS_TSDP_PROTECT.DROP_POLICY (
   policy_name              IN VARCHAR2,
   policy_apply_condition   IN POLICY_CONDITION default TSDP$null_condition);

DBMS_TSDP_PROTECT.DROP_POLICY (
   policy_name              IN VARCHAR2);
```

Parameters

Table 171–9 DROP_POLICY Procedure Parameters

Parameter	Description
policy_name	Name of the policy to drop
policy_apply_condition	To be initialized with the relevant condition

Usage Notes

- The combination of policy_condition and policy_enable_options can be dropped from a TSDP policy by giving the policy_apply_condition parameter. The default condition-default options combination can also be dropped (if it exists for the policy) by passing an empty associative array of type DBMS_TSDP_PROTECT.POLICY_CONDITION.
- If the condition-enable_options combination that is being dropped is the last condition-enable_options combination for the policy, the policy itself is dropped.
- A policy can be completely dropped by using the overloaded of the procedure that takes only policy_name.
- A policy or one of its conditions can be dropped only if the policy is not associated with any sensitive column type. This also means that a policy that is being dropped is not enabled on any column (object).

Examples

Dropping the condition-enable_options combination based on a specific condition:

```
DECLARE
   policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
   policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
   DBMS_TSDP_PROTECT.DROP_POLICY ('PARTIAL_MASK_POLICY', policy_conditions);
END;
```

The default condition-enable_options combination can be dropped by passing an empty associative array of type DBMS_TSDP_PROTECT.POLICY_CONDITIONS for the policy_apply_condition parameter:

```
DECLARE
   policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
```

```
  DBMS_TSDP_PROTECT.DROP_POLICY ('redact_partial_cc', policy_conditions);
END;
```

Dropping a TSDP policy:

```
BEGIN
   DBMS_TSDP_PROTECT.DROP_POLICY(
   policy_name => 'PARTIAL_MASK_POLICY');
END;
```

ENABLE_PROTECTION_COLUMN Procedure

This procedure enables protection for columns.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN (
   schema_name        IN  VARCHAR2 DEFAULT '%',
   table_name         IN  VARCHAR2 DEFAULT '%',
   column_name        IN  VARCHAR2 DEFAULT '%',
   policy_name        IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 171–10 ENABLE_PROTECTION_COLUMN Procedure Parameters

Parameter	Description
schema_name	Name of the schema containing the column
table_name	Table containing the column
column_name	Column name
policy_name	Optional policy name. If given, only this policy is enabled.

Usage Notes

- Only a TSDP Policy that is associated with the sensitive column type of the sensitive column can be enabled using this Procedure.
- LIKE condition is used for schema_name, table_name and column_name. AND semantics is followed.

Examples

Enable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

ENABLE_PROTECTION_SOURCE Procedure

This procedure enables protection based on the source of truth for the sensitive columns.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE (
   discovery_sourcename      IN  VARCHAR2);
```

Parameters

Table 171–11 ENABLE_PROTECTION_SOURCE Procedure Parameters

Parameter	Description
discovery_sourcename	Name of the discovery source. This could be the Application Data Model (ADM) name or the database user.

Examples

Enable protection for all columns corresponding to ADM_Demo:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE ('ADM_Demo');
```

ENABLE_PROTECTION_TYPE Procedure

This procedure enables protection for a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE (
   sensitive_type         IN VARCHAR2);
```

Parameters

Table 171–12 ENABLE_PROTECTION_TYPE Procedure Parameters

Parameter	Description
sensitive_type	Name of the sensitive column type

Examples

Enable protection for all columns identified by SSN_TYPE:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE ('SSN_TYPE');
```

172

DBMS_TTS

The DBMS_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view `TRANSPORT_SET_VIOLATIONS`.

See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Upgrade Guide*

This chapter contains the following topics:

Using DBMS_TTS

Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user SYS.

Exceptions

```
ts_not_found  EXCEPTION;
PRAGMA exception_init(ts_not_found, -29304);
ts_not_found_num NUMBER := -29304;

invalid_ts_list  EXCEPTION;
PRAGMA exception_init(invalid_ts_list, -29346);
invalid_ts_list_num NUMBER := -29346;

sys_or_tmp_ts     EXCEPTION;
PRAGMA exception_init(sys_or_tmp_ts, -29351);
sys_or_tmp_ts_num NUMBER := -29351;
```

Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently:

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.
- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.

Summary of DBMS_TTS Subprograms

These two procedures are designed to be called by database administrators.

Table 172–1 DBMS_TTS Package Subprograms

Subprogram	Description
DOWNGRADE Procedure on page 172-7	Downgrades transportable tablespace-related data
TRANSPORT_SET_CHECK Procedure on page 172-8	Checks if a set of tablespaces (to be transported) is self-contained

DOWNGRADE Procedure

This procedure downgrades transportable tablespace related data.

Syntax

```
DBMS_TTS.DOWNGRADE;
```

TRANSPORT_SET_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

Syntax

```
DBMS_TTS.TRANSPORT_SET_CHECK (
   ts_list          IN CLOB,
   incl_constraints IN BOOLEAN DEFAULT FALSE,
   full_check       IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 172–2 TRANSPORT_SET_CHECK Procedure Parameters

Parameter	Description
ts_list	List of one or more tablespaces, separated by comma.
incl_constraints	TRUE if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The incl_constraints parameter is a default so that TRANSPORT_SET_CHECK will work if it is called with only the ts_list argument.)
full_check	Indicates whether a full or partial dependency check is required. If TRUE, treats all IN and OUT pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to TRUE for TSPITR or if a strict version of transportable is desired. By default the parameter is set to FALSE. It will only consider OUT pointers as violations.

Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

```
SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
```

173

DBMS_TYPES

The DBMS_TYPES package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- Using DBMS_TYPES
  - Constants
  - Exceptions

Using DBMS_TYPES

- Constants
- Exceptions

Constants

The following table lists the constants in the DBMS_TYPES package.

Table 173–1 DBMS_TYPES Constants

Constant	Description
NO_DATA	Is only relevant if PieceWise is called, for a collection or any dataset. Denotes the end of collection/any dataset when all the elements have been accessed
SUCCESS	The operation succeeded
TYPECODE_BDOUBLE	A NUMBER type
TYPECODE_BFILE	A BFILE type
TYPECODE_BFLOAT	A NUMBER type
TYPECODE_BLOB	A BLOB type
TYPECODE_CFILE	A CFILE type
TYPECODE_CHAR	A CHAR type
TYPECODE_CLOB	A CLOB type
TYPECODE_DATE	A DATE type
TYPECODE_INTERVAL_DS	An INTERVAL_DS type
TYPECODE_INTERVAL_YM	A INTERVAL_YM type
TYPECODE_MLSLABEL	An MLSLABEL type
TYPECODE_NAMEDCOLLECTION	A named collection (VARRAY/nested table) type
TYPECODE_NCHAR	A NCHAR type
TYPECODE_NCLOB	A NCLOB type
TYPECODE_NUMBER	A NUMBER type
TYPECODE_NVARCHAR2	A NVARCHAR2 type
TYPECODE_OBJECT	An OBJECT type
TYPECODE_OPAQUE	An OPAQUE type
TYPECODE_RAW	A RAW type
TYPECODE_REF	A REF type
TYPECODE_TABLE	A nested table collection type
TYPECODE_TIMESTAMP	A TIMESTAMP type
TYPECODE_TIMESTAMP_LTZ	A TIMESTAMP_LTZ type
TYPECODE_TIMESTAMP_TZ	A TIMESTAMP_TZ type
TYPECODE_UROWID	A UROWID type
TYPECODE_VARCHAR2	A VARCHAR2 type
TYPECODE_VARCHAR	A VARCHAR type
TYPECODE_VARRAY	A VARRAY collection type

Exceptions

- INVALID_PARAMETERS
- INCORRECT_USAGE
- TYPE_MISMATCH

174

DBMS_UTILITY

The DBMS_UTILITY package provides various utility subprograms.

This chapter contains the following topics:

Using DBMS_UTILITY

Security Model

DBMS_UTILITY runs with the privileges of the calling user for the NAME_RESOLVE Procedure and the COMPILE_SCHEMA Procedure. This is necessary so that the SQL works correctly.

The package does not run as SYS. The privileges are checked using DBMS_DDL.

Constants

The DBMS_UTILITY package uses the constants shown in Table 174–1, " DBMS_UTILITY Constants".

Table 174–1 DBMS_UTILITY Constants

Name	Type	Value	Description
INV_ERROR_ON_ RESTRICTIONS	PLS_INTEGER	1	This constant is the only legal value for the p_option_flags parameter of the INVALIDATE subprogram

Exceptions

The following table lists the exceptions raised by DBMS_UTILITY.

Table 174–2 Exceptions Raised by DBMS_UTILITY

Exception	Error Code	Description
INV_NOT_EXIST_OR_NO_PRIV	-24237	Raised by the INVALIDATE subprogram when the object_id argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated
INV_MALFORMED_SETTINGS	-24238	Raised by the INVALIDATE subprogram if a compiler setting is specified more than once in the p_plsql_object_settings parameter
INV_RESTRICTED_OBJECT	-24239	Raised by the INVALIDATE subprogram when different combinations of conditions pertaining to the p_object_id parameter are contravened

Data Structures

The DBMS_UTILITY package defines a single RECORD type and TABLE types.

Record Types

- INSTANCE_RECORD Record Type

Table Types

- DBLINK_ARRAY TABLE Type
- INDEX_TABLE_TYPE Table Type
- INSTANCE_TABLE Table Type
- LNAME_ARRAY Table Type
- NAME_ARRAY Table Type
- NUMBER_ARRAY Table Type
- UNCL_ARRAY Table Type

INSTANCE_RECORD Record Type

This type describes a list of active instance number-name pairs.

Syntax

```
TYPE INSTANCE_RECORD IS RECORD (
     inst_number   NUMBER,
     inst_name     VARCHAR2(60));
```

Fields

Table 174–3 INSTANCE_RECORD Record Type Fields

Field	Description
inst_number	Active instance number
inst_name	Instance name

DBLINK_ARRAY TABLE Type

This type stores a list of database links.

Syntax

```
TYPE DBLINK_ARRAY IS TABLE OF VARCHAR2(128) INDEX BY BINARY_INTEGER;
```

INDEX_TABLE_TYPE Table Type

This type describes the order in which generated objects are returned to a user.

Syntax

```
TYPE INDEX_TABLE_TYPE IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

INSTANCE_TABLE Table Type

This type describes a table of INSTANCE_RECORD Record Type.

Syntax

```
TYPE INSTANCE_TABLE IS TABLE OF INSTANCE_RECORD INDEX BY BINARY_INTEGER;
```

Usage Notes

The starting index of `INSTANCE_TABLE` Is 1; `INSTANCE_TABLE` Is Dense.

LNAME_ARRAY Table Type

This type stores lists of `LONG NAME` including fully qualified attribute names.

Syntax

```
TYPE LNAME_ARRAY IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

NAME_ARRAY Table Type

This type stores lists of `NAME`.

Syntax

```
TYPE NAME_ARRAY IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

NUMBER_ARRAY Table Type

This type describes the order in which generated objects are returned to users.

Syntax

```
TYPE NUMBER_ARRAY IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

UNCL_ARRAY Table Type

This type stores lists of "user"."name"."column"@link

Syntax

```
TYPE UNCL_ARRAY IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_UTILITY Subprograms

Table 174–4 DBMS_UTILITY Package Subprograms

Subprogram	Description
ACTIVE_INSTANCES Procedure on page 174-17	Returns the active instance
ANALYZE_DATABASE Procedure on page 174-18	Analyzes all the tables, clusters and indexes in a database
ANALYZE_PART_OBJECT Procedure on page 174-19	Analyzes the given tables and indexes
ANALYZE_SCHEMA Procedure on page 174-20	Analyzes all the tables, clusters and indexes in a schema
CANONICALIZE Procedure on page 174-21	Canonicalizes a given string
COMMA_TO_TABLE Procedures on page 174-22	Converts a comma-delimited list of names into a PL/SQL table of names
COMPILE_SCHEMA Procedure on page 174-23	Compiles all procedures, functions, packages, views and triggers in the specified schema
CREATE_ALTER_TYPE_ERROR_TABLE Procedure on page 174-24	Creates an error table to be used in the `EXCEPTION` clause of the `ALTER TYPE` statement
CURRENT_INSTANCE Function on page 174-25	Returns the current connected instance number
DATA_BLOCK_ADDRESS_BLOCK Function on page 174-26	Gets the block number part of a data block address
DATA_BLOCK_ADDRESS_FILE Function on page 174-27	Gets the file number part of a data block address
DB_VERSION Procedure on page 174-28	Returns version information for the database
EXEC_DDL_STATEMENT Procedure on page 174-29	Executes the DDL statement in `parse_string`
EXPAND_SQL_TEXT Procedure on page 174-30	Recursively replaces any view references in the input SQL query with the corresponding view subquery
FORMAT_CALL_STACK Function on page 174-31	Formats the current call stack
FORMAT_ERROR_BACKTRACE Function on page 174-32	Formats the backtrace from the point of the current error to the exception handler where the error has been caught
FORMAT_ERROR_STACK Function on page 174-35	Formats the current error stack
GET_CPU_TIME Function on page 174-36	Returns the current CPU time in 100th's of a second
GET_DEPENDENCY Procedure on page 174-37	Shows the dependencies on the object passed in.
GET_ENDIANNESS Function on page 174-37	Gets the endianness of the database platform
GET_HASH_VALUE Function on page 174-39	Computes a hash value for the given string

Table 174–4 (Cont.) DBMS_UTILITY Package Subprograms

Subprogram	Description
GET_PARAMETER_VALUE Function on page 174-40	Gets the value of specified init.ora parameter
GET_SQL_HASH Function on page 174-42	Computes a hash value for the given string using MD5 algorithm
GET_TIME Function on page 174-43	Returns the current time in 100th's of a second
GET_TZ_TRANSITIONS Procedure on page 174-44	Returns timezeone transitions by `regionid` from the `timezone.dat` file
INVALIDATE Procedure on page 174-45	Invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings
IS_BIT_SET Function on page 174-48	Checks the bit setting for the given bit in the given `RAW` value
IS_CLUSTER_DATABASE Function on page 174-49	Determines if the database is running in cluster database mode
MAKE_DATA_BLOCK_ ADDRESS Function on page 174-50	Creates a data block address given a file number and a block number
NAME_RESOLVE Procedure on page 174-51	Resolves the given name
NAME_TOKENIZE Procedure on page 174-53	Calls the parser to parse the given name
OLD_CURRENT_SCHEMA Function on page 174-54	Returns the session value from `SYS_CONTEXT ('USERENV', 'CURRENT_SCHEMA')`
OLD_CURRENT_USER Function on page 174-55	Returns the session value from `SYS_CONTEXT ('USERENV', 'CURRENT_USER')`
PORT_STRING Function on page 174-56	Returns a string that uniquely identifies the version of Oracle and the operating system
SQLID_TO_SQLHASH Function on page 174-57	Converts a SQL ID into a hash value
TABLE_TO_COMMA Procedures on page 174-58	Converts a PL/SQL table of names into a comma-delimited list of names
VALIDATE Procedure on page 174-59	Makes invalid database objects valid
WAIT_ON_PENDING_DML Function on page 174-61	Waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified SCN have either committed or been rolled back

ACTIVE_INSTANCES Procedure

This procedure returns the active instance.

Syntax

```
DBMS_UTILITY.ACTIVE_INSTANCES (
   instance_table   OUT INSTANCE_TABLE,
   instance_count   OUT NUMBER);
```

Parameters

Table 174–5 ACTIVE_INSTANCES Procedure Parameters

Procedure	Description
instance_table	Contains a list of the active instance numbers and names. When no instance is up, the list is empty.
instance_count	Number of active instances

ANALYZE_DATABASE Procedure

This procedure analyzes all the tables, clusters and indexes in a database.

Syntax

```
DBMS_UTILITY.ANALYZE_DATABASE (
   method             IN  VARCHAR2,
   estimate_rows      IN  NUMBER DEFAULT NULL,
   estimate_percent   IN  NUMBER DEFAULT NULL,
   method_opt         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 174–6 ANALYZE_DATABASE Procedure Parameters

Parameter	Description
method	One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.
estimate_rows	Number of rows to estimate
estimate_percent	Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.
method_opt	Method options of the following format: [FOR TABLE] [FOR ALL [INDEXED] COLUMNS] [SIZE n] [FOR ALL INDEXES]

Exceptions

ORA-20000: Insufficient privileges for some object in this database

ANALYZE_PART_OBJECT Procedure

This procedure is equivalent to SQL:

```
"ANALYZE TABLE|INDEX [<schema>.]<object_name> PARTITION <pname> [<command_type>]
[<command_opt>] [<sample_clause>]
```

Syntax

```
DBMS_UTILITY.ANALYZE_PART_OBJECT (
   schema        IN VARCHAR2 DEFAULT NULL,
   object_name   IN VARCHAR2 DEFAULT NULL,
   object_type   IN CHAR     DEFAULT 'T',
   command_type  IN CHAR     DEFAULT 'E',
   command_opt   IN VARCHAR2 DEFAULT NULL,
   sample_clause IN VARCHAR2 DEFAULT 'sample 5 percent ');
```

Parameters

Table 174–7 ANALYZE_PART_OBJECT Procedure Parameters

Parameter	Description
schema	Schema of the object_name
object_name	Name of object to be analyzed, must be partitioned
object_type	Type of object, must be T (table) or I (index)
command_type	Must be V (validate structure)
command_opt	Other options for the command type. For C, E it can be FOR table, FOR all LOCAL indexes, FOR all columns or combination of some of the 'for' options of analyze statistics (table). For V, it can be CASCADE when object_type is T.
sample_clause	Sample clause to use when command_type is 'E'

Usage Notes

For each partition of the object, run in parallel using job queues.

ANALYZE_SCHEMA Procedure

This procedure analyzes all the tables, clusters and indexes in a schema.

Syntax

```
DBMS_UTILITY.ANALYZE_SCHEMA (
   schema             IN  VARCHAR2,
   method             IN  VARCHAR2,
   estimate_rows      IN  NUMBER DEFAULT NULL,
   estimate_percent   IN  NUMBER DEFAULT NULL,
   method_opt         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 174–8 ANALYZE_SCHEMA Procedure Parameters

Parameter	Description
schema	Name of the schema
method	One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.
estimate_rows	Number of rows to estimate
estimate_percent	Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.
method_opt	Method options of the following format: [FOR TABLE] [FOR ALL [INDEXED] COLUMNS] [SIZE n] [FOR ALL INDEXES]

Exceptions

ORA-20000: Insufficient privileges for some object in this schema

CANONICALIZE Procedure

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as 'table'), and strips off white spaces for a single identifier so that ' table ' becomes TABLE.

Syntax

```
DBMS_UTILITY.CANONICALIZE(
   name           IN    VARCHAR2,
   canon_name     OUT   VARCHAR2,
   canon_len      IN    BINARY_INTEGER);
```

Parameters

Table 174–9 CANONICALIZE Procedure Parameters

Parameter	Description
name	String to be canonicalized
canon_name	Canonicalized string
canon_len	Length of the string (in bytes) to canonicalize

Return Values

Returns the first canon_len bytes in canon_name.

Usage Notes

- If name is NULL, canon_name becomes NULL.
- If name is not a dotted name, and if name begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with NLS_UPPER. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If name is a dotted name (such as a."b".c), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with NLS_UPPER and apply begin and end double quotes to the capitalized form of this component. In such a case, each canonicalized component will be concatenated together in the input position, separated by ".".
- Any other character after a[.b]* will be ignored.
- The procedure does not handle cases like 'A B.'

Examples

- a becomes A
- "a" becomes a
- "a".b becomes "a"."B"
- "a".b,c.f becomes "a"."B" with",c.f" ignored.

COMMA_TO_TABLE Procedures

These procedures converts a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.COMMA_TO_TABLE (
   list   IN  VARCHAR2,
   tablen OUT BINARY_INTEGER,
   tab    OUT uncl_array);

DBMS_UTILITY.COMMA_TO_TABLE (
   list   IN  VARCHAR2,
   tablen OUT BINARY_INTEGER,
   tab    OUT lname_array);
```

Parameters

Table 174–10 COMMA_TO_TABLE Procedure Parameters

Parameter	Description
`list`	Comma separated list of list of 'names', where a name should have the following format for the first overloading: `a [. b [. c ]][ @ d ]` and the following format for the second overloading: `a [. b]*` where `a`, `b`, `c`, `d` are simple identifiers (quoted or unquoted).
`tablen`	Number of tables in the PL/SQL table
`tab`	PL/SQL table which contains list of names

Return Values

A PL/SQL table is returned, with values `1..n` and `n+1` is `null`.

Usage Notes

- The `list` must be a non-empty comma-delimited list: Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.
- Entries in the comma-delimited list cannot include multibyte characters.
- The values in `tab` are copied from the original list, with no transformations.
- The procedure fails if the string between separators is longer than 30 bytes.

COMPILE_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

Syntax

```
DBMS_UTILITY.COMPILE_SCHEMA (
   schema          IN VARCHAR2,
   compile_all     IN BOOLEAN DEFAULT TRUE,
   reuse_settings  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 174–11 COMPILE_SCHEMA Procedure Parameters

Parameter	Description
schema	Name of the schema
compile_all	If TRUE, will compile everything within the schema regardless of whether it is VALID
	If FALSE, will compile only INVALID objects
reuse_settings	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

Exceptions

Table 174–12 COMPILE_SCHEMA Procedure Exceptions

Exception	Description
ORA-20000	Insufficient privileges for some object in this schema
ORA-20001	Cannot recompile SYS objects
ORA-20002	Maximum iterations exceeded. Some objects may not have been recompiled.

Usage Notes

- Note that this subprogram is a wrapper for theRECOMP_SERIAL Procedure included with the UTL_RECOMP package.
- After calling this procedure, you should select from view ALL_OBJECTS for items with status of INVALID to see if all objects were successfully compiled.
- To see the errors associated with INVALID objects, you may use the Enterprise Manager command:

  ```
  SHOW ERRORS <type> <schema>.<name>
  ```

CREATE_ALTER_TYPE_ERROR_TABLE Procedure

This procedure creates an error table to be used in the `EXCEPTION` clause of the `ALTER TYPE` statement.

Syntax

```
DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(
   schema_name      IN     VARCHAR2,
   table_name       IN     VARCHAR2);
```

Parameters

Table 174–13 CREATE_ALTER_TYPE_ERROR_TABLE Procedure Parameters

Parameter	Description
`schema_name`	Name of the schema
`table_name`	Name of the table created

Exceptions

An error is returned if the table already exists.

CURRENT_INSTANCE Function

This function returns the current connected instance number. It returns `NULL` when connected instance is down.

Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE
   RETURN NUMBER;
```

DATA_BLOCK_ADDRESS_BLOCK Function

This function gets the block number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (
   dba NUMBER)
  RETURN NUMBER;
```

Parameters

Table 174–14 DATA_BLOCK_ADDRESS_BLOCK Function Parameters

Parameter	Description
dba	Data block address

Pragmas

```
pragma restrict_references(data_block_address_block, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Block offset of the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

DATA_BLOCK_ADDRESS_FILE Function

This function gets the file number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (
   dba NUMBER)
  RETURN NUMBER;
```

Parameters

Table 174–15 DATA_BLOCK_ADDRESS_FILE Function Parameters

Parameter	Description
dba	Data block address

Pragmas

```
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

Return Values

File that contains the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

DB_VERSION Procedure

This procedure returns version information for the database.

Syntax

```
DBMS_UTILITY.DB_VERSION (
   version       OUT VARCHAR2,
   compatibility OUT VARCHAR2);
```

Parameters

Table 174–16 DB_VERSION Procedure Parameters

Parameter	Description
`version`	A string which represents the internal software version of the database (for example, 7.1.0.0.0). The length of this string is variable and is determined by the database version.
`compatibility`	The compatibility setting of the database determined by the "compatible" `init.ora` parameter. If the parameter is not specified in the `init.ora` file, then `NULL` is returned.

EXEC_DDL_STATEMENT Procedure

This procedure executes the DDL statement in `parse_string`.

Syntax

```
DBMS_UTILITY.EXEC_DDL_STATEMENT (
   parse_string IN VARCHAR2);
```

Parameters

Table 174–17 EXEC_DDL_STATEMENT Procedure Parameters

Parameter	Description
`parse_string`	DDL statement to be executed

EXPAND_SQL_TEXT Procedure

This procedure recursively replaces any view references in the input SQL query with the corresponding view subquery.

Syntax

```
DBMS_UTILITY.EXPAND_SQL_TEXT (
   input_sql_text     IN           CLOB,
   output_sql_text    OUT NOCOPY   CLOB);
```

Parameters

Table 174–18 EXPAND_SQL_TEXT Procedure Parameters

Parameter	Description
input_sql_text	Input SQL query text
output_sql_text	View-expanded query text

Exceptions

Table 174–19 EXPAND_SQL_TEXT Procedure Exceptions

Exception	Description
ORA-00942	Current user does not have select privileges on all the views and tables recursively referenced in the input_sql_text
ORA-24251	input_sql_text is not a SELECT statement
ORA-00900	Input is not valid
ORA-29477	Input LOB size exceeds maximum size of 4GB -1

Usage Notes

The expanded and merged SQL statement text is copied to output_sql_text on successful completion. The resulting query text only contains references to underlying tables and is semantically equivalent with some caveats:

- If there are invoker rights functions called from any of the views, they may be called as a different user in the resulting query text if the view owner is different from the user who will eventually compile/run the expanded SQL text.
- The VPD policy expands differently if there is a function supplied to generate the dynamic WHERE clause. This function would return differently, for example, if the userid caused the expansion to be different.
- If there are references to remote objects, results are undetermined.

FORMAT_CALL_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

Syntax

```
DBMS_UTILITY.FORMAT_CALL_STACK
  RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(format_call_stack,WNDS);
```

Return Values

This returns the call stack, up to 2000 bytes.

FORMAT_ERROR_BACKTRACE Function

This function displays the call stack at the point where an exception was raised, even if the subprogram is called from an exception handler in an outer scope. The output is similar to the output of the SQLERRM function, but not subject to the same size limitation.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_BACKTRACE
  RETURN VARCHAR2;
```

Return Values

The backtrace string. A NULL string is returned if no error is currently being handled.

Examples

```
CREATE OR REPLACE PROCEDURE Log_Errors ( i_buff in varchar2 ) IS
  g_start_pos integer := 1;
  g_end_pos  integer;

  FUNCTION Output_One_Line RETURN BOOLEAN IS
  BEGIN
    g_end_pos := Instr ( i_buff, Chr(10), g_start_pos );

    CASE g_end_pos > 0
      WHEN true THEN
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
g_end_pos-g_start_pos ) );
        g_start_pos := g_end_pos+1;
        RETURN TRUE;

      WHEN FALSE THEN
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
(Length(i_buff)-g_start_pos)+1 ) );
        RETURN FALSE;
    END CASE;
  END Output_One_Line;

BEGIN
  WHILE Output_One_Line() LOOP NULL;
  END LOOP;
END Log_Errors;

    or database administrator.
*/
```

FORMAT_ERROR_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_STACK
  RETURN VARCHAR2;
```

Return Values

This returns the error stack, up to 2000 bytes.

GET_CPU_TIME Function

This function returns a measure of current CPU processing time in hundredths of a second. The difference between the times returned from two calls measures the CPU processing time (not the total elapsed time) between those two points.

Syntax

```
DBMS_UTILITY.GET_CPU_TIME
 RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from some arbitrary epoch.

Usage Notes

The amount of work performed is calculated by measuring the difference between a start point and end point for a particular operation.

GET_DEPENDENCY Procedure

This procedure shows the dependencies on the object passed in.

Syntax

```
DBMS_UTILITY.GET_DEPENDENCY
 type      IN     VARCHAR2,
 schema    IN     VARCHAR2,
 name      IN     VARCHAR2);
```

Parameters

Table 174–20 GET_DEPENDENCY Procedure Parameters

Parameter	Description
type	Type of the object, for example if the object is a table give the type as 'TABLE'
schema	Schema name of the object
name	Name of the object

Usage Notes

This procedure uses the DBMS_OUTPUTpackage to display results, and so you must declare SET SERVEROUTPUT ON if you wish to view dependencies. Alternatively, any application that checks the DBMS_OUTPUT output buffers can invoke this subprogram and then retrieve the output by means of DBMS_OUTPUT subprograms such as GET_LINES.

GET_ENDIANNESS Function

This function gets the endianness of the database platform.

Syntax

```
DBMS_UTILITY.GET_ENDIANNESS
 RETURN NUMBER;
```

Return Values

A `NUMBER` value indicating the endianness of the database platform: 1 for big-endian or 2 for little-endian.

GET_HASH_VALUE Function

This function computes a hash value for the given string.

Syntax

```
DBMS_UTILITY.GET_HASH_VALUE (
   name      VARCHAR2,
   base      NUMBER,
   hash_size NUMBER)
  RETURN NUMBER;
```

Parameters

Table 174–21 GET_HASH_VALUE Function Parameters

Parameter	Description
name	String to be hashed.
base	Base value for the returned hash value at which to start
hash_size	Desired size of the hash table

Pragmas

```
pragma restrict_references(get_hash_value, WNDS, RNDS, WNPS, RNPS);
```

Return Values

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the hash_size value. Using a power of 2 for the hash_size parameter works best.

GET_PARAMETER_VALUE Function

This function gets the value of specified `init.ora` parameter.

Syntax

```
DBMS_UTILITY.GET_PARAMETER_VALUE (
   parnam     IN        VARCHAR2,
   intval     IN OUT    BINARY_INTEGER,
   strval     IN OUT    VARCHAR2,
   listno     IN        BINARY_INTEGER DEFAULT 1)
  RETURN BINARY_INTEGER;
```

Parameters

Table 174–22 GET_PARAMETER_VALUE Function Parameters

Parameter	Description
`parnam`	Parameter name
`intval`	Value of an integer parameter or the value length of a string parameter
`strval`	Value of a string parameter
`listno`	List item number. If retrieving parameter values for a parameter that can be specified multiple times to accumulate values, use this parameter to get each individual parameter.

Return Values

Parameter type:

- 0 if parameter is an `INTEGER/BOOLEAN` parameter
- 1 if parameter is a string/file parameter

Usage Notes

- To execute the this function, you must have the `SELECT` privilege on the V$PARAMETER dynamic view.
- When using `DBMS_UTILITY.GET_PARAMETER_VALUE`, only the first parameter setting of `/dir1` is returned when `init.ora` is set as follows:

  ```
  utl_file_dir = /dir1
  utl_file_dir = /dir2
  ```

  However, the full comma-delimited string is returned if you are using:

  ```
  utl_file_dir = /dir1, /dir2
  ```

Examples

```
DECLARE
  parnam VARCHAR2(256);
  intval BINARY_INTEGER;
  strval VARCHAR2(256);
  partyp BINARY_INTEGER;
BEGIN
  partyp := dbms_utility.get_parameter_value('max_dump_file_size',
```

```
                                                intval, strval);
  dbms_output.put('parameter value is: ');
  IF partyp = 1 THEN
    dbms_output.put_line(strval);
  ELSE
    dbms_output.put_line(intval);
  END IF;
  IF partyp = 1 THEN
    dbms_output.put('parameter value length is: ');
    dbms_output.put_line(intval);
  END IF;
  dbms_output.put('parameter type is: ');
  IF partyp = 1 THEN
    dbms_output.put_line('string');
  ELSE
    dbms_output.put_line('integer');
  END IF;
END;
```

GET_SQL_HASH Function

This function computes a hash value for the given string using MD5 algorithm.

Syntax

```
Dbms_utility.get_sql_hash (
   name          IN   VARCHAR2,
   hash          OUT  RAW,
   pre10ihash    OUT  NUMBER)
  RETURN NUMBER;
```

Pragmas

Pragma Restrict_references(`Get_sql_hash`, `Wnds`, `Rnds`, `Wnps`, `Rnps`);

Parameters

Table 174–23 GET_SQL_HASH Procedure Parameters

Parameter	Description
`name`	String to be hashed
`hash`	Optional field to store all 16 bytes of returned hash value
`pre10ihash`	Optional field to store the pre 10i database version hash value

Return Values

A hash value (last 4 bytes) based on the input string. the MD5 hash algorithm computes a 16 byte hash value, but we only return the last 4 bytes so that we can return an actual number. one could use an optional raw parameter to get all 16 bytes and to store the pre 10*i* hash value of 4 bytes in the pre10*i* hash optional parameter.

GET_TIME Function

This function determines the current time in 100th's of a second. This subprogram is primarily used for determining elapsed time. The subprogram is called twice – at the beginning and end of some process – and then the first (earlier) number is subtracted from the second (later) number to determine the time elapsed.

Syntax

```
DBMS_UTILITY.GET_TIME
  RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from the point in time at which the subprogram is invoked.

Usage Notes

Numbers are returned in the range -2147483648 to 2147483647 depending on platform and machine, and your application must take the sign of the number into account in determining the interval. For instance, in the case of two negative numbers, application logic must allow that the first (earlier) number will be larger than the second (later) number which is closer to zero. By the same token, your application should also allow that the first (earlier) number be negative and the second (later) number be positive.

GET_TZ_TRANSITIONS Procedure

This procedure returns time zone transitions by `regionid` from the `timezone.dat` file.

Syntax

```
DBMS_UTILITY.GET_TZ_TRANSITIONS
   regionid      IN     NUMBER,
   transitions   OUT    MAXRAW);
```

Parameters

Table 174–24 GET_TZ_TRANSITIONS Procedure Parameters

Parameter	Description
`regionid`	Number corresponding to the region
`transitions`	Raw bytes from the `timezone.dat` file

Exceptions

Table 174–25 GET_TZ_TRANSITIONS Procedure Exceptions

Exception	Description
`ORA-6502: PL/SQL: NUMERIC OR VALUE ERROR`	For an invalid `regionid`

INVALIDATE Procedure

This procedure invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings. It also invalidates any objects that (directly or indirectly) depend on the object being invalidated.

Syntax

```
DBMS_UTILITY.INVALIDATE (
   p_object_id              NUMBER,
   p_plsql_object_settings  VARCHAR2 DEFAULT NULL,
   p_option_flags           PLS_INTEGER DEFAULT 0);
```

Parameters

Table 174–26 INVALIDATE Procedure Parameters

Parameter	Description
p_object_id	ID number of object to be invalidated. This is the same as the value of the OBJECT_ID column from ALL_OBJECTS. If the object_id argument is NULL or invalid then the exception inv_not_exist_or_no_priv is raised. The caller of this procedure must have create privileges on the object being invalidated else the inv_not_exist_or_no_priv exception is raised.
p_plsql_object_settings	Optional parameter that ignored if the object specified by p_object_id is not a PL/SQL object. If no value is specified for this parameter then the PL/SQL compiler settings are left unchanged, that is, equivalent to REUSE SETTINGS. If a value is provided, it must specify the values of the PL/SQL compiler settings separated by one or more spaces. Each setting can be specified only once else inv_malformed_settings exception will be raised. The setting values are changed only for the object specified by p_object_id and do not affect dependent objects that may be invalidated. The setting names and values are case insensitive. If a setting is omitted and REUSE SETTINGS is specified, then if a value was specified for the compiler setting in an earlier compilation of this library unit, Oracle Database uses that earlier value. If a setting is omitted and REUSE SETTINGS was not specified or no value has been specified for the parameter in an earlier compilation, then the database will obtain the value for that setting from the session environment.
p_option_flags	Optional parameter defaults to zero (no flags). Option flags supported by invalidate. ■ inv_error_on_restrictions (see Constants on page 174-4): The subprogram imposes various restrictions on the objects that can be invalidated. For example, the object specified by p_object_id cannot be a table. By default, invalidate quietly returns on these conditions (and does not raise an exception). If the caller sets this flag, the exception inv_restricted_object is raised.

Exceptions

Table 174–27 INVALIDATE Exceptions

Exception	Description
INV_NOT_EXIST_OR_NO_PRIV	Raised when the object_id argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated
INV_MALFORMED_SETTINGS	Raised if a compiler setting is specified more than once in the p_plsql_object_settings parameter
INV_RESTRICTED_OBJECT	Raised when different combinations of conditions pertaining to the p_object_id parameter are contravened

Usage Notes

The object type (object_type column from ALL_OBJECTS) of the object specified by p_object_id must be a PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY, TRIGGER, TYPE, TYPE BODY, LIBRARY, VIEW, OPERATOR, SYNONYM, or JAVA CLASS. If the object is not one of these types and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

If the object specified by p_object_id is the package specification of STANDARD, DBMS_STANDARD, or specification or body of DBMS_UTILITY and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

If the object specified by p_object_id is an object type specification and there exist tables which depend on the type and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

Examples

Example 1

```
DBMS_UTILITY.INVALIDATE (1232, 'PLSQL_OPTIMIZE_LEVEL = 2 REUSE SETTINGS');
```

Assume that the object_id 1232 refers to the procedure remove_emp in the HR schema. Then the above call will mark the remove_emp procedure invalid and change it's PLSQL_OPTIMIZE_LEVEL compiler setting to 2. The values of other compiler settings will remain unchanged since REUSE SETTINGS is specified.

Objects that depend on hr.remove_emp will also get marked invalid. Their compiler parameters will not be changed.

Example 2

```
DBMS_UTILITY.INVALIDATE (40775, 'plsql_code_type = native');
```

Assume that the object_id 40775 refers to the type body leaf_category_typ in the OE schema. Then the above call will mark the type body invalid and change its PLSQL_CODE_TYPE compiler setting to NATIVE. The values of other compiler settings will be picked up from the current session environment since REUSE SETTINGS has not been specified.

Since no objects can depend on bodies, there are no cascaded invalidations.

Example 3

```
DBMS_UTILITY.INVALIDATE (40796);
```

Assume that the `object_id` 40796 refers to the view `oc_orders` in the `OE` schema. Then the above call will mark the `oc_orders` view invalid.

Objects that depend on `oe.oc_orders` will also get marked invalid.

IS_BIT_SET Function

This function checks the bit setting for the given bit in the given RAW value.

Syntax

```
DBMS_UTILITY.IS_BIT_SET (
   r     IN    RAW,   n     IN    NUMBER)
 RETURN NUMBER;
```

Parameters

Table 174–28 IS_BET_SET Function Parameters

Parameter	Description
r	RAW source
n	Bit in r to check

Return Values

This function returns 1 if bit n in raw r is set, zero otherwise. Bits are numbered high to low with the lowest bit being bit number 1.

IS_CLUSTER_DATABASE Function

This function finds out if this database is running in cluster database mode.

Syntax

```
DBMS_UTILITY.IS_CLUSTER_DATABASE
  RETURN BOOLEAN;
```

Return Values

This function returns `TRUE` if this instance was started in cluster database mode; `FALSE` otherwise.

MAKE_DATA_BLOCK_ADDRESS Function

This function creates a data block address given a file number and a block number. A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

Syntax

```
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (
   file  NUMBER,
   block NUMBER)
  RETURN NUMBER;
```

Parameters

Table 174–29 MAKE_DATA_BLOCK_ADDRESS Function Parameters

Parameter	Description
`file`	File that contains the block
`block`	Offset of the block within the file in terms of block increments

Pragmas

```
pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Data block address.

NAME_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

Syntax

```
DBMS_UTILITY.NAME_RESOLVE (
   name          IN  VARCHAR2,
   context       IN  NUMBER,
   schema        OUT VARCHAR2,
   part1         OUT VARCHAR2,
   part2         OUT VARCHAR2,
   dblink        OUT VARCHAR2,
   part1_type    OUT NUMBER,
   object_number OUT NUMBER);
```

Parameters

Table 174–30 NAME_RESOLVE Procedure Parameters

Parameter	Description
name	Name of the object. This can be of the form [[a.]b.]c[@d], where a, b, c are SQL identifier and d is a dblink. No syntax checking is performed on the dblink. If a dblink is specified, or if the name resolves to something with a dblink, then object is not resolved, but the schema, part1, part2 and dblink OUT parameters are filled in. a, b and c may be delimited identifiers, and may contain Globalization Support (NLS) characters (single and multibyte).
context	Must be an integer between 0 and 9. ■ 0 - table ■ 1 - PL/SQL (for 2 part names) ■ 2 - sequences ■ 3 - trigger ■ 4 - Java Source ■ 5 - Java resource ■ 6 - Java class ■ 7 - type ■ 8 - Java shared data ■ 9 - index
schema	Schema of the object: c. If no schema is specified in name, then the schema is determined by resolving the name.
part1	First part of the name. The type of this name is specified part1_type (synonym or package).
part2	If this is non-NULL, then this is a subprogram name. If part1 is non-NULL, then the subprogram is within the package indicated by part1. If part1 is NULL, then the subprogram is a top-level subprogram.

Table 174–30 (Cont.) NAME_RESOLVE Procedure Parameters

Parameter	Description
dblink	If this is non-NULL, then a database link was either specified as part of name or name was a synonym which resolved to something with a database link. In this case, if further name translation is desired, then you must call the DBMS_UTILITY.NAME_RESOLVE procedure on this remote node.
part1_type	Type of part1 is: ■ 5 - synonym ■ 7 - procedure (top level) ■ 8 - function (top level) ■ 9 - package
object_number	Object identifier

Exceptions

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax error that are possible when specifying object names.

NAME_TOKENIZE Procedure

This procedure calls the parser to parse the given name as

a [. b [. c]][@ dblink]

It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as `NULL`.

Syntax

```
DBMS_UTILITY.NAME_TOKENIZE (
   name    IN  VARCHAR2,
   a       OUT VARCHAR2,
   b       OUT VARCHAR2,
   c       OUT VARCHAR2,
   dblink  OUT VARCHAR2,
   nextpos OUT BINARY_INTEGER);
```

Parameters

Table 174–31 NAME_RESOLVE Procedure Parameters

Parameter	Description
`name`	Input name, consisting of SQL identifiers (for example, scott.foo@dblink)
`a`	Output for the first token of the name
`b`	Output for the second token of the name (if applicable)
`c`	Output for the third token of the name (if applicable)
`dblink`	Output for the `dblink` of the name
`nextpos`	Next position after parsing the input name

OLD_CURRENT_SCHEMA Function

This function returns the session value from `sys_context ('userenv', 'current_schema')`.

Syntax

```
DBMS_UTILITY.OLD_CURRENT_SCHEMA
 RETURN VARCHAR2;
```

OLD_CURRENT_USER Function

This function returns the session value from `sys_context` ('`userenv`', '`current_user`').

Syntax

```
DBMS_UTILITY.OLD_CURRENT_USER
 RETURN VARCHAR2;
```

PORT_STRING Function

This function returns a string that identifies the operating system and the `TWO TASK PROTOCOL` version of the database. For example, "`VAX/VMX-7.1.0.0`"

The maximum length is port-specific.

Syntax

```
DBMS_UTILITY.PORT_STRING
   RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(port_string, WNDS, RNDS, WNPS, RNPS);
```

SQLID_TO_SQLHASH Function

This function converts a SQL ID into a hash value.

Syntax

```
DBMS_UTILITY.SQLID_TO_SQLHASH (
   sql_id    IN   VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 174–32 SQLID_TO_SQLHASH Function Parameters

Parameter	Description
sql_id	SQL ID of a SQL statement. Must be VARCHAR2(13).

TABLE_TO_COMMA Procedures

This procedure converts a PL/SQL table of names into a comma-delimited list of names. This takes a PL/SQL table, `1..n`, terminated with `n+1 null`. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.TABLE_TO_COMMA (
   tab    IN  UNCL_ARRAY,
   tablen OUT BINARY_INTEGER,
   list   OUT VARCHAR2);

DBMS_UTILITY.TABLE_TO_COMMA (
   tab    IN  lname_array,
   tablen OUT BINARY_INTEGER,
   list   OUT VARCHAR2);
```

Parameters

Table 174–33 TABLE_TO_COMMA Procedure Parameters

Parameter	Description
`tab`	PL/SQL table which contains list of table names
`tablen`	Number of tables in the PL/SQL table
`list`	Comma separated list of tables

Return Values

A comma-delimited list and the number of elements found in the table.

VALIDATE Procedure

This procedure makes invalid database objects valid.

Syntax

```
DBMS_UTILITY.VALIDATE(
    object_id       NUMBER);

DBMS_UTILITY.VALIDATE(
   owner          VARCHAR2,
   objname        VARCHAR2,
   namespace      NUMBER,   edition_name   := SYS_CONTEXT ('USERENV', 'CURRENT_
EDITION'));
```

Parameters

Table 174–34 VALIDATE Procedure Parameters

Parameter	Description
owner	Name of the user who owns the object. Same as the OWNER field in ALL_OBJECTS.
objname	Name of the object to be validated. Same as the OBJECT_NAME field in ALL_OBJECTS.
namespace	Namespace of the object. Same as the namespace field in obj$. Equivalent numeric values are as follows: ■ 1 = TABLE/PROCEDURE/TYPE ■ 2 = BODY ■ 3 = TRIGGER ■ 4 = INDEX ■ 5 = CLUSTER ■ 8 = LOB ■ 9 = DIRECTORY ■ 10 = QUEUE ■ 11 = REPLICATION OBJECT GROUP ■ 12 = REPLICATION PROPAGATOR ■ 13 = JAVA SOURCE ■ 14 = JAVA RESOURCE ■ 58 = (Data Mining) MODEL
edition_name	[Note: Currently not operable. Reserved for future use]

Usage Notes

- No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
- If the object being validated is not actual in the specified edition, the subprogram automatically switches into the edition in which the object is actual prior to validation. That is, a call to VALIDATE will not actualize the object in the specified edition.

- The INVALIDATE Procedure invalidates a database object and optionally changes its PL/SQL compiler parameter settings. The object to be invalidated is specified by its `object_id`. The subprogram automatically switches to the edition in which the object is actual prior to invalidation. That is, a call to `INVALIDATE` will not actualize the object in the current edition.

WAIT_ON_PENDING_DML Function

This function waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified `scn` have either committed or been rolled back.

Syntax

```
DBMS_UTILITY.WAIT_ON_PENDING_DML (
    tables     IN       VARCHAR2,
    timeout    IN       BINARY_INTEGER,
    scn        IN OUT   NUMBER)
  RETURN BOOLEAN;
```

Parameters

Table 174–35 WAIT_ON_PENDING_DML Function Parameters

Parameter	Description
`tables`	Comma-separated list of one or more table names. The list must be valid for COMMA_TO_TABLE Procedures, and each item valid to the NAME_RESOLVE Procedure. Neither column specifiers nor DBLINK (database link) specifiers are allowed in the names, and each name must resolve to an existing table in the local database.
`timeout`	Maximum number of seconds to wait, totalled across all tables/transactions. A `NULL` or negative value will cause a very long wait.
`scn`	SCN prior to which transactions must have begun to be considered relevant to this request. If the value is `NULL` or not recognized as a meaningful scn on input, the most current SCN across all instances will be used and will be set into the passed argument as an output. If a meaningful value is passed in, its value will be preserved in the output.

Return Values

`TRUE` if all relevant transactions have committed or been rolled back, `FALSE` if the timeout occurred prior to all relevant transactions committing or being rolled back

175

DBMS_WARNING

The DBMS_WARNING package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the PLSQL_WARNINGS initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

Using DBMS_WARNING

- Security Model

Security Model

Note that for all the following interfaces, if value of the scope parameter is `SYSTEM`, then the user must have `ALTER SYSTEM` privilege.

Summary of DBMS_WARNING Subprograms

Table 175–1 DBMS_WARNING Package Subprograms

Subprogram	Description
ADD_WARNING_SETTING_CAT Procedure on page 175-5	Modifies the current `session` or `system` warning settings of the `warning_category` previously supplied
ADD_WARNING_SETTING_NUM Procedure on page 175-6	Modifies the current `session` or `system` warning settings of the or `warning_number` previously supplied
GET_CATEGORY Function on page 175-7	Returns the category name, given the message number
GET_WARNING_SETTING_CAT Function on page 175-8	Returns the specific warning category in the session
GET_WARNING_SETTING_NUM Function on page 175-9	Returns the specific warning number in the session
GET_WARNING_SETTING_STRING Function on page 175-10	Returns the entire warning string for the current session
SET_WARNING_SETTING_STRING Procedure on page 175-11	Replaces previous settings with the new value

ADD_WARNING_SETTING_CAT Procedure

You can modify the current session's or system's warning settings with the value supplied. The value will be added to the existing parameter setting if the value for the warning_category or warning_value has not been set, or override the existing value. The effect of calling this function is same as adding the qualifier (ENABLE/DISABLE/ERROR) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_CAT (
   warning_category    IN    VARCHAR2,
   warning_value       IN    VARCHAR2,
   scope               IN    VARCHAR2);
```

Parameters

Table 175–2 ADD_WARNING_SETTING_CAT Procedure Parameters

Parameter	Description
warning_category	Name of the category. Allowed values are ALL, INFORMATIONAL, SEVERE and PERFORMANCE.
warning_value	Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.
scope	Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.

ADD_WARNING_SETTING_NUM Procedure

You can modify the current `session` or `system` warning settings with the value supplied. If the value was already set, you will override the existing value. The effect of calling this function is same as adding the qualifier (`ENABLE` / `DISABLE`/ `ERROR`) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_NUM (
   warning_number      IN    NUMBER,
   warning_value       IN    VARCHAR2,
   scope               IN    VARCHAR2);
```

Parameters

Table 175–3 ADD_WARNING_SETTING_NUM Procedure Parameters

Parameter	Description
`warning_number`	The warning number. Allowed values are all valid warning numbers.
`warning_value`	Value for the category. Allowed values are `ENABLE`, `DISABLE`, and `ERROR`.
`scope`	Specifies if the changes are being performed in the session context or the system context. Allowed values are `SESSION` or `SYSTEM`.

GET_CATEGORY Function

This function returns the category name, given the message number.

Syntax

```
DBMS_WARNING.GET_CATEGORY (
   warning_number  IN   pls_integer)
RETURN VARCHAR2;
```

Parameters

Table 175–4 GET_CATEGORY Function Parameters

Parameter	Description
warning_number	The warning message number.

GET_WARNING_SETTING_CAT Function

This function returns the specific warning category setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_CAT (
   warning_category    IN    VARCHAR2)
RETURN warning_value;
```

Parameters

Table 175–5 GET_WARNING_SETTING_CAT Function Parameters

Parameter	Description
warning_category	Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE).

GET_WARNING_SETTING_NUM Function

This function returns the specific warning number setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_NUM (
   warning_number      IN    NUMBER)
RETURN warning_value;
```

Parameters

Table 175–6 GET_WARNING_SETTING_NUM Function Parameters

Parameter	Description
warning_number	Warning number. Allowed values are all valid warning numbers.

GET_WARNING_SETTING_STRING Function

This function returns the entire warning string for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_STRING
 RETURN VARCHAR2;
```

Usage Notes

Use this function when you do not have `SELECT` or `READ` privilege on `v$parameter` or `v$paramater2` fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using `SET_WARNING_SETTING_STRING`.

SET_WARNING_SETTING_STRING Procedure

This procedure replaces previous settings with the new value. The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of '=' when issuing an `ALTER SESSION` or `SYSTEM SET PLSQL_WARNINGS` command. This will have same effect as `ALTER SESSION` OR `ALTER SYSTEM` command.

Syntax

```
DBMS_WARNING.SET_WARNING_SETTING_STRING (
   warning_value   IN   VARCHAR2,
   scope           IN   VARCHAR2);
```

Parameters

Table 175–7 SET_WARNING_SETTING_STRING Procedure Parameters

Parameter	Description
`warning_value`	The new string that will constitute the new value.
`scope`	This will specify if the changes are being done in the session context, or system context. Allowed values are `SESSION` or `SYSTEM`.

176

DBMS_WM

The DBMS_WM package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

Documentation of DBMS_WM

For a complete description of this package, see `DBMS_WM` in *Oracle Database Workspace Manager Developer's Guide.*

177

DBMS_WORKLOAD_CAPTURE

The DBMS_WORKLOAD_CAPTURE package configures the Workload Capture system and produce the workload capture data. Replay of this capture is implemented by way of the DBMS_WORKLOAD_REPLAY package.

> **See Also:** *Oracle Database Testing Guide* for more information about Database Replay

This chapter contains the following topics:

- Using DBMS_WORKLOAD_CAPTURE
  - Overview
  - Security ModelSummary of DBMS_WORKLOAD_CAPTURE Subprograms
-

Using DBMS_WORKLOAD_CAPTURE

Overview

Since the capture infrastructure is instance wide (and also within an Oracle Real Application Clusters (Oracle RAC)), only one workload capture is being produced at any point in time. Thus capture interfaces do not need a state object passed in as a parameter since there is one single state at any point in time. This means that all subprograms cannot be methods of an object but are package wide PL/SQL subprograms.

Security Model

The following code describes the minimal set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (wrc `someuser/somepassword` or wrc `USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;

GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute wrc on hosts that are used for the replay clients and be able to access the file system appropriately to copy the capture to the replay clients' hosts if required.

Summary of DBMS_WORKLOAD_CAPTURE Subprograms

This table list the package subprograms in alphabetical order.

Table 177–1 DBMS_WORKLOAD_CAPTURE Package Subprograms

Subprogram	Description
ADD_FILTER Procedures on page 177-6	Adds a specified filter
DELETE_CAPTURE_INFO Procedure on page 177-8	Deletes the rows in the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views that corresponds to the given workload capture ID
DELETE_FILTER Procedure on page 177-9	Deletes a specified filter
EXPORT_AWR Procedure on page 177-10	Exports the AWR snapshots associated with a given capture ID
FINISH_CAPTURE Procedure on page 177-11	Finalizes the workload capture by signaling all connected sessions to stop capture, and stops future requests to the database from being captured
GET_CAPTURE_INFO Function on page 177-12	Retrieves all the information regarding a workload capture present in the stipulated directory, imports the information into the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views, and returns the appropriate `DBA_WORKLOAD_CAPTURES.ID`
IMPORT_AWR Function on page 177-13	Imports the AWR snapshots associated with a given capture ID
REPORT Function on page 177-14	Returns a report on the workload capture under consideration using one or more different sources
START_CAPTURE Procedure	Initiates workload capture on all instances

ADD_FILTER Procedures

This procedure adds a filter to capture a subset of the workload.

Syntax

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
   fname           IN   VARCHAR2 NOT NULL,
   fattribute      IN   VARCHAR2 NOT NULL,
   fvalue          IN   VARCHAR2 NOT NULL);

DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
   fname           IN   VARCHAR2 NOT NULL,
   fattribute      IN   VARCHAR2 NOT NULL,
   fvalue          IN   NUMBER NOT NULL);
```

Parameters

Table 177–2 ADD_FILTER Procedure Parameters

Parameter	Description
fname	Name for the filter to be added. Can be used to delete the filter later if it is not required. (Mandatory)
fattribute	Specifies the attribute on which the filter needs to be applied (Mandatory). The possible values are: ■ INSTANCE_NUMBER - type NUMBER ■ USER - type STRING ■ MODULE - type STRING ■ ACTION - type STRING ■ PROGRAM - type STRING ■ SERVICE - type STRING ■ PDB_NAME - type STRING
fvalue	Specifies the value to which the given attribute should be equal to for the filter to be considered active. Wildcards like '%' are acceptable for all attributes that are of type STRING. This means that the filter for a NUMBER attribute is parsed as "attribute = value", with the filter for a STRING attribute parsed as "attribute like value" (Mandatory).

Usage Notes

- The workload capture filters work in either the DEFAULT INCLUSION or the DEFAULT EXCLUSION mode as determined by the default_action input to the START_CAPTURE Procedure.
- ADD_FILTER adds a new filter that affects the next workload capture, and whether the filters are considered as INCLUSION filters or EXCLUSION filters depends on the value of the default_action input to START_CAPTURE Procedure.
- Filters once specified are valid only for the next workload capture. If the same set of filters need to be used for subsequent capture, they need to be specified each time before the START_CAPTURE Procedure is executed.
- All the filters are listed in the DBA_WORKLOAD_FILTERS view.

- You can capture the workload for a particular PDB by specifying a filter of PDB type.

Examples

- By default, a capture works in an `INCLUSION` mode, which records everything except for those requests that satisfy conditions of specified filters. For example, if you want to exclude all requests from `SCOTT`, you can add the following filter before starting a capture.

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user1', 'USER', 'SCOTT');
```

- Multiple filters are evaluated according to the logical disjunction operator `OR`. Therefore, if you want to record workload for both `SCOTT` and `JOHN`, you add an additional filter:

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user2', 'USER', 'JOHN');
```

- In a CDB, you exclude the workload of a particular PDB by the filter:

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter pdb workload', 'PDB_NAME',
'CDB1_PDB1');
```

- To use DBMS_APPLICATION_INFO to identify workload that is issued to the database:

```
DBMS_APPLICATION_INFO.SET_MODULE('ORDER_ENTRY', NULL);
-- run some SQL here
DBMS_APPLICATION_INFO.SET_ACTION('ORDER_ENTRY_LOG');
-- run logging SQL
```

- If having captured workload, you want to exclude the logging SQL from the captured, specify a filter for capture:

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter logging operations', 'ACTION', 'ORDER_
ENTRY_LOG');
```

- To filter out the full order entry transaction, define a filter:

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter order entry', 'MODULE', 'ORDER_
ENTRY');
```

DELETE_CAPTURE_INFO Procedure

This procedure deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_CAPTURE_INFO
   capture_id     IN   NUMBER);
```

Parameters

Table 177–3 DELETE_CAPTURE_INFO Procedure Parameters

Parameter	Description
capture_id	ID of the workload capture that needs to be deleted. Corresponds to DBA_WORKLOAD_CAPTURES.ID. (Mandatory)

Usage Notes

Passing the ID of a capture that is in progress will first automatically stop that capture.

DELETE_FILTER Procedure

This procedure deletes a specified filter.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_FILTER (
   filter_name           IN   VARCHAR2(40) NOT NULL);
```

Parameters

Table 177–4 DELETE_FILTER Procedure Parameters

Parameter	Description
filter_name	Filter to be deleted

Usage Notes

The DELETE_FILTER Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the ADD_FILTER Procedures after any capture has been completed. Filters that have been added using ADD_FILTER before a START_CAPTURE and FINISH_CAPTURE cannot be deleted anymore using this subprogram.

EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a given capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.EXPORT_AWR (
   capture_id     IN NUMBER);
```

Parameters

Table 177–5 EXPORT_AWR Procedure Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots are to be exported. (Mandatory)

Usage Notes

This procedure works only if the corresponding workload capture was performed in the current database (meaning that the corresponding row in DBA_WORKLOAD_CAPTURES was not created by calling the GET_CAPTURE_INFO Function) and the AWR snapshots that correspond to the original capture time period are still available.

FINISH_CAPTURE Procedure

This procedure signals all connected sessions to stop the workload capture and stops future requests to the database from being captured.

Syntax

```
DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
   timeout     IN   NUMBER  DEFAULT 30
   reason       IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177–6 FINISH_CAPTURE Procedure Parameters

Parameter	Description
timeout	Specifies in seconds for how long the procedure should wait before it times out. Pass 0 if you want to cancel the current workload capture and not wait for any sessions to flush it's capture buffers. Default value: 30 seconds
reason	Specifies a reason for calling the procedure. The reason appears in the column ERROR_MESSAGE of the view DBA_WORKLOAD_CAPTURES.

Usage Notes

- By default, FINISH_CAPTURE waits for 30 seconds to receive a successful acknowledgement from all sessions in the database cluster before timing out.
- All sessions that either were in the middle of executing a user request or received a new user request, while FINISH_CAPTURE was waiting for acknowledgements, flush their buffers and send back their acknowledgement to FINISH_CAPTURE.
- If a database session remains idle (waiting for the next user request) throughout the duration of FINISH_CAPTURE, the session might have unflushed capture buffers and does not send it's acknowledgement to FINISH_CAPTURE.

  To avoid this, do not have sessions that remain idle (waiting for the next user request) while invoking FINISH_CAPTURE. Either close the database session(s) before running FINISH_CAPTURE or send new database requests to those sessions during FINISH_CAPTURE.

GET_CAPTURE_INFO Function

This procedure retrieves all information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID

Syntax

```
DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO
   dir      IN   VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 177–7 GET_CAPTURE_INFO Function Parameters

Parameter	Description
dir	Name of the DIRECTORY object (case sensitive) where all the workload capture files are located (Mandatory)

Usage Notes

If an appropriate row describing the capture in the stipulated directory already exists in DBA_WORKLOAD_CAPTURES, the GET_CAPTURE_INFO Function simply returns that row's DBA_WORKLOAD_CAPTURES.ID. If no existing row matches the capture present in the stipulated directory a new row is inserted to DBA_WORKLOAD_CAPTURES and that row's ID is returned.

IMPORT_AWR Function

This procedure imports the AWR snapshots associated with a given capture ID provided those AWR snapshots were exported earlier from the original capture system using the EXPORT_AWR Procedure.

Syntax

```
DBMS_WORKLOAD_CAPTURE.IMPORT_AWR (
   capture_id       IN   NUMBER,
   staging_schema   IN   VARCHAR2,
   force_cleanup    IN   BOOLEAN DEFAULT FALSE)
 RETURN NUMBER;
```

Parameters

Table 177–8 IMPORT_AWR Function Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots should be imported. (Mandatory)
staging_schema	Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the capture directory to the SYS AWR schema.The SYS schema is not a valid input. (Mandatory, Case sensitive).

force_cleanup	Values:
	■ TRUE - any AWR data present in the given staging_schema are removed before the actual import operation. All tables with names that match any of the tables in AWR are dropped before the actual import. This typically is equivalent to dropping all tables returned by the following SQL:
	`SELECT table_name FROM dba_tables`
	`WHERE owner = staging_schema`
	`AND table_name like 'WR_$%';`
	Use this option only if you are sure that there are no important data in any such tables in the staging_schema.
	■ FALSE - (default) no tables dropped from the staging_schema prior to the import operation

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_CAPTURES view.

Usage Notes

IMPORT_AWR fails if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM$_SNAPSHOT or WRH$_PARAMETER. Please drop any such tables in the staging_schema before invoking IMPORT_AWR.

REPORT Function

This function generates a report on the stipulated workload capture.

Syntax

```
DBMS_WORKLOAD_CAPTURE.REPORT (
   capture_id      IN   NUMBER,
   format          IN   VARCHAR2)
 RETURN CLOB;
```

Parameters

Table 177–9 REPORT Function Parameters

Parameter	Description
capture_id	ID of the workload capture whose capture report is required. (Mandatory) This relates to the directory that contains the workload capture on which the Report needs to be generated. Should be a valid DIRECTORY object that points to a valid directory in the host system that contains a workload capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_TEXT and DBMS_WORKLOAD_CAPTURE.TYPE_HTML.(Mandatory)

Return Values

The report body in the desired format returned as a CLOB.

Table 177–10 Constants Used by Report Function

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2(4)	'HTML'	Generates the HTML version of the report
TYPE_TEXT	VARCHAR2(4)	'TEXT'	Used as input to the format argument to generate the text version of the report

START_CAPTURE Procedure

This procedure initiates workload capture on all instances.

Syntax

```
DBMS_WORKLOAD_CAPTURE.START_CAPTURE (
   name              IN  VARCHAR2,
   dir               IN  VARCHAR2,
   duration          IN  NUMBER   DEFAULT NULL,
   default_action    IN  VARCHAR2 DEFAULT 'INCLUDE',
   auto_unrestrict   IN  BOOLEAN  DEFAULT TRUE,
   capture_sts       IN  BOOLEAN  DEFAULT FALSE,
   sts_cap_interval  IN  NUMBER   DEFAULT 300);
```

Parameters

Table 177–11 START_CAPTURE Procedure Parameters

Parameter	Description
name	Name of the workload capture. Allows the workload capture to be given a label, such as "Thanksgiving weekend" or "Christmas peak workload" for future reference. The workload capture's name is preserved along with the captured workload actions. (Mandatory)
dir	Name of the DIRECTORY object (case sensitive) where all the workload capture files are stored. Should contain enough space to hold all the workload capture files. (Mandatory)
duration	Optional input to specify the duration (in seconds) for which the workload needs to be captured. DEFAULT is NULL which means that workload capture continues until the user executes DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE.
default_action	Can be either INCLUDE or EXCLUDE. Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as INCLUSION filters or EXCLUSION filters. ■ If INCLUDE, by default all user requests to the database are captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as EXCLUSION filters, determining the workload that is not captured. (DEFAULT, and so all the filters specified are assumed to be EXCLUSION filters.) ■ If EXCLUDE, by default no user request to the database is captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as INCLUSION filters, determining the workload that is captured.
auto_unrestrict	Can be either TRUE or FALSE. ■ If TRUE, all instances started up in RESTRICTED mode using STARTUP RESTRICT are automatically unrestricted upon a successful START_CAPTURE. (DEFAULT) ■ If FALSE, no database instance is automatically unrestricted.

Table 177–11 (Cont.) START_CAPTURE Procedure Parameters

Parameter	Description
capture_sts	If this parameter is TRUE, a SQL tuning set capture is also started in parallel with workload capture. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the AWR data. Currently, parallel STS capture is not supported in an Oracle RAC environment, so this parameter has no effect if used in that context. Capture filters defined using the DBMS_WORKLOAD_REPLAY interface do not apply to the SQL tuning set capture. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). If starting SQL set capture fails, workload capture is stopped. The reason is stored in DBA_WORKLOAD_CAPTURES.ERROR_MESSAGE. The default value is FALSE.
sts_cap_interval	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.

Usage Notes

- All user requests sent to database after a successful invocation of START_CAPTURE are recorded in the given dir directory for the given duration provided that one was specified. If no duration was specified, the capture lasts indefinitely until the FINISH_CAPTURE Procedure is executed.
- A workload capture once started continues to record user requests across database instance shutdowns and startups for the specified duration, or until FINISH_CAPTURE is executed, whichever occurs first.
- One can use workload filters (as described with regard to the ADD_FILTER Procedures) to capture only a subset of the user requests sent to the database. By default, when no workload filters are defined, all user requests are captured.
- Workload that is initiated from Oracle Database background processes (such as SMON, PMON, MMON) and Oracle Database Scheduler Jobs (as detailed in the DBMS_SCHEDULER package) is not captured, no matter how the workload filters are defined. These activities should happen automatically on an appropriately configured replay system.
- By default, all database instances that were started up in RESTRICTED mode using STARTUP RESTRICT are UNRESTRICTED upon a successful invocation of START_CAPTURE Use FALSE for the auto_unrestrict input parameter, if you do not want this behavior.
- It is important to have a well-defined starting point for the workload so that the replay system can be restored to that point before initiating a replay of the captured workload. To have a well-defined starting point for the workload capture, it is preferable not to have any active user sessions when START_CAPTURE is executed. If ongoing sessions have ongoing transactions, those transactions are not replayed properly in subsequent database replays, since only that part of the transaction whose calls were executed after START_CAPTURE are replayed.

178

DBMS_WORKLOAD_REPLAY

The DBMS_WORKLOAD_REPLAY package provides an interface to replay a workload capture.

> **See Also:** *Oracle Database Testing Guide* for more information about database replay

This chapter contains the following topics:

- Using DBMS_WORKLOAD_REPLAY
  - Overview
  - Security Model
- Summary of DBMS_WORKLOAD_REPLAY Subprograms

Using DBMS_WORKLOAD_REPLAY

Overview

The DBMS_WORKLOAD_REPLAY package provides an interface to replay a workload capture that was originally created by way of the DBMS_WORKLOAD_CAPTURE package. Typically, the DBMS_WORKLOAD_CAPTURE package is used in the production system to capture a production workload, and the DBMS_WORKLOAD_REPLAY package is subsequently used in a test system to replay the captured production workload for testing purposes.

Security Model

The following code describes the minimum set of privileges required to

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (wrc `someuser/somepassword` or wrc `USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;

GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. The Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running.

The replay client is a multithreaded program (an executable named `wrc` located in the `$ORACLE_HOME/bin` directory) where each thread submits a workload from a captured session. The OS user performing the replay must be able to execute `wrc` on hosts that are used for the replay clients and be able to access the file system appropriately to be able to copy the capture to the replay clients' hosts if required.

Summary of DBMS_WORKLOAD_REPLAY Subprograms

This table lists the package subprograms in alphabetical order.

Table 178–1 DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
ADD_CAPTURE Function on page 178-7	Adds the given capture to the current schedule
ADD_FILTER Procedure on page 178-8	Adds a filter to replay only a subset of the captured workload
ADD_SCHEDULE_ORDERING Function on page 178-9	Adds a schedule order between two captures
BEGIN_REPLAY_SCHEDULE Procedure on page 178-10	Initiates the creation of a reusable replay schedule
CALIBRATE Function on page 178-11	Operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload
CANCEL_REPLAY Procedure on page 178-12	Cancels the workload replay in progress
COMPARE_PERIOD_REPORT Procedure on page 178-13	Generates a report comparing a replay to its capture or to another replay of the same capture
COMPARE_SQLSET_REPORT Function on page 178-14	Generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture
CREATE_FILTER_SET Procedure on page 178-15	Uses the replay filters added to create a set of filters to use against the replay in `replay_dir`
DELETE_FILTER Procedure on page 178-16	Deletes the named filter
DELETE_REPLAY_INFO Procedure on page 178-17	Deletes the rows in `DBA_WORKLOAD_REPLAYS` that corresponds to the given workload replay ID
END_REPLAY_SCHEDULE Procedure on page 178-18	Wraps up the creation of the current schedule
EXPORT_AWR Procedure on page 178-19	Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID
GENERATE_CAPTURE_SUBSET Procedure on page 178-20	Creates a new capture from an existing workload capture
GET_DIVERGING_STATEMENT Function on page 178-21	Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID
GET_REPLAY_DIRECTORY Function on page 178-22	Returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure.
GET_REPLAY_INFO Function on page 178-23	Retrieves information about the workload capture and the history of all the workload replay attempts from the related directory
GET_REPLAY_TIMEOUT Procedure on page 178-24	Retrieves the replay timeout setting
IMPORT_AWR Function on page 178-25	Imports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID
INITIALIZE_CONSOLIDATED_REPLAY Procedure on page 178-26	Puts the database state in `INIT` for a multiple-capture replay

Table 178–1 (Cont.) DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
INITIALIZE_REPLAY Procedure on page 178-27	Initializes replay, and loads specific data produced during processing into the database
IS_REPLAY_PAUSED Function on page 178-28	Reports whether the replay is currently paused
PAUSE_REPLAY Procedure on page 178-29	Pauses the in-progress workload replay
POPULATE_DIVERGENCE Procedure on page 178-29	Precomputes the divergence information for the given call, stream, or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls
PREPARE_REPLAY Procedure on page 178-31	Puts the database in a special "Prepare" mode
PREPARE_CONSOLIDATED_REPLAY Procedure on page 178-35	Puts the database in a special "Prepare" mode for a multiple-capture replay
PROCESS_CAPTURE Procedure on page 178-37	Processes the workload capture found in `capture_dir` in place
REMAP_CONNECTION Procedure on page 178-38	Remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay
REMOVE_CAPTURE Procedure on page 178-39	Removes the given capture from the current schedule
REMOVE_SCHEDULE_ORDERING Procedure on page 178-40	Removes an existing schedule order from the current replay schedule
REPORT Function on page 178-41	Generates a report on the given workload replay
RESUME_REPLAY Procedure on page 178-42	Resumes a paused workload replay
REUSE_REPLAY_FILTER_SET Procedure on page 178-43	Reuses filters in the specified filter set as if each were added using the ADD_SCHEDULE_ORDERING Function
SET_ADVANCED_PARAMETER Procedure on page 178-44	Sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure
SET_REPLAY_DIRECTORY Procedure on page 178-45	Sets a directory that contains multiple workload captures as the current replay directory
SET_REPLAY_TIMEOUT Procedure on page 178-46	Sets the replay timeout setting
SET_USER_MAPPING Procedure on page 178-47	Sets a new schema or user name to be used during replay instead of the captured user
START_CONSOLIDATED_REPLAY Procedure on page 178-48	Starts the replay of a multiple-capture capture
START_REPLAY Procedure on page 178-49	Starts the workload replay
USE_FILTER_SET Procedure on page 178-50	Uses the given filter set that has been created by calling the CREATE_FILTER_SET Procedure to filter the current replay

ADD_CAPTURE Function

This function adds the given capture to the current schedule. The directory has to be a valid capture processed in the current database's version. It returns a unique ID that identifies this capture within this schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
   capture_dir_name      IN    VARCHAR2,
   start_delay_seconds   IN    NUMBER  DEFAULT 0,
   stop_replay           IN    BOOLEAN FALSE,
   take_begin_snapshot   IN    BOOLEAN TRUE,
   take_end_snapshot     IN    BOOLEAN TRUE,
   query_only            IN    BOOLEAN DEFAULT FALSE)
 RETURN NUMBER;

DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
   capture_dir_name      IN    VARCHAR2,
   start_delay_seconds   IN    NUMBER  DEFAULT 0,
   stop_replay           IN    BOOLEAN FALSE,
   take_begin_snapshot   IN    BOOLEAN TRUE,
   take_end_snapshot     IN    BOOLEAN TRUE,
   query_only            IN    VARCHAR2 DEFAULT 'N')
 RETURN NUMBER;
```

Parameters

Table 178–2 ADD_CAPTURE Function Parameters

Parameter	Description
capture_dir_name	Name of the OS directory containing the capture under the replay top-level directory
start_delay_seconds	Delay time in seconds before the replay of this capture starts
stop_replay	Stop the replay after it finishes
take_begin_snapshot	Take an AWR snapshot when the replay of this capture starts
take_end_snapshot	Take an AWR snapshot when the replay of this capture finishes
query_only	Replay only the read-only queries of this workload capture

Usage Notes

The SET_REPLAY_DIRECTORY Procedure must have already been called.

ADD_FILTER Procedure

This procedure adds a filter to replay only a subset of the captured workload.

The procedure adds a new filter that is used in the next replay filter set created using the CREATE_FILTER_SET Procedure. This filter will be considered an "INCLUSION" or "EXCLUSION" filter depending on the argument passed to CREATE_FILTER_SET when creating the filter set.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
   fname           IN VARCHAR2,
   fattribute      IN VARCHAR2,
   fvalue          IN VARCHAR2);

DBMS_WORKLOAD_REPLAY.ADD_FILTER (
   fname           IN VARCHAR2,
   fattribute      IN VARCHAR2,
   fvalue          IN NUMBER);
```

Parameters

Table 178–3 ADD_FILTER Procedure Parameters

Parameter	Description
fname	(Mandatory) Name of the filter. Can be used to delete the filter later if it is not required.
fattribute	(Mandatory) Specifies the attribute on which the filter is defined as one of the following values of type STRING : ■ USER ■ MODULE ■ ACTION ■ PROGRAM ■ SERVICE ■ CONNECTION_STRING
fvalue	(Mandatory) Specifies the value to which the given 'attribute' must be equal to for the filter to be considered active. Wildcards such as '%' are acceptable for all attributes that are of type STRING. Currently all the listed values of fattribute are of type STRING. INSTANCE_NUMBER is a NUMBER attribute. It is currently only supported for capture.

ADD_SCHEDULE_ORDERING Function

This function adds a schedule order between two captures. Together, `schedule_capture_id` and waitfor_capture_id form a schedule ordering that previously added by the ADD_SCHEDULE_ORDERING Function. The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waiting_for_capture_id` finishes.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_SCHEDULE_ORDERING (
   schedule_capture_id     IN VARCHAR2,
   waitfor_capture_id      IN VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 178–4 ADD_SCHEDULE_ORDERING Function Parameters

Parameter	Description
`schedule_capture_id`	Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, its replay will not start until the replay of another capture specified by `waitfor_capture_id` runs to completion.
`waitfor_capture_id`	Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, the replay of capture specified by `schedule_capture_id` will not start until the replay of this capture runs to completion.

Return Values

Returns a non-zero error code if the constraint cannot be added

Usage Notes

The two captures must have already been added to the replay schedule.

BEGIN_REPLAY_SCHEDULE Procedure

This procedure initiates the creation of a reusable replay schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.BEGIN_REPLAY_SCHEDULE  (
   replay_dir_obj      IN     VARCHAR2,
   schedule_name       IN     VARCHAR2);
```

Parameters

Table 178–5 BEGIN_REPLAY_SCHEDULE Procedure Parameters

Parameter	Description
`replay_dir_obj`	Directory object that points to the replay directory that contains all the capture directories involved in the schedule
`schedule_name`	Name of the schedule to be replayed

Usage Notes

- Only one schedule can be in creation mode at a time. Calling the subprogram again before `end_replay_schedule` will raise an error.
- Prerequisites:
  - The workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
  - The user must have copied the capture directory appropriately.
  - The database is not in replay mode.
  - The SET_REPLAY_DIRECTORY Procedure has already been called.

CALIBRATE Function

This function operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload. This function returns the results as an XML CLOB.

Syntax

```
DBMS_WORKLOAD_REPLAY.CALIBRATE (
   capture_dir          IN VARCHAR2,
   process_per_cpu      IN BINARY_INTEGER DEFAULT 4,
   threads_per_process  IN BINARY_INTEGER DEFAULT 50)
  RETURN CLOB;
```

Parameters

Table 178–6 CALIBRATE Function Parameters

Parameter	Description
capture_dir	Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data
process_per_cpu	Maximum number of processes allowed for each CPU (default is 4)
threads_per_process	Maximum number of threads allowed for each process (default is 50)

Return Values

Returns a CLOB formatted as XML that contains:

- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

Usage Notes

- Prerequisite: The input workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

```
$ wrc mode=calibrate replaydir=
```

CANCEL_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

Syntax

```
DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY (
   error_msg    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 178–7 CANCEL_REPLAY Procedure Parameters

Parameter	Description
error_msg	An optional reason for cancelling the replay can be passed which is recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE.

Usage Notes

Prerequisite: A call to the INITIALIZE_REPLAY Procedure, or PREPARE_REPLAY Procedure, or START_REPLAY Procedure was already issued.

COMPARE_PERIOD_REPORT Procedure

This procedure generates a report comparing a replay to its capture or to another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_PERIOD_REPORT (
   replay_id1   IN   NUMBER,
   replay_id2   IN   NUMBER,
   format       IN   VARCHAR2,
   result       OUT  CLOB );
```

Parameters

Table 178–8 COMPARE_PERIOD_REPORT Procedure Parameters

Parameter	Description
replay_id1	First ID of the workload replay whose report is requested
replay_id2	Second ID of the workload replay whose report is requested. If this is NULL, then the comparison is done with the capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML and DBMS_WORKLOAD_CAPTURE.TYPE_XML.
result	Output of the report (CLOB)

COMPARE_SQLSET_REPORT Function

This procedure generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_SQLSET_REPORT (
   replay_id1    IN NUMBER,
   replay_id2    IN NUMBER,
   format        IN VARCHAR2,
   r_level       IN VARCHAR2 DEFAULT 'ALL',
   r_sections    IN VARCHAR2 DEFAULT 'ALL',
   result        OUT CLOB )
  RETURN VARCHAR2;
```

Parameters

Table 178–9 COMPARE_SQLSET_REPORT Function Parameters

Parameter	Description
`replay_id1`	First ID of the workload replay after a change
`replay_id2`	Second ID of the workload replay before a change. If this is `NULL`, then the comparison is done with the capture.
`format`	Specifies the report format. Valid values are `DBMS_WORKLOAD_CAPTURE.TYPE_HTML`, `DBMS_WORKLOAD_CAPTURE.TYPE_XML` and `DBMS_WORKLOAD_CAPTURE.TYPE_TEXT`.
`r_level`	See `level` parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package
`r_sections`	See `section` parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package
`result`	Output of the report (`CLOB`)

CREATE_FILTER_SET Procedure

This procedure creates a new filter set for the replays at `replay_dir`. It includes all the replay filters that have already been added by the ADD_FILTER Procedure. After the procedure has completed and replay initiated, the newly-created filter set can be used to filter the replay in `replay_dir` by calling the USE_FILTER_SET Procedure.

Syntax

```
DBMS_WORKLOAD_REPLAY.CREATE_FILTER_SET(
   replay_dir       IN  VARCHAR2,
   filter_set       IN  VARCHAR2,
   default_action   IN  VARCHAR2 DEFAULT 'INCLUDE');
```

Parameters

Table 178–10 CREATE_FILTER_SET Procedure Parameters

Parameter	Description
`replay_dir`	Object directory of the replay to be filtered
`filter_set`	Name of the filter set to create (to use in USE_FILTER_SET Procedure)
`default_action`	Can be either `INCLUDE` or `EXCLUDE`. Determines whether, by default, every captured call must be replayed or not. Also determines whether the workload filters specified must be considered as `INCLUSION` filters or `EXCLUSION` filters.) If it is `INCLUDE`, then by default all captured calls are replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_SCHEDULE_ORDERING Function are treated as `EXCLUSION` filters, and will determine the workload that will not be replayed. If it is `EXCLUDE`, then by default no captured call to the database is replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using he ADD_SCHEDULE_ORDERING Function are treated as `INCLUSION` filters, and will determine the workload that is replayed. Default: `INCLUDE` and all the filters specified are assumed to be `EXCLUSION` filters

Usage Notes

This operation must be invoked when no replay is initialized, prepared, or in progress.

DELETE_FILTER Procedure

This procedure deletes the named filter.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_FILTER(
   fname    IN  VARCHAR2);
```

Parameters

Table 178–11 DELETE_FILTER Procedure Parameters

Parameter	Description
fname	(Mandatory) Name of the filter that must be deleted

DELETE_REPLAY_INFO Procedure

This procedure deletes the rows in DBA_WORKLOAD_REPLAYS that correspond to the given workload replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (
   replay_id    IN  NUMBER);
```

Parameters

Table 178–12 DELETE_REPLAY_INFO Procedure Parameters

Parameter	Description
replay_id	(Mandatory) ID of the workload replay that must be deleted. Corresponds to DBA_WORKLOAD_REPLAYS.ID

END_REPLAY_SCHEDULE Procedure

This procedure wraps up the creation of the current schedule. The schedule is now saved and associated with the replay directory and can be used for a replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.END_REPLAY_SCHEDULE;
```

Usage Notes

The BEGIN_REPLAY_SCHEDULE Procedure must have already been called.

EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a stipulated replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (
   replay_id    IN  NUMBER);
```

Parameters

Table 178–13 EXPORT_AWR Function Parameters

Parameter	Description
replay_id	(Mandatory) ID of the replay whose AWR snapshots are to be exported

Usage Notes

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic EXPORT_AWR invocation failed.
- This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in DBA_WORKLOAD_REPLAYS was not created by calling the GET_REPLAY_INFO Function) and the AWR snapshots that correspond to that replay time period are still available.

GENERATE_CAPTURE_SUBSET Procedure

This procedure creates a new capture from an existing workload capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.GENERATE_CAPTURE_SUBSET (
   input_capture_dir          IN   VARCHAR2,
   output_capture_dir         IN   VARCHAR2,
   new_capture_name           IN   VARCHAR2,
   begin_time                 IN   NUMBER,
   begin_include_incomplete   IN   BOOLEAN DEFAULT TRUE,
   end_time                   IN   NUMBER,
   end_include_incomplete     IN   BOOLEAN DEFAULT FALSE,
   parallel_level             IN   NUMBER DEFAULT NULL);
```

Parameters

Table 178–14 GENERATE_CAPTURE_SUBSET Procedure Parameters

Parameter	Description
input_capture_dir	(Mandatory) Name of the directory object that points to an existing workload capture
output_capture_dir	(Mandatory) Name of the directory object that points to the new capture
new_capture_name	(Mandatory) Name of new capture
begin_time	Start of the time range - time offset in seconds from the start of a workload capture
begin_include_incomplete	Column to include incomplete calls caused by begin_time
end_time	End of the time range - time offset in seconds from the start of a workload capture. If end_time is zero or end_time is less or equal than begin_time, the time range is invalid. The new capture will use the whole duration of the input capture.
end_include_incomplete	Column to include incomplete calls caused by end_time
parallel_level	Number of Oracle processes used to process the input captures in a parallel fashion. The NULL default value will auto-compute the parallelism level based on number of CPUs, whereas a value of 1 will enforce serial execution.

GET_DIVERGING_STATEMENT Function

This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_DIVERGING_STATEMENT (
   replay_id    IN NUMBER,
   stream_id    IN NUMBER,
   call_counter IN NUMBER)
  RETURN CLOB;
```

Parameters

Table 178–15 GET_DIVERGING_STATEMENT Function Parameters

Parameter	Description
`replay_id`	ID of the replay in which that call diverged
`stream_id`	Stream ID of the diverging call
`call_counter`	Call counter of the diverging call

Usage Notes

- Returns a `CLOB` formatted as XML that contains:
  - SQL ID
  - SQL Text
  - Bind information: position, name and value
- This function will silently invoke the POPULATE_DIVERGENCE Procedure to read the information from the capture files. Therefore, if divergence has not been populated, then the first call to this function for a particular diverging call might take longer, especially in very large captures.

GET_REPLAY_DIRECTORY Function

This function returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure. It returns `NULL` if no replay directory has been set.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_DIRECTORY
   RETURN VARCHAR2;
```

GET_REPLAY_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (
   dir    IN VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 178–16 GET_REPLAY_INFO Function Parameters

Parameter	Description
dir	(Mandatory) Name of the workload replay directory object (case sensitive).

Return Values

The procedure returns the CAPTURE_ID, which can be associated with both DBA_WORKLOAD_CAPTURES.ID and DBA_WORKLOAD_REPLAYS.CAPTURE_ID to access the imported information.

Usage Notes

- The procedure first imports a row into DBA_WORKLOAD_CAPTURES which will contain information about the capture. It then imports a row for every replay attempt retrieved from the given replay directory into DBA_WORKLOAD_REPLAYS.
- The procedure will not insert new rows to DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_REPLAYS if these views already contain rows describing the capture and replay history present in the given directory.

GET_REPLAY_TIMEOUT Procedure

This procedure gets the replay timeout setting.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_TIMEOUT (
   enabled       OUT  BOOLEAN,
   min_delay     OUT  NUMBER,
   max_delay     OUT  NUMBER,
   delay_factor  OUT  NUMBER);
```

Parameters

Table 178–17 GET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
enabled	TRUE if the timeout action is enabled, FALSE otherwise.
min_delay	Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than min_delay.
max_delay	Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay.
delay_factor	Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor.

Usage Notes

This procedure can be called anytime during replay.

IMPORT_AWR Function

This procedure imports the AWR snapshots from a given replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (
   replay_id       IN   NUMBER,
   staging_schema  IN   VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 178–18 IMPORT_AWR Function Parameters

Parameter	Description
replay_id	(Mandatory) ID of the replay whose AWR snapshots must be imported
staging_schema	(Mandatory) Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to the SYS AWR schema. The SYS schema is not a valid input.

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_REPLAYS view.

Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the EXPORT_AWR Procedure.
- IMPORT_AWR will fail if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM$_SNAPSHOT or WRH$_PARAMETER. Drop any such tables in the staging_schema before invoking IMPORT_AWR.

INITIALIZE_CONSOLIDATED_REPLAY Procedure

This procedure puts the database state in `INIT` for a multiple-capture replay. It uses the `replay_dir` which has already been defined by the SET_REPLAY_DIRECTORY Procedure, pointing to a directory that contains all the capture directories involved in the schedule. It reads data about schedule `schedule_name` from the directory, and loads required connection data into the replay system.

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_CONSOLIDATED_REPLAY (
   replay_name         IN    VARCHAR2,
   schedule_name       IN    VARCHAR2);
```

Parameters

Table 178–19 INITIALIZE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
`replay_name`	(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.
`schedule_name`	Name of the schedule to be replayed. It must have been created through the BEGIN_REPLAY_SCHEDULE Procedure for the replay directory `replay_dir`.

Usage Notes

Prerequisites:

- Workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
- Database state has been logically restored to what it was at the beginning of the original workload capture.
- The SET_REPLAY_DIRECTORY Procedure has been called.

INITIALIZE_REPLAY Procedure

This procedure puts the database state in INIT for REPLAY mode, and loads data into the replay system that is required before preparing for the replay (by executing the PAUSE_REPLAY Procedure).

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (
   replay_name     IN  VARCHAR2,
   replay_dir      IN  VARCHAR2);
```

Parameters

Table 178–20 INITIALIZE_REPLAY Procedure Parameters

Parameter	Description
replay_name	(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.
replay_dir	Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data

Usage Notes

- Prerequisites:
  - Workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
  - Database state has been logically restored to what it was at the beginning of the original workload capture.
- The subprogram loads data into the replay system that is required before preparing for the replay by calling the PAUSE_REPLAY Procedure.

  For instance, during capture the user may record the connection string each session used to connect to the server. The INITIALIZE_REPLAY Procedure loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

  Elaborating on the example described in the PROCESS_CAPTURE Procedure, the user could invoke the following:

  ```
  DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');
  ```

  This command will load up the connection map and by default will set all replay time connection strings to be equal to NULL. A NULL replay time connection string means that the workload replay clients (WRCs) will connect to the default host as determined by the replay client's runtime environment settings. The user can change a particular connection string to a new one (or a new service point) for replay by using the REMAP_CONNECTION Procedure.

IS_REPLAY_PAUSED Function

This function reports whether the replay is currently paused.

Syntax

```
DBMS_WORKLOAD_REPLAY.IS_REPLAY_PAUSED
   RETURN BOOLEAN;
```

Return Values

Returns `TRUE` if the PAUSE_REPLAY Procedure has been called successfully and the RESUME_REPLAY Procedure has not been called yet.

Usage Notes

A call to the START_REPLAY Procedure must have already been issued as a prerequisite.

PAUSE_REPLAY Procedure

This procedure pauses the in-progress workload replay. All subsequent user calls from the replay clients will be stalled until either a call to the RESUME_REPLAY Procedure is issued or the replay is cancelled.

Syntax

```
DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY;
```

Usage Notes

- Prerequisite: A call to the START_REPLAY Procedure must have already been issued.
- User calls that were already in-progress when this procedure was invoked are allowed to run to completion. Only subsequent user calls, when issued, are paused.

POPULATE_DIVERGENCE Procedure

This procedure precomputes the divergence information for the given call, stream, or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls.

Syntax

```
DBMS_WORKLOAD_REPLAY.POPULATE_DIVERGENCE (
   replay_id    IN   NUMBER,
   stream_id    IN   NUMBER DEFAULT NULL,
   call_counter IN   NUMBER DEFAULT NULL);
```

Parameters

Table 178–21 POPULATE_DIVERGENCE Procedure Parameters

Parameter	Description
replay_id	ID of the replay
stream_id	Stream ID of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given replay.
call_counter	Call counter of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given stream.

PREPARE_REPLAY Procedure

This procedure puts the database state in `PREPARE FOR REPLAY` mode.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
   synchronization           IN BOOLEAN   DEFAULT TRUE,
   connect_time_scale        IN NUMBER    DEFAULT 100,
   think_time_scale          IN NUMBER    DEFAULT 100,
   think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,
   scale_up_multiplier       IN NUMBER    DEFAULT 1,
   capture_sts               IN BOOLEAN   DEFAULT FALSE,
   sts_cap_interval          IN NUMBER    DEFAULT 300);

DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
   synchronization           IN VARCHAR2  DEFAULT 'OBJECT_ID',
   connect_time_scale        IN NUMBER    DEFAULT 100,
   think_time_scale          IN NUMBER    DEFAULT 100,
   think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,
   scale_up_multiplier       IN NUMBER    DEFAULT 1,
   capture_sts               IN BOOLEAN   DEFAULT FALSE,
   sts_cap_interval          IN NUMBER    DEFAULT 300);
```

Parameters

Table 178–22 PREPARE_REPLAY Procedure Parameters

Parameter	Description
`synchronization`	Turns synchronization `ON` or `OFF` during workload replay. ■ `OFF` - Workload replay runs asynchronously. ■ `SCN` - The `COMMIT` order observed during the original workload capture is preserved during replay. Every action that is replayed is executed only after all of its dependent `COMMIT`s (all `COMMIT`s that were issued before the given action in the original workload capture) have finished execution. ■ `OBJECT_ID` - This is the default, and uses a more advanced synchronization scheme. Every action that is replayed is executed only after the relevant `COMMIT`s have finished executing. The relevant `COMMIT`s are the ones that were issued before the given action in the original workload capture and that had modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This `OBJECT_ID` scheme has the same logical property of making sure that any action will see the same data it saw during capture, but will allow more concurrency during replays for the actions that do not touch the same objects/tables. For legacy reasons, there is a boolean version of this procedure: ■ `TRUE` means `'OBJECT_ID'` ■ `FALSE` means `'OFF'`

Table 178–22 (Cont.) PREPARE_REPLAY Procedure Parameters

Parameter	Description
connect_time_scale	Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Application of the connect_time_scale Parameter" on page 178-33.
think_time_scale	Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Application of the think_time_scale Parameter" on page 178-33.
think_time_auto_correct	Auto corrects the think time between calls appropriately when a user call takes longer to complete during replay than during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See "Application of the think_time_auto_correct Parameter" on page 178-33
scale_up_multiplier	Defines the number of times the query workload is scaled up during replay. Each captured session is replayed concurrently as many times as the value of the scale_up_multiplier. However, only one of the sessions in each set of identical replay sessions executes both queries and updates. The remaining sessions only execute queries.
capture_sts	If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the AWR data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is FALSE.
sts_cap_interval	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.

Usage Notes

- Prerequisites:
  - The database has been initialized for replay using the INITIALIZE_REPLAY Procedure.
  - Any capture time connection strings that require remapping have been already done using the REMAP_CONNECTION Procedure.
- One or more external replay clients (WRC) can be started once the PREPARE_REPLAY procedure has been executed.
- With regard to scale_up_multiplier:
  - One replay session (base session) of each set of identical sessions will replay every call from the capture as usual.
  - The remaining sessions (scale-up sessions) will only replay calls that are read-only. Thus, DDL, DML, and PL/SQL calls that modified the database is skipped. SELECT FOR UPDATE statements are also skipped.
  - Read-only calls from the scale-up are synchronized appropriately and obey the timings defined by think_time_scale, connect_time_scale, and think_

time_auto_correct. Also, the queries are made to wait for the appropriate commits.

- No replay data or error divergence records are generated for the scale-up sessions.
- All base or scale-up sessions that replay the same capture file will connect from the same workload replay client.

Examples

Application of the connect_time_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : Capture was started
12:10 : First session connect  (10m after)
12:30 : Second session connect (30m after)
12:42 : Third session connect  (42m after)
```

If the connect_time_scale is 50, then the session connects will happen as follows:

```
12:00 : Replay was started with 50% connect time scale
12:05 : First session connect  ( 5m after)
12:15 : Second session connect (15m after)
12:21 : Third session connect  (21m after)
```

If the connect_time_scale is 200, then the session connects will happen as follows:

```
12:00 : Replay was started with 200% connect time scale
12:20 : First session connect  (20m after)
13:00 : Second session connect (60m after)
13:24 : Third session connect  (84m after)
```

Application of the think_time_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4mins
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the think_time_scale is 50 during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:05 : First user call issued 5 mins (50% of 10m) after the completion of
        previous call
12:10 : First user call completes in 5m (takes a minute longer)
12:18 : Second user call issued 8 mins (50% of 16m) after the completion of prev
        call
12:25 : Second user call completes in 7m (takes 3 minutes less)
12:26 : Third user call issued 1 min  (50% of 2m) after the completion of prev
        call
12:35 : Third user call completes in 9m (takes a minute longer)
```

Application of the think_time_auto_correct Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4m
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the think_time_scale is 100 and the think_time_auto_correct is TRUE during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:10 : First user call issued 10 mins after the completion of prev call
12:15 : First user call completes in 5m (takes 1 minute longer)
12:30 : Second user call issued 15 mins (16m minus the extra time of 1m the prev
        call took) after the completion of prev call
12:44 : Second user call completes in 14m (takes 4 minutes longer)
12:44 : Third user call issued immediately (2m minus the extra time of 4m the prev
        call took) after the completion of prev call
12:52 : Third user call completes in 8m
```

PREPARE_CONSOLIDATED_REPLAY Procedure

Similar to the PREPARE_REPLAY Procedure, this procedure puts the database in a special "Prepare" mode for a multiple-capture replay. The difference is that this subprogram should be used only for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
   synchronization           IN BOOLEAN,
   connect_time_scale        IN NUMBER    DEFAULT 100,
   think_time_scale          IN NUMBER    DEFAULT 100,
   think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,
   capture_sts               IN BOOLEAN   DEFAULT FALSE,
   sts_cap_interval          IN NUMBER    DEFAULT 300);

DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
   synchronization           IN VARCHAR2  DEFAULT 'OBJECT_ID',,
   connect_time_scale        IN NUMBER    DEFAULT 100,
   think_time_scale          IN NUMBER    DEFAULT 100,
   think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,
   capture_sts               IN BOOLEAN   DEFAULT FALSE,
   sts_cap_interval          IN NUMBER    DEFAULT 300);
```

Parameters

Table 178–23 PREPARE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
synchronization	Turns synchronization ON or OFF during workload replay. When synchronization is ON, the COMMIT order observed during the original workload capture is preserved during replay. Every action that is replayed is executed ONLY AFTER all of its dependent COMMITs (all COMMITs that were issued before the given action in the original workload capture) have finished execution. DEFAULT is TRUE which preserves commit order. When synchronization is OBJECT_ID, a more advanced synchronization scheme is used. Every action that is replayed is executed only after the relevant COMMITs have finished executing. The relevant COMMITs are the ones that were issued before the given action in the original workload capture and that had modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This OBJECT_ID scheme has the same logical property of making sure that any action will see the same data it saw during capture, but will allow more concurrency during replays for the actions that do not touch the same objects/tables. DEFAULT VALUE: SCN, preserve commit order. For legacy reasons, there is a boolean version of this procedure: ■ TRUE means 'SCN' ■ FALSE means 'OFF'
connect_time_scale	Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Application of the connect_time_scale Parameter" on page 178-33.

Table 178–23 (Cont.) PREPARE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
think_time_scale	Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Application of the think_time_auto_correct Parameter" on page 178-33
think_time_auto_correct	Auto corrects the think time between calls appropriately when user calls takes longer to complete during replay than during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See "Application of the think_time_auto_correct Parameter" on page 178-33
capture_sts	If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the Automatic Workload Repository (AWR) data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is FALSE.
sts_cap_interval	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.

Usage Notes

A consolidated replay replays multiple captures in one replay. Each capture records different system change number (SCN) values. For this reason SCN-based sync is not supported for consolidated replays. Consolidated replays only support non-sync mode and the Object-ID based synchronization, and SCN-based synchronization is currently not supported.

PROCESS_CAPTURE Procedure

This procedure processes the workload capture found in `capture_dir` in place.

Syntax

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (
   capture_dir            IN   VARCHAR2,
   parallel_level         IN   NUMBER DEFAULT NULL);
```

Parameters

Table 178–24 PROCESS_CAPTURE Procedure Parameters

Parameter	Description
`catpure_dir`	(Mandatory) Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files are added to this directory.
`parallel_level`	Number of Oracle processes used to process the capture in parallel. The `NULL` default value will auto-compute the parallelism level, whereas a value of 1 will enforce serial execution.

Usage Notes

- This subprogram analyzes the workload capture found in the `capture_dir` and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.
- Once this procedure runs successfully, the capture_dir can be used as input to the INITIALIZE_REPLAY Procedure in order to replay the captured workload present in `capture_dir`.
- Before a workload capture can be replayed in a particular database version, the capture must be processed using `PROCESS_CAPTURE` in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

  For example, suppose workload "foo" was captured in `rec_dir` in Oracle database version 10.2.0.5. In order to replay the workload "foo" in version 11.1.0.1 the workload must be processed in version 11.1.0.1. The following procedure must be executed in an 11.1.0.1 database in order to process the capture directory `rec_dir`:

  ```
  DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE('rec_dir');
  ```

  Now, `rec_dir` contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload "foo" in 11.1.0.1 databases as many times as required.

REMAP_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
   connection_id         IN  NUMBER,
   replay_connection     IN  VARCHAR2);

DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
   capture_number        IN  VARCHAR2,
   connection_id         IN  NUMBER,
   replay_connection     IN  VARCHAR2);
```

Parameters

Table 178–25 REMAP_CONNECTION Procedure Parameters

Parameter	Description
capture_number	Pointing to a capture of the current replay schedule
connection_id	ID of the connection to be remapped. Corresponds to DBA_WORKLOAD_CONNECTION_MAP.CONN_ID.
replay_connection	New connection string to be used during replay

Usage Notes

- Prior to calling REMAP_CONNECTION all replay connection strings are set to NULL by default. If a replay_connection is NULL, then the replay sessions will connect as determined by the replay client's runtime environment. For example, if the environment variable TNS_ADMIN is defined and the user does not call the REMAP_CONNECTION Procedure, then the wrc executable will connect to the server specified in the tnsnames.ora file pointed to by TNS_ADMIN.
- A valid replay_connection must specify a connect identifier or a service point. See the *Oracle Database Net Services Reference* for ways to specify connect identifiers (such as net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.
- An error is returned if no row matches the given connection_id.
- Use the DBA_WORKLOAD_CONNECTION_MAP view to review all the connection strings that are used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.

REMOVE_CAPTURE Procedure

This procedure removes the given capture from the current schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_CAPTURE (
   schedule_capture_number    IN     NUMBER);
```

Parameters

Table 178–26 REMOVE_CAPTURE Procedure Parameters

Parameter	Description
schedule_capture_number	Unique ID that identifies this capture within this schedule

REMOVE_SCHEDULE_ORDERING Procedure

This procedure removes an existing schedule order from the current replay schedule. Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the ADD_SCHEDULE_ORDERING Function (`schedule_capture_id`, `waitfor_capture_id`). The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waiting_for_capture_id` finishes.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_SCHEDULE_ORDERING (
   schedule_capture_id     IN         NUMBER,
   waitfor_capture_id      IN         NUMBER);
```

Parameters

Table 178–27 REMOVE_SCHEDULE_ORDERING Procedure Parameters

Parameter	Description
`schedule_capture_id`	Points to a capture that has been added to the current replay schedule (see procedure description).
`waitfor_capture_id`	Points to a capture that has been added to the current replay schedule.

Usage Notes

Prerequisites:

- The BEGIN_REPLAY_SCHEDULE Procedure must have been called.
- The replay schedule order should have already been added using the ADD_SCHEDULE_ORDERING Function.

REPORT Function

This function generates a report on the stipulated workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REPORT (
   replay_id          IN NUMBER,
   format             IN VARCHAR2)
  RETURN CLOB;
```

Parameters

Table 178–28 REPORT Function Parameters

Parameter	Description
`replay_id`	(Mandatory) Specifies the ID of the workload replay whose report is requested.
`format`	(Mandatory) Specifies the report format. Valid values: ■ HTML - Generates the HTML version of the report ■ XML - Generates the XML version of the report ■ TEXT - Generates the text version of the report

Return Values

The report body in the desired format returned as a `CLOB`

RESUME_REPLAY Procedure

This procedure resumes a paused workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.RESUME_REPLAY;
```

Usage Notes

Prerequisite: A call to the PAUSE_REPLAY Procedure must have already been issued.

REUSE_REPLAY_FILTER_SET Procedure

This procedure reuses filters in the specified filter set as if each were added using the ADD_SCHEDULE_ORDERING Function. Each call adds one filter set, which is a collection of individual filters on various attributes. Also, a new filter rule can be added, and an existing filter can be deleted before invoking the CREATE_FILTER_SET Procedure to create a new filter set.

Syntax

```
DBMS_WORKLOAD_REPLAY.REUSE_REPLAY_FILTER_SET(
   replay_dir  IN VARCHAR2,
   filter_set  IN VARCHAR2);
```

Parameters

Table 178–29 REUSE_REPLAY_FILTER_SET Procedure Parameters

Parameter	Description
replay_dir	Capture ID of the existing filter set with which it is associated
filter_set	Name of the filter set to be reused

SET_ADVANCED_PARAMETER Procedure

This procedure sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure. The advanced parameters control aspects of the replay that are more specialized. The advanced parameters are reset to their default values after the replay has finished.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
   pname    IN   VARCHAR2,
   pvalue   IN   VARCHAR2);

DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
   pname    IN   VARCHAR2,
   pvalue   IN   NUMBER);

DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
   pname    IN   VARCHAR2,
   pvalue   IN   BOOLEAN);
```

Parameters

Table 178–30 SET_ADVANCED_PARAMETER Procedure Parameters

Parameter	Description
pname	Name of the parameter (case insensitive)
pvalue	Value of the parameter

Usage Notes

The current parameters and values that can be used are:

```
'DO_NO_WAIT_COMMITS': (default: FALSE)
```

This parameter controls whether the COMMITs issued by replay sessions is NOWAIT. The default value for this parameter is FALSE. In this case all the COMMITs are issued with the mode they were captured (wait, no-wait, batch, no-batch). If the parameter is set to TRUE, then all COMMITs are issued in no-wait mode. This is useful in cases where the replay is becoming noticeably slow because of a high volume of concurrent COMMITs. Setting the parameter to TRUE will significantly decrease the waits on the 'log file sync' event during the replay with respect to capture.

SET_REPLAY_DIRECTORY Procedure

This procedure sets a directory that contains multiple workload captures as the current replay directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_DIRECTORY (
   replay_dir    IN    VARCHAR2);
```

Parameters

Table 178–31 SET_REPLAY_DIRECTORY Procedure Parameters

Parameter	Description
replay_dir	Name of the OS directory containing the captures for a workload consolidation

SET_REPLAY_TIMEOUT Procedure

This procedure sets the replay timeout setting. The purpose is to abort user calls that might make the replay much slower or even cause a replay hang.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_TIMEOUT (
   enabled       OUT  BOOLEAN DEFAULT TRUE,
   min_delay     OUT  NUMBER DEFAULT 10,
   max_delay     OUT  NUMBER DEFAULT 120,
   delay_factor  OUT  NUMBER DEFAULT 8);
```

Parameters

Table 178–32 SET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
enabled	TRUE to enable the timeout action, and FALSE to disable.
min_delay	Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than min_delay. Default = 10.
max_delay	Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay. Default = 120.
delay_factor	Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor. Default = 8.

Usage Notes

- This procedure can be called anytime during replay.
- Call delay is defined as the difference between replay and capture if replay elapsed time is longer than call elapsed time.
- Once a replay timeout action is enabled, a user call will exit with ORA-15569 if it has been delayed more than the condition specified by the replay action. The call and its error are reported as error divergence.
- Replay timeout operates as follows:
  - The timeout action has no effect if it is not enabled.
  - If the call delay in minutes is less than a lower bound specified by parameter min_delay, then the timeout action is non-operational.
  - If the delay in minutes is more than a upper bound specified by parameter max_delay, the timeout action will abort the user call and throw ORA-15569.
  - For delay that is between the lower bound and upper bound, the user call will abort with ORA-15569 only when the current replay elapsed time is more than the product of capture elapsed time and parameter delay_factor.

SET_USER_MAPPING Procedure

This procedure sets a new schema or user name to be used during replay instead of the captured user.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
   schedule_cap_id      IN NUMBER,
   capture_user         IN VARCHAR2,
   replay_user          IN VARCHAR2);

DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
   capture_user         IN VARCHAR2,
   replay_user          IN VARCHAR2);
```

Parameters

Table 178–33 SET_USER_MAPPING Procedure Parameters

Parameter	Description
schedule_cap_id	ID of the a capture in the schedule
capture_user	User name during the time of the workload capture
replay_user	User name to which captured user is remapped during replay.

Usage Notes

- A schedule_cap_id of NULL is used for regular non-consolidate replay.
- The replay must be initialized but not prepared in order to use this subprogram.
- If replay_user is set to NULL, then the mapping is disabled.
- After multiple calls with the same capture_user, the last call always takes effect.
- To list all the mappings that will be in effect during the subsequent replay execute the following:

  ```
  SELECT * FROM DBA_WORKLOAD_ACTIVE_USER_MAP
  ```

- The overloaded version without the schedule_cap_id calls the one with the schedule_cap_id argument by passing in NULL.
- Mappings are stored in a table made public through the view DBA_WORKLOAD_USER_MAP. To remove old mappings execute

  ```
  DELETE * FROM DBA_WORKLOAD_USER_MAP
  ```

START_CONSOLIDATED_REPLAY Procedure

This procedure starts the replay of a multiple-capture capture. It should be used only for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_CONSOLIDATED_REPLAY;
```

Usage Notes

Prerequisites:

- The call to the PREPARE_REPLAY Procedure was already issued.
- A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.

START_REPLAY Procedure

This procedure starts the workload replay. All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified, and those replay clients (WRC) will begin issuing the captured workload. It should only be used for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_REPLAY;
```

Usage Notes

- Prerequisites:
  - The call to the PREPARE_REPLAY Procedure was already issued.
  - A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.
- Use the WRC's `CALIBRATE` mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:

  ```
  $ wrc mode=calibrate replaydir=.
  ```

USE_FILTER_SET Procedure

This procedure applies a filter set to a capture in the current replay schedule. The filter set must have been created by calling the CREATE_FILTER_SET Procedure.

Syntax

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
   capture_number   IN    VARCHAR2,
   filter_set       IN    VARCHAR2);

DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
   filter_set       IN    VARCHAR2);
```

Parameters

Table 178–34 USE_FILTER_SET Procedure Parameters

Parameter	Description
capture_number	Pointing to a capture of the current replay schedule
filter_set	Name of the filter set

Usage Notes

The filter set must have been created by calling the CREATE_FILTER_SET Procedure.

179

DBMS_WORKLOAD_REPOSITORY

The `DBMS_WORKLOAD_REPOSITORY` package lets you manage the Workload Repository, performing operations such as managing snapshots and baselines.

> **See Also:** *Oracle Database Performance Tuning Guide* for more information about the "Automatic Workload Repository"

The chapter contains the following topics:

Using DBMS_WORKLOAD_REPOSITORY

This section contains topics which relate to using the DBMS_WORKLOAD_REPOSITORY package.

Examples

This example shows how to generate an AWR text report with the DBMS_WORKLOAD_REPOSITORY package for database identifier 1557521192, instance id 1, snapshot ids 5390 and 5391 and with default options.

```
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
   DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
     1557521192,  1, 5390, 5392) ) ;
```

You can call the DBMS_WORKLOAD_REPOSITORY packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (awrrpt.sql in this case) for the packaged function, which prompts the user for required information.

Data Structures

The DBMS_WORKLOAD_REPOSITORY package defines an object and associated table types.

OBJECT Types

- AWR_BASELINE_METRIC_TYPE Object Type

TABLE Types

- AWR_BASELINE_METRIC_TYPE_TABLE Table Type
- AWRRPT_INSTANCE_LIST_TYPE Table Type

AWR_BASELINE_METRIC_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

Syntax

```
TYPE breakpoint_info AS OBJECT (
   baseline_name      VARCHAR2(64),
   dbid               NUMBER NOT NULL,
   instance_number    NUMBER NOT NULL,
   beg_time           DATE NOT NULL,
   end_time           DATE NOT NULL,
   metric_id          NUMBER NOT NULL,
   metric_name        VARCHAR2(64) NOT NULL,
   metric_unit        VARCHAR2(64) NOT NULL,
   num_interval       NUMBER NOT NULL,
   interval_size      NUMBER NOT NULL,
   average            NUMBER NOT NULL,
   minimum            NUMBER NOT NULL,
   maximum            NUMBER NOT NULL);
```

Fields

Table 179–1 RUNTIME_INFO Fields

Field	Description
baseline_name	Name of the Baseline
dbid	Database ID for the snapshot
instance_number	Instance number for the snapshot
beg_time	Begin time of the interval
end_time	End time of the interval
metric_id	Metric ID
metric_name	Metric name
metric_unit	Unit of measurement
num_interval	Number of intervals observed
interval_size	Interval size (in hundredths of a second)
average	Average over the period
minimum	Minimum value observed
maximum	Maximum value observed

AWR_BASELINE_METRIC_TYPE_TABLE Table Type

This type is used by the SELECT_BASELINE_METRIC Function.

Syntax

```
CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;
```

AWRRPT_INSTANCE_LIST_TYPE Table Type

This type provides an alternative to a comma-separated list.

Syntax

```
CREATE TYPE awrrpt_instance_list_type AS TABLE OF NUMBER;
```

Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

Table 179–2 DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
ADD_COLORED_SQL Procedure on page 179-10	Adds a colored SQL ID
ASH_GLOBAL_REPORT_ HTML Function on page 179-11	Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.
ASH_GLOBAL_REPORT_TEXT Function on page 179-14	Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in Text format.
ASH_REPORT_HTML Function on page 179-17	Displays the ASH report in HTML
ASH_REPORT_TEXT Function on page 179-20	Displays the ASH report in text
AWR_DIFF_REPORT_HTML Function on page 179-23	Displays the AWR Diff-Diff report in HTML
AWR_DIFF_REPORT_TEXT Function on page 179-24	Displays the AWR Diff-Diff report in text
AWR_GLOBAL_DIFF_REPORT_ HTML Functions on page 179-25	Displays the Global AWR Compare Periods Report in HTML
AWR_GLOBAL_DIFF_REPORT_ TEXT Functions on page 179-26	Displays the Global AWR Compare Periods Report in text
AWR_GLOBAL_REPORT_ HTML Functions on page 179-27	Displays the Global AWR report in HTML
AWR_GLOBAL_REPORT_TEXT Functions on page 179-28	Displays the Global AWR report in text
AWR_REPORT_HTML Function on page 179-29	Displays the AWR report in HTML
AWR_REPORT_TEXT Function on page 179-30	Displays the AWR report in text
AWR_SET_REPORT_ THRESHOLDS Procedure on page 179-31	Configures specified report thresholds, including the number of rows in the report
AWR_SQL_REPORT_HTML Function on page 179-32	Displays the AWR SQL Report in HTML format
AWR_SQL_REPORT_TEXT Function on page 179-33	Displays the AWR SQL Report in text format
CREATE_BASELINE Functions & Procedures on page 179-34	Creates a single baseline
CREATE_BASELINE_ TEMPLATE Procedures on page 179-34	Creates a baseline template
CREATE_SNAPSHOT Function and Procedure on page 179-38	Creates a manual snapshot immediately
DROP_BASELINE Procedure on page 179-39	Drops a previously-defined baseline
DROP_BASELINE_TEMPLATE Procedure on page 179-40	Removes a baseline template that is no longer needed

Table 179–2 (Cont.) DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
DROP_SNAPSHOT_RANGE Procedure on page 179-41	Drops a range of snapshots
MODIFY_SNAPSHOT_ SETTINGS Procedures on page 179-42	Modifies the snapshot settings
MODIFY_BASELINE_ WINDOW_SIZE Procedure on page 179-44	Modifies the window size for the Default Moving Window Baseline
PURGE_SQL_DETAILS Procedure on page 179-45	Purges SQL details, specifically rows from `WRH$_SQLTEXT` and `WRH$_SQL_PLAN` that do not have corresponding rows (DBID, SQL_ID) in `WRH$_SQLSTAT`.
REMOVE_COLORED_SQL Procedure on page 179-46	Removes a colored SQL ID
RENAME_BASELINE Procedure on page 179-47	Renames a baseline
SELECT_BASELINE_METRIC Function on page 179-48	Shows the values of the metrics corresponding to a baseline
UPDATE_OBJECT_INFO Procedure on page 179-49	Updates rows of `WRH$_SEG_STAT_OBJ` table that represent objects in the local database

ADD_COLORED_SQL Procedure

This procedure adds a colored SQL ID. If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a `TOP SQL`). Capture occurs if the SQL is found in the cursor cache at snapshot time.To uncolor the SQL, invoke the REMOVE_COLORED_SQL Procedure.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ADD_COLORED_SQL(
   sql_id          IN VARCHAR2,
   dbid            IN NUMBER DEFAULT NULL);
```

Parameters

Table 179–3 ADD_COLORED_SQL Procedure Parameters

Parameter	Description
`sql_id`	13-character external SQL ID
`dbid`	Optional DBID, defaults to Local `DBID`

ASH_GLOBAL_REPORT_HTML Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_HTML(
   l_dbid          IN NUMBER,
   l_inst_num      IN VARCHAR2((1023),
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
   l_data_src      IN NUMBER    DEFAULT 0,
   l_container     IN VARCHAR2  DEFAULT NULL)
 RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 179–4 ASH_GLOBAL_REPORT_HTML Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instances (such as '1,2,3'), or NULL to report on all instances in the database
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)
l_data_src	Ignored since the report works off of data on disk only

Table 179–4 (Cont.) ASH_GLOBAL_REPORT_HTML Parameters

Parameter	Description
l_container	Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V$CONTAINERS. Behavior is as follows: ■ If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. ■ If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB. Note: If while connected to a PDB you request information from another PDB this produces an empty report.

Return Values

The output will be one column of VARCHAR2(1500).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123 ' pass that sql_id value to the l_sql_id argument:

  ```
  l_sql_id =>  'abcdefghij123'
  ```

  Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

  ```
  l_module =>  'PAYROLL', l_action =>  'PROCESS'
  ```

  Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

Table 179–5 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V$SESSION.SID)	No
l_sql_id	SQL ID (for example, V$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V$SESSION.MODULE)	Yes
l_action	Action name (for example, V$SESSION.ACTION)	Yes

Table 179–5 (Cont.) ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_client_id	Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)	Yes
l_data_src	Wildcards are not allowed for l_data_src as it is of numeric datatype	No

ASH_GLOBAL_REPORT_TEXT Function

This table function Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in Text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_TEXT(
   l_dbid          IN VARCHAR2(1023),
   l_inst_num      IN NUMBER,
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
   l_data_src      IN NUMBER    DEFAULT 0,
   l_container     IN VARCHAR2  DEFAULT NULL)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 179–6 ASH_GLOBAL_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instances (such as '1,2,3'), or NULL to report on all instances in the database
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)
l_data_src	Ignored since the report works off of data on disk only

Table 179–6 (Cont.) ASH_GLOBAL_REPORT_TEXT Parameters

Parameter	Description
l_container	Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V$CONTAINERS. Behavior is as follows: ■ If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. ■ If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB. Note: If while connected to a PDB you request information from another PDB this produces an empty report.

Return Values

The output will be one column of VARCHAR2(320).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123 ' pass that SQL_ID value to the l_sql_id argument:

```
l_sql_id =>  'abcdefghij123'
```

Table 179–7 ASH_GLOBAL_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V$SESSION.SID)	No
l_sql_id	SQL ID (for example, V$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V$SESSION.MODULE)	Yes
l_action	Action name (for example, V$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)	Yes
l_plsql_entry	PL/SQL entry point (for example, "SYS.DBMS_LOB.*")	Yes
l_data_src	Wildcards are not allowed for l_data_src as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

  ```
  l_module =>  'PAYROLL', l_action =>  'PROCESS'
  ```

  Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

ASH_REPORT_HTML Function

This table function displays the ASH Spot report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
   l_dbid          IN NUMBER,
   l_inst_num      IN NUMBER,
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
   l_data_src      IN NUMBER    DEFAULT 0,
   l_container     IN VARCHAR2  DEFAULT NULL)
 RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 179–8 ASH_REPORT_HTML Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)

Table 179–8 (Cont.) ASH_REPORT_HTML Parameters

Parameter	Description
l_data_src	Can be used to specify a data source (see Usage Notes) ■ 1 => memory (V$ACTIVE_SESION_HISTORY) ■ 2 => disk (DBA_HIST_ACTIVE_SESS_HISTORY) ■ 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.
l_container	Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V$CONTAINERS. Behavior is as follows: ■ If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. ■ If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB. Note: If while connected to a PDB you request information from another PDB this produces an empty report.

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (l_btime and l_etime, respectively) to find all rows in that time range either from memory, or disk, or both. However, using l_data_src, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between l_btime and l_time found in memory, use

  ```
  l_data_src =>  1
  ```

  Similarly, to generate a report on samples found only on disk, use

  ```
  l_data_src => 2
  ```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123 ' pass that sql_id value to the l_sql_id argument:

  ```
  l_sql_id =>  'abcdefghij123'
  ```

  Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module =>  'PAYROLL', l_action =>  'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

Table 179–9 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V$SESSION.SID)	No
l_sql_id	SQL ID (for example, V$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V$SESSION.MODULE)	Yes
l_action	Action name (for example, V$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)	Yes

ASH_REPORT_TEXT Function

This table function displays the ASH Spot report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_TEXT(
   l_dbid          IN NUMBER,
   l_inst_num      IN NUMBER,
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
   l_data_src      IN NUMBER    DEFAULT 0,
   l_container     IN VARCHAR2  DEFAULT NULL)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 179–10 ASH_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)

Table 179–10 (Cont.) ASH_REPORT_TEXT Parameters

Parameter	Description
l_data_src	Can be used to specify a data source (see Usage Notes) ■ 1 => memory (V$ACTIVE_SESION_HISTORY) ■ 2 => disk (DBA_HIST_ACTIVE_SESS_HISTORY) ■ 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.
l_container	Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V$CONTAINERS. Behavior is as follows: ■ If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. ■ If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB. Note: If while connected to a PDB you request information from another PDB this produces an empty report.

Return Values

The output will be one column of VARCHAR2(80).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (l_btime and l_etime, respectively) to find all rows in that time range either from memory, or disk, or both. However, using l_data_src, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between l_btime and l_time found in memory, use

  ```
  l_data_src =>  1
  ```

  Similarly, to generate a report on samples found only on disk, use

  ```
  l_data_src => 2
  ```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123 ' pass that SQL_ID value to the l_sql_id argument:

  ```
  l_sql_id =>  'abcdefghij123'
  ```

Table 179–11 ASH_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V$SESSION.SID)	No

Table 179–11 (Cont.) ASH_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sql_id	SQL ID (for example, V$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V$SESSION.MODULE)	Yes
l_action	Action name (for example, V$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)	Yes
l_plsql_entry	PL/SQL entry point (for example, "SYS.DBMS_LOB.*")	Yes
l_data_src	Wildcards are not allowed for l_data_src as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

  ```
  l_module =>  'PAYROLL', l_action =>  'PROCESS'
  ```

  Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

AWR_DIFF_REPORT_HTML Function

This table function displays the AWR Compare Periods report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_HTML(
   dbid1     IN NUMBER,
   inst_num1 IN NUMBER,
   bid1      IN NUMBER,
   eid1      IN NUMBER,
   dbid2     IN NUMBER,
   inst_num2 IN NUMBER,
   bid2      IN NUMBER,
   eid2      IN NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 179–12 AWR_DIFF_REPORT_HTML Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st 'Begin Snapshot' ID
eid1	1st 'End Snapshot' ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd 'Begin Snapshot' ID
eid2	2nd 'End Snapshot' ID

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrddrpt.sql script which prompts users for the required information.

AWR_DIFF_REPORT_TEXT Function

This table function displays the AWR Compare Periods report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_TEXT(
   dbid1     IN NUMBER,
   inst_num1 IN NUMBER,
   bid1      IN NUMBER,
   eid1      IN NUMBER,
   dbid2     IN NUMBER,
   inst_num2 IN NUMBER,
   bid2      IN NUMBER,
   eid2      IN NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 179–13 AWR_DIFF_REPORT_TEXT Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st 'Begin Snapshot' ID
eid1	1st 'End Snapshot' ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd 'Begin Snapshot' ID
eid2	2nd 'End Snapshot' ID

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrddrpt.sql script which prompts users for the required information.

AWR_GLOBAL_DIFF_REPORT_HTML Functions

This table function displays Global AWR Compare Periods Report in HTML format.

The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
   dbid1        IN    NUMBER,
   inst_num1    IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid1         IN    NUMBER,
   eid1         IN    NUMBER,
   dbid2        IN    NUMBER,
   inst_num2    IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid2         IN    NUMBER,
   eid2         IN    NUMBER)
  RETURN awrrpt_html_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
   dbid1        IN    NUMBER,
   inst_num1    IN    VARCHAR2,
   bid1         IN    NUMBER,
   eid1         IN    NUMBER,
   dbid2        IN    NUMBER,
   inst_num2    IN    VARCHAR2,
   bid2         IN    NUMBER,
   eid2         IN    NUMBER)
  RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 179–14 AWR_GLOBAL_DIFF_REPORT_HTML Function Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid1	1st Begin Snap ID
eid1	1st End Snapshot ID
dbid2	2nd database identifier
inst_num2	2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid2	2nd Begin Snap ID
eid2	2nd End Snapshot ID

Return Values

The output will be one column of `VARCHAR2(1500)`.

AWR_GLOBAL_DIFF_REPORT_TEXT Functions

This table function displays Global AWR Compare Periods Report in text format.

The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
   dbid1        IN    NUMBER,
   inst_num1    IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid1         IN    NUMBER,
   eid1         IN    NUMBER,
   dbid2        IN    NUMBER,
   inst_num2    IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid2         IN    NUMBER,
   eid2         IN    NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
   dbid1        IN    NUMBER,
   inst_num1    IN    VARCHAR2,
   bid1         IN    NUMBER,
   eid1         IN    NUMBER,
   dbid2        IN    NUMBER,
   inst_num2    IN    VARCHAR2,
   bid2         IN    NUMBER,
   eid2         IN    NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 179–15 AWR_GLOBAL_DIFF_REPORT_TEXT Functions Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid1	1st Begin Snap ID
eid1	1st End Snapshot ID
dbid2	2nd database identifier
inst_num2	2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid2	2nd Begin Snap ID
eid2	2nd End Snapshot ID

Return Values

The output will be one column of `VARCHAR2(320)`.

AWR_GLOBAL_REPORT_HTML Functions

This table function displays the Global AWR report in HTML.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
   l_dbid        IN    NUMBER,
   l_inst_num    IN    AWRRPT_INSTANCE_LIST_TYPE,   l_bid         IN    NUMBER,
   l_eid         IN    NUMBER,
   l_options     IN    NUMBER DEFAULT 0)
  RETURN awrrpt_html_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
   l_dbid       IN    NUMBER,
   l_inst_num   IN    VARCHAR2,   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
  RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 179–16 AWR_GLOBAL_REPORT_HTML Function Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
l_bid	Begin Snap ID
l_eid	End Snapshot ID
l_options	Report level (currently not used)

Return Values

The output will be one column of VARCHAR2(1500).

AWR_GLOBAL_REPORT_TEXT Functions

This table function displays the Global AWR report in text.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
   l_dbid        IN    NUMBER,
   l_inst_num    IN    AWRRPT_INSTANCE_LIST_TYPE,
   l_bid         IN    NUMBER,
   l_eid         IN    NUMBER,
   l_options     IN    NUMBER DEFAULT 0)
  RETURN awrdrpt_text_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    VARCHAR2,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 179–17 AWR_GLOBAL_REPORT_TEXT Function Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
l_bid	Begin Snap ID
l_eid	End Snapshot ID
l_options	A flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of VARCHAR2(320).

AWR_REPORT_HTML Function

This table function displays the AWR report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 179–18 AWR_REPORT_HTML Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	The 'Begin Snapshot' ID
l_eid	The 'End Snapshot' ID
l_options	A flag to specify to control the output of the report. Currently, Oracle supports one value: ■ l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of VARCHAR2(1500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrrpt.sql script which prompts users for the required information.

AWR_REPORT_TEXT Function

This table function displays the AWR report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 179–19 AWR_REPORT_TEXT Parameters

Parameter	Description
`l_dbid`	Database identifier
`l_insT_num`	Instance number
`l_bid`	The `'Begin Snapshot' ID`
`l_eid`	The `'End Snapshot' ID`
`l_options`	A flag to specify to control the output of the report. Currently, Oracle supports one value: ▪ `l_options - 8`. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of `VARCHAR2(80)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

AWR_SET_REPORT_THRESHOLDS Procedure

This procedure configure specified report thresholds, including the number of rows in the report.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS(
   top_n_events         IN   NUMBER DEFAULT NULL,
   top_n_files          IN   NUMBER DEFAULT NULL,
   top_n_segments       IN   NUMBER DEFAULT NULL,
   top_n_services       IN   NUMBER DEFAULT NULL,
   top_n_sql            IN   NUMBER DEFAULT NULL,
   top_n_sql_max        IN   NUMBER DEFAULT NULL,
   top_sql_pct          IN   NUMBER DEFAULT NULL,
   shmem_threshold      IN   NUMBER DEFAULT NULL,
   versions_threshold   IN   NUMBER DEFAULT NULL);
```

Parameters

Table 179–20 AWR_SET_REPORT_THRESHOLDS Procedure Parameters

Parameter	Description
top_n_events	Number of most significant wait events to be included
top_n_files	Number of most active files to be included
top_n_segments	Number of most active segments to be included
top_n_services	Number of most active services to be included
top_n_sql	Number of most significant SQL statements to be included
top_n_sql_max	Number of SQL statements to be included if their activity is greater than that specified by top_sql_pct
top_sql_pct	Significance threshold for SQL statements between top_n_sql and top_n_sql_max
shmem_threshold	Shared memory low threshold
versions_threshold	Plan version count low threshold

User Notes

- The effect of each setting depends on the type of report being generated as well as on the underlying AWR data. Not all settings are meaningful for each report type. Invalid settings (such as negative numbers) are ignored.
- Settings are effective only in the context of the session that executes the AWR_SET_REPORT_THRESHOLDS procedure. For example, to get a report that lists top 12 segments as compared to the default, one can invoke as follows:

  ```
  DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS (top_n_segments=>12);
  ```

AWR_SQL_REPORT_HTML Function

This table function displays the AWR SQL Report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_sqlid      IN    VARCHAR2,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 179–21 AWR_SQL_REPORT_HTML Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	The 'Begin Snapshot' ID
l_eid	The 'End Snapshot' ID
l_sqlid	SQL ID of statement to be analyzed
l_options	A flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrsqrpt.sql script which prompts users for the required information.

AWR_SQL_REPORT_TEXT Function

This table function displays the AWR SQL Report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_sqlid      IN    VARCHAR2,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 179–22 AWR_SQL_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	The 'Begin Snapshot' ID
l_eid	The 'End Snapshot' ID
l_sqlid	SQL ID of statement to be analyzed
l_options	Flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of VARCHAR2(120).

Usage Notes

You can call the function directly but Oracle recommends you use the awrsqrpt.sql script which prompts users for the required information.

CREATE_BASELINE Functions & Procedures

This function and procedure creates a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_snap_id    IN  NUMBER,
   end_snap_id      IN  NUMBER,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_snap_id    IN  NUMBER,
   end_snap_id      IN  NUMBER,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL)
 RETURN NUMBER;

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_time       IN  DATE,
   end_time         IN  DATE,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_time       IN  DATE,
   end_time         IN  DATE,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL);
 RETURN NUMBER;
```

Parameters

Table 179–23 CREATE_BASELINE Function & Procedure Parameters

Parameter	Description
start_snap_id	Start snapshot sequence number for the baseline'
end_snap_id	End snapshot sequence number for the baseline
start_time	Start time for the baseline'
end_time	End time for the baseline
baseline_name	Name of baseline.
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL.

Exceptions

- An error will be returned if this baseline name already exists in the system.

- The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

Examples

This example creates a baseline (named 'oltp_peakload_bl') between snapshots 105 and 107 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,
end_snap_id => 107,
baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the CREATE BASELINE action, you will see the newly created baseline in the Workload Repository.

CREATE_BASELINE_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

Syntax

Specifies a template for generating a baseline for a single time period in the future.

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
   start_time              IN DATE,
   end_time                IN DATE,
   baseline_name           IN VARCHAR2,
   template_name           IN VARCHAR2,
   expiration              IN NUMBER,
   dbid                    IN NUMBER DEFAULT NULL);
```

Specifies a template for creating and dropping baseline based on repeating time periods:

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
   day_of_week             IN VARCHAR2,
   hour_in_day             IN NUMBER,
   duration                IN NUMBER,
   start_time              IN DATE,
   end_time                IN DATE,
   baseline_name_prefix    IN VARCHAR2,
   template_name           IN VARCHAR2,
   expiration              IN NUMBER,
   dbid                    IN NUMBER DEFAULT NULL);
```

Parameters

Table 179–24 CREATE_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
start_time	Start Time for the baseline to be created'
end_time	End Time for the baseline to be created
baseline_name	Name of baseline to be created
template_name	Name for the template
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.
day_of_week	Day of week that the baseline should repeat on. Specify one of the following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY.
hour_in_day	Value of 0-23 to specify the Hour in the Day the baseline should start
duration	Duration (in number of hours) after hour in the day that the baseline should last

Table 179–24 (Cont.) CREATE_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
baseline_name_prefix	Name for baseline prefix. When creating the baseline, the name of the baseline will be the prefix appended with the date information.

CREATE_SNAPSHOT Function and Procedure

This function and procedure create snapshots. In the case of the function, the snapshot ID is returned.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
   flush_level IN VARCHAR2 DEFAULT 'TYPICAL');

DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
   flush_level IN VARCHAR2 DEFAULT 'TYPICAL')
 RETURN NUMBER;
```

Parameters

Table 179–25 CREATE_SNAPSHOT Parameters

Parameter	Description
flush_level	Flush level for the snapshot is either 'TYPICAL' or 'ALL'

Examples

This example creates a manual snapshot at the TYPICAL level:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT();
```

If you query the DBA_HIST_SNAPSHOT view after the CREATE_SNAPSHOT action, you will see one more snapshot ID added to the Workload Repository.

DROP_BASELINE Procedure

This procedure drops a previously-defined baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE(
   baseline_name  IN  VARCHAR2,
   cascade        IN  BOOLEAN DEFAULT FALSE,
   dbid           IN  NUMBER DEFAULT NULL);
```

Parameters

Table 179–26 DROP_BASELINE Parameters

Parameter	Description
baseline_name	Name of baseline to drop from the system
cascade	If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed.
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.

Examples

This example drops the baseline 'oltp_peakload_bl' without dropping the underlying snapshots:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
       baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the DROP_BASELINE action, you will see the specified baseline definition is removed. You can query the DBA_HIST_SNAPSHOT view to find that the underlying snapshots are left intact.

DROP_BASELINE_TEMPLATE Procedure

This procedure removes a template that is no longer needed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE(
   template_name           IN VARCHAR2,   dbid                    IN NUMBER
DEFAULT NULL);
```

Parameters

Table 179–27 DROP_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
`template_name`	Name of the template to remove
`dbid`	Database Identifier for baseline. If `NULL`, this takes the database identifier for the local database. Defaults to `NULL`.

DROP_SNAPSHOT_RANGE Procedure

This procedure drops a range of snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(
   low_snap_id    IN  NUMBER,
   high_snap_id   IN  NUMBER
   dbid           IN  NUMBER DEFAULT NULL);
```

Parameters

Table 179–28 DROP_SNAPSHOT_RANGE Procedure Parameters

Parameter	Description
low_snap_id	Low snapshot id of snapshots to drop.
high_snap_id	High snapshot id of snapshots to drop.
dbid	Database id (default to local DBID.

Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the dba_hist_snapshot view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.

MODIFY_SNAPSHOT_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The INTERVAL setting affects how often snapshots are automatically captured.
- The RETENTION setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a NUMBER and the second takes a VARCHAR2 for the topnsql argument. The differences are described under the Parameters description.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
   retention   IN  NUMBER    DEFAULT NULL,
   interval    IN  NUMBER    DEFAULT NULL,
   topnsql     IN  NUMBER    DEFAULT NULL,
   dbid        IN  NUMBER    DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
   retention   IN  NUMBER    DEFAULT NULL,
   interval    IN  NUMBER    DEFAULT NULL,
   topnsql     IN  VARCHAR2,
   dbid        IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 179–29 MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
retention	New retention time (in minutes). The specified value must be in the range of MIN_RETENTION (1 day) to MAX_RETENTION (100 years). If ZERO is specified, snapshots will be retained forever. A large system-defined value will be used as the retention setting. If NULL is specified, the old value for retention is preserved. NOTE: The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the MODIFY_BASELINE_WINDOW_SIZE Procedure can be used to adjust the window size.
interval	New interval setting between each snapshot, in units of minutes. The specified value must be in the range MIN_INTERVAL (10 minutes) to MAX_INTERVAL (1 year). If ZERO is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting. If NULL is specified, the current value is preserved.

Table 179–29 (Cont.) MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
topnsql	■ If NUMBER: Top N SQL size. The number of Top SQL to flush for each SQL criteria (Elapsed Time, CPU Time, Parse Calls, Shareable Memory, Version Count). The value for this setting will not be affected by the statistics/flush level and will override the system default behavior for the AWR SQL collection. The setting will have a minimum value of 30 and a maximum value of 50,000. Specifying NULL will keep the current setting. ■ If VARCHAR2: Users are allowed to specify the following values: (DEFAULT, MAXIMUM, N), where N is the number of Top SQL to flush for each SQL criteria. Specifying DEFAULT will revert the system back to the default behavior of Top 30 for statistics level TYPICAL and Top 100 for statistics level ALL. Specifying MAXIMUM will cause the system to capture the complete set of SQL in the cursor cache. Specifying the number N is equivalent to setting the Top N SQL with the NUMBER type. Specifying NULL for this argument will keep the current setting.
dbid	Database identifier in AWR for which to modify the snapshot settings. If NULL is specified, the local dbid will be used. Defaults to NULL.

Examples

This example changes the interval setting to one hour and the retention setting to two weeks for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
  interval  =>  60,
  retention =>  20160);
```

If you query the DBA_HIST_WR_CONTROL table after this procedure is executed, you will see the changes to these settings.

MODIFY_BASELINE_WINDOW_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE(
   window_size     IN   NUMBER,
   dbid            IN   NUMBER DEFAULT NULL);
```

Parameters

Table 179–30 MODIFY_BASELINE_WINDOW_SIZE Procedure Parameters

Parameter	Description
window_size	New Window size for the default Moving Window Baseline, in number of days.
dbid	Database ID (default to local DBID)

Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the MODIFY_SNAPSHOT_SETTINGS Procedures can be used to adjust the retention setting. A moving window can be set to a maximum of 13 weeks.

PURGE_SQL_DETAILS Procedure

This procedure purges SQL details, specifically rows from WRH$_SQLTEXT, WRH$_SQL_PLAN, and WRH$_SQL_BIND_METADATA that do not have corresponding rows (DBID, SQL_ID) in WRH$_SQLSTAT.

The subprogram calls for the DBID for which to run the purge. If the DBID is not specified, the database DBID is used. You can constrain runtime by specifying the maximum number of rows to purge per table. If no maximum is specified, the subprograms tries to purge all applicable rows.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.PURGE_SQL_DETAILS(
   numrows IN NUMBER DEFAULT NULL,
   dbid    IN NUMBER DEFAULT NULL);
```

Parameters

Table 179–31 PURGE_SQL_DETAILS Procedure Parameters

Parameter	Description
numrows	Number of rows
dbid	Database ID (default to local DBID)

REMOVE_COLORED_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the TOP list.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.REMOVE_COLORED_SQL(
   sql_id          IN VARCHAR2,
   dbid            IN NUMBER DEFAULT NULL);
```

Parameters

Table 179–32 REMOVE_COLORED_SQL Procedure Parameters

Parameter	Description
sql_id	13-character external SQL ID
dbid	Optional dbid, defaults to Local DBID

RENAME_BASELINE Procedure

This procedure renames a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(
   old_baseline_name     IN   VARCHAR2,
   new_baseline_name     IN VARCHAR2,
   dbid                  IN NUMBER DEFAULT NULL);
```

Parameters

Table 179–33 RENAME_BASELINE Procedure Parameters

Parameter	Description
old_baseline_name	Old baseline name
new_baseline_name	New baseline name
dbid	Database ID (default to local DBID)

SELECT_BASELINE_METRIC Function

This table function shows the values of the metrics corresponding to a baseline. The table function will return an object of the AWR_BASELINE_METRIC_TYPE Object Type.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRIC(
   baseline_name     IN VARCHAR2,
   dbid              IN NUMBER DEFAULT NULL,
   instance_num      IN NUMBER DEFAULT NULL)
 RETURN awr_metric_type_table PIPELINED;
```

Parameters

Table 179–34 SELECT_BASELINE_METRIC Function Parameters

Parameter	Description
baseline_name	Name of the baseline for which we would like to view metrics
dbid	Database Identifier for baseline. If NULL, then use the database identifier for the local database. Defaults to NULL.
instance_num	Instance for which number the user wants to see statistics. If NULL, show statistics for the local instance. Defaults to NULL.

UPDATE_OBJECT_INFO Procedure

This procedure updates rows of WRH$_SEG_STAT_OBJ table that represent objects in the local database. It attempts to determine the current names for all object belonging to the local database, except those with 'MISSING' and/or 'TRANSIENT' values in the name columns. The amount of work performed at each invocation of this routine may be controlled by setting the input parameter.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_OBJECT_INFO(
   maxrows   IN  NUMBER  DEFAULT 0);
```

Parameters

Table 179–35 UPDATE_OBJECT_INFO Procedure Parameters

Parameter	Description
maxrows	Maximum number of rows to be updated. Default= 0, meaning there is no limit.

180

DBMS_XA

The DBMS_XA package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL*Plus sessions or processes using PL/SQL.

> **See Also:** *Oracle Database Advanced Application Developer's Guide* for more information about "Developing Applications with Oracle XA"

The chapter contains the following topics:

Using DBMS_XA

Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (`XID`) and associate or disassociate the current session with the transaction branch.

Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.

Security Model

This package is created under SYS. Operations provided by this package are performed under the current calling user, not under the package owner SYS.Any DBMS_XA subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any DBMS_XA subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

SELECT or READ privilege on SYS.DBA_PENDING_TRANSACTIONS is required for users who need to execute XA_RECOVER subprogram.

FORCE ANY TRANSACTION privilege is required for users who need to manipulate XA transactions created by other users.

Constants

The DBMS_XA package uses the constants shown in Table 180–1 for use in the flag field of the XA_START Function and the XA_END Function.

Table 180–1 DBMS_XA Constants for Flag Field of XA_START & XA_END Functions

Name	Type	Value	Description
TMNOFLAGS	PLS_INTEGER	00000000	Indicates no flag value is selected.
TMSUCCESS	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('04000000')	Dissociates caller from transaction branch
TMJOIN	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('00200000')	Caller is joining existing transaction branch.
TMSUSPEND	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('02000000')	Caller is suspending, not ending, association
TMRESUME	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('08000000')	Caller is resuming association with suspended transaction branch.

The DBMS_XA package uses the constants shown in Table 180–2 for Possible Return Values

Table 180–2 DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_RBBASE	PLS_INTEGER	100	Inclusive lower bound of the rollback codes
XA_RBROLLBACK	PLS_INTEGER	XA_RBBASE	Rollback was caused by an unspecified reason
XA_RBCOMMFAIL	PLS_INTEGER	XA_RBBASE+1	Rollback was caused by a communication failure
XA_RBDEADLOCK	PLS_INTEGER	XA_RBBASE+2	Deadlock was detected
XA_RBINTEGRITY	PLS_INTEGER	XA_RBBASE+3	Condition that violates the integrity of the resources was detected
XA_RBOTHER	PLS_INTEGER	XA_RBBASE+4	Resource manager rolled back the transaction for an unlisted reason
XA_RBPROTO	PLS_INTEGER	XA_RBBASE+5	Protocol error occurred in the resource manager
XA_RBTIMEOUT	PLS_INTEGER	XA_RBBASE+6	transaction branch took long
XA_RBTRANSIENT	PLS_INTEGER	XA_RBBASE+7	May retry the transaction branch
XA_RBEND	PLS_INTEGER	XA_RBTRANSIENT	Inclusive upper bound of the rollback codes
XA_NOMIGRATE	PLS_INTEGER	9	Transaction branch may have been heuristically completed

Table 180–2 (Cont.) DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_HEURHAZ	PLS_INTEGER	8	Transaction branch may have been heuristically completed
XA_HEURCOM	PLS_INTEGER	7	Transaction branch has been heuristically committed
XA_HEURRB	PLS_INTEGER	6	Transaction branch has been heuristically rolled back
XA_HEURMIX	PLS_INTEGER	5	Some of the transaction branches have been heuristically committed, others rolled back
XA_RETRY	PLS_INTEGER	4	Routine returned with no effect and may be re-issued
XA_RDONLY	PLS_INTEGER	3	Transaction was read-only and has been committed
XA_OK	PLS_INTEGER	0	Normal execution
XAER_ASYNC	PLS_INTEGER	-2	Asynchronous operation already outstanding
XAER_RMERR	PLS_INTEGER	-3	Resource manager error occurred in the transaction branch
XAER_NOTA	PLS_INTEGER	-4	XID is not valid
XAER_INVAL	PLS_INTEGER	-5	Invalid arguments were given
XAER_PROTO	PLS_INTEGER	-6	Routine invoked in an improper context
XAER_RMFAIL	PLS_INTEGER	-7	Resource manager unavailable
XAER_DUPID	PLS_INTEGER	-8	XID already exists
XAER_OUTSIDE	PLS_INTEGER	-9	Resource manager doing work outside global transaction

Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, XA_PREPARE/COMMIT/ ROLLBACK/FORGET may not be called when the transaction is still associated with the current session. Only after XA_END has been called so that there is not any transaction associated with the current session, the application may call XA_PREPARE/COMMIT/ ROLLBACK/FORGET.

XAER_PROTO error is returned from XA_PREPARE/COMMIT/ROLLBACK/FORGET if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.

Data Structures

The DBMS_XA package uses the following OBJECT type and associated TABLE type.

OBJECT Types

- DBMS_XA_XID Object Type

TABLE Types

- DBMS_XA_XID_ARRAY Table Type

DBMS_XA_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

> **See Also:** For more information, see "Distributed Transaction Processing: The XA Specification" in the public XA Standard.

Syntax

```
TYPE DBMS_XA_XID IS OBJECT(
  formatid      NUMBER,
  gtrid         RAW(64),
  bqual         RAW(64),
  constructor function DBMS_XA_XID(
       gtrid     IN   NUMBER)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID (
       gtrid     IN   RAW,
       bqual     IN   RAW)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID(
       formatid  IN   NUMBER,
       gtrid     IN   RAW,
       bqual     IN   RAW DEFAULT HEXTORAW('00000000000000000000000000000001'))
    RETURN SELF AS RESULT)
```

Attributes

Table 180–3 DBMS_XA_XID Object Type

Attribute	Description
formatid	Format identifier, a number identifying different transaction managers (TM)
gtrid	Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes
bqual	Branch qualifier, of which the maximum size is 64 bytes

DBMS_XA_XID_ARRAY Table Type

This type is used to define an array of `xid` that represent a list of global transaction branches.

Syntax

```
TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID
```

Summary of DBMS_XA Subprograms

Table 180–4 DBMS_Xa Package Subprograms

Subprogram	Description
DIST_TXN_SYNC Procedure on page 180-12	Used in recovery of synchronization when utilizing Oracle Real Application Clusters (Oracle RAC)
XA_COMMIT Function on page 180-13	Commits the global transaction specified by `xid`
XA_END Function on page 180-14	Disassociates the current session from the transaction branch specified by `xid`
XA_FORGET Function on page 180-15	Informs the resource manager to forget about a heuristically committed or rolled back transaction branch.
XA_GETLASTOER Function on page 180-16	Obtains the last Oracle error code, in case of failure of previous XA calls.
XA_PREPARE Function on page 180-17	Prepares the transaction branch specified in `xid` for committing the transaction subsequently if possible
XA_RECOVER Function on page 180-18	Obtains a list of prepared or heuristically completed transaction branches from a resource manager
XA_ROLLBACK Function on page 180-19	Informs the resource manager to roll back work done on behalf of a transaction branch
XA_SETTIMEOUT Function on page 180-20	Sets the transaction timeout in seconds for the current session
XA_START Function on page 180-21	Associates the current session with the transaction branch specified by `xid`

DIST_TXN_SYNC Procedure

This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (Oracle RAC) instances fails.

Syntax

```
DBMS_XA.DIST_TXN_SYNC;
```

XA_COMMIT Function

This function commits the global transaction specified by xid.

Syntax

```
DBMS_XA.XA_COMMIT (
   xid       IN  DBMS_XA_XID,
   onePhase  IN  BOOLEAN)
RETURN PLS_INTEGER;
```

Parameters

Table 180–5 XA_COMMIT Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 180-9
onePhase	If TRUE, apply single phase commit

Return Values

See Table 180–2, " DBMS_XA Constants for Possible Return Values". Possible return values indicating error are: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO. Other possible return values include: XA_OK, XA_RB*, XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, and XA_HEURMIX.

Usage Notes

- An application must not call COMMIT, but instead must call XA_COMMIT to commit the global transaction specified by xid. If a user needs to commit a transaction branch that is created by other users, FORCE ANY TRANSACTION must be granted to the user.
- If onePhase is TRUE, the resource manager should use a one-phase commit protocol to commit the work done on behalf of xid. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding XA_PREPARE call has returned XA_OK, should XA_COMMIT be called.
- The application must make a separate XA_COMMIT call for each of the transaction branches of the global transaction for which XA_PREPARE has returned XA_OK.
- If the resource manager did not commit the transaction and the parameter onePhase is set to TRUE, the resource manager may return one of the XA_RB* code. Upon return, the resource manager has rolled back the branch's work and has released all held resources.

XA_END Function

This function disassociates the current session from the transaction branch specified by xid

A transaction manager calls XA_END when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When XA_END successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists

Syntax

```
DBMS_XA.XA_END (
   xid   IN  DBMS_XA_XID,
   flag  IN  PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 180–6 XA_END Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 180-9
flag	See Table 180–1, " DBMS_XA Constants for Flag Field of XA_START & XA_END Functions".

Return Values

See Table 180–2, " DBMS_XA Constants for Possible Return Values". Possible return values in error are XAER_RMERR, XAER_RMFAILED, XAER_NOTA, XAER_INVAL, XAER_PROTO, or XA_RB*.

Usage Notes

- TMSUCCESS or TMSUSPEND may be specified in flag, and the transaction branch is disassociated with the current session in detached state if the return value is XA_OK. TMFAIL is not supported. XA_END may be called with either TMSUCCESS or TMSUSPEND to disassociate the transaction branch identified by xid from the current session.
- XA_OK is returned if XA_END succeeds. An application must check the return value and handle error cases. Only when XA_OK is returned, the application should proceed for other normal operations.
- Executing a ROLLBACK statement without calling XA_END first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until XA_END is called.
- Executing a COMMIT statement without calling XA_END first will result in ORA-02089: COMMIT is not allowed in a subordinate session.
- Executing a COMMIT or a ROLLBACK statement after XA_END has no effect on the transaction identified by xid, since this transaction is no longer associated with the current session. To commit the transaction ID or the XA_ROLLBACK Function to commit/rollback the transaction specified by the xid.

XA_FORGET Function

This function informs the resource manager to forget about a heuristically committed or rolled back transaction branch.

Syntax

```
DBMS_XA.XA_FORGET (
   xid       IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

Table 180–7 XA_FORGET Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 180-9

Return Values

See Table 180–2, " DBMS_XA Constants for Possible Return Values". Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

XA_GETLASTOER Function

This function obtains the last Oracle error code, in case of failure of previous XA calls.

Syntax

```
DBMS_XA.XA_GETLASTOER
 RETURN PLS_INTEGER;
```

Return Values

The return value carries the last Oracle error code.

XA_PREPARE Function

This function prepares the transaction branch specified in `xid` for committing the transaction subsequently if possible.

Syntax

```
DBMS_XA.XA_PREPARE (
   xid   IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

Table 180–8 XA_PREPARE Function Parameters

Parameter	Description
`xid`	See DBMS_XA_XID Object Type on page 180-9

Return Values

See Table 180–2, " DBMS_XA Constants for Possible Return Values". Possible return codes include: `XA_OK`, `XA_RDONLY`, `XA_RB*`, `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`.

Usage Notes

- If a user needs to prepare a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- An application must keep track of all the branches of one global transaction, and prepare each transaction branch. Only if all branches of the global transaction have been prepared successfully and `XA_PREPARE` has returned `XA_OK`, the application may proceed to call `XA_COMMIT`.

XA_RECOVER Function

This function obtains a list of prepared or heuristically completed transaction branches from a resource manager.

Syntax

```
DBMS_XA.XA_RECOVER
 RETURN DBMS_XA_XID_ARRAY;
```

Return Values

See DBMS_XA_XID_ARRAY Table Type

Usage Notes

- The flags `TMSTARTSCAN`, `TMENDSCAN`, `TMNOFLAGS` are not supported.
- The privilege `SELECT ON DBA_PENDING_TRANSACTIONS` must be granted to the user who needs to call `XA_RECOVER`.

XA_ROLLBACK Function

This function informs the resource manager to roll back work done on behalf of a transaction branch.

Syntax

```
DBMS_XA.XA_ROLLBACK (
   xid       IN  DBMS_XA_XID)
 RETURN PLS_INTEGER;
```

Parameters

Table 180–9 XA_ROLLBACK Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 180-9

Return Values

See Table 180–2, " DBMS_XA Constants for Possible Return Values". Possible return values are: XA_OK, XA_RB*, XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, or XA_HEURMIX.

Usage Notes

If a user needs to rollback a transaction branch that created by other users, the privilege FORCE ANY TRANSACTION must be granted to the user.

XA_SETTIMEOUT Function

This function sets the transaction timeout in seconds for the current session.

Syntax

```
DBMS_XA.XA_SETTIMEOUT (
   seconds  IN  PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 180–10 XA_SETTIMEOUT Function Parameters

Parameter	Description
seconds	The timeout value indicates the maximum time in seconds that a transaction branch may be disassociated from the session before the system automatically aborts the transaction. The default value is 60 seconds.

Return Values

See Table 180–2, " DBMS_XA Constants for Possible Return Values". Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, or XAER_INVAL.

Usage Notes

Only if return value is XA_OK, is the timeout value successfully set.

XA_START Function

This function associates the current session with a transaction branch specified by the xid.

Syntax

```
DBMS_XA.XA_START (
   xid   IN  DBMS_XA_XID,    flag  IN  PLS_INTEGER)  RETURN PLS_INTEGER;
```

Parameters

Table 180–11 XA_START Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 180-9
flag	See Table 180–1, " DBMS_XA Constants for Flag Field of XA_START & XA_END Functions".

Return Values

See Table 180–2, " DBMS_XA Constants for Possible Return Values"

Usage Notes

- If TMJOIN or TMRESUME is specified in flag, the start is for joining an existing transaction branch identified by the xid. TMJOIN flag should be used when the transaction is detached with TMSUCCESS flag. TMRESUME should be used when the transaction branch is detached with TMSUSPEND flag. XA_START may be called with either flag to join an existing transaction branch.
- If TMNOFLAGS is specified in flag, and neither TMJOIN nor TMRESUME is specified, a new transaction branch is to be started. If the transaction branch specified in xid already exists, XA_START returns an XAER_DUPID error code.
- Possible return values in error include: XAER_RMERR, XAER_RMFAIL, XAER_DUPID, XAER_OUTSIDE, XAER_NOTA, XAER_INVAL, and XAER_PROTO.
- XA_OK is returned if XA_START succeeds. An application must check the return value and handle error cases. Only when XA_OK is returned, the PL/SQL application should proceed for other normal operations.Transaction stacking is not supported. If there is an active transaction associated with the current session, may not be called to start or join another transaction. XAER_PROTO will be returned if XA_START is called with an active global transaction branch associated with the session. XAER_OUTSIDE will be returned if XA_START is called with a local transaction associated with the current session.

181

DBMS_XDB

Note: The DBMS_XDB package subprograms and constants are deprecated with Oracle Database 12*c*. While all features continue to be supported for backward compatibility, Oracle recommends that you use the alternative procedures provided in each case. For more information, see Deprecated Subprograms on page 181-4 and Constants on page 181-8.

The DBMS_XDB package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

See Also:

- *Oracle XML DB Developer's Guide*
- *Oracle Database New Features Guide*

This chapter contains the following topics:

Using DBMS_XDB

This section contains topics which relate to using the `DBMS_XDB` package.

Overview

The DBMS_XDB package supports the following features:

- The Resource Management functionality providesLINK Procedures, EXISTSRESOURCE Function, LOCKRESOURCE Function, GETLOCKTOKEN Procedure, UNLOCKRESOURCE Function, CREATERESOURCE Functions, RENAMERESOURCE Procedure, DELETERESOURCE Procedure, GETRESOID Function, CREATEOIDPATH Function, and CREATEFOLDER Function subprograms which complement Resource Views.
- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database. Some of these methods can be used for both Oracle resources and arbitrary database objects. Use CHECKPRIVILEGES Function, GETACLDOCUMENT Function, and CHANGEPRIVILEGES Function for Oracle Resources. ACLCHECKPRIVILEGES Function provides access to Oracle's ACL-based Security mechanism without storing objects in the Hierarchy.
- Configuration Session Management is supported by CFG_REFRESH Procedure, CFG_GET Function and CFG_UPDATE Procedure. methods.
- The XDB username is created during XDB installation. This user owns a set of default tables and packages. GETXDB_TABLESPACE Function and the DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE Procedure enable movement of schemas to a specified tablespace, and support the default SYSAUX tablespace introduction

Deprecated Subprograms

> **Note:** Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

All subprograms in the `DBMS_XDB` package are deprecated with Oracle Database 12*c* and substituted by the alternative subprograms with the same names in either the `DBMS_XDB_CONFIG` package or the `DBMS_XDB_REPOS` package as listed in the table.

Security Model

Owned by XDB, the DBMS_XDB package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is SYS or XDB, or the current user has the XDBADMIN or DBA role.

Constants

All constants as described in Table 181–2, " DBMS_XDB Constants"are deprecated in Oracle Release 12*c* in that they are relocated to either the DBMS_XDB_CONFIG package or the DBMS_XDB_REPOS package. The specifics of transference in each case are detailed in the **Relocated** column.

Oracle recommends that you do not use constants in their DBMS_XDB context in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

Table 181–2 DBMS_XDB Constants

Constant	Type	Value	Description	Relocated
DELETE_RESOURCE	NUMBER	1	Deletes a resource; fails if the resource has children.	DBMS_XDB_REPOS
DELETE_RECURSIVE	NUMBER	2	Deletes a resource and its children, if any.	DBMS_XDB_REPOS
DELETE_FORCE	NUMBER	3	Deletes the resource, even if the object it contains is invalid.	DBMS_XDB_REPOS
DELETE_RECURSIVE_FORCE	NUMBER	4	Deletes a resource and its children, if any, even if the object it contains is invalid.	DBMS_XDB_REPOS
DELETE_RES_METADATA_CASCADE	NUMBER	1	Deletes the corresponding row in the metadata table	DBMS_XDB_REPOS
DELETE_RES_METADATA_NOCASCADE	NUMBER	2	Does not delete the row in the metadata table	DBMS_XDB_REPOS
DEFAULT_LOCK_TIMEOUT CONSTANT	PLS_INTEGER	(60*60)	Default time (in seconds) after which lock will expire	DBMS_XDB_REPOS
LINK_TYPE_HARD	NUMBER	1	Type of link to be created (default)	DBMS_XDB_REPOS
LINK_TYPE_WEAK	NUMBER	2	Type of link to be created	DBMS_XDB_REPOS
LINK_TYPE_SYMBOLIC	NUMBER	3	Type of link to be created	DBMS_XDB_REPOS
ON_DENY_NEXT_CUSTOM	NUMBER	1	If access denied, the next custom authorization is tried	DBMS_XDB_CONFIG
ON_DENY_BASIC	NUMBER	2	If access denied, basic authentication is used	DBMS_XDB_CONFIG
XDB_ENDPOINT_HTTP	NUMBER	1	Defining listener for first HTTP port	DBMS_XDB_CONFIG
XDB_ENDPOINT_HTTP2	NUMBER	2	Defining listener for second HTTP port	DBMS_XDB_CONFIG
XDB_PROTOCOL_TCP	NUMBER	1	Defining listener for HTTP protocol	DBMS_XDB_CONFIG
XDB_PROTOCOL_TCPS	NUMBER	2	Defining listener for HTTPS protocol	DBMS_XDB_CONFIG

Summary of DBMS_XDB Subprograms

Table 181–3 DBMS_XDB Package Subprograms

Subprogram	Description
ACLCHECKPRIVILEGES Function on page 181-12	Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.
ADDHTTPEXPIREMAPPING Procedure on page 181-13	Adds to `xdb$config` a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.
ADDMIMEMAPPING Procedure on page 181-14	Adds a mime mapping to the XDB configuration
ADDSCHEMALOCMAPPING Procedure on page 181-15	Adds a schema location mapping to the XDB configuration
ADDSERVLET Procedure on page 181-16	Adds a servlet to XDB configuration
ADDSERVLETMAPPING Procedure on page 181-17	Adds a servlet mapping to XDB configuration
ADDSERVLETSECROLE Procedure on page 181-18	Adds a security role `REF` to a specified servlet in the XDB configuration
ADDXMLEXTENSION Procedure on page 181-19	Adds adds an XML extension to the XDB configuration
APPENDRESOURCEMETADATA Procedure on page 181-20	Takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource
CFG_GET Function on page 181-21	Retrieves the session's configuration information
CFG_REFRESH Procedure on page 181-22	Refreshes the session's configuration information to the latest configuration
CFG_UPDATE Procedure on page 181-23	Updates the configuration information
CHANGEOWNER Procedure on page 181-24	Changes the owner of the resource/s to the specified owner.
CHANGEPRIVILEGES Function on page 181-25	Adds a specified ACE to a specified resource's ACL
CHECKPRIVILEGES Function on page 181-26	Checks access privileges granted to the current user on the specified resource
CREATEFOLDER Function on page 181-27	Creates a new folder resource in the hierarchy
CREATEOIDPATH Function on page 181-28	Creates a virtual path to the resource based on object ID
CREATERESOURCE Functions on page 181-29	Creates a new resource
DELETEHTTPEXPIREMAPPING Procedure on page 181-31	Deletes from `xdb$config` all mappings of the URL pattern to an expiration date
DELETEMIMEMAPPING Procedure on page 181-32	Deletes the mime mapping from the XDB configuration
DELETERESOURCE Procedure on page 181-33	Deletes a resource from the hierarchy

Table 181–3 (Cont.) DBMS_XDB Package Subprograms

Subprogram	Description
DELETERESOURCEMETADATA Procedures on page 181-34	Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)
DELETESCHEMALOCMAPPING Procedure on page 181-35	Deletes the schema location mapping for the specified schema URL from the XDB configuration.
DELETESERVLET Procedure on page 181-36	Deletes a servlet from XDB configuration
DELETESERVLETMAPPING Procedure on page 181-37	Deletes the servlet mapping for the specified servlet name from the XDB configuration
DELETESERVLETSECROLE Procedure on page 181-38	Deletes the specified role from a servlet in the XDB configuration
DELETEXMLEXTENSION Procedure on page 181-39	Deletes the specified XML extension from the XDB configuration
ENABLEDIGESTAUTHENTICATION Procedure on page 181-40	Enables digest authentication
EXISTSRESOURCE Function on page 181-41	Determines if a resource is the hierarchy, based on its absolute path
GETACLDOCUMENT Function on page 181-42	Retrieves ACL document that protects resource given its path name
GETCONTENTBLOB Function on page 181-43	Retrieves the contents of a resource returned as a BLOB
GETCONTENTCLOB Function on page 181-44	Retrieves the contents of a resource returned as a CLOB
GETCONTENTVARCHAR2 Function on page 181-45	Retrieves the contents of a resource returned as a string
GETCONTENTXMLREF Function on page 181-46	Retrieves the contents of a resource returned as a a `REF` to an `XMLTYPE`
GETCONTENTXMLTYPE Function on page 181-47	Retrieves the contents of a resource returned as an `XMLTYPE`
GETFTPPORT Function on page 181-48	Gets the value of the current FTP port
GETHTTPPORT Function on page 181-49	Gets the value of the current HTTP port
GETHTTPREQUESTHEADER Function on page 181-50	Gets the values of the passed header
GETLISTENERENDPOINT Procedure on page 181-51	Retrieves the parameters of a listener end point corresponding to the XML DB HTTP server
GETLOCKTOKEN Procedure on page 181-52	Returns that resource's lock token for the current user given a path to a resource
GETPRIVILEGES Function on page 181-53	Gets all privileges granted to the current user on a specified resource
GETRESOID Function on page 181-54	Returns the object ID of the resource from its absolute path
GETXDB_TABLESPACE Function on page 181-55	Returns the current tablespace of the XDB (user)
HASBLOBCONTENT Function on page 181-56	Returns `TRUE` if the resource has BLOB content

Table 181–3 (Cont.) DBMS_XDB Package Subprograms

Subprogram	Description
HASCHARCONTENT Function on page 181-57	Returns `TRUE` if the resource has character content
HASXMLCONTENT Function on page 181-58	Returns `TRUE` if the resource has XML content
HASXMLREFERENCE Function on page 181-59	Returns `TRUE` if the resource has `REF` to XML content
ISFOLDER Function on page 181-60	Returns `TRUE` if the resource is a folder or container
LINK Procedures on page 181-61	Creates a link to an existing resource
LOCKRESOURCE Function on page 181-62	Gets a WebDAV-style lock on that resource given a path to that resource
PROCESSLINKS Procedure on page 181-63	Processes document links in the specified resource
PURGERESOURCEMETADATA Procedure on page 181-64	Deletes all user metadata from a resource
RENAMERESOURCE Procedure on page 181-65	Renames the XDB resource
SETACL Procedure on page 181-66	Sets the ACL on a specified resource
SETFTPPORT Procedure on page 181-67	Sets the FTP port to a new value
SETHTTPPORT Procedure on page 181-68	Sets the HTTP port to a new value
SETLISTENERENDPOINT Procedure on page 181-69	Sets the parameters of a listener end point corresponding to the XML DB HTTP server
SETLISTENERLOCALACCESS Procedure on page 181-70	Restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface or on both localhost and non-localhost interfaces
SPLITPATH Procedure on page 181-71	Splits the path into a parentpath and childpath
TOUCHRESOURCE Procedure on page 181-72	Changes the modification time of the resource to the current time
UNLOCKRESOURCE Function on page 181-73	Unlocks the resource given a lock token and resource path
UPDATERESOURCEMETADATA Procedures on page 181-74	Updates metadata for a resource

ACLCHECKPRIVILEGES Function

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the ACLCHECKPRIVILEGES Function.

This function checks access privileges granted to the current user by specified ACL document by the OWNER of the resource. Returns positive integer if all privileges are granted.

Syntax

```
DBMS_XDB.ACLCHECKPRIVILEGES(
   acl_path  IN  VARCHAR2,
   owner     IN  VARCHAR2,
   privs     IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 181–4 ACLCHECKPRIVILEGES Function Parameters

Parameter	Description
acl_path	Absolute path in the Hierarchy for ACL document
owner	Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution
privs	An XMLType instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function.

ADDHTTPEXPIREMAPPING Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ADDHTTPEXPIREMAPPING Procedure.

This procedure adds to `xdb$config` a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.

Syntax

```
DBMS_XDB.ADDHTTPEXPIREMAPPING (
     pattern    IN    VARCHAR2,
     expire     IN    VARCHAR2);
```

Parameters

Table 181–5 ADDHTTPEXPIREMAPPING Procedure Parameters

Parameter	Description
`pattern`	URL pattern (only * accepted as wildcards)

`expire`	Expiration directive, follows the `ExpireDefault` in Apache's `mod_expires`:
	`base [plus] (num type)*`
	`-- base: now | modification`
	`-- type: year|years|month|months|week|weeks|day|days|minute|minutess|second|seconds`

Examples

```
DBMS_XDB.ADDHTTPEXPIREMAPPING ('/public/test1/*', 'now plus 4 weeks');
DBMS_XDB.ADDHTTPEXPIREMAPPING (
             '/public/test2/*', 'modification plus 1 day 30 seconds');
```

ADDMIMEMAPPING Procedure

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ADDMIMEMAPPING Procedure.

This procedure adds the following mime mapping to XDB configuration:

```
<mime-mapping>
<extension>extension</extension>
<mime-type>mimetype</mime-type>
</mime-mapping>
```

Syntax

```
DBMS_XDB.ADDMIMEMAPPING(
     extension    IN   VARCHAR2,
     mimetype     IN   VARCHAR2);
```

Parameters

Table 181–6 ADDMIMEMAPPING Procedure Parameters

Parameter	Description
`extension`	Extension for which a mime type is being added
`mimetype`	Mime type

ADDSCHEMALOCMAPPING Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ADDMIMEMAPPING Procedure.

This procedure adds the following schema location mapping to the XDB configuration:

```
<schemaLocation-mapping>
     <namespace>namespace</namespace>
     <element>element</element>
      <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

Syntax

```
DBMS_XDB.ADDSCHEMALOCMAPPING(
     namespace    IN   VARCHAR2,
     element      IN   VARCHAR2,
     schemaURL    IN   VARCHAR2);
```

Parameters

Table 181–7 ADDSCHEMALOCMAPPING Procedure Parameters

Parameter	Description
namespace	Namespace
element	Element
schemaURL	Schema URL

ADDSERVLET Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ADDSERVLET Procedure.

This procedure adds the following servlet to XDB configuration:

```
<servlet>
     <servlet-name>name</servlet-name>
<servlet-language>language</servlet-language>
     <display-name>dispname</display-name>
     <description>descript</description>
     <servlet-class>class</servlet-class>
     <servlet-schema>schema</servlet-schema>
</servlet>
```

Syntax

```
DBMS_XDB.ADDSERVLET(
     name       IN   VARCHAR2,
    language    IN   VARCHAR2,
    dispname    IN   VARCHAR2,
    icon        IN   VARCHAR2 := NULL,
    descript    IN   VARCHAR2 := NULL,
    class       IN   VARCHAR2 := NULL,
    jspfile     IN   VARCHAR2 := NULL,
    plsql       IN   VARCHAR2 := NULL);
```

Parameters

Table 181–8 ADDSERVLET Procedure Parameters

Parameter	Description
`name`	Servlet name
`language`	Must be one of "C", "Java", "PL/SQL"
`dispname`	Display name
`icon`	Icon
`descript`	Description
`class`	The `class` / `jspfile` / `plsql` function corresponding to this servlet. The first non-`NULL` argument amongst these three is chosen, and the others are treated as `NULL`.
`jspfile`	The `class` / `jspfile` / `plsql` function corresponding to this servlet. The first non-`NULL` argument amongst these three is chosen, and the others are treated as `NULL`.
`plsql`	The `class` / `jspfile` / `plsql` function corresponding to this servlet. The first non-`NULL` argument amongst these three is chosen, and the others are treated as `NULL`.
`schema`	Schema

ADDSERVLETMAPPING Procedure

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ADDSERVLETMAPPING Procedure.

This procedure adds the following servlet mapping to XDB configuration:

```
<servlet-mapping>     <servlet-pattern>pattern</servlet-pattern>
<servlet-name>name</servlet-name></servlet-mapping>
```

Syntax

```
DBMS_XDB.ADDSERVLETMAPPING(
     pattern   IN   VARCHAR2,     name      IN   VARCHAR2);
```

Parameters

Table 181–9 ADDSERVLETMAPPING Procedure Parameters

Parameter	Description
pattern	Sservlet pattern
name	Servlet name

ADDSERVLETSECROLE Procedure

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ADDSERVLETSECROLE Procedure.

This procedure adds the following security role `REF` to a specified servlet in XDB configuration:

```
<security-role-ref>
     <role-name>rolename</role-name>
     <role-link>rolelink</role-link>
     <description>descript</description>
</security-role-ref>
```

Syntax

```
DBMS_XDB.ADDSERVLETSECROLE(
     servname    IN   VARCHAR2,     rolename    IN   VARCHAR2,     rolelink    IN
VARCHAR2,     descript    IN   VARCHAR2 := NULL);
```

Parameters

Table 181–10 ADDSERVLETSECROLE Procedure Parameters

Parameter	Description
`servname`	Sservlet name
`rolename`	Role name
`rolelink`	Role link
`descript`	Description

ADDXMLEXTENSION Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ADDXMLEXTENSION Procedure.

This procedure adds the following XML extension to the XDB configuration under `<xml-extensions>`:

```
<extension>extension</extension>
```

Syntax

```
DBMS_XDB.ADDXMLEXTENSION(
     extension    IN   VARCHAR2);
```

Parameters

Table 181–11 ADDXMLEXTENSION Procedure Parameters

Parameter	Description
extension	XML extension to be added

APPENDRESOURCEMETADATA Procedure

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the APPENDRESOURCEMETADATA Procedure.

This procedure takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource.

Syntax

```
DBMS_XDB.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  XMLTYPE);

DBMS_XDB.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  REF SYS.XMLTYPE);
```

Parameters

Table 181–12 APPENDRESOURCEMETADATA Procedure

Parameter	Description
`abspath`	Absolute path of the resource
`metadata`	Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.

Usage Notes

- In the case in which a `REF` is passed in, the procedure stores the `REF` in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the `RESID` column for the metadata table. Note that the`REF` passed in must be unique. In other words, there must not be a`REF` with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a `REF` that already exists.
- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

CFG_GET Function

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the CFG_GET Function.

This function retrieves the session's configuration information as an `XMLType` instance.

Syntax

```
DBMS_XDB.CFG_GET
 RETURN SYS.XMLType;
```

CFG_REFRESH Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the CFG_REFRESH Procedure.

This procedure refreshes the session's configuration information to the latest configuration.

Syntax

```
DBMS_XDB.CFG_REFRESH;
```

CFG_UPDATE Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the CFG_UPDATE Procedure.

This procedure updates the configuration information and commits the change.

Syntax

```
DBMS_XDB.CFG_UPDATE(
   xdbconfig   IN  SYS.XMLTYPE);
```

Parameters

Table 181–13 CFG_UPDATE Procedure Parameters

Parameter	Description
xdbconfig	The new configuration data

CHANGEOWNER Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CHANGEOWNER Procedure.

This procedure changes the owner of the resource/s to the specified owner.

Syntax

```
DBMS_XDB.CHANGEOWNER(
     abspath    IN   VARCHAR2,
     owner      IN   VARCHAR2,
     recurse    IN   BOOLEAN := FALSE);
```

Parameters

Table 181–14 CHANGEOWNER Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`owner`	New owner for the resource
`recurse`	If `TRUE`, recursively change owner of all resources in the folder tree

CHANGEPRIVILEGES Function

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CHANGEPRIVILEGES Function.

This function adds a specified ACE to a specified resource's ACL.

Syntax

```
DBMS_XDB.CHANGEPRIVILEGES(
   res_path   IN    VARCHAR2,
   ace        IN    xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 181–15 CHANGEPRIVILEGES Function Parameters

Parameter	Description
res_path	Path name of the resource for which privileges need to be changed
ace	An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (grant/deny) already exists in the ACL, the new ACE is added at the end of the ACL.

CHECKPRIVILEGES Function

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CHECKPRIVILEGES Function.

This function checks access privileges granted to the current user on the specified resource.

Syntax

```
DBMS_XDB.CHECKPRIVILEGES(
   res_path   IN  VARCHAR2,
   privs      IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 181–16 CHECKPRIVILEGES Function Parameters

Parameter	Description
`res_path`	Absolute path in the Hierarchy for resource
`privs`	An `XMLType` instance of the privilege element specifying the requested set of access privileges

Return Values

A positive integer if all requested privileges granted.

CREATEFOLDER Function

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CREATEFOLDER Function.

This function creates a new folder resource in the hierarchy.

Syntax

```
DBMS_XDB.CREATEFOLDER(
   path   IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 181–17 CREATEFOLDER Function Parameters

Parameter	Description
`path`	Path name for the new folder

Return Values

`TRUE` if operation successful; `FALSE`, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if `'/folder1/folder2'` is passed as the path parameter, then `'/folder1'` must already exist.

CREATEOIDPATH Function

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CREATEOIDPATH Function.

This function creates a virtual path to the resource based on object ID.

Syntax

```
DBMS_XDB.CREATEOIDPATH(
   oid    IN   RAW)
 RETURN VARCHAR2;
```

Parameters

Table 181–18 CREATEOIDPATH Function Parameters

Parameter	Description
oid	Object ID of the resource

CREATERESOURCE Functions

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CREATERESOURCE Functions.

The functions create a new resource. The description of the overload options precede each version of the syntax

Syntax

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     datarow        IN  REF SYS.XMLTYPE,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  BLOB,
     csid           IN  NUMBER :=0,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```
DBMS_XDB.CREATERESOURCE (
     abspath        IN  VARCHAR2,
     data           IN  BFILE,
     csid           IN  NUMBER :=0,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```
DBMS_XDB.CREATERESOURCE (
     abspath        IN  VARCHAR2,
     data           IN  CLOB,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```
DBMS_XDB.CREATERESOURCE (
   abspath        IN  VARCHAR2,
   data           IN  VARCHAR2,
   schemaurl      IN  VARCHAR2 := NULL,
   elem           IN  VARCHAR2 := NULL)
 RETURN BOOLEAN;
```

Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

```
DBMS_XDB.CREATERESOURCE (
   abspath        IN  VARCHAR2,
   data           IN  SYS.XMLTYPE,
   schemaurl      IN  VARCHAR2 := NULL,
   elem           IN  VARCHAR2 := NULL)
 RETURN BOOLEAN;
```

Parameters

Table 181–19 CREATERESOURCE Function Parameters

Parameter	Description
abspath	Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if /foo/bar.txt is passed in, then folder /foo must already exist.
data	String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.
datarow	REF to an XMLType row to be used as the contents
csid	Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: ▪ From the abspath extension, determine the resource's MIME type. ▪ If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; ▪ Otherwise, it is defaulted to the database character set.
createfolders	If TRUE, create the parent folders if they do not exist
schemaurl	For XML data, schema URL data conforms to (default NULL)
elem	Element name (default NULL)

Return Values

TRUE if operation successful; FALSE, otherwise.

DELETEHTTPEXPIREMAPPING Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the DELETEHTTPEXPIREMAPPING Procedure.

This procedure deletes from `xdb$config` all mappings of the URL pattern to an expiration date.

Syntax

```
DBMS_XDB.DELETEHTTPEXPIREMAPPING(
     pattern  IN   VARCHAR2);
```

Parameters

Table 181–20 DELETEHTTPEXPIREMAPPING Procedure Parameters

Parameter	Description
`pattern`	URL pattern (only * accepted as wildcards)

DELETEMIMEMAPPING Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the CFG_GET Function.

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

Syntax

```
DBMS_XDB.DELETEMIMEMAPPING(
     extension    IN   VARCHAR2);
```

Parameters

Table 181–21 DELETEMIMEMAPPING Procedure Parameters

Parameter	Description
`extension`	Extension for which a mime type is to be deleted

DELETERESOURCE Procedure

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the DELETERESOURCE Procedure.

This procedure deletes a resource from the hierarchy.

Syntax

```
DBMS_XDB.DELETERESOURCE(
   path          IN      VARCHAR2,
   delete_option IN      PLS_INTEGER);
```

Parameters

Table 181–22 DELETERESOURCE Procedure Parameters

Parameter	Description
path	Path name of the resource to delete
delete_option	The option that controls how a a resource is deleted; defined in Table 181–2 on page 181-8: ■ DELETE_RESOURCE ■ DELETE_RECURSIVE ■ DELETE_FORCE ■ DELETE_RECURSIVE_FORCE

DELETERESOURCEMETADATA Procedures

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the DELETERESOURCEMETADATA Procedures.

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
   abspath        IN  VARCHAR2,
   metadata       IN  REF SYS.XMLTYPE,
   delete_option  IN  pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
   abspath        IN VARCHAR2,
   metadatans     IN VARCHAR2,
   metadataname   IN VARCHAR2,
   delete_option  IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

Table 181–23 DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`metadata`	`REF` to the piece of metadata (schema based) to be deleted
`mettadatans`	Namespace of the metadata fragment to be removed
`mettadataname`	Local name of the metadata fragment to be removed
`delete_option`	Only applicable for schema-based metadata, this can be one of the following: ▪ `DELETE_RES_METADATA_CASCADE` - deletes the corresponding row in the metadata table ▪ `DELETE_RES_METADATA_NOCASCADE` - does not delete the row in the metadata table

DELETESCHEMALOCMAPPING Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the DELETESCHEMALOCMAPPING Procedure.

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

Syntax

```
DBMS_XDB.DELETESCHEMALOCMAPPING(
     schemaURL    IN   VARCHAR2);
```

Parameters

Table 181–24 DELETESCHEMALOCMAPPING Procedure Parameters

Parameter	Description
schemaURL	Schema URL

DELETESERVLET Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the DELETESERVLET Procedure.

This procedure deletes a servlet from the XDB configuration.

Syntax

```
DBMS_XDB.DELETESERVLET(
     name         IN    VARCHAR2);
```

Parameters

Table 181–25 DELETESERVLET Procedure Parameters

Parameter	Description
name	Servlet name

DELETESERVLETMAPPING Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the DELETESERVLETMAPPING Procedure.

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

Syntax

```
DBMS_XDB.DELETESERVLETMAPPING(
     name       IN   VARCHAR2);
```

Parameters

Table 181–26 DELETESERVLETMAPPING Procedure Parameters

Parameter	Description
name	Servlet name

DELETESERVLETSECROLE Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the DELETESERVLETSECROLE Procedure.

This procedure deletes the specified role from a servlet in the XDB configuration.

Syntax

```
DBMS_XDB.DELETESERVLETSECROLE(
     servname    IN   VARCHAR2,     rolename    IN   VARCHAR2);
```

Parameters

Table 181–27 DELETESERVLETSECROLE Procedure Parameters

Parameter	Description
servname	Servlet name
rolename	Name of the role to be deleted

DELETEXMLEXTENSION Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the DELETEXMLEXTENSION Procedure.

This procedure deletes the specified XML extension from the XDB configuration.

Syntax

```
DBMS_XDB.DELETEXMLEXTENSION(
     extension    IN   VARCHAR2);
```

Parameters

Table 181–28 DELETEXMLEXTENSION Procedure Parameters

Parameter	Description
extension	XML extension to be deleted

ENABLEDIGESTAUTHENTICATION Procedure

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ENABLEDIGESTAUTHENTICATION Procedure.

This procedure enabling digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

Syntax

```
DBMS_XDB.ENABLEDIGESTAUTHENTICATION;
```

EXISTSRESOURCE Function

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the EXISTSRESOURCE Function.

This function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

Syntax

```
DBMS_XDB.EXISTSRESOURCE(
   abspath    IN    VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 181–29 EXISTSRESOURCE Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

TRUE if the resource is found.

GETACLDOCUMENT Function

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETACLDOCUMENT Function.

This function retrieves ACL document that protects resource given its path name.

Syntax

```
DBMS_XDB.GETACLDOCUMENT(
   abspath  IN  VARCHAR2)
  RETURN sys.xmltype;
```

Parameters

Table 181–30 GETACLDOCUMENT Function Parameters

Parameter	Description
`abspath`	Path name of the resource whose ACL document is required

Return Values

The `XMLType` for ACL document.

GETCONTENTBLOB Function

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTBLOB Function.

This function retrieves the contents of a resource returned as a BLOB.

Syntax

```
DBMS_XDB.GETCONTENTBLOB(
     abspath    IN     VARCHAR2,
     csid       OUT    PLS_INTEGER,
     locksrc    IN     BOOLEAN := FALSE)
  RETURN BLOB;
```

Parameters

Table 181–31 GETCONTENTBLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource
csid	If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.
locksrc	Contents of the resource as a BLOB

Return Values

The contents of the resource as a BLOB.

GETCONTENTCLOB Function

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTCLOB Function.

This function gets the contents of a resource returned as a `CLOB`.

Syntax

```
DBMS_XDB.GETCONTENTCLOB(
     abspath    IN     VARCHAR2,
  RETURN CLOB;
```

Parameters

Table 181–32 GETCONTENTCLOB Function Parameters

Parameter	Description
`abspath`	Absolute path of the resource

Return Values

The contents of the resource as a CLOB.

GETCONTENTVARCHAR2 Function

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTVARCHAR2 Function.

This function gets the contents of a resource returned as a string.

Syntax

```
DBMS_XDB.GETCONTENTVARCHAR2(
     abspath    IN     VARCHAR2,
  RETURN BLOB;
```

Parameters

Table 181–33 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a string.

GETCONTENTXMLREF Function

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTXMLREF Function.

This function retrieves the contents of a resource returned as a a `REF` to an `XMLTYPE`.

Syntax

```
DBMS_XDB.GETCONTENTXMLREF(
     abspath    IN     VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 181–34 GETCONTENTXMLREF Function Parameters

Parameter	Description
`abspath`	Absolute path of the resource

Return Values

The contents of the resource as a `REF` to an `XMLTYPE`.

GETCONTENTXMLTYPE Function

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTXMLTYPE Function.

This function retrieves the contents of a resource returned as an `XMLTYPE`.

Syntax

```
DBMS_XDB.GETCONTENTXMLTYPE(
     abspath    IN     VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 181–35 GETCONTENTXMLTYPE Function Parameters

Parameter	Description
`abspath`	Absolute path of the resource

Return Values

The contents of the resource as an XMLTYPE.

GETFTPPORT Function

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the GETFTPPORT Function.

This procedure gets the value of the current FTP port.

Syntax

```
DBMS_XDB.GETFTPPORT
 RETURN NUMBER;
```

GETHTTPPORT Function

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the GETHTTPPORT Function.

This procedure gets the value of the current HTTP port.

Syntax

```
DBMS_XDB.GETHTTPPORT
 RETURN NUMBER;
```

GETHTTPREQUESTHEADER Function

Note: This procedure is deprecated in Release 12*c*.

This function, if called during an HTTP request serviced by XDB, returns the values of the passed header. It is used by routines that implement custom authentication.

Syntax

```
DBMS_XDB.GETHTTPREQUESTHEADER(
    header_name    IN   VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 181–36 GETHTTPREQUESTHEADER Function Parameters

Parameter	Description
`header_name`	Passed header

Return Values

Returns `NULL` in case the header is not present in the request, or for `AUTHENTICATION`, for security reasons.

GETLISTENERENDPOINT Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the GETLISTENERENDPOINT Procedure.

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

Syntax

```
DBMS_XDB.GETLISTENERENDPOINT (
   endpoint  IN   NUMBER,
   host      OUT  VARCHAR2,    port      OUT  NUMBER,
   protocol  OUT  NUMBER);
```

Parameters

Table 181–37 GETLISTENERENDPOINT Procedure Parameters

Parameter	Description
`endpoint`	End point to be retrieved. Its value can be `XDB_ENDPOINT_HTTP` or `XDB_ENDPOINT_HTTP2`.
`host`	Interface on which the listener end point listens
`port`	Port on which the listener end point listens
`protocol`	Transport protocol accepted by the listener end point

GETLOCKTOKEN Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETLOCKTOKEN Procedure.

Given a path to a resource, this procedure returns that resource's lock token for the current user.

Syntax

```
DBMS_XDB.GETLOCKTOKEN(
   path          IN      VARCHAR2,
   locktoken     OUT     VARCHAR2);
```

Parameters

Table 181–38 GETLOCKTOKEN Procedure Parameters

Parameter	Description
`path`	Path name to the resource
`locktoken`	Logged-in user's lock token for the resource

Usage Notes

The user must have `READPROPERTIES` privilege on the resource.

GETPRIVILEGES Function

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETPRIVILEGES Function.

This function gets all privileges granted to the current user on a specified resource.

Syntax

```
DBMS_XDB.GETPRIVILEGES(
   res_path    IN     VARCHAR2)
 RETURN sys.xmltype;
```

Parameters

Table 181–39 GETPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the hierarchy of the resource

Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

GETRESOID Function

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETRESOID Function.

Returns the object ID of the resource from its absolute path.

Syntax

```
DBMS_XDB.GETRESOID(
   abspath IN VARCHAR2)
RETURN RAW;
```

Parameters

Table 181–40 GETRESOID Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

NULL if the resource is not present.

GETXDB_TABLESPACE Function

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETXDB_TABLESPACE Function.

This function returns the current tablespace of the XDB (user).

Syntax

```
DBMS_XDB.GETXDB_TABLESPACE
 RETURN VARCHAR2;
```

HASBLOBCONTENT Function

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASBLOBCONTENT Function.

This function returns TRUE if the resource has BLOB content.

Syntax

```
DBMS_XDB.HASBLOBCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 181–41 HASBLOBCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has BOB content.

HASCHARCONTENT Function

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASCHARCONTENT Function.

This function returns `TRUE` if the resource has character content.

Syntax

```
DBMS_XDB.HASCHARCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 181–42 HASCHARCONTENT Function Parameters

Parameter	Description
`abspath_path`	Absolute path of the resource

Return Values

`TRUE` if the resource has character content.

HASXMLCONTENT Function

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASXMLCONTENT Function.

This function returns `TRUE` if the resource has XML content.

Syntax

```
DBMS_XDB.HASXMLCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 181–43 HASXMLCONTENT Function Parameters

Parameter	Description
`abspath_path`	Absolute path of the resource

Return Values

`TRUE` if the resource has XML content.

HASXMLREFERENCE Function

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASXMLREFERENCE Function.

This function returns `TRUE` if the resource has a `REF` to XML content.

Syntax

```
DBMS_XDB.HASXMLREFERENCE
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 181–44 HASXMLREFERENCE Function Parameters

Parameter	Description
`abspath_path`	Absolute path of the resource

Return Values

`TRUE` resource has a `REF` to XML content.

ISFOLDER Function

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the ISFOLDER Function.

This function returns `TRUE` if the resource is a folder or container.

Syntax

```
DBMS_XDB.ISFOLDER
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 181–45 DBMS_XDB.ISFOLDER Function Parameters

Parameter	Description
`abspath_path`	Absolute path of the resource

Return Values

`TRUE` if the resource is a folder or container.

LINK Procedures

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the LINK Procedures.

This procedure creates from a specified folder to a specified resource.

Syntax

```
DBMS_XDB.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2);

DBMS_XDB.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2,
   linktype     IN   PLS_INTEGER := DBMS_XDB.LINK_TYPE_HARD);
```

Parameters

Table 181–46 LINK Procedure Parameters

Parameter	Description
srcpath	Path name of the resource to which a link is created
linkfolder	Folder in which the new link is placed
linkname	Name of the new link
linktype	Type of link to be created: ■ DBMS_XDB.LINK_TYPE_HARD (default) ■ DBMS_XDB.LINK_TYPE_WEAK ■ DBMS_XDB.LINK_TYPE_SYMBOLIC

LOCKRESOURCE Function

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the LOCKRESOURCE Function.

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

Syntax

```
DBMS_XDB.LOCKRESOURCE(
   path      IN  VARCHAR2,
   depthzero IN  BOOLEAN,
   shared    IN  boolean)
RETURN BOOLEAN;
```

Parameters

Table 181–47 LOCKRESOURCE Function Parameters

Parameter	Description
`path`	Path name of the resource to lock.
`depthzero`	Currently not supported
`shared`	Passing `TRUE` obtains a shared write lock

Return Values

`TRUE` if successful.

Usage Notes

The user must have `UPDATE` privileges on the resource.

PROCESSLINKS Procedure

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the PROCESSLINKS Procedure.

This procedure processes document links in the specified resource.

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(
 abspath  IN  VARCHAR2,
 recurse  IN  BOOLEAN := FALSE);
```

Parameters

Table 181–48 PROCESSLINKS Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource. If the path is a folder, use the recurse flag.
recurse	Used only if abspath specifies a folder. If TRUE, process links of all resources in the folder hierarchy rooted at the specified resource. If FALSE, process links of all documents in this folder only.

PURGERESOURCEMETADATA Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the PURGERESOURCEMETADATA Procedure.

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(
 abspath  IN  VARCHAR2);
```

Parameters

Table 181–49 PURGERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource

RENAMERESOURCE Procedure

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the RENAMERESOURCE Procedure.

This procedure renames the XDB resource.

Syntax

```
DBMS_XDB.RENAMERESOURCE(
   srcpath    IN  VARCHAR2,
   destfolder IN  CARCHAR2,
   newname    IN  VARCHAR2);
```

Parameters

Table 181–50 RENAMERESOURCE Procedure Parameters

Parameter	Description
srcpath	Absolute path in the Hierarchy for the source resource destination folder
destfolder	Absolute path in the Hierarchy for the destination folder
newname	Name of the child in the destination folder

SETACL Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the SETACL Procedure.

This procedure sets the ACL on a specified resource to be the ACL specified by path.

Syntax

```
DBMS_XDB.SETACL(
   res_path   IN  VARCHAR2,
   acl_path   IN  VARCHAR2);
```

Parameters

Table 181–51 SETACL Procedure Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
acl_path	Absolute path in the Hierarchy for ACL

Usage Notes

The user must have <write-acl> privileges on the resource.

SETFTPPORT Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the SETFTPPORT Procedure.

This procedure sets the FTP port to a new value.

Syntax

```
DBMS_XDB.SETFTPPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 181–52 SETFTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the FTP port is set

SETHTTPPORT Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the SETHTTPPORT Procedure.

This procedure sets the HTTP port to a new value.

Syntax

```
DBMS_XDB.SETHTTPPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 181–53 SETHTTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the HTTP port is set

SETLISTENERENDPOINT Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the SETLISTENERENDPOINT Procedure.

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server. Both HTTP and HTTP2 end points can be set by invoking this procedure.

Syntax

```
DBMS_XDB.SETLISTENERENDPOINT (
   endpoint  IN  NUMBER,
   host      IN  VARCHAR2,    port      IN  NUMBER,
   protocol  IN  NUMBER);
```

Parameters

Table 181–54 SETLISTENERENDPOINT Procedure Parameters

Parameter	Description
endpoint	End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point is to listen. Its value can be 'LOCALHOST,' NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.
port	Port on which the listener end point is to listen
protocol	Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS

SETLISTENERLOCALACCESS Procedure

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the SETLISTENERLOCALACCESS Procedure.

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to `TRUE`) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to `FALSE`).

Syntax

```
DBMS_XDB.SETLISTENERLOCALACCESS (
   l_access    BOOLEAN);
```

Parameters

Table 181–55 SETLISTENERLOCALACCESS Procedure Parameters

Parameter	Description
`l_access`.	`TRUE` or `FALSE`.

SPLITPATH Procedure

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the SPLITPATH Procedure.

This procedure splits the path into a parentpath and childpath.

Syntax

```
DBMS_XDB.SPLITPATH(
      abspath     IN  VARCHAR2,
      parentpath  OUT VARCHAR2,
     childpath    OUT VARCHAR2);
```

Parameters

Table 181–56 SPLITPATH Procedure Parameters

Parameter	Description
abspath	Absolute path to be split
parentpath	Parentpath
childpath	Childpath

TOUCHRESOURCE Procedure

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the TOUCHRESOURCE Procedure.

This procedure changes the modification time of the resource to the current time.

Syntax

```
DBMS_XDB.TOUCHRESOURCE
     abspath    IN     VARCHAR2);
```

Parameters

Table 181–57 DBMS_XDB.TOUCHRESOURCE Procedure Parameters

Parameter	Description
abspath_path	Absolute path of the resource

UNLOCKRESOURCE Function

> **Note:** This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the UNLOCKRESOURCE Function.

This function unlocks the resource given a lock token and a path to the resource.

Syntax

```
DBMS_XDB.UNLOCKRESOURCE(
   path     IN  VARCHAR2,
   deltoken IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 181–58 UNLOCKRESOURCE Function Parameters

Parameter	Description
`path`	Path name to the resource
`deltoken`	Lock token to be removed

Return Values

`TRUE` if operation successful.

Usage Notes

The user must have `UPDATE` privileges on the resource.

UPDATERESOURCEMETADATA Procedures

Note: This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the UPDATERESOURCEMETADATA Procedures.

This procedure updates metadata for a resource. The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its `REF`. It replaces that piece of metadata with user-defined metadata which is either in the form of a `REF` to `XMLTYPE` or an `XMLTYPE`.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath  IN VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldns          IN   VARCHAR2,
   oldname IN VARCHAR,
   newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath       IN   VARCHAR2,
   oldns         IN   VARCHAR2,
   oldname       IN   VARCHAR,
   newmetadata   IN   REF SYS.XMLTYPE);
```

Parameters

Table 181–59 UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`oldmetadata`	`REF` to the old of metadata
`newmetadata`	`REF` to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)

Table 181–59 (Cont.) UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
oldns	Namespace identifying old metadata
oldname	Local name identifying old metadata

Usage Notes

In the case of REF, it stores the REF in the resource and the metadata is stored in a separate table. Uniqueness of REFs is enforced. In the case where the XMLTYPE is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

182

DBMS_XDB_ADMIN

The DBMS_XDB_ADMIN package provides an interface to manage the Oracle XML DB repository.

> **See Also:** *Oracle XML DB Developer's Guide* for information about Oracle XML DB Repository

This chapter contains the following topics:

Using DBMS_XDB_ADMIN

Deprecated Subprograms

> **Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

The following subprograms are deprecated with Oracle Database 11*g*:

- CREATEREPOSITORYXMLINDEX Procedure
- DROPREPOSITORYXMLINDEX Procedure
- XMLINDEXADDPATH Procedure
- XMLINDEXREMOVEPATH Procedure

Security Model

Owned by XDB, the DBMS_XDB_ADMIN package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB or DBA. Subprograms in this package are executed using the privileges of the current user.

Summary of DBMS_XDB_ADMIN Subprograms

This table lists the package subprograms in alphabetical order.

Table 182–1 DBMS_XDB_ADM Package Subprograms

Subprogram	Description
CREATENONCEKEY Procedure on page 182-6	Generates a nonce value for use in digest authentication
CREATEREPOSITORYXMLINDEX Procedure on page 182-7	[Deprecated] Creates an XMLIndex on the XML DB repository
DROPREPOSITORYXMLINDEX Procedure on page 182-8	[Deprecated] Drops the XMLIndex on the XML DB repository
INSTALLDEFAULTWALLET Procedure on page 182-9	Installs the default XDB wallet in the default XDB wallet directory
MOVEXDB_TABLESPACE Procedure on page 182-10	Moves the XDB (user) to the specified tablespace
REBUILDHIERARCHICALINDEX Procedure on page 182-11	Rebuilds the hierarchical index after import or export operations
XMLINDEXADDPATH Procedure on page 182-12	[Deprecated] Takes a path in XML DB repository as an input and index all the resources under this given path
XMLINDEXREMOVEPATH Procedure on page 182-13	[Deprecated] Removes the index for the given path

CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

Syntax

```
DBMS_XDB_ADMIN.CREATENONCEKEY;
```

CREATEREPOSITORYXMLINDEX Procedure

Note: This procedure is deprecated with Oracle Database 11*g*.

This procedure creates an XMLIndex on the XML DB repository.

Syntax

```
DBMS_XDB_ADMIN.CREATEREPOSITORYXMLINDEX;
```

DROPREPOSITORYXMLINDEX Procedure

Note: This procedure is deprecated in Oracle Database 11*g*.

This procedure drops the XMLIndex on the XML DB repository.

Syntax

```
DBMS_XDB_ADMIN.DROPREPOSITORYXMLINDEX;
```

INSTALLDEFAULTWALLET Procedure

This procedure installs the default XDB wallet in the default XDB wallet directory. The directory name where the XDB wallet is stored is prefixed either by `ORACLE_BASE` when it is defined, or `ORACLE_HOME`. It is then followed by `/admin/`*`db_name`*`/xdb_wallet` where *db_name* is the unique database name.

Syntax

```
DBMS_XDB_ADMIN.INSTALLDEFAULTWALLET;
```

Usage Notes

Only `SYS` can install or replace the default wallet.

MOVEXDB_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

Syntax

```
DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE(
   new_tablespace   IN  VARCHAR2);
```

Parameters

Table 182–2 MOVEXDB_TABLESPACE Procedure Parameters

Parameter	Description
new_tablespace	Name of the tablespace to where the XDB is moved

Usage Notes

- This operation waits for all concurrent XDB sessions to exit.
- If MOVEXDB_TABLESPACE fails, the user should restart the database before issuing any further command.Failure to do so will result into unexpected behavior from the database.
- The XDB repository by default resides in the SYSAUX tablespace. Using this procedure it can be moved to another tablespace. As a best practice we recommend to create a dedicated tablespace for the XDB repository only and not share it with other objects (such as tables). The tablespace containing the XDB repository should never be set to READ ONLY because this might affect various XML operations being executed.

REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

Syntax

```
DBMS_XDB_ADMIN.REBUILDHIERARCHICALINDEX;
```

XMLINDEXADDPATH Procedure

Note: This procedure is deprecated with Oracle Database 11*g*.

This procedure adds to the repository xmlindex the resource identified by path (when `recurse` is `FALSE`) or adds to the repository xmlindex the sub-tree of resources rooted at path (when `recurse` is `TRUE`). The default value for `recurse` is `TRUE`.

Syntax

```
DBMS_XDB_ADMIN.XMLINDEXADDPATH(
   path         IN  VARCHAR2,
   recurse      IN  BOOLEAN);
```

Parameters

Table 182–3 XMLINDEXADDPATH Procedure Parameters

Parameter	Description
`path`	Path to a resource
`recurse`	`TRUE` or `FALSE`

XMLINDEXREMOVEPATH Procedure

Note: This procedure is deprecated with Oracle Database 11*g*.

This procedure removes from the repository xmlindex the resource identified by path (when `recurse` is `FALSE`) or removes from the repository xmlindex the sub-tree of resources rooted at path (when `recurse` is `TRUE`). The default value for `recurse` is `TRUE`.

Syntax

```
DBMS_XDB_ADMIN.XMLINDEXREMOVEPATH(
   path              IN  VARCHAR2,
   isrecursive       IN  BOOLEAN);
```

Parameters

Table 182–4 XMLINDEXREMOVEPATH Procedure Parameters

Parameter	Description
`path`	Path to a resource
`recurse`	`TRUE` or `FALSE`

183

DBMS_XDB_CONFIG

The DBMS_XDB_CONFIG package provides an interface for configuring Oracle XML DB and its repository.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

- Using DBMS_XDB_CONFIG
  - Overview
  - Security Model
  - Constants
- Summary of DBMS_XDB_CONFIG Subprograms

Using DBMS_XDB_CONFIG

Overview

PL/SQL package `DBMS_XDB_CONFIG` is the Oracle XML DB resource application program interface (API) for PL/SQL for DBAs to configure their system. This API provides functions and procedures to access and manage Oracle XML DB Repository resources using PL/SQL. It includes methods for managing resource security and Oracle XML DB configuration.

Oracle XML DB Repository is modeled on XML, and provides a database file system for any data. The repository maps path names (or URLs) onto database objects of XMLType and provides management facilities for these objects.

PL/SQL package DBMS_XDB_CONFIG is an API that you can use to manage all of the following:

- Oracle XML DB resources
- Oracle XML DB security based on access control lists (ACLs). An ACL is a list of access control entries (ACEs) that determines which principals (users and roles) have access to which resources.
- Oracle XML DB configuration

Security Model

Owned by XDB, the DBMS_XDB_CONFIG package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Constants

The DBMS_XDB_CONFIG package uses the constants shown in Table 183–1, " DBMS_XDB_CONFIG Constants".

Table 183–1 DBMS_XDB_CONFIG Constants

Constant	Type	Value	Description
XDB_ENDPOINT_HTTP	NUMBER	1	Defining listener for first HTTP port
XDB_ENDPOINT_HTTP2	NUMBER	2	Defining listener for second HTTP port
XDB_PROTOCOL_TCP	NUMBER	1	Defining listener for HTTP protocol
XDB_PROTOCOL_TCPS	NUMBER	2	Defining listener for HTTPS protocol

Summary of DBMS_XDB_CONFIG Subprograms

Table 183–2 DBMS_XDB_CONFIG Package Subprograms

Subprogram	Description
ADDHTTPEXPIREMAPPING Procedure on page 183-8	Adds to `XDB$CONFIG` a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.
ADDMIMEMAPPING Procedure on page 183-9	Adds a mime mapping to XDB configuration
ADDSCHEMALOCMAPPING Procedure on page 183-10	Adds a schema location mapping to the XDB configuration
ADDSERVLET Procedure on page 183-11	Adds a servlet to XDB configuration
ADDSERVLETMAPPING Procedure on page 183-12	Adds a servlet mapping to XDB configuration
ADDSERVLETSECROLE Procedure on page 183-13	Adds a security role `REF` to a specified servlet in XDB configuration
ADDXMLEXTENSION Procedure on page 183-14	Adds adds the following XML extension to the XDB configuration under `<xml-extensions>`: <extension>extension</extension>
CFG_GET Function on page 183-15	Retrieves the session's configuration information as an `XMLType` instance
CFG_REFRESH Procedure on page 183-16	Refreshes the session's configuration information to the latest configuration
CFG_UPDATE Procedure on page 183-17	Updates the configuration information and commits the change.
DELETEHTTPEXPIREMAPPING Procedure on page 183-18	Deletes from `XDB$CONFIG` all mappings of the URL pattern to an expiration date
DELETEMIMEMAPPING Procedure on page 183-19	Deletes the mime mapping for a specified extension from the XDB configuration
DELETESCHEMALOCMAPPING Procedure on page 183-20	Deletes the schema location mapping for a specified schema URL from the XDB configuration
DELETESERVLET Procedure on page 183-21	Deletes a servlet from the XDB configuration
DELETESERVLETMAPPING Procedure on page 183-22	Deletes the servlet mapping for a specified servlet name from the XDB configuration
DELETESERVLETSECROLE Procedure on page 183-23	Deletes the specified role from a servlet in the XDB configuration
DELETEXMLEXTENSION Procedure on page 183-24	Deletes the specified XML extension from the XDB configuration
ENABLEDIGESTAUTHENTICATION Procedure on page 183-25	Enables enables digest authentication
GETFTPPORT Function on page 183-26	Gets the value of the current FTP port
GETHTTPPORT Function on page 183-27	Gets the value of the current HTTP port

Table 183–2 (Cont.) DBMS_XDB_CONFIG Package Subprograms

Subprogram	Description
GETHTTPCONFIGREALM Function on page 183-28	Gets the realm name
GETHTTPSPORT Function on page 183-29	Gets the value of the current HTTPS port
GETLISTENERENDPOINT Procedure on page 183-30	Gets the parameters of a listener end point corresponding to the XML DB HTTP server
SETFTPPORT Procedure on page 183-31	Sets the FTP port to a new value
SETHTTPPORT Procedure on page 183-32	Sets the HTTP port to a new value
SETHTTPCONFIGREALM Procedure on page 183-33	Sets the realm to a new value
SETHTTPSPORT Procedure on page 183-34	Sets the HTTPS port to a new value
SETLISTENERENDPOINT Procedure on page 183-35	Sets the parameters of a listener end point corresponding to the XML DB HTTP server
SETLISTENERLOCALACCESS Procedure on page 183-36	Restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to `TRUE`) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to `FALSE`)
USEDPORT Procedure on page 183-37	Obtains the port numbers used by other pluggable databases in the same consolidation database

ADDHTTPEXPIREMAPPING Procedure

This procedure adds to XDB$CONFIG a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.

Syntax

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
     pattern    IN    VARCHAR2,
     expire     IN    VARCHAR2);
```

Parameters

Table 183–3 ADDHTTPEXPIREMAPPING Procedure Parameters

Parameter	Description
pattern	URL pattern (only * accepted as wildcards)
expire	Expiration directive, follows the ExpireDefault in Apache's mod_expires: base [plus] (num type)* -- base: now | modification -- type: year|years|month|months|week|weeks|day|days| minute|minutess|second|seconds

Examples

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING ('/public/test1/*', 'now plus 4 weeks');
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
             '/public/test2/*', 'modification plus 1 day 30 seconds');
```

ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

```
<mime-mapping>
<extension>extension</extension>
<mime-type>mimetype</mime-type>
</mime-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDMIMEMAPPING(
     extension    IN   VARCHAR2,
     mimetype     IN   VARCHAR2);
```

Parameters

Table 183–4 ADDMIMEMAPPING Procedure Parameters

Parameter	Description
`extension`	Extension for which a mime type is being added
`mimetype`	Mime type

ADDSCHEMALOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

```
<schemaLocation-mapping>
     <namespace>namespace</namespace>
     <element>element</element>
      <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSCHEMALOCMAPPING(
     namespace    IN   VARCHAR2,
     element      IN   VARCHAR2,
     schemaURL    IN   VARCHAR2);
```

Parameters

Table 183–5 ADDSCHEMALOCMAPPING Procedure Parameters

Parameter	Description
`namespace`	Namespace
`element`	Element
`schemaURL`	Schema URL

ADDSERVLET Procedure

This procedure adds the following servlet to XDB configuration:

```
<servlet>
     <servlet-name>name</servlet-name>
<servlet-language>language</servlet-language>
     <display-name>dispname</display-name>
     <description>descript</description>
     <servlet-class>class</servlet-class>
     <servlet-schema>schema</servlet-schema>
</servlet>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLET(
     name       IN   VARCHAR2,
    language    IN   VARCHAR2,
    dispname    IN   VARCHAR2,
    icon        IN   VARCHAR2 := NULL,
    descript    IN   VARCHAR2 := NULL,
    class       IN   VARCHAR2 := NULL,
    jspfile     IN   VARCHAR2 := NULL,
    plsql       IN   VARCHAR2 := NULL);
```

Parameters

Table 183–6 ADDSERVLET Procedure Parameters

Parameter	Description
`name`	Servlet name
`language`	Must be one of "C", "Java", "PL/SQL"
`dispname`	Display name
`icon`	Icon
`descript`	Description
`class`	The `class` / `jspfile` / `plsql` function corresponding to this servlet. The first non-`NULL` argument amongst these three is chosen, and the others are treated as `NULL`.
`jspfile`	The `class` / `jspfile` / `plsql` function corresponding to this servlet. The first non-`NULL` argument amongst these three is chosen, and the others are treated as `NULL`.
`plsql`	The `class` / `jspfile` / `plsql` function corresponding to this servlet. The first non-`NULL` argument amongst these three is chosen, and the others are treated as `NULL`.
`schema`	Schema

ADDSERVLETMAPPING Procedure

This procedure adds the following servlet mapping to XDB configuration:

```
<servlet-mapping>     <servlet-pattern>pattern</servlet-pattern>
<servlet-name>name</servlet-name></servlet-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLETMAPPING(
     pattern   IN   VARCHAR2,     name      IN   VARCHAR2);
```

Parameters

Table 183–7 ADDSERVLETMAPPING Procedure Parameters

Parameter	Description
pattern	Sservlet pattern
name	Servlet name

ADDSERVLETSECROLE Procedure

This procedure adds the following security role `REF` to a specified servlet in XDB configuration:

```
<security-role-ref>
     <role-name>rolename</role-name>
     <role-link>rolelink</role-link>
     <description>descript</description>
</security-role-ref>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLETSECROLE(
     servname    IN   VARCHAR2,     rolename    IN   VARCHAR2,     rolelink    IN
VARCHAR2,     descript    IN   VARCHAR2 := NULL);
```

Parameters

Table 183–8 ADDSERVLETSECROLE Procedure Parameters

Parameter	Description
`servname`	Sservlet name
`rolename`	Role name
`rolelink`	Role link
`descript`	Description

ADDXMLEXTENSION Procedure

This procedure adds the following XML extension to the XDB configuration under `<xml-extensions>`:

```
<extension>extension</extension>
```

Syntax

```
DBMS_XDB_CONFIG.ADDXMLEXTENSION(
     extension    IN   VARCHAR2);
```

Parameters

Table 183–9 ADDXMLEXTENSION Procedure Parameters

Parameter	Description
`extension`	XML extension to be added

CFG_GET Function

This function retrieves the session's configuration information as an `XMLType` instance.

Syntax

```
DBMS_XDB_CONFIG.CFG_GET
 RETURN SYS.XMLType;
```

CFG_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

Syntax

```
DBMS_XDB_CONFIG.CFG_REFRESH;
```

CFG_UPDATE Procedure

This procedure updates the configuration information and commits the change.

Syntax

```
DBMS_XDB_CONFIG.CFG_UPDATE(
   xdbconfig   IN  SYS.XMLTYPE);
```

Parameters

Table 183–10 CFG_UPDATE Procedure Parameters

Parameter	Description
xdbconfig	The new configuration data

DELETEHTTPEXPIREMAPPING Procedure

This procedure deletes from XDB$CONFIG all mappings of the URL pattern to an expiration date.

Syntax

```
DBMS_XDB_REPOS.DELETEHTTPEXPIREMAPPING(
     pattern  IN   VARCHAR2);
```

Parameters

Table 183–11 DELETEHTTPEXPIREMAPPING Procedure Parameters

Parameter	Description
pattern	URL pattern (only * accepted as wildcards)

DELETEMIMEMAPPING Procedure

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETEMIMEMAPPING(
     extension    IN   VARCHAR2);
```

Parameters

Table 183–12 DELETEMIMEMAPPING Procedure Parameters

Parameter	Description
extension	Extension for which a mime type is to be deleted

DELETESCHEMALOCMAPPING Procedure

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESCHEMALOCMAPPING(
     schemaURL     IN    VARCHAR2);
```

Parameters

Table 183–13 DELETESCHEMALOCMAPPING Procedure Parameters

Parameter	Description
schemaURL	Schema URL

DELETESERVLET Procedure

This procedure deletes a servlet from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLET(
     name         IN   VARCHAR2);
```

Parameters

Table 183–14 DELETESERVLET Procedure Parameters

Parameter	Description
name	Servlet name

DELETESERVLETMAPPING Procedure

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETMAPPING(
     name       IN    VARCHAR2);
```

Parameters

Table 183–15 DELETESERVLETMAPPING Procedure Parameters

Parameter	Description
name	Servlet name

DELETESERVLETSECROLE Procedure

This procedure deletes the specified role from a servlet in the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETSECROLE(
     servname    IN   VARCHAR2,     rolename    IN   VARCHAR2);
```

Parameters

Table 183–16 DELETESERVLETSECROLE Procedure Parameters

Parameter	Description
servname	Servlet name
rolename	Name of the role to be deleted

DELETEXMLEXTENSION Procedure

This procedure deletes the specified XML extension from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETEXMLEXTENSION(
     extension    IN   VARCHAR2);
```

Parameters

Table 183–17 DELETEXMLEXTENSION Procedure Parameters

Parameter	Description
extension	XML extension to be deleted

ENABLEDIGESTAUTHENTICATION Procedure

This procedure enables digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

Syntax

```
DBMS_XDB_CONFIG.ENABLEDIGESTAUTHENTICATION;
```

GETFTPPORT Function

This procedure gets the value of the current FTP port.

Syntax

```
DBMS_XDB_CONFIG.GETFTPPORT
 RETURN NUMBER;
```

GETHTTPPORT Function

This function gets the value of the current HTTP port.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPPORT
 RETURN NUMBER;
```

GETHTTPCONFIGREALM Function

This function gets the realm name. Definition of a realm is referenced in IETF's RFC2617.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPCONFIGREALM
 RETURN VARCHAR2;
```

GETHTTPSPORT Function

This procedure gets the value of the current HTTPS port.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPPORT
 RETURN NUMBER;
```

Usage Notes

Returns `NULL` if no port has been configured

GETLISTENERENDPOINT Procedure

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

Syntax

```
DBMS_XDB_CONFIG.GETLISTENERENDPOINT (
   endpoint  IN   NUMBER,
   host      OUT  VARCHAR2,    port      OUT  NUMBER,
   protocol  OUT  NUMBER);
```

Parameters

Table 183–18 GETLISTENERENDPOINT Procedure Parameters

Parameter	Description
endpoint	End point to be retrieved. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point listens
port	Port on which the listener end point listens
protocol	Transport protocol accepted by the listener end point

SETFTPPORT Procedure

This procedure sets the FTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETFTPPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 183–19 SETFTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the FTP port is set

SETHTTPPORT Procedure

This procedure sets the HTTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 183–20 SETHTTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the HTTP port is set

SETHTTPCONFIGREALM Procedure

This procedure modifies the realm value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPCONFIGREALM(
   realm IN VARCHAR2);
```

Parameters

Table 183–21 SETHTTPPORT Procedure Parameters

Parameter	Description
realm	Realm as defined in IETF's RFC2617

SETHTTPSPORT Procedure

This procedure sets the HTTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPSPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 183–22 SETHTTPSPORT Procedure Parameters

Parameter	Description
new_port	Value to which the HTTPS port is set

SETLISTENERENDPOINT Procedure

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server. Both HTTP and HTTP2 end points can be set by invoking this procedure.

Syntax

```
DBMS_XDB_CONFIG.SETLISTENERENDPOINT (
   endpoint  IN  NUMBER,
   host      IN  VARCHAR2,    port      IN  NUMBER,
   protocol  IN  NUMBER);
```

Parameters

Table 183–23 SETLISTENERENDPOINT Procedure Parameters

Parameter	Description
endpoint	End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point is to listen. Its value can be 'LOCALHOST,' NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.
port	Port on which the listener end point is to listen
protocol	Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS

SETLISTENERLOCALACCESS Procedure

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to `TRUE`) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to `FALSE`).

Syntax

```
DBMS_XDB_CONFIG.SETLISTENERLOCALACCESS (
   l_access   BOOLEAN);
```

Parameters

Table 183–24 SETLISTENERLOCALACCESS Procedure Parameters

Parameter	Description
`l_access`.	`TRUE` or `FALSE`.

USEDPORT Procedure

This procedure obtains the port numbers used by other pluggable databases in the same consolidation database.

Syntax

```
DBMS_XDB_CONFIG.USEDPORT;
```

184

DBMS_XDB_CONSTANTS

The DBMS_XDB_CONSTANTS package provides an interface to commonly used constants. Users should use constants instead of dynamic strings to avoid typographical errors.

This chapter contains the following topics:

Using DBMS_XDB_CONSTANTS

Security Model

Owned by XDB, the DBMS_XDB_CONSTANTS package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Summary of DBMS_XDB_CONSTANTS Subprograms

Table 184–1 DBMS_XDB_CONSTANTS Package Subprograms

Subprograms	Description
ENCODING_DEFAULT Function on page 184-7	Returns `'AL32UTF8'`
ENCODING_ISOLATIN1 Function on page 184-8	Returns `'WE8ISO8859P1'`
ENCODING_UTF8 Function on page 184-9	Returns `'AL32UTF8'`
ENCODING_WIN1252 Function on page 184-10	Returns `'WE8MSWIN1252'`
NAMESPACE_ACL Function on page 184-11	Returns `'http://xmlns.oracle.com/xdb/acl.xsd'`
NAMESPACE_METADATA Function on page 184-12	Returns `'http://xmlns.oracle.com/xdbuserMetaData'`
NAMESPACE_ORACLE Function on page 184-13	Returns `'http://xmlns.oracle.com'`
NAMESPACE_ORACLE_XDB Function on page 184-14	Returns `'http://xmlns.oracle.com/xdb'`
NAMESPACE_RESOURCE Function on page 184-15	Returns `'http://xmlns.oracle.com/xdb/XDBResource.xsd'`
NAMESPACE_RESOURCE_EVENT Function on page 184-16	Returns `'http://xmlns.oracle.com/resourceEvent'`
NAMESPACE_RESOURCE_CONFIG Function on page 184-17	Returns `'http://xmlns.oracle.com/XDBResConfig.xsd'`
NAMESPACE_XDBSCHEMA Function on page 184-18	Returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd'`
NAMESPACE_XMLDIFF Function on page 184-19	Returns `'http://xmlns.oracle.com/xdb/xdiff.xsd'`
NAMESPACE_XMLINSTANCE Function on page 184-19	Returns `'http://www.w3.org/2001/XMLSchema-instance'`
NAMESPACE_XMLSCHEMA Function on page 184-21	Returns `'http://www.w3.org/2001/XMLSchema'`

Table 184–1 (Cont.) DBMS_XDB_CONSTANTS Package Subprograms

Subprograms	Description
NSPREFIX_ACL_ACL Function on page 184-22	Returns `'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'`
NSPREFIX_RESCONFIG_RC Function on page 184-23	Returns `'xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'`
NSPREFIX_RESOURCE_R Function on page 184-24	Returns `'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd"'`
NSPREFIX_XDB_XDB Function on page 184-25	Returns `'http://xmlns.oracle.com/xdb'`
NSPREFIX_XMLINSTANCE_XSI Function on page 184-26	Returns `'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'`
NSPREFIX_XMLDIFF_XD Function on page 184-27	Returns `'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'`
NSPREFIX_XMLSCHEMA_XSD Function on page 184-28	Returns `'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'`
SCHEMAURL_ACL Function on page 184-29	Returns `'http://xmlns.oracle.com/xdb/acl.xsd'`
SCHEMAELEM_RES_ACL Function on page 184-30	Returns `'http://xmlns.oracle.com/xdb/acl.xsd#acl'`
SCHEMAELEM_RESCONTENT_BINARY Function on page 184-31	Returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'`
SCHEMAELEM_RESCONTENT_TEXT Function on page 184-32	Returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'`
SCHEMAURL_RESOURCE Function on page 184-33	Returns `'http://xmlns.oracle.com/xdb/XDBResource.xsd'`
SCHEMAURL_XDBSCHEMA Function on page 184-34	Returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd'`
XDBSCHEMA_PREFIXES Function on page 184-35	Returns `'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb'`
XSD_ATTRIBUTE Function on page 184-36	Returns `'attribute'`
XSD_COMPLEX_TYPE Function on page 184-37	Returns `'complexType'`

Table 184–1 (Cont.) DBMS_XDB_CONSTANTS Package Subprograms

Subprograms	Description
XSD_ELEMENT Function on page 184-38	Returns `'element'`
XSD_GROUP Function on page 184-39	Returns `'group'`

ENCODING_DEFAULT Function

This function returns `'AL32UTF8'`.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_DEFAULT
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'AL32UTF8'`

ENCODING_ISOLATIN1 Function

This function returns `'WE8ISO8859P1'`.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_ISOLATIN1
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'WE8ISO8859P1'`

ENCODING_UTF8 Function

This function returns `'AL32UTF8'`.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_UTF8
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'AL32UTF8'`

ENCODING_WIN1252 Function

This function returns `'WE8MSWIN1252'`.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_WIN1252
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'WE8MSWIN1252'`

NAMESPACE_ACL Function

This function returns `'http://xmlns.oracle.com/xdb/acl.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ACL
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/acl.xsd'`

NAMESPACE_METADATA Function

This function returns `'http://xmlns.oracle.com/xdbuserMetaData'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_METADATA
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdbuserMetaData'`

NAMESPACE_ORACLE Function

This function returns `'http://xmlns.oracle.com'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE
  RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com'`

NAMESPACE_ORACLE_XDB Function

This function returns `'http://xmlns.oracle.com/xdb'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE_XDB
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb'`

NAMESPACE_RESOURCE Function

This function returns `'/XDBResource.xsd'`

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBResource.xsd`

NAMESPACE_RESOURCE_EVENT Function

This function returns `'http://xmlns.oracle.com/resourceEvent'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_EVENT
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/resourceEvent'`

NAMESPACE_RESOURCE_CONFIG Function

This function returns `'http://xmlns.oracle.com/XDBResConfig.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_CONFIG
  RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/XDBResConfig.xsd'`

NAMESPACE_XDBSCHEMA Function

This function returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XDBSCHEMA
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBSchema.xsd'`

NAMESPACE_XMLDIFF Function

This function returns `'http://xmlns.oracle.com/xdb/xdiff.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLDIFF
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/xdiff.xsd'`

NAMESPACE_XMLINSTANCE Function

This function returns `'http://www.w3.org/2001/XMLSchema-instance'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLINSTANCE
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://www.w3.org/2001/XMLSchema-instance'`

NAMESPACE_XMLSCHEMA Function

This function returns `'http://www.w3.org/2001/XMLSchema'`.

Syntax

```
DBMS_XDB_CONSTANTS. NAMESPACE_XMLSCHEMA
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://www.w3.org/2001/XMLSchema'`

NSPREFIX_ACL_ACL Function

This function returns `'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_ACL_ACL
  RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'`

NSPREFIX_RESCONFIG_RC Function

This function returns
''xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESCONFIG_RC
  RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

Returns ''xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'

NSPREFIX_RESOURCE_R Function

This function returns `'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESOURCE_R
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'`

NSPREFIX_XDB_XDB Function

This function returns `'http://xmlns.oracle.com/xdb'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XDB_XDB
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb'`

NSPREFIX_XMLINSTANCE_XSI Function

This function returns `'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLINSTANCE_XSI
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'`

NSPREFIX_XMLDIFF_XD Function

This function returns `'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLDIFF_XD
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'`

NSPREFIX_XMLSCHEMA_XSD Function

This function returns `'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLSCHEMA_XSD
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'`

SCHEMAURL_ACL Function

This function returns `'http://xmlns.oracle.com/xdb/acl.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_ACL
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/acl.xsd'`

SCHEMAELEM_RES_ACL Function

This function returns `'http://xmlns.oracle.com/xdb/acl.xsd#acl'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RES_ACL
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/acl.xsd#acl'`

SCHEMAELEM_RESCONTENT_BINARY Function

This function returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_BINARY
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'`

SCHEMAELEM_RESCONTENT_TEXT Function

This function returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_TEXT
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'`

SCHEMAURL_RESOURCE Function

This function returns `'http://xmlns.oracle.com/xdb/XDBResource.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_RESOURCE
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBResource.xsd'`

SCHEMAURL_XDBSCHEMA Function

This function returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_XDBSCHEMA
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBSchema.xsd'`

XDBSCHEMA_PREFIXES Function

This function returns `'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb'`.

Syntax

```
DBMS_XDB_CONSTANTS.XDBSCHEMA_PREFIXES
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

```
'xmlns:xsd="http://www.w3.org/2001/XMLSchema"
xmlns:xdb="http://xmlns.oracle.com/xdb'
```

XSD_ATTRIBUTE Function

This function returns `'attribute'`.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_ATTRIBUTE
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'attribute'`

XSD_COMPLEX_TYPE Function

This function returns `'complexType'`.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_COMPLEX_TYPE
  RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'complexType'`

XSD_ELEMENT Function

This function returns `'element'`.

Syntax

```
DBMS_XDB_CONSTANTS. XSD_ELEMENT
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'element'`

XSD_GROUP Function

This function returns `'group'`

Syntax

```
DBMS_XDB_CONSTANTS.XSD_GROUP
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'group'`

185

DBMS_XDB_REPOS

The DBMS_XDB_REPOS package provides an interface to operate on the Oracle XML database Repository.

> **See Also:** Oracle XML DB Developer's Guide for more information regarding:
>
> - Using and managing repository resources
> - ACL-based security management (controlling access to repository resources)
> - Managing XLink and XInclude links
> - Loading documents into the repository
> - Creating, deleting, and managing resource metadata

This chapter contains the following topics:

Using DBMS_XDB_REPOS

Overview

The DBMS_XDB_REPOS package lets you operate on the Oracle XML DB Repository to create, modify and delete resources, including managing security based on access control lists (ACLs). The interface provides both query and DML functions. Using a combination of PL/SQL packages - DBMS_XDB_REPOS, DBMS_XDBZ, and DBMS_XDB_VERSION - you can create, delete, and rename documents and folders, move a file or folder within the folder hierarchy, set and change the access permissions on a file or folder, and initiate and manage versioning.

Security Model

Owned by XDB, the DBMS_XDB_REPOS package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is SYS or XDB, or the current user has the XDBADMIN or DBA role.

Constants

The DBMS_XDB_REPOS package uses the constants shown in Table 185–1, " DBMS_XDB_REPOS Constants".

Table 185–1 DBMS_XDB_REPOS Constants

Constant	Type	Value	Description
DELETE_RESOURCE	NUMBER	1	Deletes a resource; fails if the resource has children.
DELETE_RECURSIVE	NUMBER	2	Deletes a resource and its children, if any.
DELETE_FORCE	NUMBER	3	Deletes the resource, even if the object it contains is invalid
DELETE_RECURSIVE_FORCE	NUMBER	4	Deletes a resource and its children, if any, even if the object it contains is invalid
DELETE_RES_METADATA_CASCADE	NUMBER	1	Deletes the row in the metadata
DELETE_RES_METADATA_NOCASCADE	NUMBER	2	Does not delete the row
DEFAULT_LOCK_TIMEOUT	PLS_INTEGER	(60*60)	Timeout value (in seconds) of the webdav lock
LINK_TYPE_HARD	NUMBER	1	Hard link of a folder to a resource
LINK_TYPE_WEAK	NUMBER	2	Weak link of a folder to a resource
LINK_TYPE_SYMBOLIC	NUMBER	3	Symbolic link of a folder to a resource

Summary of DBMS_XDB_REPOS Subprograms

Table 185–2 DBMS_XDB_REPOS Package Subprograms

Subprogram	Description
ACLCHECKPRIVILEGES Function on page 185-8	Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.
APPENDRESOURCEMETADATA Procedure on page 185-9	Takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource
CHANGEOWNER Procedure on page 185-10	Changes the owner of the resource/s to the specified owner.
CHANGEPRIVILEGES Function on page 185-11	Adds a specified ACE to a specified resource's ACL
CHECKPRIVILEGES Function on page 185-12	Checks access privileges granted to the current user on the specified resource
CREATEFOLDER Function on page 185-13	Creates a new folder resource in the hierarchy
CREATEOIDPATH Function on page 185-14	Creates a virtual path to the resource based on object ID
CREATERESOURCE Functions on page 185-15	Creates a new resource
DELETERESOURCE Procedure on page 185-17	Deletes a resource from the hierarchy
DELETERESOURCEMETADATA Procedures on page 185-18	Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)
EXISTSRESOURCE Function on page 185-19	Determines if a resource is the hierarchy, based on its absolute path
GETACLDOCUMENT Function on page 185-20	Retrieves ACL document that protects resource given its path name
GETCONTENTBLOB Function on page 185-21	Retrieves the contents of a resource returned as a BLOB
GETCONTENTCLOB Function on page 185-22	Retrieves the contents of a resource returned as a CLOB
GETCONTENTVARCHAR2 Function on page 185-23	Retrieves the contents of a resource returned as a string
GETCONTENTXMLREF Function on page 185-24	Retrieves the contents of a resource returned as a a `REF` to an `XMLTYPE`
GETCONTENTXMLTYPE Function on page 185-25	Retrieves the contents of a resource returned as an `XMLTYPE`
GETLOCKTOKEN Procedure on page 185-26	Returns that resource's lock token for the current user given a path to a resource
GETPRIVILEGES Function on page 185-27	Gets all privileges granted to the current user on a specified resource
GETRESOID Function on page 185-28	Returns the object ID of the resource from its absolute path
GETXDB_TABLESPACE Function on page 185-29	Returns the current tablespace of the XDB (user)

Table 185–2 (Cont.) DBMS_XDB_REPOS Package Subprograms

Subprogram	Description
HASBLOBCONTENT Function on page 185-30	Returns `TRUE` if the resource has BLOB content
HASCHARCONTENT Function on page 185-31	Returns `TRUE` if the resource has character content
HASXMLCONTENT Function on page 185-32	Returns `TRUE` if the resource has XML content
HASXMLREFERENCE Function on page 185-33	Returns `TRUE` if the resource has `REF` to XML content
ISFOLDER Function on page 185-34	Returns `TRUE` if the resource is a folder or container
LINK Procedures on page 185-35	Creates a link to an existing resource
LOCKRESOURCE Function on page 185-36	Gets a WebDAV-style lock on that resource given a path to that resource
PROCESSLINKS Procedure on page 185-37	Processes document links in the specified resource
PURGERESOURCEMETADATA Procedure on page 185-38	Deletes all user metadata from a resource
RENAMERESOURCE Procedure on page 185-39	Renames the XDB resource
SETACL Procedure on page 185-40	Sets the ACL on a specified resource
SPLITPATH Procedure on page 185-41	Splits the path into a parentpath and childpath
TOUCHRESOURCE Procedure on page 185-42	Changes the modification time of the resource to the current time
UNLOCKRESOURCE Function on page 185-43	Unlocks the resource given a lock token and resource path
UPDATERESOURCEMETADATA Procedures on page 185-44	Updates metadata for a resource

ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the OWNER of the resource. Returns positive integer if all privileges are granted.

Syntax

```
DBMS_XDB_REPOS.ACLCHECKPRIVILEGES(
   acl_path  IN  VARCHAR2,
   owner     IN  VARCHAR2,
   privs     IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 185–3 ACLCHECKPRIVILEGES Function Parameters

Parameter	Description
acl_path	Absolute path in the Hierarchy for ACL document
owner	Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution
privs	An XMLType instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function.

APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource.

Syntax

```
DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  XMLTYPE);

DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  REF SYS.XMLTYPE);
```

Parameters

Table 185–4 APPENDRESOURCEMETADATA Procedure

Parameter	Description
abspath	Absolute path of the resource
metadata	Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.

Usage Notes

- In the case in which a REF is passed in, the procedure stores the REF in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the RESID column for the metadata table. Note that theREF passed in must be unique. In other words, there must not be aREF with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a REF that already exists.
- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner.

Syntax

```
DBMS_XDB_REPOS.CHANGEOWNER(
     abspath    IN   VARCHAR2,
     owner      IN   VARCHAR2,
     recurse    IN   BOOLEAN := FALSE);
```

Parameters

Table 185–5 CHANGEOWNER Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`owner`	New owner for the resource
`recurse`	If `TRUE`, recursively change owner of all resources in the folder tree

CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL.

Syntax

```
DBMS_XDB_REPOS.CHANGEPRIVILEGES(
   res_path   IN    VARCHAR2,
   ace        IN    xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 185–6 CHANGEPRIVILEGES Function Parameters

Parameter	Description
res_path	Path name of the resource for which privileges need to be changed
ace	An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (grant/deny) already exists in the ACL, the new ACE is added at the end of the ACL.

CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Syntax

```
DBMS_XDB_REPOS.CHECKPRIVILEGES(
   res_path   IN  VARCHAR2,
   privs      IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 185–7 CHECKPRIVILEGES Function Parameters

Parameter	Description
`res_path`	Absolute path in the Hierarchy for resource
`privs`	An `XMLType` instance of the privilege element specifying the requested set of access privileges

Return Values

A positive integer if all requested privileges granted.

CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

Syntax

```
DBMS_XDB_REPOS.CREATEFOLDER(
   path   IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 185–8 CREATEFOLDER Function Parameters

Parameter	Description
path	Path name for the new folder

Return Values

TRUE if operation successful; FALSE, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.

CREATEOIDPATH Function

This function creates a virtual path to the resource based on object ID.

Syntax

```
DBMS_XDB_REPOS.CREATEOIDPATH(
   oid    IN   RAW)
 RETURN VARCHAR2;
```

Parameters

Table 185–9 CREATEOIDPATH Function Parameters

Parameter	Description
oid	Object ID of the resource

CREATERESOURCE Functions

The functions create a new resource. The description of the overload options precede each version of the syntax

Syntax

Creates a new resource with a specified string as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  VARCHAR2)
 RETURN BOOLEAN;
```

Creates a new resource with a specified XMLType data as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  SYS.XMLTYPE)
 RETURN BOOLEAN;
```

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB_REPOS.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     datarow        IN  REF SYS.XMLTYPE)
 RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```
DBMS_XDB_REPOS.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  BLOB,
     csid           IN  NUMBER :=0)
 RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```
DBMS_XDB_REPOS.CREATERESOURCE (
     abspath        IN  VARCHAR2,
     data           IN  BFILE,
     csid           IN  NUMBER :=0)
 RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
     abspath        IN  VARCHAR2,
     data           IN  CLOB)
 RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
   abspath        IN  VARCHAR2,
   data           IN  VARCHAR2,
   schemaurl      IN  VARCHAR2 := NULL,
   elem           IN  VARCHAR2 := NULL)
```

```
 RETURN BOOLEAN;
```

Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
   abspath        IN  VARCHAR2,
   data           IN  SYS.XMLTYPE,
   schemaurl      IN  VARCHAR2 := NULL,
   elem           IN  VARCHAR2 := NULL)
 RETURN BOOLEAN;
```

Parameters

Table 185–10 CREATERESOURCE Function Parameters

Parameter	Description
abspath	Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if /foo/bar.txt is passed in, then folder /foo must already exist.
data	String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.
datarow	REF to an XMLType row to be used as the contents
csid	Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: ■ From the abspath extension, determine the resource's MIME type. ■ If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; ■ Otherwise, it is defaulted to the database character set.
schemaurl	For XML data, schema URL data conforms to (default NULL)
elem	Element name (default NULL)

Return Values

TRUE if operation successful; FALSE, otherwise.

DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

Syntax

```
DBMS_XDB_REPOS.DELETERESOURCE(
   path          IN      VARCHAR2,
   delete_option IN      PLS_INTEGER);
```

Parameters

Table 185–11 DELETERESOURCE Procedure Parameters

Parameter	Description
path	Path name of the resource to delete
delete_option	The option that controls how a a resource is deleted: ■ DELETE_RESOURCE ■ DELETE_RECURSIVE ■ DELETE_FORCE ■ DELETE_RECURSIVE_FORCE

DELETERESOURCEMETADATA Procedures

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
   abspath        IN  VARCHAR2,
   metadata       IN  REF SYS.XMLTYPE,
   delete_option  IN  pls_integer := DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_
CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
   abspath        IN VARCHAR2,
   metadatans     IN VARCHAR2,
   metadataname   IN VARCHAR2,
   delete_option  IN pls_integer := DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_
CASCADE);
```

Parameters

Table 185–12 DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`metadata`	`REF` to the piece of metadata (schema based) to be deleted
`mettadatans`	Namespace of the metadata fragment to be removed
`mettadataname`	Local name of the metadata fragment to be removed
`delete_option`	Only applicable for schema-based metadata, this can be one of the following: ■ `DELETE_RES_METADATA_CASCADE` - deletes the corresponding row in the metadata table ■ `DELETE_RES_METADATA_NOCASCADE` - does not delete the row in the metadata table

EXISTSRESOURCE Function

This function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

Syntax

```
DBMS_XDB_REPOS.EXISTSRESOURCE(
   abspath    IN    VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 185–13 EXISTSRESOURCE Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

TRUE if the resource is found.

GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

Syntax

```
DBMS_XDB_REPOS.GETACLDOCUMENT(
   abspath  IN  VARCHAR2)
  RETURN sys.xmltype;
```

Parameters

Table 185–14 GETACLDOCUMENT Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

The XMLType for ACL document.

GETCONTENTBLOB Function

This function retrieves the contents of a resource returned as a BLOB.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTBLOB(
     abspath    IN     VARCHAR2,
     csid       OUT    PLS_INTEGER,
     locksrc    IN     BOOLEAN := FALSE)
  RETURN BLOB;
```

Parameters

Table 185–15 GETCONTENTBLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource
csid	If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.
locksrc	Contents of the resource as a BLOB

Return Values

The contents of the resource as a BLOB.

GETCONTENTCLOB Function

This function gets the contents of a resource returned as a `CLOB`.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTCLOB(
     abspath    IN     VARCHAR2,
  RETURN CLOB;
```

Parameters

Table 185–16 GETCONTENTCLOB Function Parameters

Parameter	Description
`abspath`	Absolute path of the resource

Return Values

The contents of the resource as a CLOB.

GETCONTENTVARCHAR2 Function

This function gets the contents of a resource returned as a string.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTVARCHAR2(
     abspath    IN     VARCHAR2,
  RETURN BLOB;
```

Parameters

Table 185–17 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a string.

GETCONTENTXMLREF Function

This function retrieves the contents of a resource returned as a a `REF` to an `XMLTYPE`.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTXMLREF(
     abspath    IN     VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 185–18 GETCONTENTXMLREF Function Parameters

Parameter	Description
`abspath`	Absolute path of the resource

Return Values

The contents of the resource as a `REF` to an `XMLTYPE`.

GETCONTENTXMLTYPE Function

This function retrieves the contents of a resource returned as an XMLTYPE.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTXMLTYPE(
     abspath    IN     VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 185–19 GETCONTENTXMLTYPE Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as an XMLTYPE.

GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource's lock token for the current user.

Syntax

```
DBMS_XDB_REPOS.GETLOCKTOKEN(
   path          IN      VARCHAR2,
   locktoken     OUT     VARCHAR2);
```

Parameters

Table 185–20 GETLOCKTOKEN Procedure Parameters

Parameter	Description
`path`	Path name to the resource
`locktoken`	Logged-in user's lock token for the resource

Usage Notes

The user must have `READPROPERTIES` privilege on the resource.

GETPRIVILEGES Function

This function gets all privileges granted to the current user on a specified resource.

Syntax

```
DBMS_XDB_REPOS.GETPRIVILEGES(
   res_path    IN     VARCHAR2)
 RETURN sys.xmltype;
```

Parameters

Table 185–21 GETPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the hierarchy of the resource

Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

GETRESOID Function

Returns the object ID of the resource from its absolute path.

Syntax

```
DBMS_XDB_REPOS.GETRESOID(
   abspath IN VARCHAR2)
RETURN RAW;
```

Parameters

Table 185–22 GETRESOID Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

NULL if the resource is not present.

GETXDB_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

Syntax

```
DBMS_XDB_REPOS.GETXDB_TABLESPACE
 RETURN VARCHAR2;
```

HASBLOBCONTENT Function

This function returns TRUE if the resource has BLOB content.

Syntax

```
DBMS_XDB_REPOS.HASBLOBCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 185–23 HASBLOBCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has BOB content.

HASCHARCONTENT Function

This function returns TRUE if the resource has character content.

Syntax

```
DBMS_XDB_REPOS.HASCHARCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 185–24 HASCHARCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has character content.

HASXMLCONTENT Function

This function returns TRUE if the resource has XML content.

Syntax

```
DBMS_XDB_REPOS.HASXMLCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 185–25 HASXMLCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has XML content.

HASXMLREFERENCE Function

This function returns TRUE if the resource has a REF to XML content.

Syntax

```
DBMS_XDB_REPOS.HASXMLREFERENCE
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 185–26 HASXMLREFERENCE Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE resource has a REF to XML content.

ISFOLDER Function

This function returns TRUE if the resource is a folder or container.

Syntax

```
DBMS_XDB_REPOS.ISFOLDER
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 185–27 ISFOLDER Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource is a folder or container.

LINK Procedures

This procedure creates from a specified folder to a specified resource.

Syntax

```
DBMS_XDB_REPOS.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2);

DBMS_XDB_REPOS.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2,
   linktype     IN   PLS_INTEGER := DBMS_XDB_REPOS.LINK_TYPE_HARD);
```

Parameters

Table 185–28 LINK Procedure Parameters

Parameter	Description
srcpath	Path name of the resource to which a link is created
linkfolder	Folder in which the new link is placed
linkname	Name of the new link
linktype	Type of link to be created: ■ DBMS_XDB.LINK_TYPE_HARD (default) ■ DBMS_XDB.LINK_TYPE_WEAK ■ DBMS_XDB.LINK_TYPE_SYMBOLIC

LOCKRESOURCE Function

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

Syntax

```
DBMS_XDB_REPOS.LOCKRESOURCE(
   path      IN  VARCHAR2,
   depthzero IN  BOOLEAN,
   shared    IN  boolean)
RETURN BOOLEAN;
```

Parameters

Table 185–29 LOCKRESOURCE Function Parameters

Parameter	Description
`path`	Path name of the resource to lock.
`depthzero`	Currently not supported
`shared`	Passing `TRUE` obtains a shared write lock

Return Values

`TRUE` if successful.

Usage Notes

The user must have `UPDATE` privileges on the resource.

PROCESSLINKS Procedure

This procedure processes document links in the specified resource.

Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA(
 abspath  IN  VARCHAR2,
 recurse  IN  BOOLEAN := FALSE);
```

Parameters

Table 185–30 PROCESSLINKS Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource. If the path is a folder, use the `recurse` flag.
`recurse`	Used only if `abspath` specifies a folder. If `TRUE`, process links of all resources in the folder hierarchy rooted at the specified resource. If `FALSE`, process links of all documents in this folder only.

PURGERESOURCEMETADATA Procedure

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA(
 abspath  IN  VARCHAR2);
```

Parameters

Table 185–31 PURGERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource

RENAMERESOURCE Procedure

This procedure renames the XDB resource.

Syntax

```
DBMS_XDB_REPOS.RENAMERESOURCE(
   srcpath    IN  VARCHAR2,
   destfolder IN  CARCHAR2,
   newname    IN  VARCHAR2);
```

Parameters

Table 185–32 RENAMERESOURCE Procedure Parameters

Parameter	Description
srcpath	Absolute path in the Hierarchy for the source resource destination folder
destfolder	Absolute path in the Hierarchy for the destination folder
newname	Name of the child in the destination folder

SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

Syntax

```
DBMS_XDB_REPOS.SETACL(
   res_path   IN  VARCHAR2,
   acl_path   IN  VARCHAR2);
```

Parameters

Table 185–33 SETACL Procedure Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
acl_path	Absolute path in the Hierarchy for ACL

Usage Notes

The user must have <write-acl> privileges on the resource.

SPLITPATH Procedure

This procedure splits the path into a parentpath and childpath.

Syntax

```
DBMS_XDB_REPOS.SPLITPATH(
      abspath     IN  VARCHAR2,
      parentpath  OUT VARCHAR2,
     childpath    OUT VARCHAR2);
```

Parameters

Table 185–34 SPLITPATH Procedure Parameters

Parameter	Description
abspath	Absolute path to be split
parentpath	Parentpath
childpath	Childpath

TOUCHRESOURCE Procedure

This procedure changes the modification time of the resource to the current time.

Syntax

```
DBMS_XDB_REPOS.TOUCHRESOURCE
     abspath    IN     VARCHAR2);
```

Parameters

Table 185–35 TOUCHRESOURCE Procedure Parameters

Parameter	Description
abspath_path	Absolute path of the resource

UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

Syntax

```
DBMS_XDB_REPOS.UNLOCKRESOURCE(
   path     IN  VARCHAR2,
   deltoken IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 185–36 UNLOCKRESOURCE Function Parameters

Parameter	Description
path	Path name to the resource
deltoken	Lock token to be removed

Return Values

TRUE if operation successful.

Usage Notes

The user must have UPDATE privileges on the resource.

UPDATERESOURCEMETADATA Procedures

This procedure updates metadata for a resource. The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
   abspath  IN VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldns          IN   VARCHAR2,
   oldname IN VARCHAR,
   newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
   abspath       IN   VARCHAR2,
   oldns         IN   VARCHAR2,
   oldname       IN   VARCHAR,
   newmetadata   IN   REF SYS.XMLTYPE);
```

Parameters

Table 185–37 UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
oldmetadata	REF to the old of metadata
newmetadata	REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)
oldns	Namespace identifying old metadata
oldname	Local name identifying old metadata

Usage Notes

In the case of REF, it stores the REF in the resource and the metadata is stored in a separate table. Uniqueness of REFs is enforced. In the case where the XMLTYPE is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

186

DBMS_XDB_VERSION

Oracle XML DB versioning interfaces are found in the `DBMS_XBD_VERSION` package. Functions and procedures of `DBMS_XDB_VERSION` help to create a VCR and manage the versions in the version history.

This chapter contains the following topic:

- Using DBMS_XDB_VERSION
  - Security Model
- Summary of DBMS_XDB_VERSION Subprograms

See Also: *Oracle XML DB Developer's Guide*

Using DBMS_XDB_VERSION

Security Model

Owned by XDB, the DBMS_XDB_VERSION package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Summary of DBMS_XDB_VERSION Subprograms

Table 186–1 DBMS_XDB_VERSION Package Subprograms

Method	Description
CHECKIN Function on page 186-5	Checks in a checked-out VCR and returns the resource id of the newly-created version
CHECKOUT Procedure on page 186-6	Checks out a VCR before updating or deleting it
GETCONTENTSBLOBBYRESID Function on page 186-7	Obtain contents as a `BLOB`
GETCONTENTSCLOBBYRESID Function on page 186-8	Obtain contents as a `CLOB`
GETCONTENTSXMLBYRESID Function on page 186-9	Obtain contents as an `XMLType`
GETPREDECESSORS Function on page 186-10	Retrieves the list of predecessors by path name
GETPREDSBYRESID Function on page 186-11	Retrieves the list of predecessors by resource id
GETRESOURCEBYRESID Function on page 186-12	Obtains the resource as an `XMLType`, given the resource object ID
GETSUCCESSORS Function on page 186-13	Retrieves the list of successors by path name
GETSUCCSBYRESID Function on page 186-14	Retrieves the list of successors by resource id
MAKEVERSIONED Function on page 186-15	Turns a regular resource whose path name is given into a version-controlled resource
UNCHECKOUT Function on page 186-16	Checks in a checked-out resource, returns the resource id of the version before the resource is checked out

CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

Syntax

```
DBMS_XDB_VERSION.CHECKIN(
   pathname VARCHAR2)
 RETURN DBMS_XDB.resid_type;
```

Parameters

Table 186–2 CHECKIN Function Parameters

Parameter	Description
pathname	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. CHECKIN Function doesn't have to take the same path name that was passed to CHECKOUT Procedure operation. However, the CHECKIN Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to CHECKIN Function because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to CHECKIN Function the resource.

CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

Syntax

```
DBMS_XDB_VERSION.Checkout(
   pathname    VARCHAR2);
```

Parameters

Table 186–3 CHECKOUT Procedure Parameters

Parameter	Description
pathname	The path name of the VCR to be checked out.

Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot CHECKOUT Procedure the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the CHECKOUT Procedure operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, if the resource doesn't exist.

GETCONTENTSBLOBBYRESID Function

This function obtain contents as a BLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSBLOBYRESID(
   resid      DBMS_XDB.resid_type)
 RETURN BLOB;
```

Parameters

Table 186–4 GETCONTENTSBLOBYRESID Function Parameters

Parameter	Description
resid	The resource id.

GETCONTENTSCLOBBYRESID Function

This function obtains contents as a CLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSCLOBYRESID(
   resid     DBMS_XDB.resid_type)
 RETURN CLOB;
```

Parameters

Table 186–5 GETCONTENTSCLOBYRESID Function Parameters

Parameter	Description
resid	The resource id.

GETCONTENTSXMLBYRESID Function

This function obtains contents as an XMLType.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSXMLBYRESID(
   resid      DBMS_XDB.resid_type)
 RETURN XMLType;
```

Parameters

Table 186–6 GETCONTENTSXMLBYRESID Function Parameters

Parameter	Description
resid	The resource id.

Return Values

If the contents are not valid XML, returns NULL.

GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

Syntax

```
DBMS_XDB_VERSION.GETPREDECESSORS(
   pathname       VARCHAR2)
 RETURN resid_list_type;
```

Parameters

Table 186–7 GETPREDECESSORS Function Parameters

Parameter	Description
pathname	The path name of the resource.

Return Values

An exception is raised if pathname is illegal.

GETPREDSBYRESID Function

This function retrieves the list of predecessors by resource id.

Syntax

```
DBMS_XDB_VERSION.GETPREDSBYRESID(
   resid      resid_type)
 RETURN resid_list_type;
```

Parameters

Table 186–8 GETPREDSBYRESID Function Parameters

Parameter	Description
resid	The resource id.

Usage Notes

Getting predecessors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the RESID is illegal.

GETRESOURCEBYRESID Function

This function obtains the resource as an `XMLType`, given the resource object ID. Because the system does not create a path name for versions, this function is useful for retrieving the resource using its resource id.

Syntax

```
DBMS_XDB_VERSION.GETRESOURCEBYRESID(
   resid      resid_type)
 RETURN XMLType;
```

Parameters

Table 186–9 GETRESOURCEBYRESID Function Parameters

Parameter	Description
`resid`	The resource id.

GETSUCCESSORS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

Syntax

```
DBMS_XDB_VERSION.GETSUCCESSORS(
   pathname VARCHAR2)
 RETURN resid_list_type;
```

Parameters

Table 186–10 GETSUCCESSORS Function Parameters

Parameter	Description
pathname	The path name of the resource.

Usage Notes

Getting successors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the pathname is illegal.

GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

Syntax

```
DBMS_XDB_VERSION.GETSUCCSBYRESID(
   resid    resid_type)
  RETURN resid_list_type;
```

Parameters

Table 186–11 GETSUCCSBYRESID Function Parameters

Parameter	Description
resid	The resource id.

Usage Notes

Getting successors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the pathname is illegal.

MAKEVERSIONED Function

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

Syntax

```
DBMS_XDB_VERSION.MAKEVERSIONED(
   pathname   VARCHAR2)
 RETURN DBMS_XDB.resid_type;
```

Parameters

Table 186–12 MAKEVERSIONED Function Parameters

Parameter	Description
pathname	The path name of the resource to be put under version control.

Return Values

This function returns the resource ID of the first version, or root, of the VCR.

Usage Notes

If two or more path names are bound with the same resource, a copy of the resource is created, and the given path name is bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn't exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.

UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

Syntax

```
DBMS_XDB_VERSION.UNCHECKOUT(
   pathname     VARCHAR2)
 RETURN DBMS_XDB.resid_type;
```

Parameters

Table 186–13 UNCHECKOUT Function Parameters

Parameter	Description
pathname	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. The UNCHECKOUT Function does not have to take the same path name that was passed to the operation by the CHECKOUT Procedure. However, the UNCHECKOUT Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to UNCHECKOUT Function, because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to UNCHECKOUT Function the resource.

Exceptions

An exception is raised if the path name doesn't exist.

187

DBMS_XDBRESOURCE

The DBMS_XDBRESOURCE package provides the interface to operate on the resource's metadata and contents.

> **See Also:** Oracle XML DB Developer's Guide for examples of "Using DBMS_XDBRESOURCE"

This chapter contains the following topics:

Using DBMS_XDBRESOURCE

Overview

The DBMS_XDBRESOURCE package provides routines to get and set the resource's metadata and contents. To take advantage of the DOM traversal facility, provided in DBMS_XMLDOM package, an XDBResource instance could be converted to a DOMDocument type by using DBMS_XDBRESOURCE.MAKEDOCUMENT routine.

Security Model

Owned by XDB, the DBMS_XDBRESOURCE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Summary of DBMS_XDBRESOURCE Subprograms

Table 187–1 DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
FREERESOURCE Procedure on page 187-8	Frees any memory associated with an XDBResource
GETACL Function on page 187-9	Given an XDBResource, returns its ACL as string
GETACLDOCFROMRES Function on page 187-10	Returns the ACL Document for the given resource as `XMLType`
GETAUTHOR Function on page 187-11	Given an XDBResource, returns its author
GETCHARACTERSET Function on page 187-12	Given an XDBResource, returns its character set
GETCOMMENT Function on page 187-13	Given an XDBResource, returns its comment
GETCONTENTBLOB Function on page 187-14	Returns the contents of the resource as a `BLOB`
GETCONTENTCLOB Function on page 187-15	Returns the contents of the resource as a `CLOB`
GETCONTENTREF Function on page 187-16	Returns the contents of the resource as an `XMLTypeRef`
GETCONTENTTYPE Function on page 187-17	Given an XDBResource, returns its content-type
GETCONTENTXML Function on page 187-18	Returns the contents of the resource as XML
GETCONTENTVARCHAR2 Function on page 187-19	Returns the contents of the resource as a string
GETCREATIONDATE Function on page 187-20	Given an XDBResource, returns its creation date
GETCREATOR Function on page 187-21	Given an XDBResource, returns its creator
GETCUSTOMMETADATA Function on page 187-22	Returns the requested custom metadata given the xpath and namespace to the metadata
GETDISPLAYNAME Function on page 187-23	Given an XDBResource, returns its display name
GETLANGUAGE Function on page 187-24	Given an XDBResource, returns its language
GETLASTMODIFIER Function on page 187-25	Given an XDBResource, returns its last modifier
GETMODIFICATIONDATE Function on page 187-26	Given an XDBResource, returns its modification date
GETOWNER Function on page 187-27	Given an XDBResource, returns its owner.
GETREFCOUNT Function on page 187-28	Given an XDBResource, returns its reference count
GETVERSIONID Function on page 187-29	Given an XDBResource, returns its version ID.
HASACLCHANGED Function on page 187-30	Returns `TRUE` if the ACL of the given resource has changed, `FALSE` otherwise
HASAUTHORCHANGED Function on page 187-31	Returns `TRUE` if the ACL of the given resource has changed `FALSE` otherwise

Table 187–1 (Cont.) DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
HASCHANGED Function on page 187-32	Returns TRUE if the element or attribute represented by the given XPath has changed, FALSE otherwise
HASCHARACTERSETCHANGED Function on page 187-33	Returns TRUE if the character set of the given resource has changed, FALSE otherwise
HASCOMMENTCHANGED Function on page 187-34	Returns TRUE if the comment of the given resource has changed, FALSE otherwise
HASCONTENTCHANGED Function on page 187-35	Returns TRUE if the contents of the given resource has changed, FALSE otherwise
HASCONTENTTYPECHANGED Function on page 187-36	Returns TRUE if the content-type of the given resource has changed, FALSE otherwise
HASCREATIONDATECHANGED Function on page 187-37	Returns TRUE if the creation date of the given resource has changed, FALSE otherwise
HASCREATORCHANGED Function on page 187-38	Returns TRUE if the creator of the given resource has changed, FALSE otherwise
HASCUSTOMMETADATACHANGED Function on page 187-39	Returns TRUE if custom-metadata for this XPath has changed, FALSE otherwise
HASDISPLAYNAMECHANGED Function on page 187-40	Returns TRUE if the display name of the given resource has changed, FALSE otherwise
HASLANGUAGECHANGED Function on page 187-41	Returns TRUE if the language of the given resource has changed, FALSE otherwise
HASLASTMODIFIERCHANGED Function on page 187-42	Returns TRUE if the last modifier of the given resource has changed, FALSE otherwise
HASMODIFICATIONDATECHANGED Function on page 187-43	Returns TRUE if the modification date of the given resource has changed, FALSE otherwise
HASOWNERCHANGED Function on page 187-44	Returns TRUE if the owner of the given resource has changed, FALSE otherwise
HASREFCOUNTCHANGED Function on page 187-45	Returns TRUE if the reference count of the given resource has changed, FALSE otherwise
HASVERSIONIDCHANGED Function on page 187-46	Returns TRUE if the version ID of the given resource has changed, FALSE otherwise
ISFOLDER Function on page 187-47	Returns TRUE if the given resource is a folder, FALSE otherwise
ISNULL Function on page 187-48	Returns TRUE if input resource is NULL, FALSE otherwise
MAKEDOCUMENT Function on page 187-49	Converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface
SAVE Procedure on page 187-50	Updates the resource with any modifications
SETACL Procedure on page 187-51	Sets the ACL of the given XDBResource to the path specified
SETAUTHOR Procedure on page 187-52	Sets the author of the given XDBResource to the specified string
SETCHARACTERSET Procedure on page 187-53	Sets the character set of the given XDBResource to a specified character set
SETCOMMENT Procedure on page 187-54	Sets a comment associated with the given XDBResource

Table 187–1 (Cont.) DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
SETCONTENT Procedures on page 187-55	Replaces the contents of the given resource with the given `CLOB`
SETCONTENTTYPE Procedure on page 187-56	Sets the content-type of the given XDBResource
SETCUSTOMMETADATA Procedure on page 187-57	Sets the custom metadata specified by the XPath and namespace to new data
SETDISPLAYNAME Procedure on page 187-58	Sets the display name of the given XDBResource
SETLANGUAGE Procedure on page 187-59	Sets the language of the given XDBResource
SETOWNER Procedure on page 187-60	Sets the owner of the given XDBResource

FREERESOURCE Procedure

This procedure frees any memory associated with an XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.FREERESOURCE (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 187–2 FREERESOURCE Procedure Parameters

Parameter	Description
res	XDBResource to free

GETACL Function

Given an XDBResource, this function returns its ACL as string.

Syntax

```
DBMS_XDBRESEROUCE.GETACL (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 187–3 GETACL Function Parameters

Parameter	Description
res	XDBResource

GETACLDOCFROMRES Function

This function returns the ACL Document for the given resource as `XMLType`.

Syntax

```
DBMS_XDBRESEROUCE.GETACLDOCFROMRES (
   res   IN    XDBResource)
 RETURN SYS.XMLTYPE;
```

Parameters

Table 187–4 GETACL Function Parameters

Parameter	Description
`res`	XDBResource

GETAUTHOR Function

Given an XDBResource, this function returns its author.

Syntax

```
DBMS_XDBRESEROUCE.GETAUTHOR (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 187–5 GETAUTHOR Function Parameters

Parameter	Description
res	XDBResource

GETCHARACTERSET Function

Given an XDBResource, this function returns its characterset.

Syntax

```
DBMS_XDBRESEROUCE.GETCHARACTERSET (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 187–6 GETCHARACTERSET Function Parameters

Parameter	Description
res	XDBResource

GETCOMMENT Function

Given an XDBResource, this function returns its comment.

Syntax

```
DBMS_XDBRESEROUCE.GETCOMMENT (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 187–7 GETCOMMENT Function Parameters

Parameter	Description
res	XDBResource

GETCONTENTBLOB Function

This function returns the contents of the resource as a BLOB.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTBLOB (
   res    IN     XDBResource,
   csid   OUT    PLS_INTEGER)
 RETURN BLOB;
```

Parameters

Table 187–8 GETCONTENTBLOB Function Parameters

Parameter	Description
res	XDBResource
csid	Character set ID of the BLOB returned

GETCONTENTCLOB Function

This function returns the contents of the resource as a CLOB.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTCLOB (
   res    IN    XDBResource)
 RETURN CLOB;
```

Parameters

Table 187–9 GETCONTENTCLOB Function Parameters

Parameter	Description
res	XDBResource

GETCONTENTREF Function

This function returns the contents of the resource as an `XMLTypeRef`.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTREF (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 187–10 GETCONTENTREF Function Parameters

Parameter	Description
`res`	XDBResource

GETCONTENTTYPE Function

Given an XDBResource, this function returns its content-type.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTTYPE (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 187–11 GETCONTENTTYPE Function Parameters

Parameter	Description
res	XDBResource

GETCONTENTXML Function

This function returns the contents of the resource as an `XMLTypeRef`.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTXML (
   res   IN    XDBResource)
 RETURN XMLType;
```

Parameters

Table 187–12 GETCONTENTXML Function Parameters

Parameter	Description
`res`	XDBResource

GETCONTENTVARCHAR2 Function

This function returns the contents of the resource as a string.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTVARCHAR2 (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 187–13 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
res	XDBResource

GETCREATIONDATE Function

Given an XDBResource, this function returns its creation date.

Syntax

```
DBMS_XDBRESEROUCE.GETCREATIONDATE (
   res   IN    XDBResource)
 RETURN TIMESTAMP;
```

Parameters

Table 187–14 GETCREATIONDATE Function Parameters

Parameter	Description
res	XDBResource

GETCREATOR Function

Given an XDBResource, this function returns its creator.

Syntax

```
DBMS_XDBRESEROUCE.GETCREATOR (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 187–15 GETCREATOR Function Parameters

Parameter	Description
res	XDBResource

GETCUSTOMMETADATA Function

This function returns the requested custom metadata given the xpath and namespace to the metadata.

Syntax

```
DBMS_XDBRESEROUCE.GETCUSTOMMETADATA (
   res        IN    XDBResource,
   xpath      IN    VARCHAR2,    namespace  IN    VARCHAR2)
 RETURN XMLType;
```

Parameters

Table 187–16 GETCUSTOMMETADATA Function Parameters

Parameter	Description
res	XDBResource
xpath	XPath for custom metadata
namespace	Namespace

Usage Notes

The first component of the XPath expression must be "Resource".

GETDISPLAYNAME Function

Given an XDBResource, this function returns its display name.

Syntax

```
DBMS_XDBRESEROUCE.GETDISPLAYNAME (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 187–17 GETDISPLAYNAME Function Parameters

Parameter	Description
res	XDBResource

GETLANGUAGE Function

Given an XDBResource, this function returns its language.

Syntax

```
DBMS_XDBRESEROUCE.GETLANGUAGE (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 187–18 GETLANGUAGE Function Parameters

Parameter	Description
res	XDBResource

GETLASTMODIFIER Function

Given an XDBResource, this function returns its last modifier.

Syntax

```
DBMS_XDBRESEROUCE.GETLASTMODIFIER (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 187–19 GETLASTMODIFIER Function Parameters

Parameter	Description
res	XDBResource

GETMODIFICATIONDATE Function

Given an XDBResource, this function returns its modification date.

Syntax

```
DBMS_XDBRESEROUCE.GETMODIFICATIONDATE (
   res   IN    XDBResource)
 RETURN TIMESTAMP;
```

Parameters

Table 187–20 GETMODIFICATIONDATE Function Parameters

Parameter	Description
res	XDBResource

GETOWNER Function

Given an XDBResource, this function returns its owner.

Syntax

```
DBMS_XDBRESEROUCE.GETOWNER (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 187–21 GETOWNER Function Parameters

Parameter	Description
res	XDBResource

GETREFCOUNT Function

Given an XDBResource, this function returns its reference count.

Syntax

```
DBMS_XDBRESEROUCE.GETREFCOUNT (
   res   IN    XDBResource)
 RETURN PLS_INTEGER;
```

Parameters

Table 187–22 GETREFCOUNT Function Parameters

Parameter	Description
res	XDBResource

GETVERSIONID Function

Given an XDBResource, this function returns its version ID.

Syntax

```
DBMS_XDBRESEROUCE.GETVERSIONID (
   res    IN    XDBResource)
 RETURN PLS_INTEGER;
```

Parameters

Table 187–23 GETVERSIONID Function Parameters

Parameter	Description
res	XDBResource

HASACLCHANGED Function

This function returns `TRUE` if the ACL of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASACLCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–24 GETACL Function Parameters

Parameter	Description
`res`	XDBResource

HASAUTHORCHANGED Function

This function returns TRUE if the author of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASAUTHORCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–25 HASAUTHORCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCHANGED Function

Given an XPath, this function determines whether the element or attribute represented by the XPath has changed.

Syntax

```
DBMS_XDBRESEROUCE.HASCHANGED (
   res          IN    XDBResource,
   xpath        IN    VARCHAR2,
   namespace    IN    VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 187–26 HASCHANGED Function Parameters

Parameter	Description
res	XDBResource
xpath	XPath to check
bnamespace	Namespace to use

HASCHARACTERSETCHANGED Function

This function returns TRUE if the character set of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCHARACTERSETCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–27 HASCHARACTERSETCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCOMMENTCHANGED Function

This function returns TRUE if the comment of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCOMMENTCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–28 HASCOMMENTCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCONTENTCHANGED Function

This function returns TRUE if the contents of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCONTENTCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–29 HASCONTENTCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCONTENTTYPECHANGED Function

This function returns TRUE if the content-type of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASCONTENTTYPECHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–30 HASCONTENTTYPECHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCREATIONDATECHANGED Function

This function returns TRUE if the creation date of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASCREATIONDATECHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–31 HASCREATIONDATECHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCREATORCHANGED Function

This function returns TRUE if the creator of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASCREATORCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–32 HASCREATORCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCUSTOMMETADATACHANGED Function

This function checks whether the custom-metadata for a given resource has changed.

Syntax

```
DBMS_XDBRESEROUCE.HASCUSTOMMETADATACHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–33 HASCUSTOMMETADATACHANGED Function Parameters

Parameter	Description
res	XDBResource

HASDISPLAYNAMECHANGED Function

This function returns `TRUE` if the display name of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASDISPLAYNAMECHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–34 HASDISPLAYNAMECHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASLANGUAGECHANGED Function

This function returns `TRUE` if the language of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASLANGUAGECHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–35 HASLANGUAGECHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASLASTMODIFIERCHANGED Function

This function returns TRUE if the last modifier of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASLASTMODIFIERCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–36 HASLASTMODIFIERCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASMODIFICATIONDATECHANGED Function

This function returns `TRUE` if the modification date of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASMODIFICATIONDATECHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–37 HASMODIFICATIONDATECHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASOWNERCHANGED Function

This function returns `TRUE` if the owner of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASOWNERCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–38 HASOWNERCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASREFCOUNTCHANGED Function

This function returns TRUE if the reference count of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASREFCOUNTCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–39 HASREFCOUNTCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASVERSIONIDCHANGED Function

This function returns `TRUE` if the version ID of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASVERSIONIDCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–40 HASVERSIONIDCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

ISFOLDER Function

This function returns TRUE if the given resource is a folder, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.ISFOLDER (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–41 ISFOLDER Function Parameters

Parameter	Description
res	XDBResource

ISNULL Function

This function returns `TRUE` if input resource is `NULL`.

Syntax

```
DBMS_XDBRESEROUCE.ISNULL (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 187–42 ISNULL Function Parameters

Parameter	Description
`res`	Input resource

MAKEDOCUMENT Function

This function converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface.

See Also: The DBMS_XMLDOM package

Syntax

```
DBMS_XDBRESEROUCE.MAKEDOCUMENT (
   res    IN    XDBResource)
 RETURN DBMS_XMLDOM.DOMDocument;
```

Parameters

Table 187–43 MAKEDOCUMENT Function Parameters

Parameter	Description
res	XDBResource

SAVE Procedure

This procedures updates the resource with any modifications.

Syntax

```
DBMS_XDBRESEROUCE.SAVE (
   res   IN    XDBResource);
```

Parameters

Table 187–44 SAVE Procedure Parameters

Parameter	Description
res	XDBResource

SETACL Procedure

This procedure sets the ACL of the given XDBResource to the path specified.

Syntax

```
DBMS_XDBRESEROUCE.SETACL (
   res      IN OUT  XDBResource,
   ACLPath  IN      VARCHAR2);
```

Parameters

Table 187–45 SETACL Procedure Parameters

Parameter	Description
res	XDBResource
ACLPath	Absolute path of the new ACL

SETAUTHOR Procedure

This procedure sets the author of the given XDBResource to the specified string.

Syntax

```
DBMS_XDBRESEROUCE.SETAUTHOR (
   res     IN OUT  XDBResource,
   author  IN      VARCHAR2);
```

Parameters

Table 187–46 SETAUTHOR Procedure Parameters

Parameter	Description
res	XDBResource
author	Author

SETCHARACTERSET Procedure

This procedure sets the character set of the given XDBResource to a specified character set.

Syntax

```
DBMS_XDBRESEROUCE.SETCHARACTERSET (
   res      IN OUT  XDBResource,
   charSet  IN      VARCHAR2);
```

Parameters

Table 187–47 SETCHARACTERSET Procedure Parameters

Parameter	Description
res	XDBResource
charset	New character set

SETCOMMENT Procedure

This procedure sets a comment associated with the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETCOMMENT (
   res      IN OUT  XDBResource,
   comment  IN      VARCHAR2);
```

Parameters

Table 187–48 SETCOMMENT Procedure Parameters

Parameter	Description
res	XDBResource
comment	New comment

SETCONTENT Procedures

This procedure replaces the contents of the given resource with the given datatype.

Syntax

```
DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      BFILE,
   csid     IN      NUMBER);

DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      BLOB,
   csid     IN      PLS_INTEGER);

DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      CLOB);

DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      REF SYS.XMLType,
   sticky   IN      BOOLEAN := TRUE);

DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      VARCHAR2);

DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      SYS.XMLType);
```

Parameters

Table 187–49 SETCONTENT Procedure Parameters

Parameter	Description
res	XDBResource
data	Data input as BFILE, BLOB, CLOB, string, XMLType
csid	Character set ID of the BFILE, BLOB
sticky	If TRUE creates a sticky REF, otherwise non-sticky

SETCONTENTTYPE Procedure

This procedure sets the content-type of the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETCONTENTTYPE (
   res         IN OUT  XDBResource,
   conttype    IN      VARCHAR2);
```

Parameters

Table 187–50 SETCONTENTTYPE Procedure Parameters

Parameter	Description
res	XDBResource
conttype	New content-type

SETCUSTOMMETADATA Procedure

This procedure sets the custom metadata specified by the xpath and namespace to new data.

Syntax

```
DBMS_XDBRESEROUCE.SETCUSTOMMETADATA (
   res          IN OUT  XDBResource,
   xpath        IN      VARCHAR2,
   namespace    IN      VARCHAR2,
   newMetadata  IN      XMLType);
```

Parameters

Table 187–51 SETCUSTOMMETADATA Procedure Parameters

Parameter	Description
res	XDBResource
xpath	XPath to change
namespace	Namespace to use
newMetadata	New data that should replace the metadata at the given XPath

Usage Notes

The first component of the XPath expression must be "Resource".

SETDISPLAYNAME Procedure

This procedure sets the display name of the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETDISPLAYNAME (
   res      IN OUT  XDBResource,
   name     IN      VARCHAR2);
```

Parameters

Table 187–52 SETDISPLAYNAME Procedure Parameters

Parameter	Description
res	XDBResource
name	New display name

SETLANGUAGE Procedure

This procedure sets the language of the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETLANGUAGE (
   res      IN OUT  XDBResource,
   ACLPath  IN      VARCHAR2);
```

Parameters

Table 187–53 SETLANGUAGE Procedure Parameters

Parameter	Description
res	XDBResource
ACLPath	New path

SETOWNER Procedure

This procedure sets the owner of the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETOWNER (
   res      IN OUT  XDBResource,
   owner    IN      VARCHAR2);
```

Parameters

Table 187–54 SETOWNER Procedure Parameters

Parameter	Description
res	XDBResource
owner	New owner

Usage Notes

The user must have the XDBADMIN privilege to call this subprogram.

188

DBMS_XDBT

The DBMS_XDBT package provides a convenient mechanism for administrators to set up a CONTEXT index on the Oracle XML DB hierarchy. The package contains procedures to create default preferences, create the index and set up automatic synchronization of the CONTEXT index

The DBMS_XDBT package also contains a set of package variables that describe the configuration settings for the index. These are intended to cover the basic customizations that installations may require, but is by no means a complete set.

> **See Also:** *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

Using DBMS_XDBT

Overview

The DBMS_XDBT package can be used in the following fashion:

- Customize the package to set up the appropriate configuration.
- Use the DROPPREFERENCES Procedure to drop any existing index preferences
- Create new index preferences using the CREATEPREFERENCES Procedure procedure
- Create the CONTEXT index using the CREATEINDEX Procedure procedure
- Set up automatic synchronization of the index using the CONFIGUREAUTOSYNC Procedure

Security Model

Owned by XDB, the DBMS_XDBT package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB. Subprograms in this package are executed using the privileges of the current user.

Operational Notes

The DBMS_XDBT package can be customized by using a PL/SQL procedure or an anonymous block to set the relevant package variables, configuration settings, and then execute the procedures. A more general approach would be to introduce the appropriate customizations by modifying this package in place, or as a copy. The system must be configured to use job queues, and the jobs can be viewed through the USER_JOBS catalog views. This section describes the configuration settings, or package variables, available to customize the DBMS_XDBT package.

Table 188–1 General Indexing Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
IndexName	XDB$CI	Name of the CONTEXT index.
IndexTablespace	XDB$RESINFO	Tablespace used by tables and indexes comprising the CONTEXT index.
IndexMemory	128M	Memory used by index creation and SYNC; less than or equal to the MAX_INDEX_MEMORY system parameter (see the CTX_ADMIN package).
LogFile	'XdbCtxLog'	The log file used for ROWID during indexing. The LOG_DIRECTORY system parameter must be set already. NULL turn s off ROWID logging.

Table 188–2 Filtering Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
SkipFilter_Types	image/%, audio/%, video/%, model/%	List of mime types that should not be indexed.
NullFilter_Types	text/plain, text/html, text/xml	List of mime types that do not need to use the INSO filter. Use this for text-based documents.
FilterPref	XDB$CI_FILTER	Name of the filter preference.

Table 188–3 Stoplist Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
StoplistPref	XDB$CI_STOPLIST	Name of the stoplist.
StopWords	0..9; 'a'..'z'; 'A'..'Z'	List of stopwords, in excess of CTXSYS.DEFAULT_STOPLIST.

Table 188–4 Sectioning and Section Group Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
SectionGroup	HTML_SECTION_GROUP	Default sectioner. Use PATH_SECTION_GROUP or AUTO_SECTION_GROUP if repository contains mainly XML documents.
SectiongroupPref	XDB$CI_SECTIONGROUP	Name of the section group.

Table 188–5 Other Index Preference Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
DatastorePref	XDB$CI_DATASTORE	Name of the datastore preference
StoragePref	XDB$CI_STORAGE	Name of the storage preference.
WordlistPref	XDB$CI_WORDLIST	Name of the wordlist preference.
DefaultLexerPref	XDB$CI_DEFAULT_LEXER	Name of the default lexer preference.

Table 188–6 SYNC (CONTEXT Synchronization) Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
AutoSyncPolicy	SYNC_BY_PENDING_COUNT	Indicates when the index should be SYNCed. One of SYNC_BY_PENDING_COUNT, SYNC_BY_TIME, or SYNC_BY_PENDING_COUNT_AND_TIME.
MaxPendingCount	2	Maximum number of documents in the CTX_USER_PENDING queue before an index SYNC is triggered. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.
CheckPendingCountInterval	10 minutes	How often, in minutes, the pending queue should be checked. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.
SyncInterval	60 minutes	Indicates how often, in minutes, the index should be SYNCed. Only if the AutoSyncPolicy is SYNC_BY_TIME or SYNC_BY_PENDING_COUNT_AND_TIME

Summary of DBMS_XDBT Subprograms

Table 188–7 DBMS_XDBT Package Subprograms

Subprogram	Description
CONFIGUREAUTOSYNC Procedure on page 188-8	Configures the CONTEXT index for automatic maintenance, SYNC
CREATEDATASTOREPREF Procedure on page 188-9	Creates a USER datastore preference for the CONTEXT index
CREATEFILTERPREF Procedure on page 188-10	Creates a filter preference for the CONTEXT index
CREATEINDEX Procedure on page 188-11	Creates the CONTEXT index on the XML DB hierarchy
CREATELEXERPREF Procedure on page 188-12	Creates a lexer preference for the CONTEXT index
CREATEPREFERENCES Procedure on page 188-13	Creates preferences required for the CONTEXT index on the XML DB hierarchy
CREATESECTIONGROUPPREF Procedure on page 188-14	Creates a storage preference for the CONTEXT index
CREATESTOPLISTPREF Procedure on page 188-15	Creates a section group for the CONTEXT index
CREATESTORAGEPREF Procedure on page 188-16	Creates a wordlist preference for the CONTEXT index
CREATEWORLDLISTPREF Procedure on page 188-17	Creates a stoplist for the CONTEXT index
DROPPREFERENCES Procedure on page 188-18	Drops any existing preferences

CONFIGUREAUTOSYNC Procedure

This procedure sets up jobs for automatic SYNCs of the CONTEXT index.

Syntax

```
DBMS_XDBT.CONFIGUREAUTOSYNC;
```

Usage Notes

- The system must be configured for job queues for automatic synchronization. The jobs can be viewed using the USER_JOBS catalog views
- The configuration parameter AutoSyncPolicy can be set to choose an appropriate synchronization policy.

The synchronization can be based on one of the following:

Sync Basis	Description
SYNC_BY_PENDING_COUNT	The SYNC is triggered when the number of documents in the pending queue is greater than a threshold (See the MaxPendingCount configuration setting on page 188-6). The pending queue is polled at regular intervals (See the CheckPendingCountInterval configuration parameter on page 188-6) to determine if the number of documents exceeds the threshold.
SYNC_BY_TIME	The SYNC is triggered at regular intervals. (See the SyncInterval configuration parameter on page 188-6).
SYNC_BY_PENDING_COUNT_AND_TIME	A combination of both of the preceding options.

CREATEDATASTOREPREF Procedure

This procedure creates a user datastore preference for the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEDATASTOREPREF;
```

Usage Notes

- The name of the datastore preference can be modified; see the DatastorePref configuration setting.
- The default USER datastore procedure also filters the incoming document. The DBMS_XDBT package provides a set of configuration settings that control the filtering process.
- The SkipFilter_Types array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not indexed. Some of the properties of the document metadata, such as author, remain unindexed.
  - The NullFilter_Types array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not filtered; however, they are still indexed. This is intended to be used for documents that are text-based, such as HTML, XML and plain-text.
  - All other documents use the INSO filter through the IFILTER API.

CREATEFILTERPREF Procedure

This procedure creates a `NULL` filter preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEFILTERPREF;
```

Usage Notes

- The name of the filter preference can be modified; see `FilterPref` configuration setting.
- The `USER` datastore procedure filters the incoming document; see CREATEDATASTOREPREF Procedurefor more details.

CREATEINDEX Procedure

This procedure creates the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEINDEX;
```

Usage Notes

- The name of the index can be changed; see the `IndexName` configuration setting.
- Set the `LogFile` configuration parameter to enable `ROWID` logging during index creation.
- Set the `IndexMemory` configuration parameter to determine the amount of memory that index creation, and later SYNCs, will use.

CREATELEXERPREF Procedure

This procedure creates a BASIC `lexer` preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATELEXERPREF;
```

Usage Notes

- The name of the `lexer` preference can be modified; see `LexerPref` configuration setting. No other configuration settings are provided.
- `MultiLexer` preferences are not supported.
- Base letter translation is turned on by default.

CREATEPREFERENCES Procedure

This procedure creates a set of default preferences based on the configuration settings.

Syntax

```
DBMS_XDBT.CREATEPREFERENCES;
```

CREATESECTIONGROUPPREF Procedure

This procedure creates a section group for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESECTIONGROUPPREF;
```

Usage Notes

- The name of the section group can be changed; see the `SectiongroupPref` configuration setting.
- The HTML sectioner is used by default. No zone sections are created by default. If the vast majority of documents are XML, consider using the `AUTO_SECTION_GROUP` or the `PATH_SECTION_GROUP`; see the `SectionGroup` configuration setting.

CREATESTOPLISTPREF Procedure

This procedure creates a stoplist for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESTOPLISTPREF;
```

Usage Notes

- The name of the stoplist can be modified; see the `StoplistPref` configuration setting.
- Numbers are not indexed.
- The `StopWords` array is a configurable list of stopwords. These are meant to be stopwords in addition to the set of stopwords in `CTXSYS.DEFAULT_STOPLIST`.

CREATESTORAGEPREF Procedure

This procedure creates a `BASIC_STORAGE` preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESTORAGEPREF;
```

Usage Notes

- The name of the storage preference can be modified; see the `StoragePref` configuration setting.
- A tablespace can be specified for the tables and indexes comprising the `CONTEXT` index; see the `IndexTablespace` configuration setting.
- Prefix and Substring indexing are not turned on by default.
- The `I_INDEX_CLAUSE` uses key compression.

CREATEWORLDLISTPREF Procedure

This procedure creates a word list preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEWORDLISTPREF;
```

Usage Notes

- The name of the word list preference can be modified; see the `WordlistPref` configuration setting. No other configuration settings are provided.
- `FUZZY_MATCH` and `STEMMER` attributes are set to `AUTO` (auto-language detection)

DROPPREFERENCES Procedure

This procedure drops any previously created preferences for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.DROPPREFERENCES;
```

189

DBMS_XDBZ

The DBMS_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

> **See Also:** *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

Using DBMS_XDBZ

This section contains topics which relate to using the `DBMS_XDBZ` package.

Security Model

Owned by XDB, the DBMS_XDBZ package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Constants

The DBMS_XDBZ package uses the constants shown in following tables.

Table 189–1 DBMS_XDBZ Constants - Name Format

Constant	Type	Value	Description
NAME_FORMAT_SHORT	PLS_INTEGER	1	DB user name or LDAP nickname
NAME_FORMAT_DISTINGUISHED	PLS_INTEGER	2	LDAP distinguished name

Table 189–2 DBMS_XDBZ Constants - Enable Option

Constant	Type	Value	Description
ENABLE_CONTENTS	PLS_INTEGER	1	Enables hierarchy for contents and is used by users when calling the ENABLE_HIERARCHY Procedure
ENABLE_RESMETADATA	PLS_INTEGER	2	Enables hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources

Table 189–3 DBMS_XDBZ Constants - Enable Option Exercised

Constant	Type	Value	Description
IS_ENABLED_CONTENTS	PLS_INTEGER	1	If hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_CONTENTS
IS_ENABLED_RESMETADATA	PLS_INTEGER	2	If hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_RESMETADATA

Summary of DBMS_XDBZ Subprograms

Table 189–4 DBMS_XDBZ Package Subprograms

Method	Description
DISABLE_HIERARCHY Procedure on page 189-7	Disables repository support for the specified `XMLTYPE` table or view
ENABLE_HIERARCHY Procedure on page 189-8	Enables repository support for the specified `XMLType` table or view
GET_ACLOID Function on page 189-9	Retrieves the ACL Object ID for the specified resource
GET_USERID Function on page 189-10	Retrieves the user ID for the specified user
IS_HIERARCHY_ENABLED Function on page 189-11	Determines if repository support for the specified `XMLType` table or view is enabled
PURGELDAPCACHE Function on page 189-12	Purges the LDAP nickname cache

CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

Syntax

```
DBMS_XDBZ.CREATENONCEKEY;
```

DISABLE_HIERARCHY Procedure

This procedure disables repository support for a particular XMLType table or view.

Syntax

```
DBMS_XDBZ.DISABLE_HIERARCHY(
   object_schema IN VARCHAR2,
   object_name   IN VARCHAR2);
```

Parameters

Table 189–5 DISABLE_HIERARCHY Procedure Parameters

Parameter	Description
object_schema	Schema name of the XMLType table or view
object_name	Name of the XMLType table or view

ENABLE_HIERARCHY Procedure

This procedure enables repository support for a particular XMLType table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

> **See Also:** *Oracle XML DB Developer's Guide* for more information about

Syntax

```
DBMS_XDBZ.ENABLE_HIERARCHY(
   object_schema   IN   VARCHAR2,
   object_name     IN   VARCHAR2,
   hierarchy_type  IN   PLS_INTEGER := DBMS_XDBZ.ENABLE_CONTENTS);
```

Parameters

Table 189–6 ENABLE_HIERARCHY Procedure Parameters

Parameter	Description
object_schema	Schema name of the XMLType table or view
object_name	Name of the XMLType table or view
hierarchy_type	How to enable the hierarchy. ■ ENABLE_CONTENTS - enable hierarchy for contents, that is, this table will store contents of resources in the repository ■ ENABLE_RESMETADATA - enable hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources If this subprogram is called on a table, another call will have no effect. Note that you cannot enable hierarchy for both contents and resource metadata.

GET_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

Syntax

```
DBMS_XDBZ.GET_ACLOID(
   aclpath   IN   VARCHAR2,
   acloid    OUT  RAW)
 RETURN BOOLEAN;
```

Parameters

Table 189–7 GET_ACLOID Function Parameters

Parameter	Description
aclpath	ACL resource path for the repository
acloid	Returned Object ID

Return Values

Returns TRUE if successful.

GET_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the `USERID` is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the `USERID` is returned in 4-byte database format.

Syntax

```
DBMS_XDBZ.GET_USERID(
   username IN  VARCHAR2,
   userid   OUT RAW,
   format   IN  BINARY_INTEGER := NAME_FORMAT_SHORT)
 RETURN BOOLEAN;
```

Parameters

Table 189–8 GET_USERID Function Parameters

Parameter	Description
`username`	Name of the database or LDAP user.
`userid`	Return parameter for the matching user id.
`format`	Format of the specified user name; valid options are: ■ `DBMS_XDBZ.NAME_FORMAT_SHORT` (default) -- DB user name or LDAP nickname ■ `DBMS_XDBZ.NAME_FORMAT_DISTINGUISHIED` -- LDAP distinguished name.

Return Values

Returns `TRUE` if successful.

IS_HIERARCHY_ENABLED Function

This function determines if repository support for the specified XMLType table or view is enabled.

Syntax

```
DBMS_XDBZ.IS_HIERARCHY_ENABLED(
   object_schema    IN  VARCHAR2,
   object_name      IN  VARCHAR2,
   hierarchy_type   IN  PLS_INTEGER := IS_ENABLED_CONTENTS)
 RETURN BOOLEAN;
```

Parameters

Table 189–9 IS_HIERARCHY_ENABLED Function Parameters

Parameter	Description
object_schema	Schema name of the XMLType table or view
object_name	Name of the XMLType table or view
hierarchy_type	Type of hierarchy to check for: ■ IS_ENABLED_CONTENTS - if hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_CONTENTS ■ IS_ENABLED_RESMETADATA - if hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_RESMETADATA

Return Values

Returns TRUE if the given XMLTYPE table or view has the XDB Hierarchy enabled with the specified type.

PURGELDAPCACHE Function

This function purges the LDAP nickname cache. Returns `TRUE` if successful.

Syntax

```
DBMS_XDBZ.PURGELDAPCACHE
 RETURN BOOLEAN;
```

190

DBMS_XEVENT

The DBMS_XEVENTpackage provides event-related types and supporting subprograms.

> **See Also:** *Oracle XML DB Developer's Guide* for more information about "Oracle XML DB Repository Events"

This chapter contains the following topics:

Using DBMS_XEVENT

Security Model

Owned by XDB, the DBMS_XEVENT package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Constants

The DBMS_XEVENT package uses the constants shown in Table 190–1:

Table 190–1 DBMS_XEVENT Constants

Name	Type	Value	Description
RENDER_EVENT	PLS_INTEGER	1	
PRE_CREATE_EVENT	PLS_INTEGER	2	
POST_CREATE_EVENT	PLS_INTEGER	3	
PRE_DELETE_EVENT	PLS_INTEGER	4	
POST_DELETE_EVENT	PLS_INTEGER	5	
PRE_UPDATE_EVENT	PLS_INTEGER	6	
POST_UPDATE_EVENT	PLS_INTEGER	7	
PRE_LOCK_EVENT	PLS_INTEGER	8	
POST_LOCK_EVENT	PLS_INTEGER	9	
PRE_UNLOCK_EVENT	PLS_INTEGER	10	
POST_UNLOCK_EVENT	PLS_INTEGER	11	
PRE_LINKIN_EVENT	PLS_INTEGER	12	
POST_LINKIN_EVENT	PLS_INTEGER	13	
PRE_LINKTO_EVENT	PLS_INTEGER	14	
POST_LINKTO_EVENT	PLS_INTEGER	15	
PRE_UNLINKIN_EVENT	PLS_INTEGER	16	
POST_UNLINKIN_EVENT	PLS_INTEGER	17	
PRE_UNLINKFROM_EVENT	PLS_INTEGER	18	
POST_UNLINKFROM_EVENT	PLS_INTEGER	19	
PRE_CHECKIN_EVENT	PLS_INTEGER	20	
POST_CHECKIN_EVENT	PLS_INTEGER	21	
PRE_CHECKOUT_EVENT	PLS_INTEGER	22	
POST_CHECKOUT_EVENT	PLS_INTEGER	23	
PRE_UNCHECKOUT_EVENT	PLS_INTEGER	24	
POST_UNCHECKOUT_EVENT	PLS_INTEGER	25	
PRE_VERSIONCONTROL_EVENT	PLS_INTEGER	26	
POST_VERSIONCONTROL_EVENT	PLS_INTEGER	27	
PRE_OPEN_EVENT	PLS_INTEGER	28	
POST_OPEN_EVENT	PLS_INTEGER	29	
PRE_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	30	
POST_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	21	
POST_CHECKIN_EVENT	PLS_INTEGER	21	

Subprogram Groups

XDBEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBEvent type.

Table 190–2 XDBEvent Subprograms

Subprogram	Description
GETCURRENTUSER Function on page 190-18	Returns the name of the user executing the operation that triggers the event
GETEVENT Function on page 190-19	Returns a value identifying the triggering event
ISNULL Functions on page 190-46	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

XDBRepositoryEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBRepositoryEvent type.

Table 190–3 XDBRepositoryEvent Subprograms

Subprogram	Description
GETAPPLICATIONDATA Function on page 190-16	Returns the `<applicationData>` element extracted from the resource configuration that defines the invoking handler
GETHANDLERLIST Function on page 190-21	Returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler
GETINTERFACE Function on page 190-22	Returns the top-level interface used to initiate the operation that triggered the event
GETLINK Function on page 190-24	Returns an `XDBLink` object for the target resource
GETLOCK Function on page 190-26	Returns the lock object corresponding to the current operation
GETOLDRESOURCE Function on page 190-30	Returns the original `XDBResource` object before the operation was executed
GETOPENACCESSMODE Function on page 190-31	Returns the access mode for the open operation
GETOPENDENYMODE Function on page 190-32	Returns the deny mode for the open operation
GETOUTPUTSTREAM Function on page 190-33	Returns the output BLOB in which the handler can write the rendered data
GETPARAMETER Function on page 190-34	Returns the value of a request or session-specific parameter
GETPARENT Function on page 190-35	Returns the resource object corresponding to a parent folder of the target resource
GETPATH Function on page 190-39	Returns the `XDBPath` object representing the path of the resource for which the event was fired
GETRESOURCE Function on page 190-40	Returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource
GETUPDATEBYTECOUNT Function on page 190-43	If the current operation is a byte-range write, returns the byte count
GETUPDATEBYTEOFFSET Function on page 190-44	If the current operation is a byte-range write, function returns the byte offset at which the range begins
GETXDBEVENT Function on page 190-45	Converts an `XDBRepositoryEvent` object to an `XDBEvent` type
ISNULL Functions on page 190-46	Returns `TRUE` if input argument is `NULL`
SETRENDERPATH Procedure on page 190-49	Specifies the path of the resource that contains the rendered contents
SETRENDERSTREAM Procedure on page 190-50	sets the `BLOB` from which the rendered contents can be read

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

XDBHandlerList Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandlerList type.

Table 190–4 XDBHandlerList Subprograms

Subprogram	Description
CLEAR Procedure on page 190-15	Clears the handler list
GETFIRST Function on page 190-20	Returns the first handler in the list
GETNAME Function on page 190-28	Returns the next handler in the list
ISNULL Functions on page 190-46	Returns `TRUE` if input argument is `NULL`
REMOVE Procedure on page 190-48	Removes the specified handler from the handler list

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

XDBHandler Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandler type.

Table 190–5 XDBHandler Type Subprograms

Subprogram	Description
GETLANGUAGE Function on page 190-23	Returns the implementation language of the handler
GETSCHEMA Function on page 190-41	Returns the schema of the handler's source
GETSOURCE Function on page 190-42	Returns the name of the Java class, PL/SQL package or object type implementing the handler
ISNULL Functions on page 190-46	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

XDBPath Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBPath type.

Table 190–6 XDBPath Type Subprograms

Subprogram	Description
GETNAME Function on page 190-28	Returns the string representation of the path
GETPARENTPATH Function on page 190-38	Returns the parent's path
ISNULL Functions on page 190-46	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

XDBLink Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBLink type.

Table 190–7 XDBLink Type Subprograms

Subprogram	Description
GETCHILDOID Function on page 190-17	Returns the OID of the resource to which the link is pointing
GETPARENTNAME Function on page 190-36	Returns the link's parent folder's name
GETPARENTOID Function on page 190-37	Returns the link's parent folder's OID
ISNULL Functions on page 190-46	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

Summary of DBMS_XEVENT Subprograms

Table 190–8 DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
CLEAR Procedure on page 190-15	Clears the handler list	XDBHandlerList Type Subprograms on page 190-8
GETAPPLICATIONDATA Function on page 190-16	Returns the `<applicationData>` element extracted from the resource configuration that defines the invoking handler	XDBRepositoryEvent Type Subprograms on page 190-7
GETCHILDOID Function on page 190-17	Returns the OID of the resource to which the link is pointing	XDBLink Type Subprograms on page 190-11
GETCURRENTUSER Function on page 190-18	Returns the name of the user executing the operation that triggers the event	XDBEvent Type Subprograms on page 190-6
GETEVENT Function on page 190-19	Returns a value identifying the triggering event	XDBEvent Type Subprograms on page 190-6
GETFIRST Function on page 190-20	Returns the first handler in the list	XDBHandlerList Type Subprograms on page 190-8
GETHANDLERLIST Function on page 190-21	Returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler	XDBRepositoryEvent Type Subprograms on page 190-7
GETINTERFACE Function on page 190-22	Returns the top-level interface used to initiate the operation that triggered the event	XDBRepositoryEvent Type Subprograms on page 190-7
GETLANGUAGE Function on page 190-23	Returns the implementation language of the handler	XDBHandler Type Subprograms on page 190-9
GETLINK Function on page 190-24	Returns an `XDBLink` object for the target resource	XDBRepositoryEvent Type Subprograms on page 190-7
GETLOCK Function on page 190-26	Returns the lock object corresponding to the current operation	XDBRepositoryEvent Type Subprograms on page 190-6
GETNAME Function on page 190-28	Returns the string representation of the path	XDBPath Type Subprograms on page 190-10
GETNAME Function on page 190-28	Returns the next handler in the list	XDBHandlerList Type Subprograms on page 190-8
GETOLDRESOURCE Function on page 190-30	Returns the original `XDBResource` object before the operation was executed	XDBRepositoryEvent Type Subprograms on page 190-6
GETOPENACCESSMODE Function on page 190-31	Returns the access mode for the open operation	XDBRepositoryEvent Type Subprograms on page 190-6

Table 190–8 (Cont.) DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
GETOPENDENYMODE Function on page 190-32	Returns the deny mode for the open operation	XDBRepositoryEvent Type Subprograms on page 190-6
GETOUTPUTSTREAM Function on page 190-33	Returns the output BLOB in which the handler can write the rendered data	XDBRepositoryEvent Type Subprograms on page 190-6
GETPARAMETER Function on page 190-34	Returns the value of a request or session-specific parameter	XDBRepositoryEvent Type Subprograms on page 190-6
GETPARENT Function on page 190-35	Returns the resource object corresponding to a parent folder of the target resource	XDBRepositoryEvent Type Subprograms on page 190-6
GETPARENTNAME Function on page 190-36	Returns the link's parent folder's name	XDBLink Type Subprograms on page 190-11
GETPARENTOID Function on page 190-37	Returns the link's parent folder's OID	XDBLink Type Subprograms on page 190-11
GETPARENTNAME Function on page 190-36	Returns the parent's path	XDBPath Type Subprograms on page 190-10
GETPATH Function on page 190-39	Returns the `XDBPath` object representing the path of the resource for which the event was fired	XDBRepositoryEvent Type Subprograms on page 190-6
GETRESOURCE Function on page 190-40	Returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource	XDBRepositoryEvent Type Subprograms on page 190-6
GETSCHEMA Function on page 190-41	Returns the schema of the handler's source	XDBHandler Type Subprograms on page 190-9
GETSOURCE Function on page 190-42	Returns the name of the Java class, PL/SQL package or object type implementing the handler	XDBHandler Type Subprograms on page 190-9
GETUPDATEBYTECOUNT Function on page 190-43	If the current operation is a byte-range write, returns the byte count	XDBRepositoryEvent Type Subprograms on page 190-6
GETUPDATEBYTEOFFSET Function on page 190-44	If the current operation is a byte-range write, function returns the byte offset at which the range begins	XDBRepositoryEvent Type Subprograms on page 190-6
GETXDBEVENT Function on page 190-45	Converts an `XDBRepositoryEvent` object to an `XDBEvent` type	XDBRepositoryEvent Type Subprograms on page 190-6

Table 190–8 (Cont.) DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
ISNULL Functions on page 190-46	Returns `TRUE` if input argument is `NULL`	XDBEvent Type Subprograms on page 190-6 XDBRepositoryEvent Type Subprograms on page 190-7 XDBHandlerList Type Subprograms on page 190-8 XDBHandler Type Subprograms on page 190-9 XDBPath Type Subprograms on page 190-10
REMOVE Procedure on page 190-48	Removes the specified handler from the handler list	XDBHandlerList Type Subprograms on page 190-8
SETRENDERPATH Procedure on page 190-49	Specifies the path of the resource that contains the rendered contents	XDBRepositoryEvent Type Subprograms on page 190-6
SETRENDERSTREAM Procedure on page 190-50	sets the `BLOB` from which the rendered contents can be read	XDBRepositoryEvent Type Subprograms on page 190-6

CLEAR Procedure

this procedure clears the handler list.

> **See Also:** XDBHandlerList Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.CLEAR (
    hl       IN OUT   XDBHandlerList);
```

Parameters

Table 190–9 CLEAR Procedure Parameters

Parameter	Description
hl	Handler list

GETAPPLICATIONDATA Function

This function returns the <applicationData> element extracted from the resource configuration that defines the invoking handler.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETAPPLICATIONDATA (
    ev   IN   XDBRepositoryEvent)
  RETURN XMLType;
```

Parameters

Table 190–10 GETAPPLICATIONDATA Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETCHILDOID Function

This function returns the OID of the resource to which the link is pointing.

> **See Also:** XDBLink Type Subprograms on page 190-11 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCHILDOID (
    link   IN   XDBLink)
  RETURN RAW;
```

Parameters

Table 190–11 GETCHILDOID Function Parameters

Parameter	Description
link	Link

GETCURRENTUSER Function

This function returns the name of the user executing the operation that triggers the event.

> **See Also:** XDBEvent Type Subprograms on page 190-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCURRENTUSER (
    ev   IN   XDBEvent)
  RETURN VARCHAR2;
```

Parameters

Table 190–12 GETCURRENTUSER Function Parameters

Parameter	Description
ev	Event of XDBEvent type

GETEVENT Function

This function returns the name of the user executing the operation that triggers the event.

> **See Also:** XDBEvent Type Subprograms on page 190-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETEVENT (
    ev   IN   XDBEvent)
  RETURN XDBEventID;
```

Parameters

Table 190–13 GETEVENT Function Parameters

Parameter	Description
ev	Event of XDBEvent type

GETFIRST Function

This function returns the first handler in the list.

> **See Also:** XDBHandlerList Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETFIRST (
    hl   IN   XDBHandlerList)
  RETURN XDBHandler;
```

Parameters

Table 190–14 GETFIRST Function Parameters

Parameter	Description
hl	Handler list

GETHANDLERLIST Function

This function returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler. The current handler can then filter out some of the subsequent handlers if necessary, subject to security checks. An insufficient privilege exception is raised if the executing user does not have the required access privilege to any of the resource configuration associating with a handler in the list.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETHANDLERLIST (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBHandlerList;
```

Parameters

Table 190–15 GETHANDLERLIST Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETINTERFACE Function

This function returns the top-level interface used to initiate the operation that triggered the event. This could be HTTP, FTP or SQL.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETINTERFACE (
    ev   IN   XDBRepositoryEvent)
  RETURN VARCHAR2;
```

Parameters

Table 190–16 GETINTERFACE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETLANGUAGE Function

This function returns the implementation language of the handler.

> **See Also:** XDBHandler Type Subprograms on page 190-9 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 190–17 GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

GETLINK Function

This function returns an `XDBLink` object for the target resource. For a link* or unlink* event, this will be the link involved in the operation. For other events, an error is returned. Using this object the handler can access link properties, such as, `ParentName`, `ParentOID`, `ChildOID` and `LinkName`.

See Also: XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINK (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBLink;
```

Parameters

Table 190–18 GETLINK Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETLINKNAME Function

This function returns the name of the link.

> **See Also:** XDBLink Type Subprograms on page 190-11 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINKNAME (
    link   IN   XDBLink)
  RETURN VARCHAR2;
```

Parameters

Table 190–19 GETLINKNAME Function Parameters

Parameter	Description
link	Link

GETLOCK Function

This function returns the lock object corresponding to the current operation.I t is only valid for lock and unlock events.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLOCK  (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBLock;
```

Parameters

Table 190–20 GETLOCK Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETLANGUAGE Function

This function returns the implementation language of the handler.

> **See Also:** XDBHandler Type Subprograms on page 190-9 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 190–21 GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

GETNAME Function

This function returns the string representation of the path.

> **See Also:** XDBPath Type Subprograms on page 190-10 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNAME (
    path   IN   XDBPath)
  RETURN VARCHAR2;
```

Parameters

Table 190–22 GETNAME Function Parameters

Parameter	Description
path	Path

GETNEXT Function

This function returns the next handler in the list.

> **See Also:** XDBHandlerList Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNEXT (
    hl   IN   XDBHandlerList)
  RETURN XDBHandler;
```

Parameters

Table 190–23 GETNEXT Function Parameters

Parameter	Description
hl	Handler list

GETOLDRESOURCE Function

This function returns the original `XDBResource` object before the operation was executed. This method applies only to update event. For other events, an error is returned. This is a read-only object, and consequently none of the modifier methods will work on this object.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOLDRESOURCE (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBResource;
```

Parameters

Table 190–24 GETOLDRESOURCE Function Parameters

Parameter	Description
`ev`	Event of XDBRepositoryEvent type

GETOPENACCESSMODE Function

This function returns the access mode for the open operation.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENACCESSMODE (
    ev   IN   XDBRepositoryEvent)
  RETURN PLS_INTEGER;
```

Parameters

Table 190–25 GETOPENACCESSMODE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- `XDBRepositoryEvent.OPEN_ACCESS_READ` (value 1)
- `XDBRepositoryEvent.OPEN_ACCESS_WRITE` (value 2)
- `XDBRepositoryEvent.OPEN_ACCESS_READ_WRITE` (value 3)

GETOPENDENYMODE Function

This function returns the deny mode for the open operation. It is only valid for the open event.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENDENYMODE (
    ev   IN   XDBRepositoryEvent)
  RETURN PLS_INTEGER;
```

Parameters

Table 190–26 GETOPENDENYMODE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- XDBRepositoryEvent.OPEN_DENY_NONE (value 0)
- XDBRepositoryEvent.OPEN_DENY_READ (value 1)
- XDBRepositoryEvent.OPEN_DENY_READ_WRITE (value 2)

GETOUTPUTSTREAM Function

This function returns the output BLOB in which the handler can write the rendered data. It is only valid for the render event.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOUTPUTSTREAM (
    ev   IN   XDBRepositoryEvent)
  RETURN BLOB;
```

Parameters

Table 190–27 GETOUTPUTSTREAM Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETPARAMETER Function

This function returns the value of a request or session-specific parameter. The definition of the `key` parameter can be found in RFC 2616 (HTTP/1.1). They will be mapped to equivalent SQL session parameters (if any).

> **See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARAMETER (
    ev   IN   XDBRepositoryEvent,
    key  IN   VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 190–28 GETPARAMETER Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type
key	Supported parameters: ■ ACCEPT ■ ACCEPT-LANGUAGE ■ ACCEPT-CHARSET ■ ACCEPT_ENCODING

GETPARENT Function

This function returns the resource object corresponding to a parent folder of the target resource. Note that this could be any folder that contains a link to the target resource. This is a read-only object, and consequently none of the modifier methods will work on this object. For a link* or unlink* event, this method returns the link's parent folder.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENT (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBResource;
```

Parameters

Table 190–29 GETPARENT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETPARENTNAME Function

This function returns the link's parent folder's name.

> **See Also:** XDBLink Type Subprograms on page 190-11 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTNAME (
    link   IN   XDBLink)
  RETURN VARCHAR2;
```

Parameters

Table 190–30 GETPARENTNAME Function Parameters

Parameter	Description
link	Link

GETPARENTOID Function

This function returns the link's parent folder's OID.

> **See Also:** XDBLink Type Subprograms on page 190-11 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTOID (
    link   IN   XDBLink)
  RETURN RAW;
```

Parameters

Table 190–31 GETPARENTOID Function Parameters

Parameter	Description
link	Link

GETPARENTPATH Function

This function returns the parent's path. The level indicates the number of levels up the hierarchy. This value must be greater than zero. Level 1 means the immediate parent. If level exceeds the height of the tree then a `NULL` is returned.

> **See Also:** XDBPath Type Subprograms on page 190-10 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTPATH (
    path   IN   XDBPath,
   level   IN   INTEGER)
  RETURN XDBPath;
```

Parameters

Table 190–32 GETPARENTPATH Function Parameters

Parameter	Description
`path`	Path
`level`	Number of levels up the hierarchy

GETPATH Function

This function returns the `XDBPath` object representing the path of the resource for which the event was fired. From this object, functions are provided to get the different path segments.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPATH (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBPath;
```

Parameters

Table 190–33 GETPATH Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETRESOURCE Function

This function returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource. This object reflects any changes made by previous handlers to the resource.

The modifier methods will work only in the pre-create and pre-update event handlers. For a link* or unlink* event, this method returns the resource that the link is pointing to. For a create event, this method returns the resource that is being created.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETRESOURCE (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBResource;
```

Parameters

Table 190–34 GETRESOURCE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETSCHEMA Function

This function returns the schema of the handler's source.

> **See Also:** XDBHandler Type Subprograms on page 190-9 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSCHEMA (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 190–35 GETSCHEMA Function Parameters

Parameter	Description
handler	Handler

GETSOURCE Function

This function returns the name of the Java class, PL/SQL package or object type implementing the handler.

> **See Also:** XDBHandler Type Subprograms on page 190-9 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSOURCE (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 190–36 GETSOURCE Function Parameters

Parameter	Description
handler	Handler

GETUPDATEBYTECOUNT Function

If the current operation is a byte-range write, the function returns the byte count. It is only valid for the inconsistent-update event.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTECOUNT (
    ev   IN   XDBRepositoryEvent)
  RETURN NUMBER;
```

Parameters

Table 190–37 GETUPDATEBYTECOUNT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETUPDATEBYTEOFFSET Function

If the current operation is a byte-range write, function returns the byte offset at which the range begins. It is only valid for the inconsistent-update event.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTEOFFSET (
    ev   IN   XDBRepositoryEvent)
  RETURN NUMBER;
```

Parameters

Table 190–38 GETUPDATEBYTEOFFSET Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETXDBEVENT Function

This function converts an `XDBRepositoryEvent` object to an `XDBEvent` type.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETXDBETEVENT (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBEvent;
```

Parameters

Table 190–39 GETXDBEVENT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

ISNULL Functions

This function returns `TRUE` if input argument is `NULL`.

See Also:

- XDBEvent Type Subprograms on page 190-6 for other subprograms in this group
- XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group
- XDBHandlerList Type Subprograms on page 190-8 for other subprograms in this group
- XDBHandler Type Subprograms on page 190-9 for other subprograms in this group
- XDBPath Type Subprograms on page 190-10 for other subprograms in this group
- XDBLink Type Subprograms on page 190-11 for other subprograms in this group

Syntax

```
DBMS_XEVENT.ISNULL (
    ev          IN   XDBEvent)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    ev          IN   XDBRepositoryEvent)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    hl          IN   XDBHandlerList)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    handler     IN   XDBHandler)
  RETURN BOOLEAN;
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    path        IN   XDBPath)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    link        IN   XDBLink)
  RETURN BOOLEAN;
```

Parameters

Table 190–40 ISNULL Function Parameters

Parameter	Description
`ev`	Event of specified type
`hl`	Handler list
`handler`	Handler

Table 190–40 (Cont.) ISNULL Function Parameters

Parameter	Description
path	Path

REMOVE Procedure

This procedure removes the specified handler from the handler list.

> **See Also:** XDBHandlerList Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.REMOVE (
    hl       IN OUT   XDBHandlerList,
    handler  IN       XDBHandler);
```

Parameters

Table 190–41 REMOVE Procedure Parameters

Parameter	Description
hl	Handler list
handler	Handler

SETRENDERPATH Procedure

This procedure specifies the path of the resource that contains the rendered contents. This should not be called after the stream returned by GETOUTPUTSTREAM Function is written to or after the SETRENDERSTREAM Procedure is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERPATH (
    ev     IN   XDBRepositoryEvent,
    path   IN   VARCHAR2);
```

Parameters

Table 190–42 SETRENDERPATH Procedure Parameters

Parameter	Description
ev	XDB Repository Event object
path	Path of the resource containing the rendered contents

SETRENDERSTREAM Procedure

This procedure sets the BLOB from which the rendered contents can be read. This should not be called after the stream returned by GETOUTPUTSTREAM is written to or after SETRENDERPATH is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERSTREAM (
    ev    IN   XDBRepositoryEvent,
    istr  IN   BLOB);
```

Parameters

Table 190–43 SETRENDERSTREAM Procedure Parameters

Parameter	Description
ev	XDBRepositoryEvent object
istr	Input stream from which to get the rendered contents

191

DBMS_XMLDOM

The DBMS_XMLDOM package is used to access XMLType objects, and implements the Document Object Model (DOM), an application programming interface for HTML and XML documents.

> **See Also:** *Oracle XML Developer's Kit Programmer's Guide*

This chapter contains the following topics:

Using DBMS_XMLDOM

Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated. In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally be seen as "data"; nevertheless, XML presents this data as documents, and the `DBMS_XMLDOM` package allows you access to both schema-based and non schema-based documents.

Note:

- Before database startup, the read-from and write-to directories in the `init.ORA` file must be specified; for example: `UTL_FILE_DIR=/mypath/insidemypath`.
- Read-from and write-to files must be on the server file system.

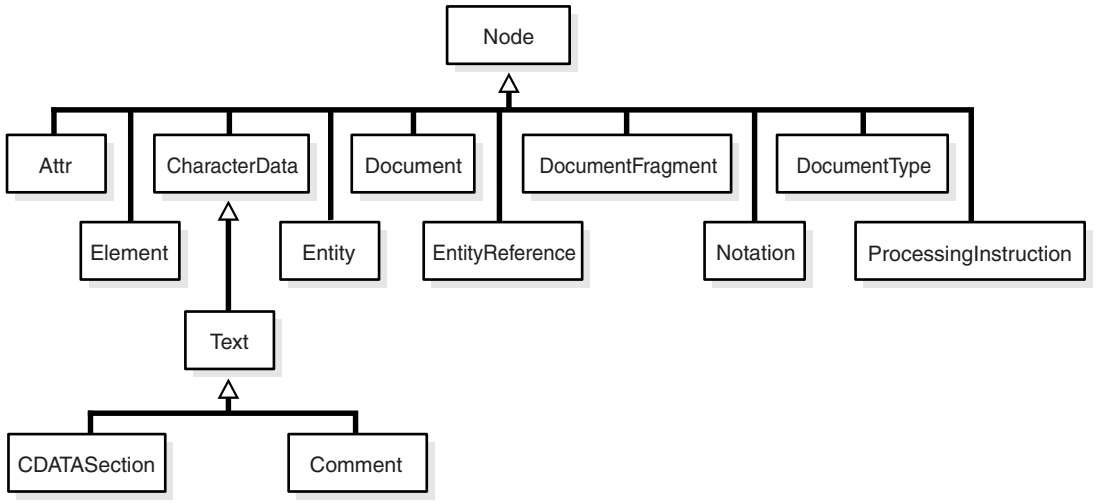
With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.

One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:

- Various DOM interfaces such as `Node`, `Element`, and others have equivalent PL/SQL types `DOMNode`, `DOMElement`, respectively.
- Various `DOMException` codes such as `WRONG_DOCUMENT_ERR`, `HIERARCHY_REQUEST_ERR`, and others, have similarly named PL/SQL exceptions.
- Various DOM Node type codes such as `ELEMENT_NODE`, `ATTRIBUTE_NODE`, and others, have similarly named PL/SQL constants.
- Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform APPENDCHILD Function on a `DOMNode n`, the APPENDCHILD FunctionPL/SQL function on page 191-42 is provided.
- To perform `setAttribute` on a `DOMElement elem`SETATTRIBUTE Procedures, use PL/SQL procedure on page 191-142.

DOM defines an inheritance hierarchy. For example, `Document`, `Element`, and `Attr` are defined to be subtypes of `Node` (see Figure 191–1). Thus, a method defined in the `Node` interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the `MAKENODE` function. Calling `MAKENODE` on various DOM types converts these types into a `DOMNode`. The appropriate functions or procedures that accept `DOMNodes` can then be called to operate on these types. If, subsequently, type specific functionality is desired, the `DOMNode` can be converted back into the original type by the `make`*`XXX`* functions, where `DOM`*`XXX`* is the desired DOM type.

Figure 191–1 Inheritance Diagram for DOM Types



The implementation of this interface follows the REC-DOM-Level-1-19981001.

Security Model

Owned by XDB, the DBMS_XMLDOM package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Constants

Defined constants of DBMS_XMLDOM are listed in Table 191–1.

Table 191–1 Defined Constants for DBMS_XMLDOM

Constant	Type	Value	Description
ELEMENT_NODE	PLS_INTEGER	1	The Node is an Element.
ATTRIBUTE_NODE	PLS_INTEGER	2	The Node is an Attribute.
TEXT_NODE	PLS_INTEGER	3	The Node is a Text node.
CDATA_SECTION_NODE	PLS_INTEGER	4	The Node is a CDataSection.
ENTITY_REFERENCE_NODE	PLS_INTEGER	5	The Node is an Entity Reference.
ENTITY_NODE	PLS_INTEGER	6	The Node is an Entity.
PROCESSING_INSTRUCTION_NODE	PLS_INTEGER	7	The Node is a Processing Instruction.
COMMENT_NODE	PLS_INTEGER	8	The Node is a Comment.
DOCUMENT_NODE	PLS_INTEGER	9	The Node is a Document.
DOCUMENT_TYPE_NODE	PLS_INTEGER	10	The Node is a Document Type Definition.
DOCUMENT_FRAGMENT_NODE	PLS_INTEGER	11	The Node is a Document fragment.
NOTATION_NODE	PLS_INTEGER	12	The Node is a Notation.

Types

The following types for DBMS_XMLDOM.DOMTYPE are defined in Table 191–2:

Table 191–2 XDB_XMLDOM Types

Type	Description
DOMATTR	Implements the DOM Attribute interface.
DOMCDATASECTION	Implements the DOM CDataSection interface.
DOMCHARACTERDATA	Implements the DOM Character Data interface.
DOMCOMMENT	Implements the DOM Comment interface.
DOMDOCUMENT	Implements the DOM Document interface.
DOMDOCUMENTFRAGMENT	Implements the DOM DocumentFragment interface.
DOMDOCUMENTTYPE	Implements the DOM Document Type interface.
DOMELEMENT	Implements the DOM Element interface.
DOMENTITY	Implements the DOM Entity interface.
DOMENTITYREFERENCE	Implements the DOM EntityReference interface.
DOMIMPLEMENTATION	Implements the DOM Implementation interface.
DOMNAMEDNODEMAP	Implements the DOM Named Node Map interface.
DOMNODE	Implements the DOM Node interface.
DOMNODELIST	Implements the DOM NodeList interface.
DOMNOTATION	Implements the DOM Notation interface.
DOMPROCESSINGINSTRUCTION	Implements the DOM Processing instruction interface.
DOMTEXT	Implements the DOM Text interface.

Exceptions

The exceptions listed in Table 191–3 are defined for DBMS_XMLDOM:

Table 191–3 Exceptions for DBMS_XMLDOM

Exception	Description
DOMSTRING_SIZE_ERR	If the specified range of text does not fit into a DOMString.
HIERARCHY_REQUEST_ERR	If any node is inserted somewhere it doesn't belong.
INDEX_SIZE_ERR	If index or size is negative, or greater than the allowed value.
INUSE_ATTRIBUTE_ERR	If an attempt is made to add an attribute that is already in use elsewhere.
INVALID_CHARACTER_ERR	If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character.
NO_DATA_ALLOWED_ERROR	If data is specified for a node that does not support data.
NOT_FOUND_ERR	If an attempt is made to reference a node in a context where it does not exist.
NO_MODIFICATION_ALLOWED_ERR	If an attempt is made to modify an object where modifications are not allowed.
NOT_SUPPORTED_ERR	If the implementation does not support the requested type of object or operation.
WRONG_DOCUMENT_ERR	If a node is used in a different document than the one that created it (that doesn't support it).

Subprogram Groups

DBMS_XMLDOM subprograms are divided into groups according to W3C Interfaces.

DOMNode Subprograms

Table 191–4 Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
ADOPTNODE Function on page 191-41	Adopts a node from another document
APPENDCHILD Function on page 191-42	Appends a new child to the node
CLONENODE Function on page 191-44	Clones the node
FREENODE Procedure on page 191-60	Frees all resources associated with the node
GETATTRIBUTES Function on page 191-64	Retrieves the attributes of the node
GETCHILDNODES Function on page 191-66	Retrieves the children of the node
GETEXPANDEDNAME Procedure and Functions on page 191-73	Retrieves the expanded name of the node
GETFIRSTCHILD Function on page 191-74	Retrieves the first child of the node
GETLASTCHILD Function on page 191-76	Retrieves the last child of the node
GETLOCALNAME Procedure and Functions on page 191-78	Retrieves the local part of the qualified name
GETNAMESPACE Procedure and Functions on page 191-81	Retrieves the node's namespace URI
GETNEXTSIBLING Function on page 191-82	Retrieves the next sibling of the node
GETNODENAME Function on page 191-84	Retrieves the Name of the Node
GETNODETYPE Function on page 191-83	Retrieves the Type of the node
GETNODEVALUE Function on page 191-85	Retrieves the Value of the Node
GETNODEVALUEASBINARYSTREAM Function & Procedure on page 191-86	Retrieves Node Value as binary stream
GETNODEVALUEASCHARACTERSTREAM Function & Procedure on page 191-87	Retrieves Node Value as character stream
GETOWNERDOCUMENT Function on page 191-91	Retrieves the owner document of the node
GETPARENTNODE Function on page 191-93	Retrieves the parent of this node
GETPREFIX Function on page 191-94	Retrieves the namespace prefix
GETPREVIOUSSIBLING Function on page 191-95	Retrieves the previous sibling of the node
GETSCHEMANODE Function on page 191-98	Retrieves the associated schema URI
HASATTRIBUTES Function on page 191-107	Tests if the node has attributes
HASCHILDNODES Function on page 191-108	Tests if the node has child nodes
IMPORTNODE Function on page 191-110	Imports a node from another document
INSERTBEFORE Function on page 191-111	Inserts a child before the reference child
ISNULL Functions on page 191-113	Tests if the node is `NULL`
MAKEATTR Function on page 191-117	Casts the node to an Attribute
MAKECDATASECTION Function on page 191-118	Casts the node to a CData Section
MAKECHARACTERDATA Function on page 191-119	Casts the node to Character Data

Table 191–4 (Cont.) Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
MAKECOMMENT Function on page 191-120	Casts the node to a Comment
MAKEDOCUMENT Function on page 191-121	Casts the node to a DOM Document
MAKEDOCUMENTFRAGMENT Function on page 191-122	Casts the node to a DOM Document Fragment
MAKEDOCUMENTTYPE Function on page 191-123	Casts the node to a DOM Document Type
MAKEELEMENT Function on page 191-124	Casts the node to a DOM Element
MAKEENTITY Function on page 191-125	Casts the node to a DOM Entity
MAKEENTITYREFERENCE Function on page 191-126	Casts the node to a DOM Entity Reference
MAKENOTATION Function on page 191-130	Casts the node to a DOM Notation
MAKEPROCESSINGINSTRUCTION Function on page 191-131	Casts the node to a DOM Processing Instruction
MAKETEXT Function on page 191-132	Casts the node to a DOM Text
REMOVECHILD Function on page 191-137	Removes a specified child from a node
REPLACECHILD Function on page 191-139	Replaces the old child with a new child
SETNODEVALUE Procedure on page 191-148	Sets the Value of the node
SETNODEVALUEASBINARYSTREAM Function & Procedure on page 191-149	Sets the Node Value as binary stream
SETNODEVALUEASCHARACTERSTREAM Function & Procedure on page 191-150	Sets the Node Value as a character stream
SETPREFIX Procedure on page 191-151	Sets the namespace prefix
USEBINARYSTREAM Function on page 191-157	Establishes that the stream is valid
WRITETOBUFFER Procedures on page 191-158	Writes the contents of the node to a buffer
WRITETOCLOB Procedures on page 191-159	Writes the contents of the node to a `CLOB`
WRITETOFILE Procedures on page 191-160	Writes the contents of the node to a file

DOMAttr Subprograms

Table 191–5 Summary of DOMAttr Subprograms; DBMS_XMLDOM

Method	Description
GETEXPANDEDNAME Procedure and Functions on page 191-73	Retrieves the expanded name of the attribute
GETLOCALNAME Procedure and Functions on page 191-78	Retrieves the local name of the attribute
GETNAME Functions on page 191-79	Retrieves the name of the attribute
GETNAMESPACE Procedure and Functions on page 191-81	Retrieves the NS URI of the attribute
GETOWNERELEMENT Function on page 191-92	Retrieves the Element node, parent of the attribute
GETQUALIFIEDNAME Functions on page 191-97	Retrieves the Qualified Name of the attribute
GETSPECIFIED Function on page 191-99	Tests if attribute was specified in the element
GETVALUE Function on page 191-103	Retrieves the value of the attribute
ISNULL Functions on page 191-113	Tests if the Attribute node is `NULL`
MAKENODE Functions on page 191-127	Casts the Attribute to a node
SETVALUE Procedure on page 191-153	Sets the value of the attribute

DOMCDataSection Subprograms

Table 191–6 Summary of DOMCdata Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 191-113	Tests if the `CDataSection` is `NULL`
MAKENODE Functions on page 191-127	Casts the `CDatasection` to a node

DOMCharacterData Subprograms

Table 191–7 Summary of DOMCharacterData Subprograms; DBMS_XMLDOM

Method	Description
APPENDDATA Procedure on page 191-43	Appends the specified data to the node data
DELETEDATA Procedure on page 191-54	Deletes the data from the specified offSets
GETDATA Functions on page 191-68	Retrieves the data of the node
GETLENGTH Functions on page 191-77	Retrieves the length of the data
INSERTDATA Procedure on page 191-112	Inserts the data in the node at the specified offSets
ISNULL Functions on page 191-113	Tests if the CharacterData is `NULL`
MAKENODE Functions on page 191-127	Casts the CharacterData to a node
REPLACEDATA Procedure on page 191-140	Changes a range of characters in the node
SETDATA Procedures on page 191-145	Sets the data to the node
SUBSTRINGDATA Function on page 191-156	Retrieves the substring of the data

DOMComment Subprograms

Table 191–8 Summary of DOMComment Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 191-113	Tests if the comment is `NULL`
MAKENODE Functions on page 191-127	Casts the Comment to a node

DOMDocument Subprograms

Table 191–9 Summary of DOMDocument Subprograms; DBMS_XMLDOM

Method	Description
CREATEATTRIBUTE Functions on page 191-45	Creates an Attribute
CREATECDATASECTION Function on page 191-46	Creates a `CDataSection` node
CREATECOMMENT Function on page 191-47	Creates a Comment node
CREATEDOCUMENT Function on page 191-48	Creates a new Document
CREATEDOCUMENTFRAGMENT Function on page 191-49	Creates a new Document Fragment
CREATEELEMENT Functions on page 191-50	Creates a new Element
CREATEENTITYREFERENCE Function on page 191-51	Creates an Entity reference
CREATEPROCESSINGINSTRUCTION Function on page 191-52	Creates a Processing Instruction
CREATETEXTNODE Function on page 191-53	Creates a Text node
FREEDOCFRAG Procedure on page 191-57	Frees the document fragment
FREEDOCUMENT Procedure on page 191-58	Frees the document
GETCHARSET Function on page 191-65	Retrieves the characterset of the `DOM` document
GETDOCTYPE Function on page 191-69	Retrieves the DTD of the document
GETDOCUMENTELEMENT Function on page 191-70	Retrieves the root element of the document
GETELEMENTSBYTAGNAME Functions on page 191-71	Retrieves ▪ the elements in the DOMNODELIST by tag name ▪ elements in the subtree of a DOMNODELIST by tagname
GETIMPLEMENTATION Function on page 191-75	Retrieves the DOM implementation
GETSTANDALONE Function on page 191-100	Retrieves the standalone property of the document
GETVERSION Function on page 191-104	Retrieves the version of the document
GETXMLTYPE Function on page 191-105	Retrieves the `XMLType` associated with the DOM Document
ISNULL Functions on page 191-113	Tests if the document is `NULL`
MAKENODE Functions on page 191-127	Casts the document to a node
NEWDOMDOCUMENT Functions on page 191-133	Creates a new document
SETCHARSET Procedure on page 191-144	Sets the characterset of the `DOM` document
SETDOCTYPE Procedure on page 191-146	Sets the DTD of the document
SETSTANDALONE Procedure on page 191-152	Sets the standalone property of the document

Table 191–9 (Cont.) Summary of DOMDocument Subprograms; DBMS_XMLDOM

Method	Description
SETVERSION Procedure on page 191-154	Sets the version of the document
WRITETOBUFFER Procedures on page 191-158	Writes the document to a buffer
WRITETOCLOB Procedures on page 191-159	Writes the document to a `CLOB`
WRITETOFILE Procedures on page 191-160	Writes the document to a file

DOMDocumentFragment Subprograms

Table 191–10 Summary of DOMDocumentFragment Subprograms; DBMS_XMLDOM

Method	Description
FREEDOCFRAG Procedure on page 191-57	Frees the specified document fragment
ISNULL Functions on page 191-113	Tests if the DocumentFragment is `NULL`
MAKENODE Functions on page 191-127	Casts the Document Fragment to a node
WRITETOBUFFER Procedures on page 191-158	Writes the contents of a document fragment into a buffer

DOMDocumentType Subprograms

Table 191–11 Summary of DOMDocumentType Subprograms; DBMS_XMLDOM

Method	Description
FINDENTITY Function on page 191-55	Finds the specified entity in the document type
FINDNOTATION Function on page 191-56	Finds the specified notation in the document type
GETENTITIES Function on page 191-72	Retrieves the nodemap of entities in the Document type
GETNAME Functions on page 191-79	Retrieves the name of the Document type
GETNOTATIONS Function on page 191-89	Retrieves the nodemap of the notations in the Document type
GETPUBLICID Functions on page 191-96	Retrieves the public ID of the document type
GETSYSTEMID Functions on page 191-101	Retrieves the system ID of the document type
ISNULL Functions on page 191-113	Tests if the Document Type is `NULL`
MAKENODE Functions on page 191-127	Casts the document type to a node

DOMElement Subprograms

Table 191–12 Summary of DOMElement Subprograms; DBMS_XMLDOM

Method	Description
FREEELEMENT Procedure on page 191-59	Frees memory allocated to a DOMElement handle
GETATTRIBUTE Functions on page 191-62	Retrieves the attribute node by name
GETATTRIBUTENODE Functions on page 191-63	Retrieves the attribute node by name
GETCHILDRENBYTAGNAME Functions on page 191-67	Retrieves children of the element by tag name
GETELEMENTSBYTAGNAME Functions on page 191-71	Retrieves ▪ the elements in the DOMNODELIST by tag name ▪ elements in the subtree of a DOMNODELIST by tagname
GETEXPANDEDNAME Procedure and Functions on page 191-73	Retrieves the expanded name of the element
GETLOCALNAME Procedure and Functions on page 191-78	Retrieves the local name of the element
GETNAMESPACE Procedure and Functions on page 191-81	Retrieves the NS URI of the element
GETQUALIFIEDNAME Functions on page 191-97	Retrieves the qualified name of the element
GETTAGNAME Function on page 191-102	Retrieves the Tag name of the element
HASATTRIBUTE Functions on page 191-106	Tests if an attribute exists
ISNULL Functions on page 191-113	Tests if the Element is `NULL`
MAKENODE Functions on page 191-127	Casts the Element to a node
NORMALIZE Procedure on page 191-134	Normalizes the text children of the element
REMOVEATTRIBUTE Procedures on page 191-135	Removes the attribute specified by the name
REMOVEATTRIBUTENODE Function on page 191-136	Removes the attribute node in the element
RESOLVENAMESPACEPREFIX Function on page 191-141	Resolve the prefix to a namespace URI
SETATTRIBUTE Procedures on page 191-142	Sets the attribute specified by the name
SETATTRIBUTENODE Functions on page 191-143	Sets the attribute node in the element

DOMEntity Subprograms

Table 191–13 Summary of DOMEntity Subprograms; DBMS_XMLDOM

Method	Description
GETNOTATIONNAME Function on page 191-88	Retrieves the notation name of the entity
GETPUBLICID Functions on page 191-96	Retrieves the public Id of the entity
GETSYSTEMID Functions on page 191-101	Retrieves the system Id of the entity
ISNULL Functions on page 191-113	Tests if the Entity is `NULL`
MAKENODE Functions on page 191-127	Casts the Entity to a node

DOMEntityReference Subprograms

Table 191–14 Summary of DOMEntityReference Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 191-113	Tests if the `DOMEntityReference` is `NULL`
MAKENODE Functions on page 191-127	Casts the `DOMEntityReference` to `NULL`

DOMImplementation Subprograms

Table 191–15 Summary of DOMImplementation Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 191-113	Tests if the `DOMImplementation` node is `NULL`
HASFEATURE Function on page 191-109	Tests if the `DOMImplementation` implements a feature

DOMNamedNodeMap Subprograms

Table 191–16 Summary of DOMNamedNodeMap Subprograms; DBMS_XMLDOM

Method	Description
GETLENGTH Functions on page 191-77	Retrieves the number of items in the map
GETNAMEDITEM Function on page 191-80	Retrieves the item specified by the name
ISNULL Functions on page 191-113	Tests if the `NamedNodeMap` is `NULL`
ITEM Functions on page 191-116	Retrieves the item given the index in the map
REMOVENAMEDITEM Function on page 191-138	Removes the item specified by name
SETNAMEDITEM Function on page 191-147	Sets the item in the map specified by the name

DOMNodeList Subprograms

Table 191–17 Summary of DOMNodeList Subprograms; DBMS_XMLDOM

Method	Description
FREENODELIST Procedure on page 191-61	Frees all resources associated with a nodelist
GETLENGTH Functions on page 191-77	Retrieves the number of items in the list
ISNULL Functions on page 191-113	Tests if the `NodeList` is `NULL`
ITEM Functions on page 191-116	Retrieves the item given the index in the list

DOMNotation Subprograms

Table 191–18 Summary of DOMNotation Subprograms; DBMS_XMLDOM

Method	Description
GETPUBLICID Functions on page 191-96	Retrieves the public Id of the notation
GETSYSTEMID Functions on page 191-101	Retrieves the system Id of the notation
ISNULL Functions on page 191-113	Tests if the Notation is `NULL`
MAKENODE Functions on page 191-127	Casts the notation to a node

DOMProcessingInstruction Subprograms

Table 191–19 Summary of DOMProcessingInstruction Subprograms; DBMS_XMLDOM

Method	Description
GETDATA Functions on page 191-68	Retrieves the data of the processing instruction
GETTARGET Function on page 191-90	Retrieves the target of the processing instruction
ISNULL Functions on page 191-113	Tests if the Processing Instruction is `NULL`
MAKENODE Functions on page 191-127	Casts the Processing Instruction to a node
SETDATA Procedures on page 191-145	Sets the data of the processing instruction

DOMText Subprograms

Table 191–20 Summary of DOMText Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 191-113	Tests if the text is NULL
MAKENODE Functions on page 191-127	Casts the text to a node
SPLITTEXT Function on page 191-155	Splits the contents of the text node into 2 text nodes

Summary of DBMS_XMLDOM Subprograms

Table 191–21 Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ADOPTNODE Function on page 191-41	Adopts a node from another document	DOMNode Subprograms on page 191-11
APPENDCHILD Function on page 191-42	Appends a new child to the node	DOMNode Subprograms on page 191-11
APPENDDATA Procedure on page 191-43	Appends the specified data to the node data	DOMCharacterData Subprograms on page 191-15
CLONENODE Function on page 191-44	Clones the node	DOMNode Subprograms on page 191-11
CREATEATTRIBUTE Functions on page 191-45	Creates an Attribute	DOMDocument Subprograms on page 191-17
CREATECDATASECTION Function on page 191-46	Creates a `CDataSection` node	DOMDocument Subprograms on page 191-17
CREATECOMMENT Function on page 191-47	Creates a Comment node	DOMDocument Subprograms on page 191-17
CREATEDOCUMENT Function on page 191-48	Creates a new Document	DOMDocument Subprograms on page 191-17
CREATEDOCUMENTFRAGMENT Function on page 191-49	Creates a new Document Fragment	DOMDocument Subprograms on page 191-17
CREATEELEMENT Functions on page 191-50	Creates a new Element	DOMDocument Subprograms on page 191-17
CREATEENTITYREFERENCE Function on page 191-51	Creates an Entity reference	DOMDocument Subprograms on page 191-17
CREATEPROCESSINGINSTRUCTION Function on page 191-52	Creates a Processing Instruction	DOMDocument Subprograms on page 191-17
CREATETEXTNODE Function on page 191-53	Creates a Text node	DOMDocument Subprograms on page 191-17
DELETEDATA Procedure on page 191-54	Deletes the data from the specified offSets	DOMCharacterData Subprograms on page 191-15
FINDENTITY Function on page 191-55	Finds the specified entity in the document type	DOMDocumentType Subprograms on page 191-20
FINDNOTATION Function on page 191-56	Finds the specified notation in the document type	DOMDocumentType Subprograms on page 191-20

Table 191–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
FREEDOCFRAG Procedure on page 191-57	Frees the document fragment	DOMDocument Subprograms on page 191-17 and DOMDocumentFragment Subprograms on page 191-19
FREEDOCUMENT Procedure on page 191-58	Frees the document	DOMDocument Subprograms on page 191-17
FREEELEMENT Procedure on page 191-59	Frees memory allocated to a DOMElement handle	DOMElement Subprograms on page 191-21
FREENODE Procedure on page 191-60	Frees all resources associated with the node	DOMNode Subprograms on page 191-11
FREENODELIST Procedure on page 191-61	Frees all resources associated with a nodelist	DOMNodeList Subprograms on page 191-26
GETATTRIBUTE Functions on page 191-62	Retrieves the attribute node by name	DOMElement Subprograms on page 191-21
GETATTRIBUTENODE Functions on page 191-63	Retrieves the attribute node by name	DOMElement Subprograms on page 191-21
GETATTRIBUTES Function on page 191-64	Retrieves the attributes of the node	DOMNode Subprograms on page 191-11
GETCHARSET Function on page 191-65	Retrieves the characterset of the `DOM` document	DOMDocument Subprograms on page 191-17
GETCHILDNODES Function on page 191-66	Retrieves the children of the node	DOMNode Subprograms on page 191-11
GETCHILDRENBYTAGNAME Functions on page 191-67	Retrieves children of the element by tag name	DOMCharacterData Subprograms on page 191-15
GETDATA Functions on page 191-68	Retrieves ▪ the data of the node ▪ the data of the processing instruction	▪ DOMCharacterData Subprograms on page 191-15 ▪ DOMProcessingInstruction Subprograms on page 191-28
GETDOCTYPE Function on page 191-69	Retrieves the DTD of the document	DOMDocument Subprograms on page 191-17
GETDOCUMENTELEMENT Function on page 191-70	Retrieves the root element of the document	DOMDocument Subprograms on page 191-17

Table 191–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETELEMENTSBYTAGNAME Functions on page 191-71	Retrieves ■ the elements in the DOMNODELIST by tag name ■ elements in the subtree of a DOMNODELIST by tagname	■ DOMDocument Subprograms on page 191-17 ■ DOMElement Subprograms on page 191-21
GETENTITIES Function on page 191-72	Retrieves the nodemap of entities in the Document type	DOMDocumentType Subprograms on page 191-20
GETEXPANDEDNAME Procedure and Functions on page 191-73	Retrieves ■ the expanded name of the node ■ the expanded name of the attribute ■ the expanded name of the element	■ DOMNode Subprograms on page 191-11 ■ DOMAttr Subprograms on page 191-13 ■ DOMElement Subprograms on page 191-21
GETFIRSTCHILD Function on page 191-74	Retrieves the first child of the node	DOMNode Subprograms on page 191-11
GETIMPLEMENTATION Function on page 191-75	Retrieves the DOM implementation	DOMDocument Subprograms on page 191-17
GETLASTCHILD Function on page 191-76	Retrieves the last child of the node	DOMNode Subprograms on page 191-11
GETLENGTH Functions on page 191-77	Retrieves ■ the length of the data ■ the number of items in the map ■ the number of items in the list	■ DOMCharacterData Subprograms on page 191-15 ■ DOMNamedNodeMap Subprograms on page 191-25 ■ DOMNodeList Subprograms on page 191-26
GETLOCALNAME Procedure and Functions on page 191-78	Retrieves ■ the local part of the qualified name ■ the local name of the attribute ■ the local name of the element	■ DOMNode Subprograms on page 191-11 ■ DOMAttr Subprograms on page 191-13 ■ DOMElement Subprograms on page 191-21
GETNAME Functions on page 191-79	Retrieves ■ the name of the attribute ■ the name of the Document type	■ DOMAttr Subprograms on page 191-13 ■ DOMDocumentType Subprograms on page 191-20

Table 191–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETNAMEDITEM Function on page 191-80	Retrieves ■ an item specified by name ■ and namespace URI on page 191-25)	■ DOMNamedNodeMap ubprograms on page 191-25 ■ DOMNamedNodeMap ubprograms
GETNAMESPACE Procedure and Functions on page 191-81	Retrieves ■ the node's namespace URI ■ the NS URI of the attribute ■ the NS URI of the element	■ DOMNode Subprograms on page 191-11 ■ DOMAttr Subprograms on page 191-13 ■ DOMElement Subprograms on page 191-21
GETNEXTSIBLING Function on page 191-82	Retrieves the next sibling of the node	DOMNode Subprograms on page 191-11
GETNODENAME Function on page 191-84	Retrieves the Name of the Node	DOMNode Subprograms on page 191-11
GETNODETYPE Function on page 191-83	Retrieves the Type of the node	DOMNode Subprograms on page 191-11
GETNODEVALUE Function on page 191-85	Retrieves the Value of the Node	DOMNode Subprograms on page 191-11
GETNODEVALUEASBINARY STREAM Function & Procedure on page 191-86	Retrieves the Node Value as binary stream	DOMNode Subprograms on page 191-11
GETNODEVALUEASCHARA CTERSTREAM Function & Procedure on page 191-87	Retrieves the Node Value as character stream	DOMNode Subprograms on page 191-11
GETNOTATIONNAME Function on page 191-88	Retrieves the notation name of the entity	DOMEntity Subprograms on page 191-22
GETNOTATIONS Function on page 191-89	Retrieves the nodemap of the notations in the Document type	DOMDocumentType Subprograms on page 191-20
GETTARGET Function on page 191-90	Retrieves the target of the processing instruction	DOMProcessingInstructio n Subprograms on page 191-28
GETOWNERDOCUMENT Function on page 191-91	Retrieves the owner document of the node	DOMNode Subprograms on page 191-11
GETOWNERELEMENT Function on page 191-92	Retrieves the Element node, parent of the attribute	DOMAttr Subprograms on page 191-13
GETPARENTNODE Function on page 191-93	Retrieves the parent of this node	DOMNode Subprograms on page 191-11
GETPREFIX Function on page 191-94	Retrieves the namespace prefix)	DOMNode Subprograms on page 191-11
GETPREVIOUSSIBLING Function on page 191-95	Retrieves the previous sibling of the node	DOMNode Subprograms on page 191-11

Table 191–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETPUBLICID Functions on page 191-96	Retrieves ▪ the public ID of the document type ▪ the public Id of the entity ▪ the public Id of the notation	▪ DOMDocumentType Subprograms on page 191-20 ▪ DOMEntity Subprograms on page 191-22 ▪ DOMNotation Subprograms on page 191-27
GETQUALIFIEDNAME Functions on page 191-97	Retrieves ▪ the Qualified Name of the attribute ▪ the qualified name of the element	▪ DOMAttr Subprograms on page 191-13 ▪ DOMElement Subprograms on page 191-21
GETSCHEMANODE Function on page 191-98	Retrieves the associated schema URI	DOMNode Subprograms on page 191-11
GETSPECIFIED Function on page 191-99	Tests if attribute was specified in the element.	DOMAttr Subprograms on page 191-13
GETSTANDALONE Function on page 191-100	Retrieves the standalone property of the document	DOMDocument Subprograms on page 191-17
GETSYSTEMID Functions on page 191-101	Retrieves ▪ the system ID of the document type ▪ the system Id of the entity ▪ the system Id of the notation	▪ DOMDocumentType Subprograms on page 191-20 ▪ DOMEntity Subprograms on page 191-22 ▪ DOMNotation Subprograms on page 191-27
GETTAGNAME Function on page 191-102	Retrieves the Tag name of the element	DOMElement Subprograms on page 191-21
GETVALUE Function on page 191-103	Retrieves the value of the attribute	DOMAttr Subprograms on page 191-13
GETVERSION Function on page 191-104	Retrieves the version of the document	DOMDocument Subprograms on page 191-17)
GETXMLTYPE Function on page 191-105	Retrieves the `XMLType` associated with the DOM Document	DOMDocument Subprograms on page 191-17
HASATTRIBUTES Function on page 191-107	Tests if the node has attributes	DOMNode Subprograms on page 191-11
HASATTRIBUTE Functions on page 191-106	Tests if an attribute exists	DOMElement Subprograms on page 191-21
HASCHILDNODES Function on page 191-108	Tests if the node has child nodes	DOMNode Subprograms on page 191-11

Table 191–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
HASFEATURE Function on page 191-109	Tests if the `DOMImplementation` implements a feature	DOMImplementation Subprograms on page 191-24
IMPORTNODE Function on page 191-110	Imports a node from another document	DOMNode Subprograms on page 191-11
INSERTBEFORE Function on page 191-111	Inserts a child before the reference child	DOMNode Subprograms on page 191-11
INSERTDATA Procedure on page 191-112	Inserts the data in the node at the specified offSets	DOMCharacterData Subprograms on page 191-15

Table 191–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ISNULL Functions on page 191-113	Tests ■ if the node is NULL ■ if the Attribute node is NULL ■ if the CDataSection is NULL ■ if the CharacterData is NULL ■ if the comment is NULL ■ if the document is NULL ■ if the DocumentFragment is NULL ■ if the Document Type is NULL ■ if the Element is NULL ■ if the Entity is NULL ■ if the DOMEntityReference is NULL ■ if the DOMImplementation node is NULL ■ if the NamedNodeMap is NULL ■ if the NodeList is NULL ■ if the Notation is NULL ■ if the Processing Instruction is NULL ■ if the text is NULL	■ DOMNode Subprograms on page 191-11 ■ DOMAttr Subprograms on page 191-13 ■ DOMCDataSection Subprograms on page 191-14 ■ DOMCharacterData Subprograms on page 191-15 ■ DOMComment Subprograms on page 191-16 ■ DOMDocument Subprograms on page 191-17 ■ DOMDocumentFragment Subprograms on page 191-19 ■ DOMDocumentType Subprograms on page 191-20 ■ DOMElement Subprograms on page 191-21 ■ DOMEntity Subprograms on page 191-22 ■ DOMEntityReference Subprograms on page 191-23 ■ DOMImplementation Subprograms on page 191-24 ■ DOMNamedNodeMap Subprograms on page 191-25 ■ DOMNodeList Subprograms on page 191-26 ■ DOMNotation Subprograms on page 191-27 ■ DOMProcessingInstruction Subprograms on page 191-28 ■ DOMText Subprograms on page 191-29

Table 191–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ITEM Functions on page 191-116	Retrieves ▪ the item given the index in the map ▪ the item given the index in the `NodeList`	▪ DOMNamedNodeMap Subprograms on page 191-25 ▪ DOMNodeList Subprograms on page 191-26
MAKEATTR Function on page 191-117	Casts the node to an Attribute	DOMNode Subprograms on page 191-11
MAKECDATASECTION Function on page 191-118	Casts the node to a CData Section	DOMNode Subprograms on page 191-11
MAKECHARACTERDATA Function on page 191-119	Casts the node to Character Data	DOMNode Subprograms on page 191-11
MAKECOMMENT Function on page 191-120	Casts the node to a Comment	DOMNode Subprograms on page 191-11
MAKEDOCUMENT Function on page 191-121	Casts the node to a DOM Document	DOMNode Subprograms on page 191-11
MAKEDOCUMENTFRAGMENT Function on page 191-122	Casts the node to a DOM Document Fragment	DOMNode Subprograms on page 191-11)
MAKEDOCUMENTTYPE Function on page 191-123	Casts the node to a DOM Document Type	DOMNode Subprograms on page 191-11
MAKEELEMENT Function on page 191-124	Casts the node to a DOM ElemenT	DOMNode Subprograms on page 191-11
MAKEENTITY Function on page 191-125	Casts the node to a DOM Entity	DOMNode Subprograms on page 191-11
MAKEENTITYREFERENCE Function on page 191-126	Casts the node to a DOM Entity Reference	DOMNode Subprograms on page 191-11

Table 191–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
MAKENODE Functions on page 191-127	Casts ■ the Attribute to a node ■ the `CDatasection` to a node ■ the CharacterData to a node ■ the Comment to a node ■ the document to a node ■ the Document Fragment to a node ■ the document type to a node ■ the Element to a node ■ the Entity to a node ■ ■ the `DOMEntityReference` to `NULL` ■ the notation to a node ■ the Processing Instruction to a node ■ the text to a node	■ DOMAttr Subprograms on page 191-13 ■ DOMCDataSection Subprograms on page 191-14 ■ DOMCharacterData Subprograms on page 191-15 ■ DOMComment Subprograms on page 191-16 ■ DOMDocument Subprograms on page 17 ■ DOMDocumentFragment Subprograms on page 191-19 ■ DOMDocumentType Subprograms on page 191-20 ■ DOMElement Subprograms on page 191-21 ■ DOMEntity Subprograms on page 191-22 ■ DOMEntityReference Subprograms on page 191-23 ■ DOMNotation Subprograms on page 191-27 ■ DOMProcessingInstruction Subprograms on page 191-28 ■ DOMText Subprograms on page 191-29
MAKENOTATION Function on page 191-130	Casts the node to a DOM Notation	DOMNode Subprograms on page 191-11
MAKEPROCESSINGINSTRUCTION Function on page 191-131	Casts the node to a DOM Processing Instruction	DOMNode Subprograms on page 191-11
MAKETEXT Function on page 191-132	Casts the node to a DOM Text	DOMNode Subprograms on page 191-11
NEWDOMDOCUMENT Functions on page 191-133	Creates a new document	DOMDocument Subprograms on page 191-17
NORMALIZE Procedure on page 191-134	Normalizes the text children of the element	DOMElement Subprograms on page 191-21

Table 191–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
REMOVEATTRIBUTE Procedures on page 191-135	Removes the attribute specified by the name	DOMElement Subprograms on page 191-21
REMOVEATTRIBUTENODE Function on page 191-136	Removes the attribute node in the element	DOMElement Subprograms on page 191-21
REMOVECHILD Function on page 191-137	Removes a specified child from a node	DOMNode Subprograms on page 191-11
REMOVENAMEDITEM Function on page 191-138	Removes the item specified by name	DOMNamedNodeMap Subprograms on page 191-25
REPLACECHILD Function on page 191-139	Replaces the old child with a new child	DOMNode Subprograms on page 191-11
REPLACEDATA Procedure on page 191-140	Changes a range of characters in the node	DOMCharacterData Subprograms on page 191-15
RESOLVENAMESPACEPREFIX Function on page 191-141	Resolve the prefix to a namespace URI	DOMElement Subprograms on page 191-21
SETATTRIBUTE Procedures on page 191-142	Sets the attribute specified by the name	DOMElement Subprograms on page 191-21
SETATTRIBUTENODE Functions on page 191-143	Sets the attribute node in the element	DOMElement Subprograms on page 191-21
SETCHARSET Procedure on page 191-144	Sets the characterset of the `DOM` document	DOMDocument Subprograms on page 191-17
SETDATA Procedures on page 191-145	Sets ■ the data to the node ■ the data of the processing instruction	■ DOMCharacterData Subprograms on page 191-15 ■ DOMProcessingInstruction Subprograms on page 191-28
SETDOCTYPE Procedure on page 191-146	Sets the DTD of the document.	DOMDocument Subprograms on page 191-17
SETNAMEDITEM Function on page 191-147	Sets the item in the map specified by the name	DOMNamedNodeMap Subprograms on page 191-25
SETNODEVALUE Procedure on page 191-148	Sets the Value of the node	DOMNode Subprograms on page 191-11
SETNODEVALUEASBINARYSTREAM Function & Procedure on page 191-149	Sets the Node Value as a binary stream	DOMNode Subprograms on page 191-11
SETNODEVALUEASCHARACTERSTREAM Function & Procedure on page 191-150	Sets the Node Value as a character stream	DOMNode Subprograms on page 191-11
SETPREFIX Procedure on page 191-151	Sets the namespace prefix	DOMNode Subprograms on page 191-11

Table 191–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
SETSTANDALONE Procedure on page 191-152	Sets the standalone property of the document	DOMDocument Subprograms on page 191-17
SETVALUE Procedure on page 191-153	Sets the value of the attribute	DOMAttr Subprograms on page 191-13
SETVERSION Procedure on page 191-154	Sets the version of the document	DOMDocument Subprograms on page 191-17
SPLITTEXT Function on page 191-155	Splits the contents of the text node into 2 text nodes	DOMText Subprograms on page 191-29
SUBSTRINGDATA Function on page 191-156	Retrieves the substring of the data	DOMCharacterData Subprograms on page 191-15
USEBINARYSTREAM Function on page 191-157	Strabismus that the stream is valid for use	DOMNode Subprograms on page 191-11
WRITETOBUFFER Procedures on page 191-158	Writes ■ the contents of the node to a buffer ■ the document to a buffer ■ the contents of a document fragment into a buffer	■ DOMNode Subprograms on page 191-11 ■ DOMDocument Subprograms on page 191-17 ■ DOMDocumentFragment Subprograms on page 191-19
WRITETOCLOB Procedures on page 191-159	Writes ■ the contents of the node to a `CLOB` ■ the document to a `CLOB`	■ DOMNode Subprograms on page 191-11 ■ DOMDocument Subprograms on page 191-17
WRITETOFILE Procedures on page 191-160	Writes ■ the contents of the node to a file ■ the document to a file	■ DOMNode Subprograms on page 191-11 ■ DOMDocument Subprograms on page 191-17

ADOPTNODE Function

This function adopts a node from another document, and returns this new node.

> **See Also:** DOMNode Subprograms on page 191-11 for other subprograms in this group

Syntax

```
DBMS_XMLDOM.ADOPTNODE(
   doc             IN   DOMDocument,
   importedNode    IN   DOMNode)
 RETURN DOMNODE;
```

Parameters

Table 191–22 ADOPTNODE Function Parameters

Parameter	Description
doc	Document that is adopting the node
importedNode	Node to adopt

Usage Notes

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.

APPENDCHILD Function

This function adds the node `newchild` to the end of the list of children of this node, and returns the newly added node. If the `newchild` is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.APPENDCHILD(
   n          IN    DOMNode,
   newchild   IN    DOMNode)
 RETURN DOMNODE;
```

Parameters

Table 191–23 APPENDCHILD Function Parameters

Parameter	Description
`n`	`DOMNode`
`newchild`	The child to be appended to the list of children of node `n`

APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

See Also: DOMCharacterData Subprograms on page 191-15

Syntax

```
DBMS_XMLDOM.APPENDDATA(
   cd      IN    DOMCHARACTERDATA,
   arg     IN    VARCHAR2);
```

Parameters

Table 191–24 APPENDDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
arg	The data to append to the existing data

CLONENODE Function

This function returns a duplicate of this node, and serves as a generic copy constructor for nodes. The duplicate node has no parent, its parent node is NULL.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.CLONENODE(
   n        IN    DOMNODE,
   deep     IN    BOOLEAN)
 RETURN DOMNODE;
```

Parameters

Table 191–25 CLONENODE Function Parameters

Parameter	Description
n	DOMNODE
deep	Determines if children are to be cloned

Usage Notes

- Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node.
- Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is TRUE).
- Cloning any other type of node simply returns a copy of this node.

CREATEATTRIBUTE Functions

This function creates a DOMATTR node.

See Also: DOMDocument Subprograms on page 191-17

Syntax

Creates a DOMATTR with the specified name:

```
DBMS_XMLDOM.CREATEATTRIBUTE(
   doc      IN    DOMDOCUMENT,
   name     IN    VARCHAR2)
 RETURN DOMATTR;
```

Creates a DOMATTR with the specified name and namespace URI:

```
DBMS_XMLDOM.CREATEATTRIBUTE(
   doc      IN    DOMDOCUMENT,
   qname     IN    VARCHAR2,
   ns       IN     VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 191–26 CREATEATTRIBUTE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
qname	New attribute qualified name
ns	Namespace

CREATECDATASECTION Function

This function creates a DOMCDATASECTION node.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.CREATECDATASECTION(
   doc      IN      DOMDOCUMENT,
   data     IN      VARCHAR2)
 RETURN DOMCDATASECTION;
```

Parameters

Table 191–27 CREATECDATASECTION Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMCDATASECTION node

CREATECOMMENT Function

This function creates a DOMCOMMENT node.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.CREATECOMMENT(
   doc      IN      DOMDOCUMENT,
   data     IN      VARCHAR2)
 RETURN DOMCOMMENT;
```

Parameters

Table 191–28 CREATECOMMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMComment node

CREATEDOCUMENT Function

This function creates a DOMDOCUMENT with specified namespace URI, root element name, DTD.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENT(
   namespaceURI       IN     VARCHAR2,
   qualifiedName      IN     VARCHAR2,
   doctype            IN     DOMTYPE := NULL)
 RETURN DOMDOCUMENT;
```

Parameters

Table 191–29 CREATEDOCUMENT Function Parameters

Parameter	Description
namespaceURI	Namespace URI
qualifiedName	Root element name
doctype	Document type

CREATEDOCUMENTFRAGMENT Function

This function creates a DOMDOCUMENTFRAGMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT(
   doc       IN      DOMDOCUMENT)
 RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 191–30 CREATEDOCUMENTFRAGMENT Function Parameters

Parameter	Description
doc	DOMDocument

CREATEELEMENT Functions

This function creates a DOMELEMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

Creates a DOMElement with specified name:

```
DBMS_XMLDOM.CREATEELEMENT(
   doc         IN      DOMDOCUMENT,
   tagName     IN      VARCHAR2)
 RETURN DOMELEMENT;
```

Creates a DOMElement with specified name and namespace URI:

```
DBMS_XMLDOM.CREATEELEMENT(
   doc         IN     DOMDOCUMENT,
   tagName     IN     VARCHAR2,
   ns          IN     VARCHAR2)
 RETURN DOMELEMENT;
```

Parameters

Table 191–31 CREATEELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagName	Tagname for new DOMELEMENT
ns	Namespace

CREATEENTITYREFERENCE Function

This function creates a DOMENTITYREFERENCE node.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.CREATEENTITYREFERENCE(
   doc         IN     DOMDOCUMENT,
   name        IN     VARCHAR2)
 RETURN DOMENTITYREFERENCE;
```

Parameters

Table 191–32 CREATEENTITYREFERENCE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
name	New entity reference name

CREATEPROCESSINGINSTRUCTION Function

This function creates a DOMPROCESSINGINSTRUCTION node.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION(
   doc       IN      DOMDocument,
   target    IN      VARCHAR2,
   data      IN      VARCHAR2)
 RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 191–33 CREATEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
doc	DOMDOCUMENT
target	Target of the new processing instruction
data	Content data of the new processing instruction

CREATETEXTNODE Function

This function creates a DOMTEXT node.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.CREATETEXTNODE(
   doc      IN     DOMDocument,
   data     IN     VARCHAR2)
 RETURN DOMTEXT;
```

Parameters

Table 191–34 CREATETEXTNODE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMText node

DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

See Also: DOMCharacterData Subprograms on page 191-15

Syntax

```
DBMS_XMLDOM.DELETEDATA(
   cd         IN     DOMCHARACTERDATA,
   offset     IN     NUMBER,
   cnt        IN     NUMBER);
```

Parameters

Table 191–35 DELETEDATA PROCEDURE Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset from which to delete the data
cnt	The number of characters (starting from offset) to delete

FINDENTITY Function

This function finds an entity in the specified DTD, and returns that entity if found.

See Also: DOMDocumentType Subprograms on page 191-20

Syntax

```
DBMS_XMLDOM.FINDENTITY(
   dt      IN     DOMDOCUMENTTYPE,
   name    IN     VARCHAR2,
   par     IN     BOOLEAN)
 RETURN  DOMENTITY;
```

Parameters

Table 191–36 FINDENTITY Function Parameters

Parameter	Description
dt	The DTD
name	Entity to find
par	Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity

FINDNOTATION Function

This function finds the notation in the specified DTD, and returns it, if found.

See Also: DOMDocumentType Subprograms on page 191-20

Syntax

```
DBMS_XMLDOM.FINDNOTATION(
   dt         IN     DOMDocumentType,
   name       IN     VARCHAR2)
 RETURN DOMNOTATION;
```

Parameters

Table 191–37 FINDNOTATION Function Parameters

Parameter	Description
dt	The DTD
name	The notation to find

FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

> **See Also:** DOMDocument Subprograms on page 191-17 and DOMDocumentFragment Subprograms on page 191-19

Syntax

```
DBMS_XMLDOM.FREEDOCFRAG(
   df     IN     DOMDOCUMENTFRAGMENT);
```

Parameters

Table 191–38 FREEDOCFRAG Procedure Parameters

Parameter	Description
df	DOM document fragment

FREEDOCUMENT Procedure

This procedure frees DOMDOCUMENT object.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.FREEDOCUMENT(
   doc      IN      DOMDOCUMENT);
```

Parameters

Table 191–39 FREEDOCUMENT Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT

FREEELEMENT Procedure

This procedure frees memory allocated to a DOMElement handle.

See Also: DOMElement Subprograms on page 191-21

Syntax

```
DBMS_XMLDOM.FREENODE(
   elem      IN     DOMELEMENT);
```

Parameters

Table 191–40 FREENODE Procedure Parameters

Parameter	Description
elem	Of type DOMELEMENT

FREENODE Procedure

This procedure frees all resources associated with a DOMNODE.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.FREENODE(
   n       IN      DOMNODE);
```

Parameters

Table 191–41 FREENODE Procedure Parameters

Parameter	Description
n	DOMNODE

FREENODELIST Procedure

This procedure frees all resources associated with a nodelist.

See Also: DOMNodeList Subprograms on page 191-26

Syntax

```
DBMS_XMLDOM.FREENODE(
   nl     IN     DOMNodeList);
```

Parameters

Table 191–42 FREENODE Procedure Parameters

Parameter	Description
nl	Of type DOMNODELIST

GETATTRIBUTE Functions

This function returns the value of an attribute of an DOMELEMENT by name.

See Also: DOMElement Subprograms on page 191-21

Syntax

Returns the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.GETATTRIBUTE(
   elem       IN      DOMELEMENT,
   name       IN      VARCHAR2)
 RETURN VARCHAR2;
```

Returns the value of a DOMELEMENT's attribute by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTE(
   elem      IN     DOMELEMENT,
   name      IN     VARCHAR2,
   ns        IN     VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 191–43 GETATTRIBUTE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
ns	Namespace

GETATTRIBUTENODE Functions

This function returns an attribute node from the DOMELEMENT by name. The function is overloaded. The specific forms of functionality are described along with the syntax declarations.

See Also: DOMElement Subprograms on page 191-21

Syntax

Returns an attribute node from the DOMELEMENT by name:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
   elem      IN     DOMElement,
   name      IN     VARCHAR2)
 RETURN DOMATTR;
```

Returns an attribute node from the DOMELEMENT by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
   elem      IN     DOMElement,
   name      IN     VARCHAR2,
   ns        IN     VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 191–44 GETATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name; * matches any attribute
ns	Namespace

GETATTRIBUTES Function

This function retrieves a NAMEDNODEMAP containing the attributes of this node (if it is an Element) or NULL otherwise.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETATTRIBUTES(
   n       IN      DOMNode)
 RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 191–45 GETATTRIBUTES Function Parameters

Parameter	Description
n	DOMNODE

GETCHARSET Function

This function retrieves the characterset of the DOM document.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.GETCHARSET(
   doc IN    DOMDocument)
 RETURN VARCHAR2;
```

Parameters

Table 191–46 GETCHARSET Function Parameters

Parameter	Description
doc	DOM document

Usage Notes

For a newly parsed document, we return the database characterset. Once the SETCHARSET Procedure is called with a non-NULL value for charset, that charset is returned.

GETCHILDNODES Function

This function retrieves a DOMNODELIST that contains all children of this node. If there are no children, this is a DOMNODELIST containing no nodes.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETCHILDNODES(
   n       IN     DOMNode)
 RETURN DOMNodeList;
```

Parameters

Table 191–47 GETCHILDNODES Function Parameters

Parameter	Description
n	DOMNODE

GETCHILDRENBYTAGNAME Functions

This function returns the children of the DOMELEMENT.

See Also: DOMElement Subprograms on page 191-21

Syntax

Returns children of the DOMELEMENT given the tag name:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
   elem      IN      DOMElement,
   name      IN      VARCHAR2)
 RETURN DOMNODELIST;
```

Returns children of the DOMELEMENT given the tag name and namespace:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
   elem      IN      DOMElement,
   name      IN      VARCHAR2,
   ns        IN      VARCHAR2)
RETURN DOMNODELIST;
```

Parameters

Table 191–48 GETCHILDRENBYTAGNAME Function Parameters

Parameter	Description
elem	DOMELEMENT
name	Tag name
ns	Namespace

GETDATA Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms on page 191-15):

```
DBMS_XMLDOM.GETDATA(
   cd      IN    DOMCHARACTERDATA)
 RETURN VARCHAR2;
```

Returns the content data of the `DOMProcessingInstruction` (See Also: DOMProcessingInstruction Subprograms on page 191-28):

```
DBMS_XMLDOM.GETDATA(
   pi      IN    DOMPROCESSINGINSTRUCTION)
 RETURN VARCHAR2;
```

Parameters

Table 191–49 GETDATA Function Parameters

Parameter	Description
`cd`	`DOMCHARACTERDATA`
`pi`	The `DOMPROCESSINGINSTRUCTION`

GETDOCTYPE Function

This function returns the DTD associated to the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.GETDOCTYPE(
   doc       IN      DOMDOCUMENT)
RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 191–50 GETDOCTYPE Function Parameters

Parameter	Description
doc	DOMDOCUMENT

GETDOCUMENTELEMENT Function

This function returns the root element of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.GETDOCUMENTELEMENT(
   doc       IN       DOMDOCUMENT)
 RETURN DOMELEMENT;
```

Parameters

Table 191–51 GETDOCUMENTELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT

GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns a DOMNODELIST of all the elements with a specified tagname (See Also: DOMDocument Subprograms on page 191-17):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   doc          IN      DOMDOCUMENT,
   tagname      IN      VARCHAR2)
 RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name (See Also: DOMElement Subprograms on page 191-21):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   elem       IN     DOMELEMENT,
   name       IN     VARCHAR2)
 RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name and namespace (See Also: DOMElement Subprograms on page 191-21):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   elem       IN     DOMELEMENT,
   name       IN     VARCHAR2,
   ns         IN     VARCHAR2)
 RETURN DOMNODELIST;
```

Parameters

Table 191–52 GETELEMENTSBYTAGNAME Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagname	Name of the tag to match on
elem	The DOMELEMENT
name	Tag name; using a wildcard(*) would match any tag
ns	Namespace

GETENTITIES Function

This function retrieves a DOMNAMEDNODEMAP containing the general entities, both external and internal, declared in the DTD.

See Also: DOMDocumentType Subprograms on page 191-20

Syntax

```
DBMS_XMLDOM.GETENTITIES(
   dt       IN     DOMDocumentType)
 RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 191–53 GETENTITIES Function Parameters

Parameter	Description
dt	DOMDOCUMENTTYPE

GETEXPANDEDNAME Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described along with the syntax declarations.

Syntax

Retrieves the expanded name of the `Node` if is in an `Element` or `Attribute` type; otherwise, returns `NULL` (See Also: DOMNode Subprograms on page 191-11)

```
DBMS_XMLDOM.GETEXPANDEDNAME(
   n       IN      DOMNODE
   data    OUT     VARCHAR);
```

Returns the expanded name of the `DOMAttr` (See Also: DOMAttr Subprograms on page 191-13):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
   a       IN     DOMAttr)
 RETURN VARCHAR2;
```

Returns the expanded name of the `DOMElement` (See Also: DOMElement Subprograms on page 191-21):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
   elem      IN    DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 191–54 GETEXPANDEDNAME Procedure and Function Parameters

Parameter	Description
n	DOMNODE
data	Returned expanded name of the `Node`
a	DOMATTR
elem	DOMELEMENT

GETFIRSTCHILD Function

This function retrieves the first child of this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETFIRSTCHILD(
   n       IN      DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 191–55 GETFIRSTCHILD Function Parameters

Parameter	Description
n	DOMNODE

GETIMPLEMENTATION Function

This function returns the DOMIMPLEMENTATION object that handles this DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.GETIMPLEMENTATION(
   doc      IN     DOMDOCUMENT)
 RETURN DOMIMPLEMENTATION;
```

Parameters

Table 191–56 GETIMPLEMENTATION Function Parameters

Parameter	Description
doc	DOMDOCUMENT

GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETLASTCHILD(
   n      IN    DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 191–57 GETLASTCHILD Function Parameters

Parameter	Description
n	DOMNODE

GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the number of characters in the data. This may have the value zero, because CharacterData nodes may be empty (See Also: DOMCharacterData Subprograms on page 191-15):

```
DBMS_XMLDOM.GETLENGTH(
   cd      IN      DOMCHARACTERDATA)
 RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is `0` to `length-1`, inclusive (See Also: DOMNamedNodeMap Subprograms on page 191-25):

```
DBMS_XMLDOM.GETLENGTH(
   nnm       IN      DOMNAMEDNODEMAP)
 RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is `0` to `length-1`, inclusive (See Also: DOMNodeList Subprograms on page 191-26):

```
DBMS_XMLDOM.GETLENGTH(
   nl      IN     DOMNODELIST)
 RETURN NUMBER;
```

Parameters

Table 191–58 GETLENGTH Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
nnm	DOMNAMEDNODEMAP
nl	DOMNODELIST

GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the local part of the node's qualified name (See Also: DOMNode Subprograms on page 191-11):

```
DBMS_XMLDOM.GETLOCALNAME(
   n        IN     DOMNODE,
   data     OUT    VARCHAR2);
```

Returns the local name of the `DOMAttr` (See Also: DOMAttr Subprograms on page 191-13):

```
DBMS_XMLDOM.GETLOCALNAME(
   a        IN     DOMATTR)
 RETURN VARCHAR2;
```

Returns the local name of the `DOMElement` (See Also: DOMElement Subprograms on page 191-21)

```
DBMS_XMLDOM.GETLOCALNAME(
   elem        IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 191–59 GETLOCALNAME Procedure and Function Parameters

Parameter	Description
n	DOMNode
data	Returned local name.
a	DOMAttr.
elem	DOMElement.

GETNAME Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Returns the name of this attribute (See Also: DOMAttr Subprograms on page 191-13):

```
DBMS_XMLDOM.GETNAME(
   a        IN     DOMATTR)
 RETURN VARCHAR2;
```

Retrieves the name of DTD, or the name immediately following the `DOCTYPE` keyword (See Also: DOMDocumentType Subprograms on page 191-20):

```
DBMS_XMLDOM.GETNAME(
   dt       IN     DOMDOCUMENTTYPE)
 RETURN VARCHAR2;
```

Parameters

Table 191–60 GETNAME Function Parameters

Parameter	Description
a	DOMATTR
dt	DOMDOCUMENTTYPE

GETNAMEDITEM Function

This function retrieves a node specified by name.

See Also: DOMNamedNodeMap Subprograms on page 191-25

Syntax

Retrieves a node specified by name:

```
DBMS_XMLDOM.GETNAMEDITEM(
   nnm    IN  DOMNAMEDNODEMAP,
   name   IN  VARCHAR2)
 RETURN DOMNODE;
```

Retrieves a node specified by name and namespace URI:

```
DBMS_XMLDOM.GETNAMEDITEM(
   nnm    IN  DOMNAMEDNODEMAP,
   name   IN  VARCHAR2,
   ns     IN  VARCHAR2)
 RETURN DOMNODE;
```

Parameters

Table 191–61 GETNAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
name	Name of the item to be retrieved
ns	Namespace

GETNAMESPACE Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the namespace URI associated with the node (See Also: DOMNode Subprograms on page 191-11):

```
DBMS_XMLDOM.GETNAMESPACE(
   n       IN     DOMNODE,
   data    OUT    VARCHAR2);
```

Retrieves the namespace of the DOMATTR (See Also: DOMAttr Subprograms on page 191-13):

```
DBMS_XMLDOM.GETNAMESPACE(
   a       IN     DOMATTR)
 RETURN VARCHAR2;
```

Retrieves the namespace of the DOMELEMENT (See Also: DOMElement Subprograms on page 191-21):

```
DBMS_XMLDOM.GETNAMESPACE(
   elem       IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 191–62 GETNAMESPACE Procedure and Function Parameters

Parameter	Description
n	DOMNODE
data	Returned namespace URI
a	DOMATTR
elem	DOMELEMENT

GETNEXTSIBLING Function

This function retrieves the node immediately following this node. If there is no such node, this returns `NULL`.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETNEXTSIBLING(
   n        IN     DOMNODE)
 RETURN DOMNode;
```

Parameters

Table 191–63 GETNEXTSIBLING Function Parameters

Parameter	Description
n	DOMNODE

GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETNODETYPE(
   n        IN      DOMNODE)
 RETURN NUMBER;
```

Parameters

Table 191–64 GETNODETYPE Function Parameters

Parameter	Description
n	DOMNODE

GETNODENAME Function

This function gets the name of the node depending on its type.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETNODENAME(
   n        IN     DOMNODE)
 RETURN VARCHAR2;
```

Parameters

Table 191–65 GETNODENAME Function Parameters

Parameter	Description
n	DOMNODE

GETNODEVALUE Function

This function gets the value of this node, depending on its type.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETNODEVALUE(
   n        IN      DOMNODE)
 RETURN VARCHAR2;*
```

Parameters

Table 191–66 GETNODEVALUE Function Parameters

Parameter	Description
n	DOMNODE

GETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 191-11

Syntax

This function returns an instance of the PL/SQL `XMLBinaryInputStream`. The node datatype must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
   n      IN     DOMNODE)
 RETURN SYS.UTL_BINARYINPUTSTREAM;
```

Using this procedure, the application passes an implementation of `SYS.UTL_BINARYOUTPUTSTREAM` into which XDB writes the contents of the node. The datatype of the node must be `RAW` or `CLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
   n        in   DOMNODE,
   value    in   SYS.UTL_BINARYOUTPUTSTREAM);
```

Parameters

Table 191–67 GETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	BINARYOUTPUTSTREAM

GETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 191-11

Syntax

This function returns an instance of the PL/SQL `XMLCharacterInputStream`. If the node data is character it is converted to the current session character set. If the node data is not character data, it is first converted to character data.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM  (
   n        IN     DOMNODE)
 RETURN SYS.UTL_CHARACTERINPUTSTREAM;
```

Using this procedure, the node data is converted, as necessary, to the session character set and then "pushed" into the `SYS.UTL_CHARACTEROUTPUTSTREAM`.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM  (
   n        IN   DOMNODE,
   value    IN   SYS.UTL_CHARACTEROUTPUTSTREAM);
```

Parameters

Table 191–68 GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	CHARACTEROUTPUTSTREAM

GETNOTATIONNAME Function

This function returns the notation name of the DOMENTITY.

See Also: DOMEntity Subprograms on page 191-22

Syntax

```
DBMS_XMLDOM.GETNOTATIONNAME(
   ent        IN     DOMENTITY)
 RETURN VARCHAR2;
```

Parameters

Table 191–69 GETNOTATIONNAME Function Parameters

Parameter	Description
ent	DOMENTITY

GETNOTATIONS Function

This function retrieves a DOMNAMEDNODEMAP containing the notations declared in the DTD.

See Also: DOMDocumentType Subprograms on page 191-20

Syntax

```
DBMS_XMLDOM.GETNOTATIONS(
   dt        IN     DOMDOCUMENTTYPE)
 RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 191–70 GETNOTATIONS Function Parameters

Parameter	Description
dt	DOMDOCUMENTTYPE

GETTARGET Function

This function returns the target of the DOMPROCESSINGINSTRUCTION.

See Also: DOMProcessingInstruction Subprograms on page 191-28

Syntax

```
DBMS_XMLDOM.GETTARGET(
   pi       IN     DOMPROCESSINGINSTRUCTION)
 RETURN VARCHAR2;
```

Parameters

Table 191–71 GETTARGET Function Parameters

Parameter	Description
pi	DOMPROCESSINGINSTRUCTION

GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is NULL.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETOWNERDOCUMENT(
   n        IN     DOMNODE)
 RETURN DOMDOCUMENT;
```

Parameters

Table 191–72 GETOWNERDOCUMENT Function Parameters

Parameter	Description
n	DOMNODE

GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

See Also: DOMAttr Subprograms on page 191-13

Syntax

```
DBMS_XMLDOM.GETOWNERELEMENT(
   a        IN     DOMATTR)
 RETURN DOMElement;
```

Parameters

Table 191–73 GETOWNERELEMENT Function Parameters

Parameter	Description
a	Attribute

GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except `Attr`, `Document`, `DocumentFragment`, `Entity`, and `Notation` may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is `NULL`.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETPARENTNODE(
   n       IN     DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 191–74 GETPARENTNODE Function Parameters

Parameter	Description
n	DOMNODE

GETPREFIX Function

This function retrieves the namespace prefix of the node.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETPREFIX(
   n        IN     DOMNODE)
 RETURN VARCHAR2;
```

Parameters

Table 191–75 GETPREFIX Function Parameters

Parameter	Description
n	DOMNODE

GETPREVIOUSSIBLING Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns `NULL`.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETPREVIOUSSIBLING(
   n        IN     DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 191–76 GETPREVIOUSSIBLING Function Parameters

Parameter	Description
n	DOMNODE

GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the public identifier of the specified DTD (See Also: DOMDocumentType Subprograms on page 191-20):

```
DBMS_XMLDOM.GETPUBLICID(
   dt       IN     DOMDOCUMENTTYPE)
 RETURN VARCHAR2;
```

Returns the public identifier of the DOMENTITY (See Also: DOMEntity Subprograms on page 191-22):

```
DBMS_XMLDOM.GETPUBLICID(
   ent      IN     DOMENTITY)
 RETURN VARCHAR2;
```

Returns the public identifier of the DOMNOTATION (See Also: DOMNotation Subprograms on page 191-27):

```
DBMS_XMLDOM.GETPUBLICID(
   n        IN     DOMNOTATION)
 RETURN VARCHAR2;
```

Parameters

Table 191–77 GETPUBLICID Function Parameters

Parameter	Description
dt	The DTD
ent	DOMENTITY
n	DOMNOTATION

GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the qualified name of the `DOMATTR` (See Also: DOMAttr Subprograms on page 191-13):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
   a         IN     DOMATTR)
 RETURN VARCHAR2;
```

Returns the qualified name of the `DOMElement` (See Also: DOMElement Subprograms on page 191-21):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
   elem      IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 191–78 GETQUALIFIEDNAME Functions Parameters

Parameter	Description
a	DOMATTR
elem	DOMELEMENT

GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETSCHEMANODE(
   n        IN     DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 191–79 GETSCHEMANODE Function Parameters

Parameter	Description
n	DOMNODE

GETSPECIFIED Function

If this attribute was explicitly specified, a value in the original document, this is true; otherwise, it is false.

See Also: DOMAttr Subprograms on page 191-13

Syntax

```
DBMS_XMLDOM.GETSPECIFIED(
   a        IN     DOMATTR)
 RETURN BOOLEAN;
```

Parameters

Table 191–80 GETSPECIFIED Function Parameters

Parameter	Description
a	DOMATTR

GETSTANDALONE Function

This function returns the standalone property associated with the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.GETSTANDALONE(
   doc        IN     DOMDOCUMENT)
 RETURN VARCHAR2;
```

Parameters

Table 191–81 GETSTANDALONE Function Parameters

Parameter	Description
doc	DOMDOCUMENT.

GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the system id of the specified DTD (See Also: DOMDocumentType Subprograms on page 191-20):

```
DBMS_XMLDOM.GETSYSTEMID(
   dt        IN     DOMDOCUMENTTYPE)
 RETURN VARCHAR2;
```

Returns the system identifier of the DOMENTITY (See Also: DOMEntity Subprograms on page 191-22):

```
DBMS_XMLDOM.GETSYSTEMID(
   ent       IN     DOMENTITY)
 RETURN VARCHAR2;
```

Returns the system identifier of the DOMNOTATION (See Also: DOMNotation Subprograms on page 191-27):

```
DBMS_XMLDOM.GETSYSTEMID(
   n         IN     DOMNOTATION)
 RETURN VARCHAR2;
```

Parameters

Table 191–82 GETSYSTEMID Function Parameters

Parameter	Description
dt	The DTD.
ent	DOMEntity.
n	DOMNotation.

GETTAGNAME Function

This function returns the name of the DOMELEMENT.

See Also: DOMElement Subprograms on page 191-21

Syntax

```
DBMS_XMLDOM.GETTAGNAME(
   elem       IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 191–83 GETTAGNAME Function Parameters

Parameter	Description
elem	The DOMELEMENT

GETVALUE Function

This function retrieves the value of the attribute.

See Also: DOMAttr Subprograms on page 191-13

Syntax

```
DBMS_XMLDOM.GETVALUE(
   a        IN      DOMATTR)
 RETURN VARCHAR2;
```

Parameters

Table 191–84 GETVALUE Function Parameters

Parameter	Description
a	DOMATTR

GETVERSION Function

This function returns the version of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.GETVERSION(
   doc        IN     DOMDOCUMENT)
 RETURN VARCHAR2;
```

Parameters

Table 191–85 GETVERSION Function Parameters

Parameter	Description
doc	DOMDOCUMENT

GETXMLTYPE Function

This function returns the `XMLType` associated with the `DOMDOCUMENT`.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.GETXMLTYPE(
   doc        IN      DOMDOCUMENT)
 RETURN SYS.XMLTYPE;
```

Parameters

Table 191–86 GETXMLTYPE Function Parameters

Parameter	Description
doc	DOMDOCUMENT

HASATTRIBUTE Functions

Verifies whether an attribute has been defined for DOMELEMENT, or has a default value.

See Also: DOMElement Subprograms on page 191-21

Syntax

Verifies whether an attribute with the specified name has been defined for DOMElement:

```
DBMS_XMLDOM.HASATTRIBUTE(
   elem     IN  DOMELEMENT,
   name     IN  VARCHAR2)
 RETURN VARCHAR2;
```

Verifies whether an attribute with specified name and namespace URI has been defined for DOMELEMENT; namespace enabled:

```
DBMS_XMLDOM.HASATTRIBUTE(
   elem     IN  DOMELEMENT,
   name     IN  VARCHAR2,
   ns       IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 191–87 HASATTRIBUTE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name; * matches any attribute
ns	Namespace

HASATTRIBUTES Function

This function returns whether this node has any attributes.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.HASATTRIBUTES(
   n        IN     DOMNODE)
 RETURN BOOLEAN;
```

Parameters

Table 191–88 HASATTRIBUTES Function Parameters

Parameter	Description
n	DOMNODE

HASCHILDNODES Function

This function determines whether this node has any children.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.HASCHILDNODES(
   n        IN     DOMNODE)
 RETURN BOOLEAN;
```

Parameters

Table 191–89 HASCHILDNODES Function Parameters

Parameter	Description
n	DOMNODE

HASFEATURE Function

This function tests if the DOMIMPLEMENTATION implements a specific feature.

See Also: DOMImplementation Subprograms on page 191-24

Syntax

```
DBMS_XMLDOM.HASFEATURE(
   di       IN     DOMIMPLEMENTATION,
   feature  IN     VARCHAR2,
   version  IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 191–90 HASFEATURE Function Parameters

Parameter	Description
di	DOMIMPLEMENTATION
feature	The feature to check for
version	The version of the DOM to check in

IMPORTNODE Function

This function imports a node from an external document and returns this new node.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.IMPORTNODE(
   doc             IN  DOMDOCUMENT,
   importedNode    IN  DOMNODE,
   deep            IN  BOOLEAN)
  RETURN DOMNODE;
```

Parameters

Table 191–91 IMPORTNODE Function Parameters

Parameter	Description
doc	Document from which the node is imported
importedNode	Node to import
deep	Setting for recursive import. ■ If this value is TRUE, the entire subtree of the node will be imported with the node. ■ If this value is FALSE, only the node itself will be imported.

Usage Notes

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.

INSERTBEFORE Function

This function inserts the node `newchild` before the existing child node `refchild`. If `refchild` is `NULL`, insert `newchild` at the end of the list of children.

If `newchild` is a `DOCUMENTFRAGMENT` object, all of its children are inserted, in the same order, before `refchild`. If the `newchild` is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.INSERTBEFORE(
   n          IN     DOMNODE,
   newchild   IN     DOMNODE,
   refchild   IN     DOMNODE)
  RETURN DOMNode;
```

Parameters

Table 191–92 INSERTBEFORE Function Parameters

Parameter	Description
`n`	`DOMNODE`
`newChild`	The child to be inserted in the `DOMNODE`
`refChild`	The reference node before which the `newchild` is to be inserted

INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

See Also: DOMCharacterData Subprograms on page 191-15

Syntax

```
DBMS_XMLDOM.INSERTDATA(
   cd       IN     DOMCHARACTERDATA,
   offset   IN     NUMBER,
   arg      IN     VARCHAR2);
```

Parameters

Table 191–93 INSERTDATA Procedure Parameters

Parameter	Description
`cd`	`DOMCHARACTERDATA`
`offset`	The offset at which to insert the data
`arg`	The value to be inserted

ISNULL Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Checks if the specified DOMNODE is NULL. Returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNode Subprograms on page 191-11):

```
DBMS_XMLDOM.ISNULL(
  n         IN     DOMNODE)
 RETURN BOOLEAN;
```

Checks that the specified DOMATTR is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMAttr Subprograms on page 191-13):

```
DBMS_XMLDOM.ISNULL(
   a        IN     DOMATTR)
 RETURN BOOLEAN;
```

Checks that the specified DOMCDATASECTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCDataSection Subprograms on page 191-14):

```
DBMS_XMLDOM.ISNULL(
   cds      IN     DOMCDATASECTION)
 RETURN BOOLEAN;
```

Checks that the specified DOMCHARACTERDATA is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCharacterData Subprograms on page 191-15):

```
DBMS_XMLDOM.ISNULL(
   cd       IN     DOMCHARACTERDATA)
 RETURN BOOLEAN;
```

Checks that the specified DOMCOMMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMComment Subprograms on page 191-16):

```
DBMS_XMLDOM.ISNULL(
   com       IN     DOMCOMMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocument Subprograms on page 191-17):

```
DBMS_XMLDOM.ISNULL(
   doc       IN     DOMDOCUMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTFRAGMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentFragment Subprograms on page 191-19):

```
DBMS_XMLDOM.ISNULL(
   df       IN     DOMDOCUMENTFRAGMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTTYPE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentType Subprograms on page 191-20):

```
DBMS_XMLDOM.ISNULL(
   dt       IN     DOMDOCUMENTTYPE)
```

```
 RETURN BOOLEAN;
```

Checks that the specified DOMELEMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMElement Subprograms on page 191-21):

```
DBMS_XMLDOM.ISNULL(
   elem     IN     DOMELEMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMENTITY is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntity Subprograms on page 191-22):

```
DBMS_XMLDOM.ISNULL(
   ent       IN     DOMENTITY)
 RETURN BOOLEAN;
```

Checks that the specified DOMENTITYREFERENCE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntityReference Subprograms on page 191-23):

```
DBMS_XMLDOM.ISNULL(
   EREF       IN     DOMENTITYREFERENCE)
 RETURN BOOLEAN;
```

Checks that the specified DOMIMPLEMENTATION is NULL; returns TRUE if it is NULL (See Also: DOMImplementation Subprograms on page 191-24):

```
DBMS_XMLDOM.ISNULL(
   di       IN     DOMIMPLEMENTATION)
 RETURN BOOLEAN;
```

Checks that the specified DOMNAMEDNODEMAP is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNamedNodeMap Subprograms on page 191-25):

```
DBMS_XMLDOM.ISNULL(
   nnm       IN     DOMNAMEDNODEMAP)
 RETURN BOOLEAN;
```

Checks that the specified DOMNODELIST is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNodeList Subprograms on page 191-26):

```
DBMS_XMLDOM.ISNULL(
   nl       IN     DOMNODELIST)
 RETURN BOOLEAN;
```

Checks that the specified DOMNOTATION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNotation Subprograms on page 191-27):

```
DBMS_XMLDOM.ISNULL(
   n       IN     DOMNOTATION)
 RETURN BOOLEAN;
```

Checks that the specified DOMPROCESSINGINSTRUCTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMProcessingInstruction Subprograms on page 191-28):

```
DBMS_XMLDOM.ISNULL(
   pi       IN     DOMPROCESSINGINSTRUCTION)
 RETURN BOOLEAN;
```

Checks that the specified DOMTEXT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMText Subprograms on page 191-29):

```
DBMS_XMLDOM.ISNULL(
```

```
   t       IN     DOMTEXT)
 RETURN BOOLEAN;
```

Parameters

Table 191–94 ISNULL Function Parameters

Parameter	Description
n	DOMNODE to check
a	DOMATTR to check
cds	DOMCDATASECTION to check
cd	DOMCHARACTERDATA to check
com	DOMCOMMENT to check
doc	DOMDOCUMENT to check
dF	DOMDOCUMENTFRAGMENT to check
dt	DOMDOCUMENTTYPE to check
elem	DOMELEMENT to check
ent	DOMENTITY to check
eref	DOMENTITYREFERENCE to check
di	DOMIMPLEMENTATION to check
nnm	DOMNAMENODEMAP to check
nl	DOMNODELIST to check
n	DOMNOTATION to check
pi	DOMPROCESSINGINSTRUCTION to check
t	DOMTEXT to check

ITEM Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the item in the map which corresponds to the `INDEX` parameter. If `INDEX` is greater than or equal to the number of nodes in this map, this returns `NULL` (See Also: DOMNamedNodeMap Subprograms on page 191-25):

```
DBMS_XMLDOM.ITEM(
   nnm       IN     DOMNAMEDNODEMAP,
   index     IN     NUMBER)
 RETURN DOMNODE;
```

Returns the item in the collection which corresponds to the `INDEX` parameter. If index is greater than or equal to the number of nodes in the list, this returns `NULL` (See Also: DOMNodeList Subprograms on page 191-26):

```
DBMS_XMLDOM.ITEM(
   nl        IN     DOMNODELIST,
   index     IN     NUMBER)
 RETURN DOMNODE;
```

Parameters

Table 191–95 ITEM Function Parameters

Parameter	Description
`nnm`	`DOMNAMEDNODEMAP`
`index`	The index in the node map at which the item is to be retrieved
`nl`	`DOMNODELIST`
`index`	The index in the `NodeList` used to retrieve the item

MAKEATTR Function

This function casts a specified DOMNODE to a DOMATTR, and returns the DOMATTR.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKEATTR(
   n        IN      DOMNODE)
 RETURN DOMATTR;
```

Parameters

Table 191–96 MAKEATTR Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKECDATASECTION Function

This function casts a specified DOMNODE to a DOMCDATASECTION.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKECDATASECTION(
   n        IN     DOMNODE)
 RETURN DOMCDATASECTION;
```

Parameters

Table 191–97 MAKECDATASECTION Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKECHARACTERDATA Function

This function casts a specified DOMNODE to a DOMCHARACTERDATA, and returns the DOMCHARACTERDATA.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKECHARACTERDATA(
   n        IN     DOMNode)
 RETURN DOMCharacterData;
```

Parameters

Table 191–98 MAKECHARACTERDATA Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKECOMMENT Function

This function casts a specified DOMNODE to a DOMCOMMENT, and returns the DOMCOMMENT.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKECOMMENT(
   n        IN      DOMNODE)
 RETURN DOMCOMMENT;
```

Parameters

Table 191–99 MAKECOMMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEDOCUMENT Function

This function casts a specified DOMNODE to a DOMDOCUMENT, and returns the DOMDOCUMENT.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENT(
   n        IN      DOMNODE)
 RETURN DOMDocument;
```

Parameters

Table 191–100 MAKEDOCUMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEDOCUMENTFRAGMENT Function

This function casts a specified DOMNODE to a DOMDOCUMENTFRAGMENT, and returns the DOMDOCUMENTFRAGMENT.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT(
   n        IN      DOMNODE)
 RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 191–101 MAKEDOCUMENTFRAGMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEDOCUMENTTYPE Function

This function casts a specified DOMNODE to a DOMDOCUMENTTYPE and returns the DOMDOCUMENTTYPE.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTTYPE(
   n        IN      DOMNODE)
 RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 191–102 MAKEDOCUMENTTYPE Function Parameters

Parameter	Description
n	DOMNODE to cast.

MAKEELEMENT Function

This function casts a specified DOMNODE to a DOMELEMENT, and returns the DOMELEMENT.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKEELEMENT(
   n        IN      DOMNODE)
 RETURN DOMELEMENT;
```

Parameters

Table 191–103 MAKEELEMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEENTITY Function

This function casts a specified DOMNODE to a DOMENTITY, and returns the DOMENTITY.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKEENTITY(
   n        IN      DOMNODE)
 RETURN DOMENTITY;
```

Parameters

Table 191–104 MAKEENTITY Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEENTITYREFERENCE Function

This function casts a specified DOMNODE to a DOMENTITYREFERENCE, and returns the DOMENTITYREFERENCE.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKEENTITYREFERENCE(
   n        IN     DOMNODE)
 RETURN DOMENTITYREFERENCE;
```

Parameters

Table 191–105 MAKEENTITYREFERENCE Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKENODE Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Casts specified DOMATTR to a DOMNODE, and returns the DOMNODE (See Also: DOMAttr Subprograms on page 191-13):

```
DBMS_XMLDOM.MAKENODE(
   a         IN      DOMATTR)
 RETURN DOMNODE;
```

Casts the DOMCDATASECTION to a DOMNODE, and returns that DOMNODE (See Also: DOMCDataSection Subprograms on page 191-14):

```
DBMS_XMLDOM.MAKENODE(
   cds       IN      DOMCDATASECTION)
 RETURN DOMNODE;
```

Casts the specified DOMCHARACTERDATA as a DOMNODE, and returns that DOMNODE (See Also: DOMCharacterData Subprograms on page 191-15):

```
DBMS_XMLDOM.MAKENODE(
   cd        IN      DOMCHARACTERDATA)
 RETURN DOMNODE;
```

Casts the specified DOMCOMMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMComment Subprograms on page 191-16):

```
DBMS_XMLDOM.MAKENODE(
   com       IN      DOMCOMMENT)
 RETURN DOMNODE;
```

Casts the DOMDOCUMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocument Subprograms on page 191-17):

```
DBMS_XMLDOM.MAKENODE(
   doc       IN      DOMDOCUMENT)
 RETURN DOMNODE;
```

Casts the specified DOMDOCUMENTFRAGMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentFragment Subprograms on page 191-19):

```
DBMS_XMLDOM.MAKENODE(
   df        IN      DOMDOCUMENTFRAGMENT)
 RETURN DOMNode;
```

Casts the specified DOMDOCUMENTTYPE to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentType Subprograms on page 191-20):

```
DBMS_XMLDOM.MAKENODE(
   dt        IN      DOMDOCUMENTTYPE)
 RETURN DOMNODE;
```

Casts the specified DOMELEMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMElement Subprograms on page 191-21):

```
DBMS_XMLDOM.MAKENODE(
   elem        IN      DOMELEMENT)
```

```
 RETURN DOMNODE;
```

Casts specified DOMENTITY to a DOMNODE, and returns that DOMNODE (See Also: DOMEntity Subprograms on page 191-22):

```
DBMS_XMLDOM.MAKENODE(
   ent       IN     DOMENTITY)
 RETURN DOMNODE;
```

Casts the DOMENTITYREFERENCE to a DOMNODE, and returns that DOMNODE (See Also: DOMEntityReference Subprograms on page 191-23):

```
DBMS_XMLDOM.MAKENODE(
   eref       IN     DOMENTITYREFERENCE)
 RETURN DOMNODE;
```

Casts the DOMNOTATION to a DOMNODE, and returns that DOMNODE (See Also: DOMNotation Subprograms on page 191-27):

```
DBMS_XMLDOM.MAKENODE(
   n       IN     DOMNOTATION)
 RETURN DOMNODE;
```

Casts the DOMPROCESSINGINSTRUCTION to a DOMNODE, and returns the DOMNODE (See Also: DOMProcessingInstruction Subprograms on page 191-28):

```
DBMS_XMLDOM.MAKENODE(
   pi       IN     DOMPROCESSINGINSTRUCTION)
 RETURN DOMNODE;
```

Casts the DOMTEXT to a DOMNODE, and returns that DOMNODE (See Also: DOMText Subprograms on page 191-29):

```
DBMS_XMLDOM.MAKENODE(
   t       IN     DOMTEXT)
 RETURN DOMNODE;
```

Parameters

Table 191–106 MAKENODE Function Parameters

Parameter	Description
a	DOMATTR to cast
cds	DOMCDATASECTION to cast
cd	DOMCHARACTERDATA to cast
com	DOMCOMMENT to cast
doc	DOMDOCUMENT to cast
df	DOMDOCUMENTFRAGMENT to cast
dt	DOMDOCUMENTTYPE to cast
elem	DOMELEMENT to cast
ent	DOMENTITY to cast
eref	DOMENTITYREFERENCE to cast
n	DOMNOTATION to cast
pi	DOMPROCESSINGINSTRUCTION to cast

Table 191–106 (Cont.) MAKENODE Function Parameters

Parameter	Description
t	DOMTEXT to cast

MAKENOTATION Function

This function casts a specified DOMNODE to a DOMNOTATION, and returns the DOMNOTATION.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKENOTATION(
   n        IN     DOMNODE)
 RETURN DOMNOTATION;
```

Parameters

Table 191–107 MAKENOTATION Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEPROCESSINGINSTRUCTION Function

This function casts a specified DOMNODE to a DOMPROCESSINGINSTRUCTION, and returns the Domprocessinginstruction.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION(
   n        IN     DOMNODE)
 RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 191–108 MAKEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKETEXT Function

This function casts a specified DOMNODE to a DOMTEXT, and returns the DOMTEXT.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKETEXT(
   n        IN      DOMNODE)
 RETURN DOMTEXT;
```

Parameters

Table 191–109 MAKETEXT Function Parameters

Parameter	Description
n	DOMNODE to cast

NEWDOMDOCUMENT Functions

This function returns a new DOMDOCUMENT instance.

See Also: DOMDocument Subprograms on page 191-17

Syntax

Returns a new DOMDOCUMENT instance:

```
DBMS_XMLDOM.NEWDOMDOCUMENT
 RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified XMLType object:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
   xmldoc    IN SYS.XMLTYPE)
 RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified CLOB:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
   cl       IN    CLOB)
 RETURN DOMDOCUMENT;
```

Parameters

Table 191–110 NEWDOMDOCUMENT Function Parameters

Parameter	Description
xmldoc	XMLType source for the DOMDOCUMENT
cl	CLOB source for the DOMDOCUMENT

NORMALIZE Procedure

This procedure normalizes the text children of the DOMELEMENT.

See Also: DOMElement Subprograms on page 191-21

Syntax

```
DBMS_XMLDOM.NORMALIZE(
   elem       IN     DOMELEMENT);
```

Parameters

Table 191–111 NORMALIZE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT

REMOVEATTRIBUTE Procedures

This procedure removes an attribute from the DOMELEMENT by name.

See Also: DOMElement Subprograms on page 191-21

Syntax

Removes the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
   elem     IN    DOMELEMENT,
   name     IN    VARCHAR2);
```

Removes the value of a DOMELEMENT's attribute by name and namespace URI.

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
   elem     IN    DOMELEMENT,
   name     IN    VARCHAR2,
   ns       IN    VARCHAR2);
```

Parameters

Table 191–112 REMOVEATTRIBUTE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
ns	Namespace

REMOVEATTRIBUTENODE Function

This function removes the specified attribute node from the DOMELEMENT. The method returns the removed node.

See Also: DOMElement Subprograms on page 191-21

Syntax

```
DBMS_XMLDOM.REMOVEATTRIBUTENODE(
   elem       IN     DOMELEMENT,
   oldAttr    IN     DOMATTR)
  RETURN DOMAttr;
```

Parameters

Table 191–113 REMOVEATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT.
oldAttr	The old DOMATTR.

REMOVECHILD Function

This function removes the child node indicated by `oldchild` from the list of children, and returns it.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.REMOVECHILD(
   n          IN     DOMNode,
   oldchild   IN     DOMNode)
 RETURN DOMNODE;
```

Parameters

Table 191–114 REMOVECHILD Function Parameters

Parameter	Description
`n`	`DOMNODE`
`oldCHild`	The child of the node `n` to be removed

REMOVENAMEDITEM Function

This function removes from the map a node specified by name, and returns this node. When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

See Also: DOMNamedNodeMap Subprograms on page 191-25

Syntax

Removes a node specified by name:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
   nnm      IN     DOMNamedNodeMap,
   name     IN     VARCHAR2)
 RETURN DOMNode;
```

Removes a node specified by name and namespace URI:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
   nnm      IN     DOMNamedNodeMap,
   name     IN     VARCHAR2,
   ns       IN     VARCHAR2)
 RETURN DOMNode;
```

Parameters

Table 191–115 REMOVENAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNamedNodeMap
name	The name of the item to be removed from the map
ns	Namespace

REPLACECHILD Function

This function replaces the child node `oldchild` with `newchild` in the list of children, and returns the `oldchild` node. If `newchild` is a `DocumentFragment` object, `oldchild` is replaced by all of the `DocumentFragment` children, which are inserted in the same order. If the `newchild` is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.REPLACECHILD(
   n           IN     DOMNode,
   newchild    IN     DOMNode,
   oldchild    IN     DOMNode)
 RETURN DOMNode;
```

Parameters

Table 191–116 REPLACECHILD Function Parameters

Parameter	Description
`n`	`DOMNode`
`newchild`	The new child which is to replace the old child
`oldchild`	The child of the node n which is to be replaced

REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and length reflect the change.

See Also: DOMCharacterData Subprograms on page 191-15

Syntax

```
DBMS_XMLDOM.REPLACEDATA(
   cd         IN     DOMCHARACTERDATA,
   offset     IN     NUMBER,
   cnt        IN     NUMBER,
   arg        IN     VARCHAR2);
```

Parameters

Table 191–117 REPLACEDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to replace
cnt	The number of characters to replace
arg	The value to replace with

RESOLVENAMESPACEPREFIX Function

This function resolves the specified namespace prefix, and returns the resolved namespace.

See Also: DOMElement Subprograms on page 191-21

Syntax

```
DBMS_XMLDOM.RESOLVENAMESPACEPREFIX(
   elem       IN     DOMELEMENT,
   prefix     IN     VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 191–118 RESOLVENAMESPACEPREFIX Function Parameters

Parameter	Description
elem	The DOMELEMENT
prefix	Namespace prefix

SETATTRIBUTE Procedures

Sets the value of a DOMELEMENT's attribute by name.

See Also: DOMElement Subprograms on page 191-21

Syntax

Sets the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.SETATTRIBUTE(
   elem       IN  DOMELEMENT,
   name       IN  VARCHAR2,
   newvalue   IN  VARCHAR2);
```

Sets the value of a DOMElement's attribute by name and namespace URI:

```
DBMS_XMLDOM.SETATTRIBUTE(
   elem       IN  DOMELEMENT,
   name       IN  VARCHAR2,
   newvalue   IN  VARCHAR2,
   ns         IN  VARCHAR2);
```

Parameters

Table 191–119 SETATTRIBUTE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
newvalue	Attribute value
ns	Namespace

SETATTRIBUTENODE Functions

Adds a new attribute node to the DOMELEMENT.

See Also: DOMElement Subprograms on page 191-21

Syntax

Adds a new attribute node to the DOMELEMENT:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
   elem      IN  DOMELEMENT,
   newAttr   IN  DOMATTR)
 RETURN DOMATTR;
```

Adds a new attribute node to the DOMElement; namespace enabled:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
   elem      IN  DOMELEMENT,
   newAttr   IN  DOMATTR,
   ns        IN  VARCHAR2)
 RETURN DOMATTR;
```

Parameters

Table 191–120 SETATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT
newAttr	The new DOMATTR
ns	The namespace

SETCHARSET Procedure

This function sets the characterset of the DOM document.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.SETCHARSET(
   doc      IN    DOMDocument,
   charset  IN    VARCHAR2);
```

Parameters

Table 191–121 SETCHARSET Procedure Parameters

Parameter	Description
doc	DOM document
charset	Characterset

Usage Notes

This is used for WRITETOFILE Procedures if not explicitly specified at that time.

SETDATA Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Sets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms on page 191-15):

```
DBMS_XMLDOM.SETDATA(
   cd       IN     DOMCHARACTERDATA,
   data     IN     VARCHAR2);
```

Sets the content data of the DOMPROCESSINGINSTRUCTION (See Also: DOMProcessingInstruction Subprograms on page 191-15):

```
DBMS_XMLDOM.SETDATA(
   pi       IN     DOMPROCESSINGINSTRUCTION,
   data     IN     VARCHAR2);
```

Parameters

Table 191–122 SETDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
data	The data to which the node is set
pi	DOMPROCESSINGINSTRUCTION
data	New processing instruction content data

SETDOCTYPE Procedure

Given a DOM document, this procedure creates a new DTD with the specified name, system id and public id and sets it in the document. This DTD can later be retrieved using the GETDOCTYPE Function.

Syntax

```
DBMS_XMLDOM.SETDOCTYPE(
  doc      IN   DOMDocument,
  name     IN   VARCHAR2,
  sysid    IN   VARCHAR2,
  pubid    IN   VARCHAR2);
```

Parameters

Table 191–123 SETDOCTYPE Procedure Parameters

Parameter	Description
doc	The document whose DTD has to be set
name	The name that the doctype needs to be initialized with
sysid	The system ID that the doctype needs to be initialized with
pubid	The public ID that the doctype needs to be initialized with

SETNAMEDITEM Function

This function adds a node using its NodeName attribute. If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, NULL is returned.

As the NodeName attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

See Also: DOMNamedNodeMap Subprograms on page 191-25

Syntax

Adds a node using its NodeName attribute:

```
DBMS_XMLDOM.SETNAMEDITEM(
   nnm      IN     DOMNAMEDNODEMAP,
   arg      IN     DOMNODE)
 RETURN DOMNode;
```

Adds a node using its NodeName attribute and namespace URI:

```
DBMS_XMLDOM.SETNAMEDITEM(
   nnm      IN     DOMNAMEDNODEMAP,
   arg       IN    DOMNODE,
   ns       IN     VARCHAR2)
 RETURN DOMNode;
```

Parameters

Table 191–124 SETNAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
arg	The Node to be added using its NodeName attribute
ns	Namespace

SETNODEVALUE Procedure

This procedure sets the value of this node, depending on its type. When it is defined to be `NULL`, setting it has no effect.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.SETNODEVALUE(
   n         IN     DOMNODE,
   nodeValue IN     VARCHAR2);
```

Parameters

Table 191–125 SETNODEVALUE Procedure Parameters

Parameter	Description
`n`	`DOMNode`
`nodeValue`	The value to which node is set

SETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 191-11

Syntax

This function returns an instance of the PL/SQL `XMLBINARYOUTPUTSTREAM` into which the caller can write the node value. The datatype of the node must be `RAW` or `BLOB` – if not, an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
   n      IN     DOMNODE)
 RETURN SYS.UTL_BINARYOUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `sys.utl_BinaryInputStream` from which XDB reads data to populate the node. The datatype of the node must be `RAW` or BLOB – if not an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
   n        in   DOMNODE,
   value    in   SYS.UTL_BINARYINPUTSTREAM);
```

Parameters

Table 191–126 SETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	BINARYINPUTSTREAM

SETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 191-11

Syntax

This function returns an instance of the PL/SQL `XMLCHARACTEROUTPUTSTREAM` type into which the caller can write the node value. The datatype of the node can be any valid XDB datatype. If the type is not character or `CLOB`, the character data written to the stream is converted to the node datatype. If the datatype of the node is character or `CLOB`, then the character data written to the stream is converted from PL/SQL session character set to the character set of the node.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM  (
   n        IN     DOMNODE)
 RETURN SYS.UTL_CHARACTEROUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `SYS.UTL_CHARACTERINPUTSTREAM` from which XDB reads to populate the node. The datatype of the node may be any valid type supported by XDB. If a non-character datatype, the character data read from the stream is converted to the datatype of the node. If the datatype of the node is either character or `CLOB`, then no conversion occurs and the character set of the node becomes the character set of the PL/SQL session.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM  (
   n        IN   DOMNODE,
   value    IN   SYS.UTL_CHARACTERINPUTSTREAM);
```

Parameters

Table 191–127 SETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
n	`DOMNODE`
value	`CHARACTERINPUTSTREAM`

SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the specified value.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.SETPREFIX(
   n       IN     DOMNODE,
   prefix  IN     VARCHAR2);
```

Parameters

Table 191–128 SETPREFIX Procedure Parameters

Parameter	Description
n	DOMNODE
prefix	The value for the namespace prefix of the node

SETSTANDALONE Procedure

This procedure sets the standalone property of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.SETSTANDALONE(
   doc          IN     DOMDOCUMENT,
   newvalue     IN     VARCHAR2);
```

Parameters

Table 191–129 SETSTANDALONE Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT
newvalue	Value of the standalone property of the document

SETVALUE Procedure

This procedure sets the value of the attribute.

See Also: DOMAttr Subprograms on page 191-13

Syntax

```
DBMS_XMLDOM.SETVALUE(
   a       IN     DOMATTR,
   value   IN     VARCHAR2);
```

Parameters

Table 191–130 SETVALUE Procedure Parameters

Parameter	Description
a	DOMATTR
value	The value to which to set the attribute

SETVERSION Procedure

This procedure sets the version of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.SETVERSION(
   doc         IN     DOMDOCUMENT,
   version     IN     VARCHAR2);
```

Parameters

Table 191–131 SETVERSION Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT
version	The version of the document

SPLITTEXT Function

This function breaks this DOMTEXT node into two DOMTEXT nodes at the specified offset.

See Also: DOMText Subprograms on page 191-29

Syntax

```
DBMS_XMLDOM.SPLITTEXT(
   t        IN     DOMTEXT,
   offset   IN     NUMBER)
 RETURN DOMText;
```

Parameters

Table 191–132 SPLITTEXT Function Parameters

Parameter	Description
t	DOMTEXT
offset	Offset at which to split

SUBSTRINGDATA Function

This function extracts a range of data from the node.

See Also: DOMCharacterData Subprograms on page 191-15

Syntax

```
DBMS_XMLDOM.SUBSTRINGDATA(
   cd        IN     DOMCHARACTERDATA,
   offset    IN     NUMBER,
   cnt       IN     NUMBER)
 RETURN VARCHAR2;
```

Parameters

Table 191–133 SUBSTRINGDATA Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The starting offset of the data from which to get the data
cnt	The number of characters (from the offset) of the data to get

USEBINARYSTREAM Function

This function returns TRUE if the datatype of the node is RAW or BLOB so that the node value may be read or written using an UTL_BINARYINPUTSTREAM or UTL_BINARYOUTPUTSTREAM. If a value of FALSE is returned, the node value may only be accessed through an UTL_CHARACTERINPUTSTREAM or UTL_CHARACTEROUTPUTSTREAM.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.USEBINARYSTREAM   (
   n        IN     DOMNODE)
 RETURN BOOLEAN;
```

Parameters

Table 191–134 USEBINARYSTREAM Function Parameters

Parameter	Description
n	DOMNODE

WRITETOBUFFER Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified buffer using the database character set (See Also: DOMNode Subprograms on page 191-11):

```
DBMS_XMLDOM.WRITETOBUFFER(
   n        IN      DOMNODE,
   buffer   IN OUT  VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: DOMDocument Subprograms on page 191-17):

```
DBMS_XMLDOM.WRITETOBUFFER(
   doc       IN      DOMDOCUMENT,
   buffer    IN OUT  VARCHAR2);
```

Writes the contents of the specified document fragment into a buffer using the database character set (See Also: DOMDocumentFragment Subprograms on page 191-19):

```
DBMS_XMLDOM.WRITETOBUFFER(
   df        IN      DOMDOCUMENTFRAGMENT,
   buffer    IN OUT  VARCHAR2);
```

Parameters

Table 191–135 WRITETOBUFFER Procedure Parameters

Parameter	Description
n	DOMNODE
buffer	Buffer to which to write
doc	DOMDOCUMENT
df	DOM document fragment

WRITETOCLOB Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified CLOB using the database character set (See Also: DOMNode Subprograms on page 191-11):

```
DBMS_XMLDOM.WRITETOCLOB(
   n       IN      DOMNODE,
   cl      IN OUT  CLOB);
```

Writes XML document to a specified CLOB using database character set (See Also: DOMDocument Subprograms on page 191-17):

```
DBMS_XMLDOM.WRITETOCLOB(
   doc     IN      DOMDOCUMENT,
   cl      IN OUT  CLOB);
```

Parameters

Table 191–136 WRITETOCLOB Procedure Parameters

Parameter	Description
n	DOMNODE
cl	CLOB to which to write
doc	DOMDOCUMENT

WRITETOFILE Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified file using the database character set (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   n          IN      DOMNODE,
   fileName   IN      VARCHAR2);
```

Writes XML node to specified file using the specified character set, which is passed in as a separate parameter (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   n          IN      DOMNODE,
   fileName   IN      VARCHAR2,
   charset    IN      VARCHAR2);
```

Writes an XML document to a specified file using database character set (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   doc        IN   DOMDOCUMENT,
   filename   IN   VARCHAR2);
```

Writes an XML document to a specified file using specified character set (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   doc        IN   DOMDOCUMENT,
   fileName   IN   VARCHAR2,
   charset    IN   VARCHAR2);
```

Parameters

Table 191–137 WRITETOFILE Procedure Parameters

Parameter	Description
n	DOMNODE
fileName	File to which to write. The filename should be in standard directory to filename format, for example /root/folder1/filename (on windows, use \ instead of /).
charset	specified character set
doc	DOMDOCUMENT
charset	Character set

192

DBMS_XMLGEN

The DBMS_XMLGEN package converts the results of a SQL query to a canonical XML format. The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a CLOB. This package is similar to the DBMS_XMLQUERY package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

> **See Also:** *Oracle XML DB Developer's Guide*, for more information on XML support and on examples of using DBMS_XMLGEN

Using DBMS_XMLGEN

Security Model

Owned by XDB, the DBMS_XMLGEN package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Summary of DBMS_XMLGEN Subprograms

Table 192–1 Summary of DBMS_XMLGEN Package Subprograms

Subprogram	Description
CLOSECONTEXT Procedure on page 192-5	Closes the context and releases all resources
CONVERT Functions on page 192-6	Converts the XML into the escaped or unescaped XML equivalent
GETNUMROWSPROCESSED Function on page 192-7	Gets the number of SQL rows that were processed in the last call to GETXML Functions
GETXML Functions on page 192-8	Gets the XML document
GETXMLTYPE Functions on page 192-9	Gets the XML document and returns it as `XMLType`
NEWCONTEXT Functions on page 192-10	Creates a new context handle
NEWCONTEXTFROMHIERARCHY Function on page 192-11	Obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result
RESTARTQUERY Procedure on page 192-12	Restarts the query to start fetching from the beginning
SETCONVERTSPECIALCHARS Procedure on page 192-13	Sets whether special characters such as `$`, which are non-XML characters, should be converted or not to their escaped representation
SETMAXROWS Procedure on page 192-14	Sets the maximum number of rows to be fetched each time
SETNULLHANDLING Procedure on page 192-15	Sets `NULL` handling options
SETROWSETTAG Procedure on page 192-16	Sets the name of the element enclosing the entire result
SETROWTAG Procedure on page 192-17	Sets the name of the element enclosing each row of the result
SETSKIPROWS Procedure on page 192-18	Sets the number of rows to skip every time before generating the XML.
USEITEMTAGSFORCOLL Procedure on page 192-19	Forces the use of the collection column name appended with the tag `_ITEM` for collection elements
USENULLATTRIBUTEINDICATOR Procedure on page 192-20	Specifies whether to use an XML attribute to indicate `NULL`ness, or to do it by omitting the inclusion of the particular entity in the XML document.

CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

Syntax

```
DBMS_XMLGEN.CLOSECONTEXT (
   ctx  IN ctxHandle);
```

Parameters

Table 192–2 CLOSECONTEXT Procedure Parameters

Parameter	Description
ctx	The context handle to close.

CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML CLOB data in encoded or decoded format. There are several version of the function.

Syntax

Uses XMLDATA in string form (VARCHAR2):

```
DBMS_XMLGEN.CONVERT (
   xmlData IN VARCHAR2,
   flag    IN NUMBER := ENTITY_ENCODE)
RETURN VARCHAR2;
```

Uses XMLDATA in CLOB form:

```
DBMS_XMLGEN.CONVERT (
   xmlData IN CLOB,
   flag    IN NUMBER := ENTITY_ENCODE)
 RETURN CLOB;
```

Parameters

Table 192–3 CONVERT Function Parameters

Parameter	Description
xmlData	The XML CLOB data to be encoded or decoded.
flag	The flag setting; ENTITY_ENCODE (default) for encode, and ENTITY_DECODE for decode.

Usage Notes

This function escapes the XML data if the ENTITY_ENCODE is specified. For example, the escaped form of the character < is <. Unescaping is the reverse transformation.

GETNUMROWSPROCESSED Function

This function retrieves the number of SQL rows processed when generating the XML using the GETXML Functions call. This count does not include the number of rows skipped before generating the XML. Note that GETXML Functions always generates an XML document, even if there are no rows present.

Syntax

```
DBMS_XMLGEN.GETNUMROWSPROCESSED (
   ctx      IN    ctxHandle)
RETURN NUMBER;
```

Parameters

Table 192–4 GETNUMROWSPROCESSED Function Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call on page 192-10.

Usage Notes

This function is used to determine the terminating condition if calling GETXML Functions in a loop.

GETXML Functions

This function gets the XML document. The function is overloaded.

Syntax

Gets the XML document by fetching the maximum number of rows specified. It appends the XML document to the CLOB passed in. Use this version of GETXML Functions to avoid any extra CLOB copies and to reuse the same CLOB for subsequent calls. Because of the CLOB reuse, this GETXML Functionscall is potentially more efficient:

```
DBMS_XMLGEN.GETXML (
   ctx          IN ctxHandle,
   tmpclob      IN OUT NCOPY CLOB,
   dtdOrSchema  IN number := NONE)
 RETURN BOOLEAN;
```

Generates the XML document and returns it as a temporary CLOB. The temporary CLOB obtained from this function must be freed using the DBMS_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
   ctx          IN ctxHandle,
   dtdOrSchema  IN number := NONE)
 RETURN CLOB;
```

Converts the results from the SQL query string to XML format, and returns the XML as a temporary CLOB, which must be subsequently freed using the DBMS_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
   sqlQuery     IN VARCHAR2,
   dtdOrSchema  IN number := NONE)
 RETURN CLOB;
```

Parameters

Table 192–5 GETXML Function Parameters

Parameter	Description
ctx	The context handle obtained from the newContext call.
tmpclob	The CLOB to which the XML document is appended.
sqlQuery	The SQL query string.
dtdOrSchema	Generate a DTD or a schema? Only NONE is supported.

Usage Notes

When the rows indicated by the SETSKIPROWS Procedure call are skipped, the maximum number of rows as specified by the SETMAXROWS Procedure call (or the entire result if not specified) is fetched and converted to XML. Use the GETNUMROWSPROCESSED Function to check if any rows were retrieved.

GETXMLTYPE Functions

This function gets the XML document and returns it as an XMLTYPE. XMLTYPE operations can be performed on the results.This function is overloaded.

Syntax

Generates the XML document and returns it as a sys.XMLType:

```
DBMS_XMLGEN.GETXMLTYPE (
   ctx           IN ctxhandle,
   dtdOrSchema   IN number := NONE)
 RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a sys.XMLType:

```
DBMS_XMLGEN.GETXMLTYPE (
   sqlQuery     IN VARCHAR2,
   dtdOrSchema  IN number := NONE)
 RETURN sys.XMLType
```

Parameters

Table 192–6 GETXMLTYPE Function Parameters

Parameter	Description
ctx	The context handle obtained from the newContext call.
sqlQuery	The SQL query string.
dtdOrSchema	Generate a DTD or a schema? Only NONE is supported.

NEWCONTEXT Functions

This function generates and returns a new context handle. This context handle is used in GETXML Functions and other functions to get XML back from the result. There are several version of the function.

Syntax

Generates a new context handle from a query:

```
DBMS_XMLGEN.NEWCONTEXT (
      query     IN VARCHAR2)
 RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```
DBMS_XMLGEN.NEWCONTEXT (
   queryString  IN SYS_REFCURSOR)
 RETURN ctxHandle;
```

Parameters

Table 192–7 NEWCONTEXT Function Parameters

Parameter	Description
`query`	The query, in the form of a `VARCHAR`, the result of which must be converted to XML.
`queryString`	The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML.

NEWCONTEXTFROMHIERARCHY Function

This function obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result.

Syntax

```
DBMS_XMLGEN.NEWCONTEXTFROMHIERARCHY (
   queryString IN VARCHAR2)
 RETURN ctxHandle;
```

Parameters

Table 192–8 NEWCONTEXTFROMHIERARCHY Function Parameters

Parameter	Description
queryString	The query string, the result of which must be converted to XML. The query is a hierarchical query typically formed using a CONNECT BY clause, and the result must have the same property as the result set generated by a CONNECT BY query. The result set must have only two columns, the level number and an XML value. The level number is used to determine the hierarchical position of the XML value within the result XML document.

RESTARTQUERY Procedure

This procedure restarts the query and generates the XML from the first row. It can be used to start executing the query again, without having to create a new context.

Syntax

```
DBMS_XMLGEN.RESTARTQUERY (
ctx  IN ctxHandle);
```

Parameters

Table 192–9 RESTARTQUERY Procedure Parameters

Parameter	Description
ctx	The context handle corresponding to the current query.

SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the < sign is converted to `<`. The default is to perform conversions. This function improves performance of XML processing when the input data cannot contain any special characters such as <, >, `"`, `'`, which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.

Syntax

```
DBMS_XMLGEN.SETCONVERTSPECIALCHARS (
ctx   IN ctxHandle,
conv  IN BOOLEAN);
```

Parameters

Table 192–10 SETCONVERTSPECIALCHARS Procedure Parameters

Parameter	Description
`ctx`	The context handle obtained from one of the NEWCONTEXT Functions call on page 192-10.
`conv`	`TRUE` indicates that conversion is needed.

SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invocation of the GETXML Functions call. It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the `maxrows` parameter.

Syntax

```
DBMS_XMLGEN.SETMAXROWS (
ctx      IN ctxHandle,
maxRows  IN NUMBER);
```

Parameters

Table 192–11 SETMAXROWS Procedure Parameters

Parameter	Description
`ctx`	The context handle corresponding to the query executed.
`maxRows`	The maximum number of rows to get for each call to GETXML Functions

SETNULLHANDLING Procedure

This procedure sets NULL handling options, handled through the flag parameter setting.

Syntax

```
DBMS_XMLGEN.SETNULLHANDLING(
ctx  IN ctx,
flag IN NUMBER);
```

Parameters

Table 192–12 SETNULLHANDLING Procedure Parameters

Parameter	Description
ctx	The context handle corresponding to the query executed.
flag	The NULL handling option set. ■ DROP_NULLS CONSTANT NUMBER:= 0; (Default) Leaves out the tag for NULL elements. ■ NULL_ATTR CONSTANT NUMBER:= 1; Sets xsi:nil="true". ■ EMPTY_TAG CONSTANT NUMBER:= 2; Sets, for example, <foo/>.

SETROWSETTAG Procedure

This procedure sets the name of the root element of the document. The default name is `ROWSET`.

Syntax

```
DBMS_XMLGEN.SETROWSETTAG (
ctx            IN ctxHandle,
rowSetTagName  IN VARCHAR2);
```

Parameters

Table 192–13 SETROWSETTAG Procedure Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call on page 192-10.
rowSetTagName	The name of the document element. Passing `NULL` indicates that you do not want the `ROWSET` element present.

Usage Notes

The user can set the `rowSetTag` to `NULL` to suppress the printing of this element. However, an error is produced if both the row and the rowset are `NULL` and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is `ROW`.

Syntax

```
DBMS_XMLGEN.SETROWTAG (
ctx         IN ctxHandle,
rowTagName  IN VARCHAR2);
```

Parameters

Table 192–14 SETROWTAG Procedure Parameters

Parameter	Description
`ctx`	The context handle obtained from the NEWCONTEXT Functions call on page 192-10.
`rowTagName`	The name of the `ROW` element. Passing `NULL` indicates that you do not want the `ROW` element present.

Usage Notes

The user can set the name of the element to `NULL` to suppress the `ROW` element itself. However, an error is produced if both the row and the rowset are `NULL` and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

SETSKIPROWS Procedure

This procedure skips a given number of rows before generating the XML output for every call to the GETXML Functions. It is used when generating paginated results for stateless Web pages using this utility. For example, when generating the first page of XML or HTML data, set `skiprows` to zero. For the next set, set the `skiprows` to the number of rows obtained in the first case. See GETNUMROWSPROCESSED Function on page 192-7.

Syntax

```
DBMS_XMLGEN.SETSKIPROWS (
ctx       IN ctxHandle,
skipRows  IN NUMBER);
```

Parameters

Table 192–15 SETSKIPROWS Procedure Parameters

Parameter	Description
`ctx`	The context handle corresponding to the query executed.
`skipRows`	The number of rows to skip for each call to `getXML`.

USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

Syntax

```
DBMS_XMLGEN.USEITEMTAGSFORCOLL (
   ctx  IN ctxHandle);
```

Parameters

Table 192–16 USEITEMTAGSFORCOLL Procedure Parameters

Parameter	Description
ctx	The context handle.

Usage Notes

Using this procedure, you can override the default to use the name of the column with the _ITEM tag appended to it. If there is a collection of NUMBER, the default tag name for the collection elements is NUMBER.

USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document. It is used as a shortcut for the SETNULLHANDLING Procedure.

Syntax

```
DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR(
ctx       IN   ctxType,
attrind   IN   BOOLEAN := TRUE);
```

Parameters

Table 192–17 USENULLATTRIBUTEINDICATOR Procedure Parameters

Parameter	Description
ctx	Context handle.
attrind	Use attribute to indicate NULL?

193

DBMS_XMLINDEX

The DBMS_XMLINDEX package provides an interface to implement asychronous indexing.

> **See Also:** *Oracle XML DB Developer's Guide* for more information about "XMLIndex"

This chapter contains the following topics:

Using DBMS_XMLINDEX

Overview

Asynchronous Index Maintenance

The basic XMLIndex is maintained on every DML operation. However, given the computing costs, in many cases the availability of stale result is adequate. In such situations, it is desirable to defer index updates to a convenient time, for example to a time when the load on the database is low. Thus a mechanism for asynchronous index maintenance is provided.

Security Model

Owned by XDB, the DBMS_XMLINDEX package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Summary of DBMS_XMLINDEX Subprograms

This table list the package subprograms in alphabetical order.

Table 193–1 DBMS_XMLINDEX Package Subprograms

Subprogram	Description
CREATEDATEINDEX Procedure on page 193-6	Creates a secondary index for date values in the `VALUE` column of a `PATH TABLE` which is the storage table of an `XMLIndex`
CREATENUMBERINDEX Procedure on page 193-7	Creates a secondary index for number values in the `VALUE` column of a `PATH TABLE` which is the storage table of an `XMLIndex`
DROPPARAMETER Procedure on page 193-8	Drops the `XMLIndex` parameter string that is associated with a given parameter identifier.
MODIFYPARAMETER Procedure on page 193-9	Modifies the `XMLIndex` parameter string that is associated with a given parameter name
PROCESS_PENDING Procedure on page 193-10	Processes pending rows for a `NONBLOCKING ALTER INDEX OPERATION` on an `XMLIndex`
REGISTERPARAMETER Procedure on page 193-11	Registers a parameter string and `XMLIndex` parameter string pair in XDB
SYNCINDEX Procedure on page 193-12	Synchronizes the index manually

CREATEDATEINDEX Procedure

This procedure creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex. The second form of the procedure allows for the date_index_clause to be set to an empty string.

Syntax

```
DBMS_XMLINDEX.CREATEDATEINDEX  (
   xml_index_schema   IN   VARCHAR2,
   xml_index_name     IN   VARCHAR2,
   date_index_name    IN   VARCHAR2,
   xmltypename        IN   VARCHAR2,
   date_index_clause  IN   VARCHAR2);

DBMS_XMLINDEX.CREATEDATEINDEX  (
   xml_index_schema   IN   VARCHAR2
   xml_index_name     IN   VARCHAR2,
   date_index_name    IN   VARCHAR2,
   xmltypename        IN   VARCHAR2);
```

Parameters

Table 193–2 CREATEDATEINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
date_index_name	Name of the secondary index to be created for date values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: DATETIME, TIME, DATE, GDAY, GMONTH, GYEAR, GYEARMONTH, GMONTHDAY.
date_index_clause	Storage clause to be applied to the date index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the date index

CREATENUMBERINDEX Procedure

This procedure creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex.

Syntax

```
DBMS_XMLINDEX.CREATENUMBERINDEX (
   xml_index_schema   IN   VARCHAR2,
   xml_index_name     IN   VARCHAR2,
   num_index_name     IN   VARCHAR2,
   num_index_clause   IN   VARCHAR2,
   xmltypename        IN   VARCHAR2);
```

Parameters

Table 193–3 CREATENUMBERINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
num_index_name	Name of the secondary index to be created for number values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema
num_index_clause	Storage clause to be applied to the number index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the number index.
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: FLOAT, DOUBLE, DECIMAL, INTEGER, NONPOSITIVEINTEGER, NEGATIVEINTEGER, LONG, INT, SHORT, BYTE, NONNEGATIVEINTEGER, UNSIGNEDLONG, UNSIGNEDINT, UNSIGNEDSHORT, UNSIGNEDBYTE, POSITIVEINTEGER.

DROPPARAMETER Procedure

This procedure drops the `XMLIndex` parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.DROPPARAMETER (
   name         IN      VARCHAR2);
```

Parameters

Table 193–4 DROPPARAMETER Procedure Parameters

Parameter	Description
`name`	Identifier for parameter string

Examples

```
DBMS_XMLINDEX.DROPPARAMETER (
   'myIndexParam');
```

MODIFYPARAMETER Procedure

This procedure modifies the XMLIndex parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.MODIFYPARAMETER (
   name        IN      VARCHAR2,
   parameter   IN      CLOB);
```

Parameters

Table 193–5 MODIFYPARAMETER Procedure Parameters

Parameter	Description
name	Identifier for parameter string
parameter	XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement

Examples

```
DBMS_XMLINDEX.MODIFYPARAMETER (
   'myIndexParam',
   'PATH TABLE po_ptab
    PATH ID INDEX po_pidx
    ORDER KEY INDEX po_oidx
    VALUE INDEX po_vidx');
```

PROCESS_PENDING Procedure

This procedure processes executes DMLs required to complete a NONBLOCKING ALTER INDEX ADD_GROUP/ADD_COLUMN operation on an XMLIndex.

Syntax

```
DBMS_XMLINDEX.PROCESS_PENDING (
   xml_index_schema    IN     VARCHAR2,
   xml_index_name      IN     VARCHAR2,
   pending_row_count   OUT    BINARY_INTEGER,
   error_row_count     OUT    BINARY_INTEGER);
```

Parameters

Table 193–6 PROCESS_PENDING Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex to be altered using NONBLOCKING ALTER INDEX OPERATION
pending_row_count	Number of pending rows to be processed
error_row_count	Number of rows for which indexing may have failed because of an error

Usage Notes

- This procedure will iteratively attempt to index all necessary rows in small batches while skipping rows that are locked and rows for which index maintenance fails with an error. Therefore, it may have to be executed multiple times for an XMLIndex until all pending rows are processed. Once all pending rows are processed, user can complete the NONBLOCKING ALTER INDEX OPERATION.
- If it is not possible process all the pending rows after multiple trials, the user will have to manually triage the locking or error issues by examining unprocessed rows in SYS_AIXSXI_######_PENDINGTAB and errors in SYS_AIXSXI_#####_ ERRORTAB.. Keeping track of rows and the errors is useful in triaging issues.

Examples

```
EXEC DBMS_XMLINDEX.PROCESS_PENDING(
   'SCOTT', 'PO_XMLINDEX_IX', out_param1, out_param2);
```

REGISTERPARAMETER Procedure

This procedure registers a parameter identifier and XMLIndex parameter string pair in XDB.

Syntax

```
DBMS_XMLINDEX.REGISTERPARAMETER (
   name        IN      VARCHAR2,
   parameter   IN      CLOB);
```

Parameters

Table 193–7 REGISTERPARAMETER Procedure Parameters

Parameter	Description
name	Identifier for parameter string
parameter	XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement

Examples

```
DBMS_XMLINDEX.REGISTERPARAMETER (
   'myIndexParam',
   'PATH TABLE po_ptab
    PATH ID INDEX po_pidx
    ORDER KEY INDEX po_oidx
    VALUE INDEX po_vidx
    PATHS(NAMESPACE MAPPING(xmlns:p="http://www.example.com/IPO"))
    GROUP MASTERGROUP XMLTABLE PO_TAB
    (''/p:PurchaseOrder''
        COLUMNS
           REFERENCE VARCHAR2(30) PATH ''p:Reference'',
           REQUESTOR VARCHAR2(30) PATH ''p:Requestor'' )
    GROUP ITEMGROUP XMLTABLE ITEMGROUP_TAB
    (''/p:PurchaseOrder/p:LineItems/p:LineItem''
        COLUMNS
           LINENUMBER NUMBER(38) PATH ''@p:ItemNumber'',
           QUANTITY NUMBER(38) PATH ''@p:Quantity'',
           DESCRIPTION VARCHAR2(256) PATH ''p:Description'''));
```

SYNCINDEX Procedure

This function synchronizes an asynchronously maintained XMLIndex. It applies to the XMLIndex changes that are logged in the pending table, and brings the path table up-to-date with the base XMLTYPE column.

Syntax

```
DBMS_XMLINDEX.SYNCINDEX (
   xml_index_schema      IN VARCHAR2,
   xml_index_name        IN VARCHAR2,
   partition_name        IN VARCHAR2 DEFAULT NULL,
   reindex               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 193–8 SYNCINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_schema_name	Name of the XMLIndex
partition_name	[Currently not supported]
reindex	Default is FALSE. If set to TRUE, this drops the secondary indexes and recreates them later so that they can be bulk-loaded.

Examples

```
EXEC DBMS_XMLINDEX.SYNCINDEX('USER1', 'SS_TAB_XMLI', REINDEX=>TRUE);
```

194

DBMS_XMLPARSER

Using DBMS_XMLPARSER, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

See Also: *Oracle XML DB Developer's Guide*

Using DBMS_XMLPARSER

Security Model

Owned by XDB, the DBMS_XDB_XMLPARSER package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Summary of DBMS_XMLPARSER Subprograms

Table 194–1 DBMS_XMLPARSER Package Subprograms

Method	Description
FREEPARSER on page 194-5	Frees a parser object.
GETDOCTYPE on page 194-6	Gets parsed DTD.
GETDOCUMENT on page 194-7	Gets DOM document.
GETRELEASEVERSION on page 194-7	Returns the release version of Oracle XML Parser for PL/SQL.
GETVALIDATIONMODE on page 194-9	Returns validation mode.
NEWPARSER on page 194-10	Returns a new parser instance
PARSE on page 194-11	Parses XML stored in the given url/file.
PARSEBUFFER on page 194-12	Parses XML stored in the given buffer
PARSECLOB on page 194-12	Parses XML stored in the given clob
PARSEDTD on page 194-14	Parses DTD stored in the given url/file
PARSEDTDBUFFER on page 194-15	Parses DTD stored in the given buffer
PARSEDTDCLOB on page 194-16	Parses DTD stored in the given clob
SETBASEDIR on page 194-17	Sets base directory used to resolve relative URLs.
SETDOCTYPE on page 194-18	Sets DTD.
SETERRORLOG on page 194-19	Sets errors to be sent to the specified file
SETPRESERVEWHITESPACE on page 194-20	Sets white space preserve mode
SETVALIDATIONMODE on page 194-21	Sets validation mode.
SHOWWARNINGS on page 194-22	Turns warnings on or off.

FREEPARSER

Frees a parser object.

Syntax

```
PROCEDURE freeParser(
    p Parser);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

GETDOCTYPE

Returns the parsed DTD; this function must be called only after a DTD is parsed.

Syntax

```
FUNCTION getDoctype(
p Parser)
RETURN DOMDocumentType;
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

GETDOCUMENT

Returns the document node of a DOM tree document built by the parser; this function must be called only after a document is parsed.

Syntax

```
FUNCTION GETDOCUMENT(
p Parser)
RETURN DOMDocument;
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

GETRELEASEVERSION

Returns the release version of the Oracle XML parser for PL/SQL.

Syntax

```
FUNCTION getReleaseVersion
RETURN VARCHAR2;
```

GETVALIDATIONMODE

Retrieves validation mode; TRUE for validating, FALSE otherwise.

Syntax

```
FUNCTION GETVALIDATIONMODE(
p Parser)
RETURN BOOLEAN;
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

NEWPARSER

Returns a new parser instance. This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

Syntax

```
FUNCTION newParser
RETURN Parser;
```

PARSE

Parses XML stored in the given URL or file. An application error is raised if parsing fails. There are several versions of this method.

Syntax	Description

`FUNCTION parse(`
`  url VARCHAR2)`
`RETURN DOMDocument;`
	Returns the built DOM Document. This is meant to be used when the default parser behavior is acceptable and just a url/file needs to be parsed.

`PROCEDURE parse(`
`  p Parser,`
`  url VARCHAR2);`
	Any changes to the default parser behavior should be effected before calling this procedure.

Parameter	IN / OUT	Description
`url`	`(IN)`	Complete path of the url/file to be parsed.
`p`	`(IN)`	Parser instance.

PARSEBUFFER

Parses XML stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEBUFFER(
p   Parser,
doc VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

PARSECLOB

Parses XML stored in the given clob. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSECLOB(
p   Parser,
doc CLOB);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

PARSEDTD

Parses the DTD stored in the given URL or file. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTD(
p     Parser,
url   VARCHAR2,
root  VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
url	(IN)	Complete path of the URL or file to be parsed.
root	(IN)	Name of the root element.

PARSEDTDBUFFER

Parses the DTD stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDBUFFER(
p    Parser,
dtd  VARCHAR2,
root VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD buffer to parse.
root	(IN)	Name of the root element.

PARSEDTDCLOB

Parses the DTD stored in the given clob. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDCLOB(
p    Parser,
dtd  CLOB,
root VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD Clob to parse.
root	(IN)	Name of the root element.

SETBASEDIR

Sets base directory used to resolve relative URLs. An application error is raised if parsing fails.

Syntax

```
PROCEDURE setBaseDir(
p   Parser,
dir VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dir	(IN)	Directory used as a base directory.

SETDOCTYPE

Sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

Syntax

```
PROCEDURE setDoctype(
p   Parser,
dtd DOMDocumentType);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD to set.

SETERRORLOG

Sets errors to be sent to the specified file.

Syntax

```
PROCEDURE setErrorLog(
p        Parser,
fileName VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
fileName	(IN)	Complete path of the file to use as the error log.

SETPRESERVEWHITESPACE

Sets whitespace preserving mode.

Syntax

```
PROCEDURE setPreserveWhitespace(
p   Parser,
yes BOOLEAN);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - preserve, FALSE - don't preserve.

SETVALIDATIONMODE

Sets validation mode.

Syntax

```
PROCEDURE setValidationMode(
p   Parser,
yes BOOLEAN);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - validate, FALSE - don't validate.

SHOWWARNINGS

Turns warnings on or off.

Syntax

```
PROCEDURE showWarnings(
p   Parser,
yes BOOLEAN);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - show warnings, FALSE - don't show warnings.

195

DBMS_XMLQUERY

DBMS_XMLQUERY provides database-to-XMLType functionality. Whenever possible, use DBMS_XMLGEN, a built-in package in C, instead of DBMS_XMLQUERY.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

Using DBMS_XMLQUERY

Security Model

Owned by XDB, the DBMS_XMLQUERY package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Constants

Table 195–1 Constants of DBMS_XMLQUERY

Constant	Description
DB_ENCODING	Used to signal that the DB character encoding is to be used.
DEFAULT_ROWSETTAG	The tag name for the element enclosing the XML generated from the result set (that is, for most cases the root node tag name) -- ROWSET.
DEFAULT_ERRORTAG	The default tag to enclose raised errors -- ERROR.
DEFAULT_ROWIDATTR	The default name for the cardinality attribute of XML elements corresponding to db.records -- NUM
DEFAULT_ROWTAG	The default tag name for the element corresponding to db.records -- ROW
DEFAULT_DATE_FORMAT	Default date mask --'MM/dd/yyyy HH:mm:ss'
ALL_ROWS	Indicates that all rows are needed in the output.
NONE	Used to specifies that the output should not contain any XML metadata (for example, no DTD).
DTD	Used to specify that the generation of the DTD is desired.
SCHEMA	Used to specify that the generation of the XML Schema is desired.
LOWER_CASE	Use lower case tag names.
UPPER_CASE	Use upper case tag names.

Types

Table 195–2 Types of DBMS_XMLQUERY

Type	Description
`ctxType`	The type of the query context handle. This is the return type of NEWCONTEXT

Summary of DBMS_XMLQUERY Subprograms

Table 195–3 DBMS_XMLQUERY Package Subprograms

Method	Description
CLOSECONTEXT on page 195-8	Closes or deallocates a particular query context.
GETDTD on page 195-9	Generates the DTD.
GETEXCEPTIONCONTENT on page 195-10	Returns the thrown exception's error code and error message.
GETNUMROWSPROCESSED on page 195-11	Returns the number of rows processed for the query.
GETVERSION on page 195-12	Prints the version of the XSU in use.
GETXML on page 195-13	Generates the XML document.
NEWCONTEXT on page 195-14	Creates a query context and it returns the context handle.
PROPAGATEORIGINALEXCEPTION on page 195-15	Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an `OracleXMLSQLException`.
REMOVEXSLTPARAM on page 195-16	Removes a particular top-level stylesheet parameter.
SETBINDVALUE on page 195-17	Sets a value for a particular bind name.
SETCOLLIDATTRNAME on page 195-18	Sets the name of the id attribute of the collection element's separator tag.
SETDATAHEADER on page 195-18	Sets the XML data header.
SETDATEFORMAT on page 195-20	Sets the format of the generated dates in the XML document.
SETENCODINGTAG on page 195-21	Sets the encoding processing instruction in the XML document.
SETERRORTAG on page 195-22	Sets the tag to be used to enclose the XML error documents.
SETMAXROWS on page 195-23	Sets the maximum number of rows to be converted to XML.
SETMETAHEADER on page 195-24	Sets the XML meta header.
SETRAISEEXCEPTION on page 195-25	Tells the XSU to throw the raised exceptions.
SETRAISENOROWSEXCEPTION on page 195-26	Tells the XSU to throw or not to throw an `OracleXMLNoRowsException` in the case when for one reason or another, the XML document generated is empty.
SETROWIDATTRNAME on page 195-27	Sets the name of the id attribute of the row enclosing tag.
SETROWIDATTRVALUE on page 195-28	Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag.
SETROWSETTAG on page 195-29	Sets the tag to be used to enclose the XML dataset.
SETROWTAG on page 195-30	Sets the tag to be used to enclose the XML element.
SETSKIPROWS on page 195-31	Sets the number of rows to skip.

Table 195–3 (Cont.) DBMS_XMLQUERY Package Subprograms

Method	Description
SETSQLTOXMLNAMEESCAPING on page 195-32	This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.
SETSTYLESHEETHEADER on page 195-33	Sets the stylesheet header.
SETTAGCASE on page 195-34	Specified the case of the generated XML tags.
SETXSLT on page 195-35	Registers a stylesheet to be applied to generated XML.
SETXSLTPARAM on page 195-36	Sets the value of a top-level stylesheet parameter.
USENULLATTRIBUTEINDICATOR on page 195-37	Specifies weather to use an XML attribute to indicate `NULL`ness.
USETYPEFORCOLLELEMTAG on page 195-38	Tells the XSU to use the collection element's type name as the collection element tag name.

CLOSECONTEXT

Closes or deallocates a particular query context

Syntax

```
PROCEDURE CLOSECONTEXT(
ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

GETDTD

Generates and returns the DTD based on the SQL query used to initialize the context. The options are described in the following table.

Syntax	Description

`FUNCTION GETDTD(`
`  ctxHdl IN ctxType,`
`  withVer IN BOOLEAN := false)`
`RETURN CLOB;`
	Function that generates the DTD based on the SQL query used to initialize the context.

`PROCEDURE GETDTD(`
`  ctxHdl IN ctxType,`
`  xDoc IN CLOB,`
`  withVer IN BOOLEAN := false);`
	Procedure that generates the DTD based on the SQL query used to initialize the context; specifies the output `CLOB` for XML document result.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`withVer`	`(IN)`	Generate the version information? `TRUE` for yes.
`xDoc`	`(IN)`	`CLOB` into which to write the generated XML document.

GETEXCEPTIONCONTENT

Returns the thrown exception's SQL error code and error message through the procedure's `OUT` parameters. This procedure is a work around the JVM functionality that obscures the original exception by its own exception, rendering PL/SQL unable to access the original exception content.

Syntax

```
PROCEDURE GETEXCEPTIONCONTENT(
ctxHdl IN ctxType,
errNo OUT NUMBER,
errMsg OUT VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`errNo`	`(OUT)`	Error number.
`errMsg`	`(OUT)`	Error message.

GETNUMROWSPROCESSED

Return the number of rows processed for the query.

Syntax

```
FUNCTION GETNUMROWSPROCESSED(
ctxHdl IN ctxType)
RETURN NUMBER;
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

GETVERSION

Prints the version of the XSU in use.

Syntax

```
PROCEDURE GETVERSION();
```

GETXML

Creates the new context, executes the query, gets the XML back and closes the context. This is a convenience function. The context doesn't have to be explicitly opened or closed. The options are described in the following table.

Syntax	Description

`FUNCTION GETXML(`
`sqlQuery IN VARCHAR2,`
`metaType IN NUMBER := NONE)`
`RETURN CLOB;`
	This function uses a SQL query in string form.

`FUNCTION GETXML(`
`sqlQuery IN CLOB,`
`metaType IN NUMBER := NONE)`
`RETURN CLOB;`
	This function uses a SQL query in `CLOB` form.

`FUNCTION GETXML(`
`ctxHdl IN ctxType,`
`metaType IN NUMBER := NONE)`
`RETURN CLOB;`
	This function generates the XML document based on a SQL query used to initialize the context.

`PROCEDURE GETXML(`
`ctxHdl IN ctxType,`
`xDoc IN CLOB,`
`metaType IN NUMBER := NONE);`
	This procedure generates the XML document based on the SQL query used to initialize the context.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`metaType`	`(IN)`	XML metadatatype (`NONE`, `DTD`, or `SCHEMA`).
`sqlQuery`	`(IN)`	SQL query.
`xDoc`	`(IN)`	`CLOB` into which to write the generated XML document.

NEWCONTEXT

Creates a query context and it returns the context handle. The options are described in the following table.

Syntax	Description
`FUNCTION NEWCONTEXT( sqlQuery IN VARCHAR2) RETURN ctxType;`	Creates a query context from a string.
`FUNCTION NEWCONTEXT( sqlQuery IN CLOB) RETURN ctxType;`	Creates a query context from a `CLOB`.

Parameter	IN / OUT	Description
`sqlQuery`	`(IN)`	SQL query, the results of which to convert to XML.

PROPAGATEORIGINALEXCEPTION

Specifies whether to throw every original exception raised or to wrap it in an `OracleXMLSQLException`.

Syntax

```
PROCEDURE PROPAGATEORIGINALEXCEPTION(
ctxHdl IN ctxType,
flag IN BOOLEAN);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`flag`	`(IN)`	`TRUE` if want to propagate original exception, `FALSE` to wrap in `OracleXMLException`.

REMOVEXSLTPARAM

Removes the value of a top-level stylesheet parameter. If no stylesheet is registered, this method is not operational.

Syntax

```
PROCEDURE REMOVEXSLTPARAM(
ctxHdl IN ctxType,
name IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Name of the top level stylesheet parameter.

SETBINDVALUE

Sets a value for a particular bind name.

Syntax

```
PROCEDURE SETBINDVALUE(
ctxHdl IN ctxType,
bindName IN VARCHAR2,
bindValue IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
bindName	(IN)	Bind name.
bindValue	(IN)	Bind value.

SETCOLLIDATTRNAME

Sets the name of the id attribute of the collection element's separator tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

Syntax

```
PROCEDURE SETCOLLIDATTRNAME(
ctxHdl IN ctxType,
attrName IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`attrName`	`(IN)`	Attribute name.

SETDATAHEADER

Sets the XML data header. The data header is an XML entity that is appended at the beginning of the query-generated XML entity, the `rowset`. The two entities are enclosed by the `docTag` argument. The last data header specified is used. Passing in `NULL` for the `header` parameter unsets the data header.

Syntax

```
PROCEDURE SETDATAHEADER(
ctxHdl IN ctxType,
header IN CLOB := null,
tag IN VARCHAR2 := null);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`header`	`(IN)`	Header.
`tag`	`(IN)`	Tag used to enclose the data header and the rowset.

SETDATEFORMAT

Sets the format of the generated dates in the XML document. The syntax of the date format pattern, the date mask, should conform to the requirements of the `java.text.SimpleDateFormat` class. Setting the mask to `NULL` or an empty string sets the default mask -- `DEFAULT_DATE_FORMAT`.

Syntax

```
PROCEDURE SETDATEFORMAT(
ctxHdl IN ctxType,
mask IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`mask`	`(IN)`	The date mask.

SETENCODINGTAG

Sets the encoding processing instruction in the XML document.

Syntax

```
PROCEDURE SETENCODINGTAG(
ctxHdl IN ctxType,
enc IN VARCHAR2 := DB_ENCODING);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
enc	(IN)	The encoding to use.

SETERRORTAG

Sets the tag to be used to enclose the XML error documents.

Syntax

```
PROCEDURE SETERRORTAG(
ctxHdl IN ctxType,
tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETMAXROWS

Sets the maximum number of rows to be converted to XML. By default, there is no set maximum.

Syntax

```
PROCEDURE SETMAXROWS (
ctxHdl IN ctxType,
rows IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
rows	(IN)	Maximum number of rows to generate.

SETMETAHEADER

Sets the XML meta header. When set, the header is inserted at the beginning of the metadata part (DTD or XMLSchema) of each XML document generated by this object. The last meta header specified is used. Passing in `NULL` for the `header` parameter unsets the meta header.

Syntax

```
PROCEDURE SETMETAHEADER(
ctxHdl IN ctxType,
header IN CLOB := null);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`Header`	`(IN)`	Header.

SETRAISEEXCEPTION

Specifies whether to throw raised exceptions. If this call isn't made or if `FALSE` is passed to the `flag` argument, the XSU catches the SQL exceptions and generates an XML document from the exception message.

Syntax

```
PROCEDURE SETRAISEEXCEPTION(
ctxHdl IN ctxType,
flag IN BOOLEAN:=true);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`flag`	`(IN)`	Throw raised exceptions? `TRUE` for yes, otherwise `FALSE`.

SETRAISENOROWSEXCEPTION

Specifies whether to throw an `OracleXMLNoRowsException` when the generated XML document is empty. By default, the exception is not thrown.

Syntax

```
PROCEDURE SETRAISENOROWSEXCEPTION(
ctxHdl IN ctxType,
flag IN BOOLEAN:=false);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`flag`	`(IN)`	Throws an `OracleXMLNoRowsException` if set to `TRUE`.

SETROWIDATTRNAME

Sets the name of the id attribute of the row enclosing tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

Syntax

```
PROCEDURE SETROWIDATTRNAME(
ctxHdl IN ctxType,
attrName IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`attrName`	`(IN)`	Attribute name.

SETROWIDATTRVALUE

Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag. Passing `NULL` or an empty string for the `colName` assigns the row count value (0, 1, 2 and so on) to the row id attribute.

Syntax

```
PROCEDURE SETROWIDATTRVALUE(
ctxHdl IN ctxType,
colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`colName`	`(IN)`	Column whose value is to be assigned to the row id attribute.

SETROWSETTAG

Sets the tag to be used to enclose the XML dataset.

Syntax

```
PROCEDURE SETROWSETTAG(
ctxHdl IN ctxType,
tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETROWTAG

Sets the tag to be used to enclose the XML element corresponding to a `db.record`.

Syntax

```
PROCEDURE SETROWTAG(
ctxHdl IN ctxType,
tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`tag`	`(IN)`	Tag name.

SETSKIPROWS

Sets the number of rows to skip. By default, 0 rows are skipped.

Syntax

```
PROCEDURE SETSKIPROWS(
ctxHdl IN ctxType,
rows IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
rows	(IN)	Maximum number of rows to skip.

SETSQLTOXMLNAMEESCAPING

This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

Syntax

```
PROCEDURE SETSQLTOXMLNAMEESCAPING(
ctxHdl IN ctxType,
flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on escaping? TRUE for yes, otherwise FALSE.

SETSTYLESHEETHEADER

Sets the stylesheet header (the stylesheet processing instructions) in the generated XML document. Passing `NULL` for the `uri` argument will unset the stylesheet header and the stylesheet type.

Syntax

```
PROCEDURE SETSTYLESHEETHEADER(
ctxHdl IN ctxType,
uri IN VARCHAR2,
type IN VARCHAR2 := 'text/xsl');
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`uri`	`(IN)`	Stylesheet URI.
`type`	`(IN)`	Stylesheet type; defaults to "`text/xsl`".

SETTAGCASE

Specifies the case of the generated XML tags.

Syntax

```
PROCEDURE SETTAGCASE(
ctxHdl IN ctxType,
tCase IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tCase	(IN)	The tag's case: ■ 0 for as are ■ 1 for lower case ■ 2 for upper case

SETXSLT

Registers a stylesheet to be applied to generated XML. If a stylesheet was already registered, it is replaced by the new one. The options are described in the following table. Passing `NULL` for the `uri` argument or an empty string for the `stylesheet` argument will unset the stylesheet header and type.

Syntax	Description
`PROCEDURE SETXSLT( ctxHdl IN ctxType, uri IN VARCHAR2, ref IN VARCHAR2 := null);`	To un-register the stylesheet pass in a null for the uri.
`PROCEDURE SETXSLT( ctxHdl IN ctxType, stylesheet CLOB, ref IN VARCHAR2 := null);`	To un-register the stylesheet pass in a null or an empty string for the stylesheet.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`uri`	`(IN)`	Stylesheet URI.
`stylesheet`	`(IN)`	Stylesheet.
`ref`	`(IN)`	URL to include, imported and external entities.

SETXSLTPARAM

Sets the value of a top-level stylesheet parameter. The parameter value is expected to be a valid XPath expression; the string literal values would therefore have to be quoted explicitly. If no stylesheet is registered, this method is not operational.

Syntax

```
PROCEDURE SETXSLTPARAM(
ctxHdl IN ctxType,
name IN VARCHAR2,
value IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Name of the top level stylesheet parameter.
value	(IN)	Value to be assigned to the stylesheet parameter.

USENULLATTRIBUTEINDICATOR

Specifies whether to use an XML attribute to indicate NULLness, or to do this by omitting the particular entity in the XML document.

Syntax

```
PROCEDURE SETNULLATTRIBUTEINDICATOR(
ctxHdl IN ctxType,
flag IN BOOLEAN);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Sets attribute to NULL if TRUE, omits from XML document if FALSE.

USETYPEFORCOLLELEMTAG

Specifies whether to use the collection element's type name as its element tag name. By default, the tag name for elements of a collection is the collection's tag name followed by `_item`.

Syntax

```
PROCEDURE USETYPEFORCOLLELEMTAG(
ctxHdl IN ctxType,
flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`flag`	`(IN)`	Turn on use of the type name?

196

DBMS_XMLSAVE

DBMS_XMLSAVE provides XML to database-type functionality.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

Using DBMS_XMLSAVE

Security Model

Owned by XDB, the DBMS_XMLSAVE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Constants

Table 196–1 Constants of DBMS_XMLSAVE

Constant	Description
DEFAULT_ROWTAG	The default tag name for the element corresponding to database records -- ROW
DEFAULT_DATE_FORMAT	Default date mask:'MM/dd/yyyy HH:mm:ss'
MATCH_CASE	Used to specify that when mapping XML elements to database entities; the XSU should be case sensitive.
IGNORE_CASE	Used to specify that when mapping XML elements to database. entities the XSU should be case insensitive.

Types

Table 196–2 Types of DBMS_XMLSAVE

Type	Description
`ctxType`	The type of the query context handle. The type of the query context handle. This the return type of NEWCONTEXT.

Summary of DBMS_XMLSAVE Subprograms

Table 196–3 DBMS_XMLSAVE Package Subprograms

Method	Description
CLEARKEYCOLUMNLIST on page 196-7	Clears the key column list.
CLEARUPDATECOLUMNLIST on page 196-8	Clears the update column list.
CLOSECONTEXT on page 196-9	It closes/deallocates a particular save context.
DELETEXML on page 196-10	Deletes records specified by data from the XML document, from the table specified at the context creation time.
GETEXCEPTIONCONTENT on page 196-11	Returns the thrown exception's error code and error message.
INSERTXML on page 196-12	Inserts the XML document into the table specified at the context creation time.
NEWCONTEXT on page 196-13	Creates a save context, and returns the context handle.
PROPAGATEORIGINALEXCEPTION on page 196-14	Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an `OracleXMLSQLException`.
REMOVEXSLTPARAM on page 196-15	Removes the value of a top-level stylesheet parameter
SETBATCHSIZE on page 196-16	Changes the batch size used during DML operations.
SETCOMMITBATCH on page 196-18	Sets the commit batch size.
SETDATEFORMAT on page 196-18	Sets the format of the generated dates in the XML document.
SETIGNORECASE on page 196-19	The XSU does mapping of XML elements to database.
SETKEYCOLUMN on page 196-20	This methods adds a column to the key column list.
SETPRESERVEWHITESPACE on page 196-21	Tells the XSU whether to preserve whitespace or not.
SETROWTAG on page 196-22	Names the tag used in the XML document to enclose the XML elements corresponding to database.
SETSQLTOXMLNAMEESCAPING on page 196-23	This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.
SETUPDATECOLUMN on page 196-24	Adds a column to the update column list.
SETXSLT on page 196-25	Registers a XSL transform to be applied to the XML to be saved.
SETXSLTPARAM on page 196-26	Sets the value of a top-level stylesheet parameter.
UPDATEXML on page 196-27	Updates the table given the XML document.

CLEARKEYCOLUMNLIST

Clears the key column list.

Syntax

```
PROCEDURE clearKeyColumnList(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLEARUPDATECOLUMNLIST

Clears the update column list.

Syntax

```
PROCEDURE clearUpdateColumnList(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLOSECONTEXT

Closes/deallocates a particular save context.

Syntax

```
PROCEDURE closeContext(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

DELETEXML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted. The options are described in the following table.

Syntax	Description

`FUNCTION deleteXML(`
`  ctxHdl IN ctxPType,`
`  xDoc IN VARCHAR2)`
`RETURN NUMBER;`
	Uses a `VARCHAR2` type for the `xDoc` parameter.

`FUNCTION deleteXML(`
`  ctxHdl IN ctxType,`
`  xDoc IN CLOB)`
`RETURN NUMBER;`
	Uses a `CLOB` type for the `xDoc` parameter.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

GETEXCEPTIONCONTENT

Through its arguments, this method returns the thrown exception's error code and error message, SQL error code. This is to get around the fact that the JVM throws an exception on top of whatever exception was raised; thus, rendering PL/SQL unable to access the original exception.

Syntax

```
PROCEDURE getExceptionContent(
   ctxHdl IN ctxType,
   errNo OUT NUMBER,
   errMsg OUT VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
errNo	(IN)	Error number.
errMsg	(IN)	Error message.

INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted. The options are described in the following table.

Syntax	Description

`FUNCTION insertXML(`
`  ctxHdl IN ctxType,`
`  xDoc IN VARCHAR2)`
`RETURN NUMBER;`
	Passes in the `xDoc` parameter as a `VARCHAR2`.

`FUNCTION insertXML(`
`  ctxHdl IN ctxType,`
`  xDoc IN CLOB)`
`RETURN NUMBER;`
	Passes in the `xDoc` parameter as a `CLOB`.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

NEWCONTEXT

Creates a save context, and returns the context handle.

Syntax

```
FUNCTION newContext(
   targetTable IN VARCHAR2)
RETURN ctxType;
```

Parameter	IN / OUT	Description
targetTable	(IN)	The target table into which to load the XML document.

PROPAGATEORIGINALEXCEPTION

Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an `OracleXMLSQLException`.

Syntax

```
PROCEDURE propagateOriginalException(
   ctxHdl IN ctxType,
   flag IN BOOLEAN);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`flag`	`(IN)`	Propagate the original exception? 0=`FALSE`, 1=`TRUE`.

REMOVEXSLTPARAM

Removes the value of a top-level stylesheet parameter.

Syntax

```
PROCEDURE removeXSLTParam(
   ctxHdl IN ctxType,
   name IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Parameter name.

SETBATCHSIZE

Changes the batch size used during DML operations. When performing inserts, updates or deletes, it is better to batch the operations so that they get executed in one shot rather than as separate statements. The flip side is that more memory is needed to buffer all the bind values. Note that when batching is used, a commit occurs only after a batch is executed. So if one of the statement inside a batch fails, the whole batch is rolled back. This is a small price to pay considering the performance gain; nevertheless, if this behavior is unacceptable, then set the batch size to 1.

Syntax

```
PROCEDURE setBatchSize(
   ctxHdl IN ctxType,
   batchSize IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
batchSize	(IN)	Batch size.

SETCOMMITBATCH

Sets the commit batch size. The commit batch size refers to the number or records inserted after which a commit should follow. If `batchSize` is less than `1` or the session is in "auto-commit" mode, using the XSU does not make any explicit commits. By default, `commitBatch` is `0`.

Syntax

```
PROCEDURE setCommitBatch(
   ctxHdl IN ctxType,
   batchSize IN NUMBER);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`batchSize`	`(IN)`	Commit batch size.

SETDATEFORMAT

Sets the format of the generated dates in the XML document. The syntax of the date format pattern, the date mask, should conform to the requirements of the class `java.text.SimpleDateFormat`. Setting the mask to `<code>null</code>` or an empty string unsets the date mask.

Syntax

```
PROCEDURE setDateFormat(
   ctxHdl IN ctxType,
   mask IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`mask`	`(IN)`	Syntax of the date format pattern.

SETIGNORECASE

The XSU does mapping of XML elements to db columns/attributes based on the element names (XML tags). This function tells the XSU to do this match case insensitive.

Syntax

```
PROCEDURE setIgnoreCase(
   ctxHdl IN ctxType,
   flag IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Ignore tag case in the XML doc? 0=FALSE, 1=TRUE.

SETKEYCOLUMN

This method adds a column to the "key column list". The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

Syntax

```
PROCEDURE setKeyColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the key column list; cannot be NULL.

SETPRESERVEWHITESPACE

Tells the XSU whether or not to preserve whitespace.

Syntax

```
PROCEDURE setPreserveWhitespace(
   ctxHdl IN ctxType,
   flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Should XSU preserve whitespace?

SETROWTAG

Names the tag used in the XML document to enclose the XML elements corresponding to db. records.

Syntax

```
PROCEDURE setRowTag(
   ctxHdl IN ctxType,
   tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETSQLTOXMLNAMEESCAPING

Turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

Syntax

```
PROCEDURE setSQLToXMLNameEscaping(
   ctxHdl IN ctxType,
   flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on escaping?

SETUPDATECOLUMN

Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the ROW element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Syntax

```
PROCEDURE setUpdateColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the update column list.

SETXSLT

Registers an XSL transform to be applied to the XML to be saved. If a stylesheet was already registered, it gets replaced by the new one. To un-register the stylesheet, pass in null for the URI. The options are described in the following table.

Syntax	Description

`PROCEDURE setXSLT(`
`ctxHdl IN ctxType,`
`uri IN VARCHAR2,`
`ref IN VARCHAR2 := null);`
	Passes in the stylesheet through a URI.

`PROCEDURE setXSLT(`
`ctxHdl IN ctxType,`
`stylesheet IN CLOB,`
`ref IN VARCHAR2 := null);`
	Passes in the stylesheet through a `CLOB`.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`uri`	`(IN)`	URI to the stylesheet to register.
`ref`	`(IN)`	URL for include, import, and external entities.
`stylesheet`	`(IN)`	`CLOB` containing the stylesheet to register.

SETXSLTPARAM

Sets the value of a top-level stylesheet parameter. The parameter is expected to be a valid XPath expression; literal values would therefore have to be explicitly quoted.

Syntax

```
PROCEDURE setXSLTParam(
   ctxHdl IN ctxType,
   name IN VARCHAR2,
   value IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Parameter name.
value	(IN)	Parameter value as an XPath expression

UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

Syntax	Description

`FUNCTION updateXML(`
`  ctxHdl IN ctxType,`
`  xDoc IN VARCHAR2)`
`RETURN NUMBER;`
	Passes in the `xDoc` parameter as a `VARCHAR2`.

`FUNCTION updateXML(`
`  ctxHdl IN ctxType,`
`  xDoc IN CLOB)`
`RETURN NUMBER;`
	Passes in the `xDoc` parameter as a `CLOB`.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

197

DBMS_XMLSCHEMA

DBMS_XMLSCHEMA package provides procedures to manage XML schemas. It is created by script dbmsxsch.sql during Oracle database installation.

> **See Also:** *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

Using DBMS_XMLSCHEMA

This section contains topics which relate to using the `DBMS_XMLSCHEMA` package.

Overview

This package provides subprograms to

- Register an XML schema
- Delete a previously registered XML schema
- Re-compile a previously registered XML schema
- Generate an XML schema
- Evolves an XML schema

Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only

The following subprograms are deprecated with release Oracle Database 12*c*:

- GENERATESCHEMA Function
- GENERATESCHEMAS Function

Security Model

Owned by XDB, the DBMS_XMLSCHEMA package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Constants

The DBMS_XMLSCHEMA package uses the constants shown in following tables.

- DBMS_XMLSCHEMA Constants - Delete Option
- DBMS_XMLSCHEMA Constants - Enable Hierarchy
- DBMS_XMLSCHEMA Constants - Register CSID

Table 197–1 DBMS_XMLSCHEMA Constants - Delete Option

Constant	Type	Value	Description
DELETE_RESTRICT	NUMBER	1	Deletion of an XML schema fails if there are any tables or XML schemas that depend on it
DELETE_INVALIDATE	NUMBER	2	Deletion of an XML schema does not fail if there are tables or XML schemas that depend on it. All dependent tables and schemas are invalidated.
DELETE_CASCADE	NUMBER	3	Deletion of an XML schema also drops all SQL types and default tables associated with it. SQL types are dropped only if gentypes argument was set to TRUE during registration of the XML schema. However, deletion of the XML schema fails if there are any instance documents conforming to the schema or any dependent XML schemas.
DELETE_CASCADE_FORCE	NUMBER	4	This option is similar to DELETE_CASCADE except that it does not check for any stored instance documents conforming to the schema or any dependent XML schemas. Also, it ignores any errors.

Table 197–2 DBMS_XMLSCHEMA Constants - Enable Hierarchy

Constant	Type	Value	Description
ENABLE_HIERARCHY_NONE	PLS_INTEGER	1	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will not be called on any tables created while registering that schema
ENABLE_HIERARCHY_CONTENTS	PLS_INTEGER	2	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS

Table 197–2 (Cont.) DBMS_XMLSCHEMA Constants - Enable Hierarchy

Constant	Type	Value	Description
ENABLE_HIERARCHY_RESMETADATA	PLS_INTEGER	3	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.

Table 197–3 DBMS_XMLSCHEMA Constants - Register CSID

Constant	Type	Value	Description
REGISTER_NODOCID	NUMBER	1	If a schema is registered for metadata use (using the value ENABLE_HIER_RESMETADATA for parameter enablehierarchy during registration), a column named DOCID is added to all tables created during schema registration. This constant can be used in the options argument of REGISTERSCHEMA to prevent the creation of this column if the user wishes to optimize on storage
REGISTER_CSID_NULL	NUMBER	-1	If user wishes to not specify the character set of the input schema document when invoking REGISTERSCHEMA, this value can be used for the csid parameter

Views

The DBMS_XMLSCHEMA package uses the views shown in Table 197–4. The columns of these views are described in detail in the *Oracle Database Reference.*

Table 197–4 Summary of Views used by DBMS_XMLSCHEMA

Schema	Description
USER_XML_SCHEMAS	All registered XML Schemas owned by the user
ALL_XML_SCHEMAS	All registered XML Schemas usable by the current user
DBA_XML_SCHEMAS	All registered XML Schemas in the database
DBA_XML_TABLES	All XMLType tables in the system
USER_XML_TABLES	All XMLType tables owned by the current user
ALL_XML_TABLES	All XMLType tables usable by the current user
DBA_XML_TAB_COLS	All XMLType table columns in the system
USER_XML_TAB_COLS	All XMLType table columns in tables owned by the current user
ALL_XML_TAB_COLS	All XMLType table columns in tables usable by the current user
DBA_XML_VIEWS	All XMLType views in the system
USER_XML_VIEWS	All XMlType views owned by the current user
ALL_XML_VIEWS	All XMLType views usable by the current user
DBA_XML_VIEW_COLS	All XMLType view columns in the system
USER_XML_VIEW_COLS	All XMLType view columns in views owned by the current user
ALL_XML_VIEW_COLS	All XMLType view columns in views usable by the current user

Operational Notes

Guidelines for Using In-Place XML Schema Evolution

Before you perform an in-place XML-schema evolution, you should follow these preparatory steps:

1. Back up all existing data (instance documents) for the XML schema that will be evolved.
2. Perform a dry run using trace only, that is, without actually evolving the XML schema or updating any instance documents, to produce a trace of the update operations that would be performed during evolution. To do this, set the flag parameter value to only `INPLACE_TRACE`. Do not also use `INPLACE_EVOLVE`. After performing the dry run, examine the trace file, verifying that the listed DDL operations are in fact those that you intend.

Summary of DBMS_XMLSCHEMA Subprograms

Table 197–5 DBMS_XMLSCHEMA Package Subprograms

Method	Description
COMPILESCHEMA Procedure on page 197-11	Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state.
COPYEVOLVE Procedure on page 197-12	Evolves registered schemas so that existing XML instances remain valid
DELETESCHEMA Procedure on page 197-14	Removes the schema from the database
GENERATESCHEMA Function on page 197-15	Generates an XML schema from an oracle type name
GENERATESCHEMAS Function on page 197-16	Generates several XML schemas from an oracle type name
INPLACEEVOLVE Procedure on page 197-17	Evolves registered schemas by propagating schema changes to object types and tables
PURGESCHEMA Procedure on page 197-19	Removes the XML schema
REGISTERSCHEMA Procedures on page 197-20	Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this.
REGISTERURI Procedure on page 197-24	Registers an XML schema specified by a URI name

COMPILESCHEMA Procedure

This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in a `ORA-31001` exception: invalid resource handle or path name.

Syntax

```
DBMS_XMLSCHEMA.COMPILESCHEMA(
   schemaurl IN VARCHAR2);
```

Parameters

Table 197–6 COMPILESCHEMA Procedure Parameters

Parameter	Description
`schemaurl`	URL identifying the schema

COPYEVOLVE Procedure

This procedure evolves registered schemas so that existing XML instances remain valid.

This procedure is accomplished in according to the following basic scenario (alternative actions are controlled by the procedure's parameters):

- copies data in schema based `XMLType` tables to temporary table storage
- drops old tables
- deletes old schemas
- registers new schemas
- creates new `XMLType` tables
- Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved
- drops temporary tables

See Also:

- "Schema Evolution" chapter of the *Oracle XML DB Developer's Guide* for examples on how to evolve existing schemas
- *Oracle Database Error Messages* for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

Syntax

```
DBMS_XMLSCHEMA.COPYEVOLVE(
   schemaurls       IN  XDB$STRUBG_LIST_T,
   newschemas       IN  XMLSequenceType,
   transforms       IN  XMLSequenceType :=NULL,
   preserveolddocs  IN  BOOLEAN :=FALSE,
   maptablename     IN  VARCHAR2 :=NULL,
   generatetables   IN  BOOLEAN :=TRUE,
   force            IN  BOOLEAN :=FALSE,
   schemaowners     IN  XDB$STRING_LIST_T :=NULL
   parallelDegree   IN  PLS_INTEGER := 0,
   options          IN  PLS_INTEGER := 0);
```

Parameters

Table 197–7 COPYEVOLVE Procedure Parameters

Parameter	Description
`schemaurls`	`VARRAY` of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the `FORCE` parameter is `TRUE`, URLs should be in the order of dependency.
`newschemas`	`VARRAY` of new schema documents. Should be specified in same order as the corresponding URLs.
`transforms`	`VARRAY` of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required.

Table 197–7 (Cont.) COPYEVOLVE Procedure Parameters

Parameter	Description
preserveolddocs	Default is FALSE, and temporary tables with old data are dropped. If TRUE, these table are still available after schema evolution is complete.
maptabname	Specifies the name of the table mapping permanent to temporary tables during the evolution process. Valid columns are: ■ SCHEMA_URL - VARCHAR2(700) - URL of schema to which this table conforms ■ SCHEMA_OWNER -VARCHAR2(30) - Owner of the schema ■ ELEMENT_NAME - VARCHAR2(256)- Element to which this table conforms ■ TAB_NAME - VARCHAR2(65) - Qualified table name: *<owner_name>.<table_name>* ■ COL_NAME - VARCHAR2(4000) - Name of the column (NULL for XMLType tables) ■ TEMP_TABNAME - VARCHAR2(30) - Name of temporary tables which holds data for this table.
generatetables	Default is TRUE, and new tables will be generated. If FALSE: ■ new tables will not be generated after registration of new schemas ■ preserveolddocs must be TRUE ■ maptablename must be non-NULL
force	Default is FALSE. If TRUE, ignores errors generated during schema evolution. Used when there are circular dependencies among schemas to ensure that all schemas are stored despite possible errors in registration.
schemaowners	VARRAY of names of schema owners. Should be specified in same order as the corresponding URLs. Default is NULL, assuming that all schemas are owned by the current user.
paralleldegree	Specifies the degree of parallelism to be used in a PARALLEL hint during the data copy stage of the evolution. If this is 0 (default), the PARALLEL hint will not be given in the data copy statements.
options	Currently, the only supported option is COPYEVOLVE_BINARY_XML which lets you register the new schemas for binary XML and create the new tables/columns with binary XML as the storage type.

Usage Notes

You should back up all schemas and documents prior to invocation because COPYEVOLVE Procedure deletes all conforming documents prior to implementing the schema evolution.

DELETESCHEMA Procedure

This procedure deletes the XML Schema specified by the URL.

Syntax

```
DBMS_XMLSCHEMA.DELETESCHEMA(
   schemaurl      IN  VARCHAR2,
   delete_option  IN  PLS_INTEGER := DELETE_RESTRICT);
```

> **See Also:** "XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Parameters

Table 197–8 DELETESCHEMA Procedure Parameters

Parameter	Description
`schemaurl`	URL identifying the schema to be deleted
`delete_option`	Delete options: ■ `DELETE_RESTRICT` - Schema deletion fails if there are any tables or schemas that depend on this schema ■ `DELETE_INVALIDATE` - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects. ■ `DELETE_CASCADE` - Schema deletion will also drop all default SQL types and default tables. However the deletion fails if there are any stored instances conforming to this schema. ■ `DELETE_CASCADE_FORCE` - Similar to `DELETE_CASCADE` except that it does not check for any stored instances conforming to this schema. Also, it ignores any errors.

Exceptions

Table 197–9 DELETESCHEMA Procedure Exceptions

Exception	Description
`ORA-31001`	Invalid resource handle or path name

GENERATESCHEMA Function

Note: This subprogram is deprecated with Oracle Database 12*c*.

This function generates XML schema(s) from an Oracle type name. It inlines all in one schema (`XMLType`).

See Also: "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.GENERATESCHEMA(
   schemaname    IN  VARCHAR2,
   typename      IN  VARCHAR2,
   elementname   IN  VARCHAR2 := NULL,
   recurse       IN  BOOLEAN  := TRUE,
   annotate      IN  BOOLEAN  := TRUE,
   embedcoll     IN  BOOLEAN  := TRUE)
RETURN SYS.XMLTYPE;
```

Parameters

Table 197–10 GENERATESCHEMA Function Parameters

Parameter	Description
`schemaname`	Name of the database schema containing the type
`typename`	Name of the Oracle type
`elementname`	The name of the top level element in the XML Schema. Defaults to `typename`.
`recurse`	Whether or not to also generate schema for all types referred to by the type specified
`annotate`	Whether or not to put the SQL annotations in the XML Schema
`embedcoll`	Determines whether the collections should be embedded in the type which refers to them, or create a `complextype`. Cannot be `FALSE` if annotations are turned on

Exceptions

Table 197–11 GENERATESCHEMA Function Exceptions

Exception	Description
`ORA-31001`	Invalid resource handle or path name

GENERATESCHEMAS Function

Note: This subprogram is deprecated with Oracle Database 12*c*.

This function generates XML schema(s) from an Oracle type name. It returns a collection of XMLTypes, one XML Schema document for each database schema.

See Also: "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.GENERATESCHEMAS(
   schemaname   IN  VARCHAR2,
   typename     IN  VARCHAR2,
   elementname  IN  VARCHAR2 := NULL,
   schemaurl    IN  VARCHAR2 := NULL,
   annotate     IN  BOOLEAN := TRUE,
   embedcoll    IN  BOOLEAN := TRUE )
 RETURN SYS.XMLTYPE;
```

Parameters

Table 197–12 GENERATESCHEMAS Function Parameters

Parameter	Description
schemaname	Name of the database schema containing the type
typename	Name of the Oracle type
elementname	The name of the top level element in the XML Schema defaults to typeName
schemaurl	Specifies base URL where schemas will be stored, needed by top level schema for import statement
annotate	Whether or not to put the SQL annotations in the XML Schema
embedcoll	Determines whether the collections be embedded in the type which refers to them, or create a complextype. Cannot be FALSE if annotations are turned on

Exceptions

Table 197–13 GENERATESCHEMAS Function Exceptions

Exception	Description
ORA-31001	Invalid resource handle or path name

INPLACEEVOLVE Procedure

This procedure evolves registered schemas by propagating schema changes to object types and tables.

Syntax

```
DBMS_XMLSCHEMA.INPLACEEVOLVE(
   schemaURL     IN   VARCHAR2,
   diffXML       IN   XMLType,
   flags         IN   NUMBER);
```

Parameters

Table 197–14 INPLACEEVOLVE Procedure Parameters

Parameter	Description
schemaurl	URL of the schema to evolve
diffXML	Changes to be applied to the schema. This is an XML document conforming to the XDIFF schema and specifies what changes need to be applied and the locations in the schema document where the changes are to be applied.
flags	The following bits may be set in this parameter to control the behavior of this procedure: ■ INPLACE_EVOLVE (value 1, meaning that bit 1 is on) – Perform in-place XML schema evolution: construct a new XML schema and validate it (against the XML schema for XML schemas); construct the DDL statements needed to evolve the instance-document disk structures, execute the DDL statements, and replace the old XML schema with the new. ■ INPLACE_TRACE (value 2, meaning that bit 2 is on) – Perform all steps necessary for in-place evolution, except executing the DDL statements and overwriting the old XML schema with the new, then write both the DDL statements and the new XML schema to a trace file. That is, each of the bits constructs the new XML schema, validates it, and determines the steps needed to evolve the disk structures underlying the instance documents. In addition: ■ Bit INPLACE_EVOLVE carries out those evolution steps and replaces the old XML schema with the new. ■ Bit INPLACE_TRACE saves the evolution steps and the new XML schema in a trace file (it does not carry out the evolution steps)

Exceptions

The procedure raises exceptions in the following cases:

- An error will be raised for invalid XPATH expressions and for XDIFF documents that do not conform to the xdiff schema.
- Path expressions that are syntactically correct but result in an invalid node in the schema document will result in an error.
- If the schema change makes the schema an ill-formed XML document or an invalid XML schema, this will raise an error.

- Any errors resulting from `CREATE TYPE`, `ALTER TYPE` and like commands will generate error messages.

Usage Notes

- Users are required to backup all their data before attempting in-place evolution, as there is no rollback with this operation.
- A user must register their new XML schema with the database using the REGISTERSCHEMA Procedures and the REGISTERURI Procedure at a schema URL that is different from that of the one to be evolved. If the new schema registers successfully and is usable, only then should the user attempt to evolve the existing schema to the new schema by means of this subprogram. If the registration of the new schema is successful, then the user must delete this schema (and all its dependent objects) before attempting to evolve the schema at the old schema URL.

PURGESCHEMA Procedure

This procedure removes the XML schema.

> **See Also:** "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.PURGESCHEMA(
   schemaid   IN  RAW);
```

Parameters

Table 197–15 PURGESCHEMA Procedure Parameters

Parameter	Description
schemaid	ID of the schema to be purged

Usage Notes

- The schema should have been originally registered for binary encoding and should have been deleted in the HIDE mode.
- Once a schema has been deleted in HIDE mode, it continues to exist in the XML DB dictionary and is used for decoding already encoded documents. The user invokes this interface when there are no stored instances encoded with this schema.
- Once the schema is purged, any space used by that schema will be reclaimed and documents encoded using the schema will raise an error if an attempt is made to decode them.
- The Schema ID can be obtained from the catalog views.

REGISTERSCHEMA Procedures

This procedure registers the specified schema for use by the database. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definition.

Note: As of Oracle Database 11*g* Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

See Also: "XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Syntax

Registers a schema specified as a `VARCHAR2`:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl        IN  VARCHAR2,
    schemadoc        IN  VARCHAR2,
    local            IN  BOOLEAN := TRUE,
    gentypes         IN  BOOLEAN := TRUE,
    genbean          IN  BOOLEAN := FALSE,
    gentables        IN  BOOLEAN := TRUE,
    force            IN  BOOLEAN := FALSE,
    owner            IN  VARCHAR2 := NULL,
    enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BFILE`. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BFILE,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BFILE` and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BFILE,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := TRUE,
   gentables        IN  BOOLEAN := TRUE,
   force            IN  BOOLEAN := TRUE,
   owner            IN  VARCHAR2 := '',
   csid             IN  NUMBER,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
```

```
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BLOB,
   local            IN  BOOLEAN := TRUE,
   genTypes         IN  BOOLEAN := TRUE,
   genBean          IN  BOOLEAN := FASLE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BLOB,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := TRUE,
   gentables        IN  BOOLEAN := TRUE,
   force            IN  BOOLEAN := TRUE,
   owner            IN  VARCHAR2 := '',
   csid             IN  NUMBER,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a CLOB

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  CLOB,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as an XMLTYPE.

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  SYS.XMLTYPE,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
```

```
schemadoc        IN  SYS.URIType,
local            IN  BOOLEAN := TRUE,
gentypes         IN  BOOLEAN := TRUE,
genbean          IN  BOOLEAN := FALSE,
force            IN  BOOLEAN := FALSE,
owner            IN  VARCHAR2 := NULL,
enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
options          IN  PLS_INTEGER := 0);
```

Parameters

Table 197–16 REGSITERSCHEMA Procedure Parameters

Parameter	Description
schemaurl	URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside schemalocation attribute of XML Schema import element.
schemadoc	A valid XML schema document
local	Is this a local or global schema? ■ By default, all schemas are registered as local schemas, under /sys/schemas/<username>/... ■ If a schema is registered as global, it is added under /sys/schemas/PUBLIC/... You need write privileges on the directory to be able to register a schema as global.
gentypes	Determines whether the schema compiler generates object types. By default, TRUE. If you use binary XML, you must be set gentypes to FALSE.
genbean	Determines whether the schema compiler generates Java beans. By default, FALSE. Oracle recommends that this parameter always be set to FALSE.
gentables	Determines whether the schema compiler generates default tables. By default, TRUE
force	If this parameter is set to TRUE, the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
csid	Identifies the character set of the input schema document. If this value is 0, the schema document's encoding is determined by the current rule for "text/xml" MIME type.

Table 197–16 (Cont.) REGSITERSCHEMA Procedure Parameters

Parameter	Description
enablehierarchy	■ ENABLE_HIERARCHY_NONE - enable hierarchy will not be called on any tables created while registering that schema ■ ENABLE_HIERARCHY_CONTENTS - enable hierarchy will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS. This is the default. ■ ENABLE_HIERARCHY_RESMETADATA - enable hierarchy will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.
options	Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits: ■ REGISTER_NODOCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column) ■ REGISTER_BINARYXML - Register the schema for Binary XML ■ REGISTER_NT_AS_IOT - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables

REGISTERURI Procedure

This procedure registers an XML Schema specified by a URI name.

> **Note:** As of Oracle Database 11g Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

Syntax

```
DBMS_XMLSCHEMA.REGISTERURI(
   schemaurl      IN  VARCHAR2,
   schemadocuri   IN  VARCHAR2,
   local          IN  BOOLEAN := TRUE,
   gentypes       IN  BOOLEAN := TRUE,
   genbean        IN  BOOLEAN := FALSE,
   gentables      IN  BOOLEAN := TRUE,
   force          IN  BOOLEAN := FALSE,
   owner          IN  VARCHAR2 := NULL,
   options          IN  PLS_INTEGER := 0);
```

Parameters

Table 197–17 REGISTERURI Procedure Parameters

Parameter	Description
`schemaurl`	Uniquely identifies the schema document. Can be used inside `schemaLocation` attribute of XML Schema import element.
`schemadocuri`	Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a `URIType` instance using the `urifactory`, and invokes the REGISTERSCHEMA Procedures.
`local`	Determines whether this is a local or global schema. By default, all schemas are registered as local schemas, under `/sys/schemas/ <username>/...` If a schema is registered as global, it is added under `/sys/schemas/PUBLIC/...` The user needs write privileges on the directory to register a global schema.
`gentypes`	Determines whether the compiler generate object types. By default, `TRUE`.
`genbean`	Determines whether the compiler generate Java beans. By default, `FALSE`.
`gentables`	Determines whether the compiler generate default tables. `TRUE` by default.
`force`	`TRUE`: schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is `FALSE`.
`owner`	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.

Table 197–17 (Cont.) REGISTERURI Procedure Parameters

Parameter	Description
options	Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits: ■ REGISTER_NODOCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column)

DBMS_XMLSCHEMA_ANNOTATE

The DBMS_XMLSCHEMA_ANNOTATE package provides an interface to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

Using DBMS_XMLSCHEMA_ANNOTATE

Overview

The DBMS_XMLSCHEMA_ANNOTATE package contains procedures to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations. Schema annotations influence the way the XML data is stored. For example, the default table annotation assigns a user-provided name to an XML element instead of allowing the database to generate a system name. Consequently, query plans are more readable and it is easier to create constraints on that table.

Security Model

Owned by XDB, the DBMS_XMLSCHEMA_ANNOTATE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms

Table 198–1 DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

Subprogram	Description
ADDXDBNAMESPACE Procedure on page 198-7	Adds the XDB namespace required for XDB annotation
DISABLEDEFAULTTABLECREATION Procedure on page 198-8	Prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element
DISABLEMAINTAINDOM Procedure on page 198-9	Sets the DOM fidelity attribute to `FALSE`
ENABLEDEFAULTTABLECREATION Procedure on page 198-10	Enables the creation of `ALL` top level tables by removing the empty default table name annotation
ENABLEMAINTAINDOM Procedure on page 198-11	Sets the DOM fidelity attribute to `TRUE`
GETSCHEMAANNOTATIONS Function on page 198-12	Creates a document containing the differences between the annotated XML schema and the original XML schema
GETSIDXDEFFROMVIEW Function on page 198-13	Takes a XMLTABLE view definition on a xmltype column or table and it returns a `CLOB` which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table
PRINTWARNINGS Procedure on page 198-14	Lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema
REMOVEANYSTORAGE Procedure on page 198-15	Removes the setting of the SQL type from the `ANY` child of the complex type with the given name
REMOVEDEFAULTTABLE Procedure on page 198-16	Removes any default table attribute given for the element. After calling this procedure, the system generates table names
REMOVEMAINTAINDOM Procedure on page 198-17	Removes all annotations used to maintain DOM from the given schema
REMOVEOUTOFLINEProcedure on page 198-18	Removes any existing `SQLInline` attributes to prevent out-of-line storage
REMOVESQLCOLLTYPE Procedure on page 198-19	Removes a SQL collection type.
REMOVESQLNAME Procedure on page 198-20	Removes a `SQLNAME` from a global element
REMOVESQLTYPE Procedure on page 198-21	Removes a SQL type
REMOVESQLTYPEMAPPING Procedure on page 198-22	Removes the SQL type mapping for the given schema type.
REMOVETABLEPROPS Procedure on page 198-23	Removes the table storage properties from the `CREATE TABLE` statement
REMOVETIMESTAMPWITHTIMEZONE Procedure on page 198-24	Removes he setting of the `TimeStampWithTimeZone` datatype from all `dateTime` typed elements in the XML schema
SETANYSTORAGE Procedure on page 198-25	Assigns a SQL datatype to the `ANY` child of the complex type with the given name
SETDEFAULTTABLE Procedure on page 198-26	Sets the name of the table for the specified global element

Table 198–1 (Cont.) DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

Subprogram	Description
SETOUTOFLINE Procedure on page 198-27	Sets the `SQLInline` attribute to `FALSE`
SETSCHEMAANNOTATATIONS Procedure on page 198-29	Takes the annotated differences resulting from a call to `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` and patches them into the provided XML schema
SETSQLCOLLTYPE Procedure on page 198-30	Assigns a SQL type name for a collection
SETSQLNAME Procedure on page 198-31	Assigns a name to the SQL attribute that corresponds to an element defined in the XML schema
SETSQLTYPE Procedure on page 198-32	Assigns a SQL type to a global object
SETSQLTYPEMAPPING Procedure on page 198-34	Defines a mapping of schema type and SQL type
SETTABLEPROPS Procedure on page 198-35	Specifies properties in the `TABLE` storage clause that is appended to the default `CREATE TABLE` statement
SETTIMESTAMPWITHTIMEZONE Procedure on page 198-36	Sets the `TIMESTAMPWITHTIMEZONE` datatype to all `dateTime` typed elements in the XML schema

ADDXDBNAMESPACE Procedure

This procedure adds the XDB namespace required for XDB annotation.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ADDXDBNAMESPACE (
   xmlschema      IN OUT XMLTYPE);
```

Parameters

Table 198–2 ADDXDBNAMESPACE Procedure Parameters

Parameter	Description
xmschema	Gets an XML Schema as XMLTYPE, performs the annotation and returns it

Usage Notes

This procedure is called implicitly by any other procedure that adds a schema annotation. Since there is no reason to add an XDB namespace without other annotations, this procedure is most likely called by other annotations procedures and not by the user directly.

DISABLEDEFAULTTABLECREATION Procedure

This procedure prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element. The first overload applies to a specified top-level element and the second applies to all top-level elements. The procedure always overwrites. This is equivalent to using the schema annotation `xdb:defaultTable=""` for the top-level element or elements.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (
   xmlschema         IN OUT XMLType,
   globalElementName IN VARCHAR2);

DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (
   xmlschema         IN OUT XMLType);
```

Parameters

Table 198–3 DISABLEDEFAULTTABLECREATION Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`globalElementName`	Name of the global element in the schema

Example

The `purchaseOrder` element will have an annotation similar to `xdb:defaultTable=""`.

```
DECLARE
   xml_schema   XMLTYPE;
BEGIN
   SELECT out INTO xml_schema FROM annotation_tab;
   DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION(xml_schema,
                                          'purchaseOrder');
   UPDATE annotation_tab SET out = xml_schema;
END;
/
```

DISABLEMAINTAINDOM Procedure

This procedure sets the DOM fidelity attribute to FALSE.

There are two overloads. The first sets DOM fidelity attribute to FALSE for all complex types, and the second sets it to FALSE for the named complex type. This is equivalent to adding xdb:maintainDOM="false" on all or specified complex types respectively.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
   xmlschema       IN OUT XMLType,
   overwrite       IN BOOLEAN default TRUE);

DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
   xmlschema       IN OUT XMLType,
   complexTypeName IN VARCHAR2,
   overwrite       IN BOOLEAN default TRUE);
```

Parameters

Table 198–4 DISABLEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
complexTypeName	The name of the complex type
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE

ENABLEDEFAULTTABLECREATION Procedure

This procedure enables the creation of ALL top level tables by removing the empty default table name annotation.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
   xmlschema            IN OUT  XMLTYPE);

DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
   xmlschema            IN OUT  XMLTYPE,
   globalElementName    IN      VARCHAR2););
```

Parameters

Table 198–5 ENABLEDEFAULTTABLECREATION Procedure Parameters

Parameter	Description
`xmlschema`	The XML schema to be annotated
`gloablElementName`	Name of the global element in the schema

Usage Notes

This procedure does not affect elements that have a default table name.

ENABLEMAINTAINDOM Procedure

This procedure sets the DOM fidelity attribute to TRUE.

There are two overloads. The first sets DOM fidelity attribute to TRUE for all complex types, and the second sets it to TRUE for the named complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (
   xmlschema       IN OUT XMLType,
   overwrite       IN BOOLEAN default TRUE);

DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (
   xmlschema        IN OUT XMLType,
   complexTypeName  IN VARCHAR2,
   overwrite        IN BOOLEAN default TRUE);
```

Parameters

Table 198–6 ENABLEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
complexTypeName	The name of the complex type
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE

GETSCHEMAANNOTATIONS Function

This function creates a document containing the differences between the annotated XML schema and the original XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS (
   xmlschema IN xmlType)
  RETURN XMLType;
```

Parameters

Table 198–7 GETSCHEMAANNOTATIONS Function Parameters

Parameter	Description
xmlschema	The original XML schema

Return Values

This function returns the document `annotations.xml` as an `XMLType`.

Usage Notes

This function saves all annotations in one document, named `annotations`, and returns it. With this document, you can apply all annotations to a non-annotated schema, using `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS`.

`DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` is not available on Oracle Database release 10.2 (only Oracle Database release 11.*x*).

See Also: SETSCHEMAANNOTATATIONS Procedure on page 29

Example

For an example of `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS`, see the example in SETSCHEMAANNOTATATIONS Procedure on page 29.

GETSIDXDEFFROMVIEW Function

This function takes a XMLTABLE view definition on a xmltype column or table and it returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSIDXDEFFROMVIEW (
   viewName   IN xmlType)
  RETURN CLOB;
```

Parameters

Table 198–8 GETSIDXDEFFROMVIEW Function Parameters

Parameter	Description
viewName	The original XML schema

Return Values

This function returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

PRINTWARNINGS Procedure

This procedure lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.PRINTWARNINGS (
   value       IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 198–9 PRINTWARNINGS Procedure Parameters

Parameter	Description
val	For the NO MATCHING ELEMENTS FOUND error message to be raised val must be set to TRUE. In cases in which user wishes to suppress this warning, set to FALSE.

Usage Notes

If an annotation maps to more than one node in the XML schema, this raise the error ANNOTATION MAPS TO MULTIPLE ELEMENTS. In this case no annotation is performed, and the user must correct the parameters to the procedure call to refer to a unique node in the XML schema.

REMOVEANYSTORAGE Procedure

This procedure removes the setting of the SQL type from the ANY child of the complex type with the given name.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEANYSTORAGE (
   xmlschema       IN OUT XMLType,
   complexTypeName IN VARCHAR2);
```

Parameters

Table 198–10 REMOVEANYSTORAGE Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated.
complexTypeName	The name of the complex type.

Usage Notes

This procedure reverses the SETANYSTORAGE Procedure.

REMOVEDEFAULTTABLE Procedure

This procedure removes any default table attribute given for the element. After calling this procedure, the system generates table names. This procedure always overwrites.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE (
   xmlschema          IN OUT XMLTYPE,
   globalElementName  IN     VARCHAR2);
```

Parameters

Table 198–11 REMOVEDEFAULTTABLE Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`globalElementName`	Name of the global element in the schema

Example

Annotations can be verified anytime using `"select out from annotation_tab"`.

```
--The purchaseOrder element will have no annotation for defaultTable.
DECLARE
   xml_schema XMLTYPE;
BEGIN
   SELECT out INTO xml_schema FROM annotation_tab;
   DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE(xml_schema,
                                              'purchaseOrder');
   UPDATE annotation_tab SET out = xml_schema;
END;
/
```

REMOVEMAINTAINDOM Procedure

This procedure removes all annotations used to maintain DOM from the given schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEMAINTAINDOM (
   xmlschema    IN OUT XMLType);
```

Parameters

Table 198–12 REMOVEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated

REMOVEOUTOFLINE Procedure

This procedure removes any existing `SQLInline` attributes to prevent out-of-line storage. There are three overloads.

Syntax

Removes the `SQLInline` attribute for the named element.

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
   xmlschema           IN OUT  XMLType,
   elementName         IN      VARCHAR2,
   elementType         IN      VARCHAR2,
   overwrite           IN      BOOLEAN default TRUE);
```

Removes the `SQLInline` attribute for the object specified by its global object and local element names.

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
   xmlschema           IN OUT  XMLType,
   globalObject        IN      VARCHAR2,
   globalObjectName    IN      VARCHAR2,
   localElementName    IN      VARCHAR2);
```

Removes the `SQLInline` attribute for the referenced global element.

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
   xmlschema         IN OUT  XMLType,
   reference         IN      VARCHAR2);
```

Parameters

Table 198–13 REMOVEMAKEOUTOFLINE Procedure Parameters

Parameter	Description
`xmlschema`	The XML schema to be annotated
`elementName`	The element name
`elementType`	The element type
`globalObject`	The global object (global complex type or global element)
`globalObjectName`	The name of the global object
`localElementName`	The name of a local element that descends from the global element
`reference`	A reference to a global element
`overwrite`	A boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`.

Usage Notes

This procedure reverses SETOUTOFLINE Procedure.

REMOVESQLCOLLTYPE Procedure

This procedure removes a SQL collection type. The first overload removes the SQL collection type corresponding to the named element and the second overload removes the type from the XML element inside the complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
   xmlschema   IN OUT XMLType,
   elementName IN VARCHAR2);

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
   xmlschema        IN OUT XMLType,
   globalObject     IN VARCHAR2,
   globalName       IN VARCHAR2,
   localElementName IN VARCHAR2);
```

Parameters

Table 198–14 REMOVESQLCOLLTYPE Procedure Parameters

Parameter	Description
`xmlschema`	The XML schema to be annotated
`elementName`	The element name
`globalObject`	The global object (global complex type or global element)
`globalName`	The name of the global object
`localElementName`	The name of a local element that descends from the global element

Usage Notes

This procedure reverses the SETSQLCOLLTYPE Procedure.

REMOVESQLNAME Procedure

This procedure removes a SQLNAME from a global element.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLNAME (
   xmlschema          IN OUT  XMLType,
   globalObject       IN      VARCHAR2,
   globalObjectName   IN      VARCHAR2,
   localObject        IN      VARCHAR2,
   localObjectName    IN      VARCHAR2,
   sqlName            IN      VARCHAR2,
   overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 198–15 REMOVESQLNAME Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localObject	Object descended from the global object
localObjectName	Name of the local object
sqlName	Name of the SQL attribute that corresponds to the element defined in the XML schema
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The shipTo element will have an annotation similar to xdb:SQLName="SHIPTO_SQLNAME".

```
DECLARE
   xml_schema   XMLTYPE;
BEGIN
   SELECT out INTO xml_schema FROM annotation_tab;
   DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
                                       'element', 'purchaseOrder',
                                       'element', 'shipTo',
                                       'SHIPTO_SQLNAME');
   UPDATE annotation_tab SET out = xml_schema;
END;
/
```

REMOVESQLTYPE Procedure

This procedure removes a SQL type. The first overload removes a SQL type from a global element and the second overload removes the type from a global element inside the complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
   xmlschema in out XMLType,
   globalElementName   IN      VARCHAR2);

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
   xmlschema           IN OUT  XMLTYPE,
   globalObject        IN      VARCHAR2,
   globalObjectName    IN      VARCHAR2,
   localObject         IN      VARCHAR2,
   localObjectName     IN      VARCHAR2);
```

Parameters

Table 198–16 REMOVESQLTYPE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated.
globalObject	Global object (global complex type or global element)
globalElementName	Name of the global element.
globalObjectName	Name of the global object
localObject	Object descended from the global object
localObjectName	Name of the local object

Usage Notes

This procedure reverses the SETSQLTYPE Procedure.

REMOVESQLTYPEMAPPING Procedure

This procedure removes the SQL type mapping for the given schema type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPEMAPPING (
   xmlschema        IN OUT  XMLTYPE,
   schemaTypeName   IN      VARCHAR2);
```

Parameters

Table 198–17 REMOVESQLTYPEMAPPING Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
schemaTypeName	Name of the schema type

Usage Notes

This procedure reverses the SETSQLTYPEMAPPING Procedure.

REMOVETABLEPROPS Procedure

This procedure removes the table storage properties from the `CREATE TABLE` statement. This procedure is overloaded. Each overload has different parameter requirements as indicated.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
   xmlschema            IN OUT  XMLTYPE,
   globalElementName    IN      VARCHAR2);

DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
   xmlschema            IN OUT  XMLTYPE,
   globalObject         IN      VARCHAR2,
   globalObjectName     IN      VARCHAR2,
   localElementName     IN      VARCHAR2);
```

Parameters

Table 198–18 REMOVETABLEPROPS Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`globalElementName`	Name of the global element in the schema
`globalObject`	Global object (global complex type or global element)
`globalObjectName`	Name of the global object
`localElementName`	Name of a local element that descends from the global element

Usage Notes

This procedure reverses the SETTABLEPROPS Procedure.

REMOVETIMESTAMPWITHTIMEZONE Procedure

This procedure removes the setting of the `TimeStampWithTimeZone` datatype from all `dateTime` typed elements in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (
   xmlschema          IN OUT  XMLTYPE);

DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (
   xmlschema         IN OUT  XMLTYPE,
   schemaTypeName    IN      VARCHAR2);
```

Parameters

Table 198–19 REMOVETIMESTAMPWITHTIMEZONE Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`schemaTypeName`	Name of the schema type

Usage Notes

This procedure reverses the SETTIMESTAMPWITHTIMEZONE Procedure.

SETANYSTORAGE Procedure

This procedure assigns a SQL datatype to the ANY child of the complex type with the given name.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETANYSTORAGE )
   xmlschema       IN OUT  XMLType,
   complexTypeName IN      VARCHAR2,
   sqlTypeName     IN      VARCHAR2,
   overwrite       IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 198–20 SETANYSTORAGE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
complexTypeName	Name of the complex type
sqlTypeName	Name of the SQL type
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The xsd:any child of complex type Items is assigned an annotation similar to xdb:SQLType="VARCHAR".

```
DECLARE   xml_schema  XMLTYPE;BEGIN   SELECT out INTO xml_schema FROM annotation_
tab;  DBMS_XMLSCHEMA_ANNOTATE.setAnyStorage (xml_schema,
'Items',                                          'VARCHAR');   UPDATE annotation_
tab SET out = xml_schema;END;
/
```

SETDEFAULTTABLE Procedure

This procedure sets the name of the table for the specified global element. This is equivalent to using the schema annotation `xdb:defaultTable="<default_table_name>"` for the top-level element.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETDEFAULTTABLE (
   xmlschema           IN  OUT  XMLTYPE,
   globalElementName   IN       VARCHAR2,
   tableName           IN       VARCHAR2,
   overwrite           IN       BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 198–21 SETDEFAULTTABLE Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`globalElementName`	Name of the global element in the schema
`tableName`	Name being assigned to the table
`overwrite`	Boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`.

SETOUTOFLINE Procedure

This procedure sets the SQLInline attribute to FALSE, that is, it sets xdb:SQLInLine=FALSE.

This forces XDB to store the corresponding elements in the XML document out-of-line as rows in a separate XMLType table. XDB stores references to each row of the XMLType table in a link table that is maintained by the main table

This procedure can improve performance in some situations if the out-of-line table acts as the driver for the query. Storing elements in an out-of-line table also reduces the numbers of columns in the base table, thus avoiding '1000 column limit' errors during XML schema registration, when some elements have complex types with many elements.

Also See: *Oracle XML DB Developer's Guide*

There are three overloads.

Syntax

Sets the SQLInline attribute to FALSE, forcing out-of-line storage for the named element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
   xmlschema          IN OUT  XMLType,
   elementName        IN      VARCHAR2,
   elementType        IN      VARCHAR2,
   defaultTableName   IN      VARCHAR2,
   overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Sets the SQLInline attribute to FALSE, forcing out-of-line storage for the element specified by its local and global name.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
   xmlschema          IN OUT  XMLType,
   globalObject       IN      VARCHAR2,
   globalObjectName   IN      VARCHAR2,
   localElementName   IN      VARCHAR2,
   defaultTableName   IN      VARCHAR2,
   overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Sets the SQLInline attribute to FALSE to force out-of-line storage and sets the default table name for all references to a particular global element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
   xmlschema         IN OUT  XMLType,
   reference         IN      VARCHAR2,
   defaultTableName  IN      VARCHAR2,
   overwrite         IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 198–22 SETOUTOFLINE Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated.
elementName	The element name

Table 198–22 (Cont.) SETOUTOFLINE Procedure Parameters

Parameter	Description
elementType	The element type
defaultTableName	The name of the default table.
globalObject	The global object (global complex type or global element)
globalObjectName	The name of the global object
localElementName	The name of a local element that descends from the global element.
reference	A reference to a global element
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Usage Notes

After XML schema registration and before loading XML instance data, use DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES() to make these references scope to the out-of-line table only. This ensures better query performance later on.

Example

The following example illustrates the third overloaded method. The element comment will have an annotation similar to xdb:defaultTable="CMMNT_DEFAULT_TABLE"

```
DECLARE
   xml_schema xmltype;
BEGIN
SELECT OUT INTO xml_schema FROM annotation_tab;

DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (xml_schema,
                                      'ipo:comment',
                                      'CMMNT_DEFAULT_TABLE');
UPDATE annotation_tab SET OUT = xml_schema;
END;
/
```

SETSCHEMAANNOTATATIONS Procedure

This procedure takes the annotated differences resulting from a call to DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS and patches them into the provided XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS (
   xmlschema     IN OUT xmlType,
   annotations   IN VARCHAR2);
```

Parameters

Table 198–23 SETSCHEMAANNOTATIONS Procedure Parameters

Parameter	Description
xmlschema	An XML schema to be patched.
annotations	The differences document produced by calling DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS on the original XML schema and an annotated XML schema.

Usage Notes

DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATATIONS is not available on Oracle Database release 10.2 (only Oracle Database release 11.*x*).

See Also: GETSCHEMAANNOTATIONS Function

Example

The following example illustrates DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS shown here and GETSCHEMAANNOTATIONS Function.

```
-- test getannotations and apply them
declare
 xml_schema xmltype;
 xml_schema2 xmltype;
 annotations xmltype;
begin
   select out into xml_schema from annotation_tab;

   -- get the annotations from the schema
   annotations := DBMS_XMLSCHEMA_ANNOTATE.getSchemaAnnotations (xml_schema);

   -- apply the annotations to the schema
   select inp into xml_schema2 from annotation_tab;

   DBMS_XMLSCHEMA_ANNOTATE.setSchemaAnnotations(xml_schema2, annotations);

   update annotation_tab t set t.out = xml_schema2;
end;
/
```

SETSQLCOLLTYPE Procedure

This procedure assigns a SQL type name for a collection. A collection is a global or local element with `maxOccurs>1`. Using this procedure, XDB creates `SQLType`s with the user-defined names provided.

There are two overloads. The first sets the name of the SQL collection type corresponding to an XML element and the second to an XML element inside the specified complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
   xmlschema          IN OUT   XMLTYPE,
   elementName        IN       VARCHAR2,
   sqlCollType        IN       VARCHAR2,
   overwrite          IN       BOOLEAN DEFAULT TRUE);

DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
   xmlschema          IN OUT XMLType,
   globalObject       IN VARCHAR2,
   globalObjectName   IN VARCHAR2,
   localElementName   IN VARCHAR2,
   sqlCollType        IN VARCHAR2,
   overwrite          IN BOOLEAN default TRUE );
```

Parameters

Table 198–24 SETSQLCOLLTYPE Procedure Parameters

Parameter	Description
`xmlschema`	The XML schema to be annotated
`elementName`	The element name
`sqlCollType`	The SQL collection type
`globalObject`	The global object (global complex type or global element)
`globalObjectName`	The name of the global object
`localElementName`	The name of a local element that descends from the global element
`overwrite`	A boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`.

Example

The `item` element will have an annotation similar to `xdb:SQLCollType="ITEM_SQL_COL_TYPE"`.

```
declare
   xml_schema xmltype;
begin
   SELECT out INTO xml_schema FROM annotation_tab;
   DBMS_XMLSCHEMA_ANNOTATE.setSQLCollType (xml_schema,
                                           'item',
                                           'ITEM_SQL_COL_TYPE',TRUE);
   UPDATE annotation_tab SET out = xml_schema;
end;
```

SETSQLNAME Procedure

This procedure assigns a name to the SQL attribute that corresponds to an element defined in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (
   xmlschema          IN OUT  XMLType,
   globalObject       IN      VARCHAR2,
   globalObjectName   IN      VARCHAR2,
   localObject        IN      VARCHAR2,
   localObjectName    IN      VARCHAR2,
   sqlName            IN      VARCHAR2,
   overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 198–25 SETSQLNAME Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localObject	Object descended from the global object
localObjectName	Name of the local object
sqlName	Name of the SQL attribute that corresponds to the element defined in the XML schema
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The shipTo element will have an annotation similar to xdb:SQLName="SHIPTO_SQLNAME".

```
DECLARE
   xml_schema   XMLTYPE;
BEGIN
   SELECT out INTO xml_schema FROM annotation_tab;
   DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
                                       'element', 'purchaseOrder',
                                       'element', 'shipTo',
                                       'SHIPTO_SQLNAME');
   UPDATE annotation_tab SET out = xml_schema;
END;
/
```

SETSQLTYPE Procedure

This procedure assigns a SQL type to a global object.

There are two overloads. The first overload assigns a SQL Type to a global object, such as a global element or global complex type and the second to a local object.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
   xmlschema            IN OUT   XMLTYPE,
   globalElementName    IN       VARCHAR2,
   sqlType              IN       VARCHAR2,
   overwrite            IN       BOOLEAN DEFAULT TRUE);

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
   xmlschema           IN OUT   XMLTYPE,
   globalObject        IN       VARCHAR2,
   globalObjectName    IN       VARCHAR2,
   localObject         IN       VARCHAR2,
   localObjectName     IN       VARCHAR2,
   sqlType             IN       VARCHAR2,
   overwrite           IN       BOOLEAN DEFAULT TRUE);
```

Parameters

Table 198–26 SETSQLTYPE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
globalElementName	Name of the global element
localObject	Object descended from the global object
localObjectName	Name of the local object
sqlType	SQL type assigned to the named global element
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The purchaseOrder element will have an annotation similar to xdb:SQLType="PO_SQLTYPE" and the shipTo element has one similar to xdb:SQLType="VARCHAR".

```
DECLARE
   xml_schema  xmltype;
BEGIN
  SELECT out INTO xml_schema FROM annotation_tab;
  DBMS_XMLSCHEMA_ANNOTATE.setSQLType (xml_schema,
                                      'purchaseOrder',
                                      'PO_SQLTYPE');
  UPDATE annotation_tab SET out = xml_schema;
END;
/
```

```
DECLARE   xml_schema   xmltype;BEGIN  SELECT out INTO xml_schema FROM annotation_
tab;  DBMS_XMLSCHEMA_ANNOTATE.setSQLType (xml_schema,
'element','purchaseOrder',                                          'element'
,'shipTo',                                          'VARCHAR');  UPDATE annotation_
tab SET out = xml_schema;END;
/
```

SETSQLTYPEMAPPING Procedure

This procedure defines a mapping of schema type and SQL type.

If you use this procedure, you do not need to call the SETSQLTYPE procedure on all instances of the schema type; instead the procedure traverses the schema and assigns the SQL type automatically.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPEMAPPING (
   xmlschema          IN OUT   XMLType,
   schemaTypeName     IN       VARCHAR2,
   sqlTypeName        IN       VARCHAR2,
   overwrite          IN       BOOLEAN DEFAULT TRUE);
```

Parameters

Table 198–27 SETSQLTYPEMAPPING Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
schemaTypeName	Schema type
sqlTypeName	Name of the SQL type
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE

Example

The attribute orderDate will have an annotation similar to xdb:SQLType="DATE".

```
declare   xml_schema xmltype;beginSELECT out INTO xml_schema FROM annotation_
tab;DBMS_XMLSCHEMA_ANNOTATE.setSQLTypeMapping (xml_schema,
'date',                                          'DATE');UPDATE annotation_tab SET
out = xml_schema;end;
/
```

SETTABLEPROPS Procedure

This procedure specifies properties in the TABLE storage clause that is appended to the default CREATE TABLE statement. There are two overloads with different parameter requirements, as indicated:

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
   xmlschema            IN OUT  XMLType,
   globalElementName    IN      VARCHAR2,
   tableProps           IN      VARCHAR2,
   overwrite            IN      BOOLEAN DEFAULT TRUE);

DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
   xmlschema            IN OUT  XMLTYPE,
   globalObject         IN      VARCHAR2,
   globalObjectName     IN      VARCHAR2,
   localElementName     IN      VARCHAR2,
   tableProps           IN      VARCHAR2,
   overwrite            IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 198–28 SETTABLEPROPS Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema
tableProps	Table properties
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localElementName	Name of a local element that descends from the global element
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The purchaseOrder element will have an annotation similar to xdb:tableProps="CACHE".

```
DECLARE   xml_schema XMLTYPE;BEGIN   SELECT out INTO xml_schema FROM annotation_
tab;  DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS(xml_schema,
'purchaseOrder' ,'CACHE');   UPDATE annotation_tab SET out = xml_schema;END;
/
```

SETTIMESTAMPWITHTIMEZONE Procedure

This procedure sets the TIMESTAMPWITHTIMEZONE datatype to all dateTime typed elements in the XML schema. This is equivalent to adding xdb:SQLType="TIMESTAMP WITH TIME ZONE" to all dateTime objects.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETTIMESTAMPWITHTIMEZONE (
   xmlschema      IN OUT   XMLTYPE,
   overwrite      IN       BOOLEAN DEFAULT TRUE);
```

Parameters

Table 198–29 SETTIMESTAMPWITHTIMEZONE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

199

DBMS_XMLSTORAGE_MANAGE

The DBMS_XMLSTORAGE_MANAGE package provides an interface to manage and modify XML storage after schema registration has been completed.

> **See Also:** *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

Using DBMS_XMLSTORAGE_MANAGE

Overview

DBMS_XMLSTORAGE_MANAGE contains procedures to manage and modify XML storage after schema registration has been completed. Use subprograms from this package to improve the performance of bulk load operations. You can disable indexes and constraints before doing a bulk load process and to enable them afterwards.

Security Model

Owned by XDB, the DBMS_XMLSTORAGE_MANAGE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Summary of DBMS_XMLSTORAGE_MANAGE Subprograms

Table 199–1 DBMS_XMLSTORAGE_MANAGE Package Subprograms

Subprogram	Description
DISABLEINDEXESANDCONSTRAINTS Procedure on page 199-6	Disables the indexes and constraints for `XMLType` tables and `XMLType` columns
ENABLEINDEXESANDCONSTRAINTS Procedure on page 199-9	Rebuilds all indexes and enables the constraints on an `XMLType` table including its child tables and out-of-line tables
EXCHANGEPOSTPROC Procedure on page 199-10	Enable constraints after exchange partition
EXCHANGEPREPROC Procedure on page 199-11	Disable constraints before exchange partition
INDEXXMLREFERENCES Procedure on page 199-12	Creates unique indexes on the `REF` columns of the given XML type table or the XML type column of a given table
RENAMECOLLECTIONTABLE Procedure on page 199-13	Renames a collection table to the given table name
SCOPEXMLREFERENCES Procedure on page 199-15	Scopes all XML references. Scoped `REF` types require less storage space and allow more efficient access than unscoped `REF` types
XPATH2TABCOLMAPPING Function on page 199-16	Maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name

DISABLEINDEXESANDCONSTRAINTS Procedure

This procedure disables the indexes and constraints for XMLType tables and XMLType columns.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS (
   owner_name    IN  VARCHAR2 DEFAULT USER,
   table_name    IN  VARCHAR2,
   column_name   IN  VARCHAR2 DEFAULT NULL,
   clear         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 199–2 DISABLEINDEXESANDCONSTRAINTS Procedure Parameters

Parameter	Description
owner_name	Owner's name
table_name	Name of the XMLType table that the procedure is being performed on
column_name	XMLType column name
clear	Boolean that when set to TRUE clears all stored index and constraint data for the table before the procedure executes. The default is FALSE, which does not clear them.

Usage Notes

Passing XMLTYPE tables

For XMLType tables, you must pass the XMLType table name on which the bulk load operation is to be performed. For XMLType columns, you must pass the relational table name and the corresponding XMLType column name.

Using clear to Enable and Disable Indexes and Constraints

Note: If the DISABLEINDEXESANDCONTRAINTS procedure is called with clear set to TRUE, it removes any index or constraint information about the XMLTYPE table or column memorized during earlier executions of the procedure.

Therefore, you must ensure that all disabled indexes and constraints are re-enabled on the table or column before you call the DISABLEINDEXESANDCONTRAINTS procedure with clear set to TRUE.

Ideally, it is recommended that you set clear set to TRUE for the first execution. For any subsequent executions (due to errors while disabling or enabling indexes) clear should be set to FALSE, the default value. Once you have successfully re-enabled all the indexes and constraints following the bulk load operation, you can call this procedure again with clear set to TRUE for the next bulk load operation.

Example

The following example illustrates the use of clear in the DISABLEINDEXESANDCONSTRAINTS procedure and the ENABLEINDEXESANDCONSTRAINTS Procedure.

First, add a not-NULL constraint on comment element of the PURCHASEORDER_TAB table:

```
ALTER TABLE PURCHASEORDER_TAB ADD CONSTRAINT c1 check
("XMLDATA"."comment" IS NOT NULL);
```

Then, disable all the indexes and constraints by passing the clear as TRUE, by calling the DISABLEINDEXESANDCONSTRAINTS procedure:

```
BEGIN
     XDB.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
                                ( USER,'PURCHASEORDER_TAB',NULL,TRUE );
END;
/
```

Next, perform a bulk load operation (such as datapump import) which violates constraint c1 in the ALTER table statement. This does not raise an error because the constraint is disabled:

```
host impdp orexample/orexample directory=dir dumpfile=dmp.txt
   tables=OREXAMPLE.PURCHASEORDER_TAB content = DATA_ONLY;
```

NOTE: To view the disabled constraints and indexes use:

```
SELECT constraint_name,table_name,status FROM all_constraints
  WHERE owner = user;
```

Finally, try to enable the constraint using the ENABLEINDEXESANDCONSTRAINTS procedure. It raises an error because c1, the not null constraint, is violated by the bulk load operation:

```
BEGIN
     XDB.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
                                        ( USER,'PURCHASEORDER_TAB');
END;
/
```

To disable all the indexes and constraints, again use DISABLEINDEXESANDCONSTRAINTS, but set clear= FALSE (because the ENABLEINDEXESANDCONSTRAINTS failed to complete successfully). Note: clear = FALSE by default, so we do not need to pass it explicitly in the next call.

```
BEGIN
     xdb.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
                                ( USER,'PURCHASEORDER_TAB');
END;
/
```

Then, delete the incorrect rows entered into the table

```
DELETE FROM purchaseorder_tab p
     WHERE p.xmldata."comment" IS NULL;
```

Re-enable the indexes and constraints using ENABLEINDEXESANDCONSTRAINTS, which completes successfully.

```
BEGIN
     xdb.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
```

```
                                                    ( USER,'PURCHASEORDER_TAB');
END;
/
```

ENABLEINDEXESANDCONSTRAINTS Procedure

This procedure rebuilds all indexes and enables the constraints on an XMLType table including its child tables and out-of-line tables. When column_name is passed, it does the same for this XMLType column.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS (
   owner_name   IN VARCHAR2 DEFAULT USER,
   table_name   IN VARCHAR2,
   column_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 199–3 ENABLEINDEXESANDCONSTRAINTS Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from
column_name	Column name

Usage Notes

This procedure reverses DISABLEINDEXESANDCONSTRAINTS Procedure.

Example

See DISABLEINDEXESANDCONSTRAINTS Procedure

EXCHANGEPOSTPROC Procedure

This procedure enable constraints after exchange partition.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPOSTPROC (
   owner_name   IN VARCHAR2 DEFAULT USER,
   table_name   IN VARCHAR2);
```

Parameters

Table 199–4 EXCHANGEPOSTPROC Procedure Parameters

Parameter	Description
`owner_user`	Owner's name
`table_name`	Name of the table that the indexes and constraints are being removed from

EXCHANGEPREPROC Procedure

This procedure disable constraints before exchange partition.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPREPROC (
   owner_name   IN VARCHAR2 DEFAULT USER,
   table_name   IN VARCHAR2);
```

Parameters

Table 199–5 EXCHANGEPREPROC Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from

INDEXXMLREFERENCES Procedure

This procedure creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table.

If the procedure creates multiple REF columns, it appends _1, _2, and so on to their names.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.INDEXXMLREFERENCES (
   owner_name    IN VARCHAR2 DEFAULT USER,
   table_name    IN VARCHAR2,
   column_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 199–6 INDEXXMLREFERENCES Procedure Parameters

Parameter	Description
owner_name	The owner's name
table_name	The table being indexed
column_name	A column name. Not needed for XML type tables.
index_name	The name of the newly created index

Usage Notes

This procedure is only used if the REFs are scoped. See SCOPEXMLREFERENCES Procedure.

Indexed REFs lead to better performance when joins between the base table and a child table occur in the query plan.

- If the base table has a higher selectivity than the child table, there is no need to index the REFs.
- If the selectivity of the child table is higher than that of the base table and if no indexes are present, then the join of one row in the child table with the base table leads to a full table scan of the base table.

INDEXXMLREFERENCES does not index REFs recursively in child tables of a table it is called on. To do this, Oracle recommends calling the procedure from within a loop over the XML_OUT_OF_LINE_TABLES or XML_NESTED_TABLES view. This creates the index names from the current value of a column in the view.

Note: This procedure is limited to the structured storage model.

RENAMECOLLECTIONTABLE Procedure

This procedure renames a collection table to the given table name.

An XPath expression specifies the collection table, starting from the `XMLtype` base table or an `XMLType` column of the base table.

This procedure provides the only way to derive a collection table name from the corresponding collection type name because there is no direct schema annotation for the purpose.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
   owner_name             IN VARCHAR2 DEFAULT USER,
   table_name             IN VARCHAR2,
   column_name            IN VARCHAR2 DEFAULT NULL,
   xpath                  IN VARCHAR2,
   collection_table_name  IN VARCHAR2
   namespaces             IN VARCHAR2 default NULL);  // For release 11.2 only
```

Parameters

Table 199–7 RENAMECOLLECTIONTABLE Procedure Parameters

Parameter	Description
`owner_name`	The name of the owner
table_name	The name of a base table that can be used as the starting point for specifying the collection table
`column_name`	An `XMLType` column that can be the starting point for specifying the collection table
`xpath`	The XPath expression that specifies the collection table
`collection_table_name`	The name of the collection table
`namespaces`	For Oracle Database 11*g* Release 2 (11.2) and higher. The namespaces used in XPath.

Usage Notes

Call this procedure after registering the XML schema.

The table name serves as a prefix to the index names.

Oracle recommends using this function because it makes query execution plans more readable.

Report errors that occur while this procedure runs to the user that called the procedure.

> **Note:** This procedure is limited to the structured storage model.

For Oracle Database 11*g* Release 2 (11.2) and higher, only, this function accepts XPath notation as well as DOT notation. If XPath notation is used, a `namespaces` parameter may also be required.

Example

The collection table name will be `EMP_TAB_NAMELIST`. You can verify this using `SELECT * FROM user_nested_tables`.

Using DOT Notation:

```
call  XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
           USER,
           'EMP_TAB',
           NULL,
           '"XMLDATA"."EMPLOYEE"."NAME"',
          ''EMP_TAB_NAMELIST);
```

Using XPath Notation:

XPath notation is available with Oracle Database 11g Release 2 (11.2) and higher.

```
call  XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
              USER,
              'EMP_TAB',
              NULL,
              '/e:Employee/Name',
              'EMP_TAB_NAMELIST',
              '''http://www.oracle.com/emp.xsd'' as "e"');
```

SCOPEXMLREFERENCES Procedure

This procedure scopes all XML references. Scoped `REF` types require less storage space and allow more efficient access than unscoped `REF` types.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES;
```

Usage Notes

- If you have used SETOUTOFLINE Procedure in the DBMS_XMLSTORAGE_MANAGE package to avoid raising `'1000 column limit'` errors during XML schema registration, you should also use SCOPEXMLREFERENCES Procedure.
- Using `SCOPEXMLREFERENCES` after XML schema registration and before loading XML instance data, makes these reference scoped to the out-of-line table only.

> **Note:** This procedure is limited to the structured storage model.

XPATH2TABCOLMAPPING Function

This function maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name. This is necessary in cases in which the user wants to create an index on this table, or to add a constraint, or to rename a table to make query execution plans more readable.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
   owner_name   IN  VARCHAR2 DEFAULT USER,
   table_name   IN  VARCHAR2,
   column_name  IN  VARCHAR2 DEFAULT NULL,
   xpath        IN  VARCHAR2,
   namespaces   IN  VARCHAR2 DEFAULT NULL)
 RETURN XMLTYPE;
```

Parameters

Table 199–8 XPATH2TABCOLMAPPING Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the base table
column_name	Optional name of the XML type column if table_name is not an XMLtype table. If table_name refers to XMLType table then column_name should be NULL.
xpath	Path expression in DOT notation or XPath notation (see examples below)
namespaces	Optional namespace definitions for path expression

Examples

XPath2TablColMapping evaluated on XMLType table with Xpath Notation, namespaces provided

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
   USER, 'XML_TAB', '', '//n1:item/n1:location',''''xdbXmark'' as "n1"'')
FROM DUAL;
```

This produces a result, for example:

```
<Result>
<Mapping TableName="SYS_NT12345" ColumnName="location"/>
</Result>
```

This allows us to define an index or constraint on table SYS_NT12345 and column location.

XPath2TablColMapping evaluated on table not of XMLType but with XMLType column by means of DOT notation

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
   USER,'PurchaseOrderTab','XMLCOL','xmldata.LineItems.LineItem', '')
FROM DUAL;
```

200

DBMS_XMLSTORE

DBMS_XMLSTORE provides the ability to store XML data in relational tables.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following sections:

Using DBMS_XMLSTORE

Security Model

Owned by XDB, the DBMS_XMLSTORE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Types

Table 200–1 Types of DBMS_XMLSTORE

Type	Description
`ctxType`	The type of the query context handle. This is the return type of NEWCONTEXT.

Summary of DBMS_XMLSTORE Subprograms

Table 200–2 DBMS_XMLSTORE Package Subprograms

Method	Description
CLEARKEYCOLUMNLIST on page 200-6	Clears the key column list.
CLEARUPDATECOLUMN LIST on page 200-7	Clears the update column list.
CLOSECONTEXT on page 200-8	It closes/deallocates a particular save context.
DELETEXML on page 200-9	Deletes records specified by data from the XML document, from the table specified at the context creation time.
INSERTXML on page 200-10	Inserts the XML document into the table specified at the context creation time.
NEWCONTEXT on page 200-11	Creates a save context, and returns the context handle.
SETKEYCOLUMN on page 200-12	This method adds a column to the key column list.
SETROWTAG on page 200-13	Names the tag used in the XML document., to enclose the XML elements corresponding to the database.
SETUPDATECOLUMN on page 200-14	Adds a column to the "update column list".
UPDATEXML on page 200-15	Updates the table given the XML document.

CLEARKEYCOLUMNLIST

Clears the key column list.

Syntax

```
PROCEDURE clearKeyColumnList(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLEARUPDATECOLUMNLIST

Clears the update column list.

Syntax

```
PROCEDURE clearUpdateColumnList(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLOSECONTEXT

Closes/deallocates a particular save context.

Syntax

```
PROCEDURE closeContext(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

DELETEXML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

Syntax	Description

`FUNCTION deleteXML(`
`  ctxHdl IN ctxPType,`
`  xDoc IN VARCHAR2)`
`RETURN NUMBER;`
	Uses a `VARCHAR2` type for the `xDoc` parameter.

`FUNCTION deleteXML(`
`  ctxHdl IN ctxType,`
`  xDoc IN CLOB)`
`RETURN NUMBER;`
	Uses a `CLOB` type for the `xDoc` parameter.

`FUNCTION deleteXML(`
`  ctxHdl IN ctxType,`
`  xDoc IN XMLType)`
`RETURN NUMBER;`
	Uses an `XMLType` type for the `xDoc` parameter.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

Note that if a user passes an XML file for insertXML to DBMS_XMLSTORE which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless SETUPDATECOLUMN is used. The use of setUpdateColumn is optional only if the elements in the XML file match up to the columns in the table.

Syntax	Description

`FUNCTION insertXML(`
`ctxHdl IN ctxType,`
`xDoc IN VARCHAR2)`
`RETURN NUMBER;`
	Passes in the xDoc parameter as a VARCHAR2.

`FUNCTION insertXML(`
`ctxHdl IN ctxType,`
`xDoc IN CLOB)`
`RETURN NUMBER;`
	Passes in the xDoc parameter as a CLOB.

`FUNCTION insertXML(`
`ctxHdl IN ctxType,`
`xDoc IN XMLType)`
`RETURN NUMBER;`
	Passes in the xDoc parameter as an XMLType.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

NEWCONTEXT

Creates a save context, and returns the context handle.

Syntax

```
FUNCTION newContext(
   targetTable IN VARCHAR2)
RETURN ctxType;
```

Parameter	IN / OUT	Description
targetTable	(IN)	The target table into which to load the XML document.

SETKEYCOLUMN

This method adds a column to the "key column list". The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations

Syntax

```
PROCEDURE setKeyColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the key column list; cannot be NULL.

SETROWTAG

Names the tag used in the XML document, to enclose the XML elements corresponding to database records.

Syntax

```
PROCEDURE setRowTag(
   ctxHdl IN ctxType,
   tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETUPDATECOLUMN

Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the `ROW` element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Note that if a user passes an XML file for INSERTXML to `DBMS_XMLSTORE` which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless setUpdateColumn is used. The use of setUpdateColumn is optional only if the elements in the XML file match up to the columns in the table.

Syntax

```
PROCEDURE setUpdateColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`colName`	`(IN)`	Column to be added to the update column list.

UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

Syntax	Description

`FUNCTION updateXML(`
`ctxHdl IN ctxType,`
`xDoc IN VARCHAR2)`
`RETURN NUMBER;`
	Passes in the `xDoc` parameter as a `VARCHAR2`.

`FUNCTION updateXML(`
`ctxHdl IN ctxType,`
`xDoc IN CLOB)`
`RETURN NUMBER;`
	Passes in the `xDoc` parameter as a `CLOB`.

`FUNCTION updateXML(`
`ctxHdl IN ctxType,`
`xDoc IN XMLType)`
`RETURN NUMBER;`
	Passes in the `xDoc` parameter as a `XMLType`.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

201

DBMS_XMLTRANSLATIONS

Note: The DBMS_XMLTRANSLATIONS package is deprecated with Oracle Database 12*c*.

The `DBMS_XMLTRANSLATIONS` package provides an interface to perform translations so that strings can be searched or displayed in various languages.

See Also: For more information, see the *Oracle XML DB Developer's Guide*

This chapter contains the following sections:

Using DBMS_XMLTRANSLATIONS

Security Model

Owned by XDB, the DBMS_XMLTRANSLATIONS package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Summary of DBMS_XMLTRANSLATIONS Subprograms

Table 201–1 DBMS_XMLSTORE Package Subprograms

Method	Description
DISABLETRANSLATION Procedure on page 201-5	Disables translations in the current session so that query or retrieval will take place on the base document ignoring session language values
ENABLETRANSLATION Procedure on page 201-6	Enables translations in the current session
EXTRACTXLIFF Function & Procedure on page 201-7	Extracts the translations in `XLIFF` format from either an `XMLTYPE` or a resource in the XDB Repository
GETBASEDOCUMENT Function on page 201-10	Returns the base document with all the translations
MERGEXLIFF Functions on page 201-12	Merges the translations in `XLIFF` format into either an `XMLTYPE` or a resource in the XDB Repository
SETSOURCELANG Function on page 201-15	Sets the source language to a particular language at the specified XPATH
TRANSLATEXML Function on page 201-17	Returns the document in the specified language
UPDATETRANSLATION Function on page 201-5	Updates the translation in a particular language at the specified `XPATH`

DISABLETRANSLATION Procedure

> **Note:** The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12*c*.

This procedure disables translations in the current session so that query or retrieval will take place on the base document ignoring session language values.

Syntax

```
DBMS_XMLTRANSLATIONS.DISABLETRANSLATION;
```

ENABLETRANSLATION Procedure

Note: The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12*c*.

This procedure enables translations in the current session. This is the default behavior.

Syntax

```
DBMS_XMLTRANSLATIONS.ENABLETRANSLATION;
```

EXTRACTXLIFF Function & Procedure

> **Note:** The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12*c*.

This function and procedure extracts the translations in XLIFF format from either an XMLTYPE or a resource in the XDB Repository.

Syntax

```
DBMS_XMLTRANSLATIONS.EXTRACTXLIFF(
   doc       IN  XMLTYPE,
   xpath     IN  VARCHAR2,
   namespace IN  VARCHAR2 := NULL)
 RETURN XMLTYPE;

DBMS_XMLTRANSLATIONS.EXTRACTXLIFF(
   abspath   IN  XMLTYPE,
   xpath     IN  VARCHAR2,
   namespace IN  VARCHAR2 := NULL)
 RETURN XMLTYPE;
```

Parameters

Table 201–2 EXTRACTXLIFF Function Parameters

Parameter	Description
doc	XMLTYPE from which the XLIFF is to be extracted
xpath	XPATH at which specifies the location of the element that needs to be translated. If no XPATH is specified, the entire document is processed.
namespace	Namespace
abspath	Absolute path of the resource from which the XLIFF is to be extracted

Return Values

The translations in the XLIFF format

Examples

Extracting the Translation from an XMLTYPE

Let doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
```

```
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <title xml:lang="es">
        Security Class Example - ES
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

Let the xpath = `'/securityClass/title'`. The output of `EXTRACTXLIFF` will be as follows:

```
<xliff version='1.1'>
  <file original='' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example - FR</target>
          <target xml:lang='es'>Security Class Example - ES</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>
```

Extracting the Translation from a Resource

Let the resource `'/public/security.xml'` =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="es">
        Security Class Example - ES
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
    <privlist>
    <privilege name="privilege1"/>
    <aggregatePrivilege name="iStorePOApprover">
        <title>
            iStore Purchase Order Approver
        </title>
        <privilegeRef name="is:privilege1"/>
        <privilegeRef name="oa:submitPO"/>
        <privilegeRef name="oa:privilege3"/>
    </aggregatePrivilege>
    <privilege name="privilege2">
        <title xml:lang="en">
            secondary privilege
        </title>
```

```
        <title xml:lang="fr" xdb:srclang="true">
            secondary privilege - FR
        </title>
        <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
        <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
    </privilege>
    </privlist>
</securityClass>
```

And let XPATH = '', then the extracted XLIFF is

```
<xliff version='1.1'>
  <file original='/public/security.xml' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example - FR</target>
          <target xml:lang='es'>Security Class Example - ES</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
  <file original='/public/security.xml' source-language='fr' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/privilege[@name="privilege2"/title'>
        <source>secondary privilege - FR</source>
        <alt-trans>
          <target xml:lang='en'>secondary privilege</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>
```

GETBASEDOCUMENT Function

Note: The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12*c*.

This function returns the base document with all the translations.

Syntax

```
DBMS_XMLTRANSLATIONS.GETBASEDOCUMENT(
   doc    IN  XMLTYPE)
 RETURN XMLTYPE;
```

Parameters

Table 201–3 GETBASEDOCUMENT Function Parameters

Parameter	Description
doc	Input XMLTYPE

Return Values

The XMLTYPE which contains the base document with all the translations

Examples

For example, for doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

For the above document, this subprogram will return:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
```

```
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

MERGEXLIFF Functions

> **Note:** The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12*c*.

This function merges the translations in XLIFF format into either an XMLTYPE or a resource in the XDB Repository.

Syntax

```
DBMS_XMLTRANSLATIONS.MERGEXLIFF(
   doc       IN  XMLTYPE,
   xliff     IN  XMLTYPE)
 RETURN XMLTYPE;

DBMS_XMLTRANSLATIONS.MERGEXLIFF(
   xliff     IN  XMLTYPE);
```

Parameters

Table 201–4 MERGEXLIFF Function & Procedure Parameters

Parameter	Description
doc	XMLTYPE from which the XLIFF is to be merged
xliff	Translations in the XLIFF format

Return Values

The result of merging 'xliff' into 'doc' at 'xpath'

Examples

Merge Translations into an XMLTYPE

Consider the following input XMLTYPE:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="es">
        Security Class Example - ES
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
    <privlist>
    <privilege name="privilege1"/>
```

```
    <aggregatePrivilege name="iStorePOApprover">
        <title>
            iStore Purchase Order Approver
        </title>
        <privilegeRef name="is:privilege1"/>
        <privilegeRef name="oa:submitPO"/>
        <privilegeRef name="oa:privilege3"/>
    </aggregatePrivilege>
    <privilege name="privilege2">
        <title xml:lang="en">
            secondary privilege
        </title>
        <title xml:lang="fr" xdb:srclang="true">
            secondary privilege - FR
        </title>
        <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
        <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
    </privilege>
    </privlist>
</securityClass>
```

Let the input `XLIFF` be as follows:

```
<xliff version='1.1'>
  <file original='/public/security.xml' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example Modified</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example Mod - FR</target>
          <target xml:lang='es'>Security Class Example Mod - ES</target>
        </alt-trans>
      </trans-unit>
      <trans-unit id='/securityClass/privilege[@name="privilege2"/title'>
        <source>secondary privilege modified</source>
        <alt-trans>
          <target xml:lang='fr'>secondary privilege mod - FR</target>
        </alt-trans>
      </trans-unit>
    </body>
</xliff>
```

The output of merge will be as follows:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">

Merge XLIFF Translations into a Resource

If the input document in the above example were to be stored in the repository at `'/public/security.xml'`, then merging the above `XLIFF` will have the same effect.

SETSOURCELANG Function

> **Note:** The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12*c*.

This function sets the source language to a particular language at the specified XPATH.

Syntax

```
DBMS_XMLTRANSLATIONS.SETSOURCELANG (
   doc       IN  XMLTYPE,
   xpath     IN  VARCHAR2,
   lang      IN  VARCHAR2,
   namespace IN  VARCHAR2 := NULL)
 RETURN XMLTYPE;
```

Parameters

Table 201–5 SETSOURCELANG Function Parameters

Parameter	Description
doc	XMLTYPE for which the source language is to be set
xpath	XPATH at which the source language is to be set
lang	Source language
namespace	Namespace

Return Values

The updated document

Examples

For example, if doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

the statement

```
setSourceLang ( doc, '/securityClass/title', 'fr' )
```

produces

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en">
        Security Class Example
    </title>
    <title xml:lang="fr" xdb:srclang="true">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

TRANSLATEXML Function

> **Note:** The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12*c*.

This function returns the document in the specified language.

Syntax

```
DBMS_XMLTRANSLATIONS.TRANSLATEXML(
   doc    IN  XMLTYPE,
   lang   IN  VARCHAR2)
 RETURN XMLTYPE;
```

Parameters

Table 201–6 TRANSLATEXML Function Parameters

Parameter	Description
doc	Input XMLTYPE
lang	Language

Return Values

The XMLTYPE which contains the document in the specified language

Examples

For example, for doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

TRANSLATEXML (doc, 'fr') will return:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="fr">
```

```
            Security Class Example - FR
        </title>
        <inherits-from>is:iStorePurchaseOrder</inherits-from>
    </securityClass>
```

UPDATETRANSLATION Function

> **Note:** The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12*c*.

This function updates the translation in a particular language at the specified XPATH.

Syntax

```
DBMS_XMLTRANSLATIONS.UPDATETRANSLATION(
   doc       IN  XMLTYPE,
   xpath     IN  VARCHAR2,
   lang      IN  VARCHAR2,
   value     IN  VARCHAR2,
   namespace IN  VARCHAR2 := NULL)
 RETURN XMLTYPE;
```

Parameters

Table 201–7 UPDATETRANSLATION Function Parameters

Parameter	Description
doc	XMLTYPE for which the translation is to be updated
xpath	XPATH at which the translation is to be updated
lang	Language for which the translation is to be updated
value	New translation
namespace	Namespace

Return Values

The updated document

Examples

For example,

```
updateTranslation ( doc, '/securityClass/title/text()', 'fr', 'Oracle' );
```

produces

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Oracle
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

202

DBMS_XPLAN

The DBMS_XPLAN package provides an easy way to display the output of the EXPLAIN PLAN command in several, predefined formats. You can also use the DBMS_XPLAN package to display the plan of a statement stored in the Automatic Workload Repository (AWR) or stored in a SQL tuning set. It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the V$SQL_PLAN and V$SQL_PLAN_STATISTICS_ALL fixed views. Finally, it displays plans from a SQL plan baseline.

See Also:

- For more information on the EXPLAIN PLAN command, the AWR, and SQL tuning set, see *Oracle Database SQL Tuning Guide*.
- For more information on the V$SQL_PLAN and V$SQL_PLAN_STATISTICS fixed views, see *Oracle Database Reference.*

This chapter contains the following topics:

Using DBMS_XPLAN

Overview

The DBMS_XPLAN package supplies five table functions:

- DISPLAY - to format and display the contents of a plan table.
- DISPLAY_AWR - to format and display the contents of the execution plan of a stored SQL statement in the AWR.
- DISPLAY_CURSOR - to format and display the contents of the execution plan of any loaded cursor.
- DISPLAY_SQL_PLAN_BASELINE - to display one or more execution plans for the SQL statement identified by SQL handle
- DISPLAY_SQLSET - to format and display the contents of the execution plan of statements stored in a SQL tuning set.

Security Model

This package runs with the privileges of the calling user, not the package owner (SYS). The table function DISPLAY_CURSOR requires SELECT or READ privileges on the following fixed views: VSQL_PLAN, VSESSION and V$SQL_PLAN_STATISTICS_ALL.

Using the DISPLAY_AWR Function requires the user to have SELECT or READ privileges on DBA_HIST_SQL_PLAN, DBA_HIST_SQLTEXT, and V$DATABASE.

Using the DISPLAY_SQLSET Functionrequires the user to have the SELECT or READ privilege on ALL_SQLSET_STATEMENTS and ALL_SQLSET_PLANS.

Using DISPLAY_SQL_PLAN_BASELINE Function requires the user to have the SELECT or READ privilege on DBA_SQL_PLAN_BASELINES as well as the privileges to execute the SQL statement for which the user is trying to get the plan.

All these privileges are automatically granted as part of the SELECT_CATALOG role.

Examples

Displaying a Plan Table Using DBMS_XPLAN.DISPLAY

Execute an explain plan command on a SELECT statement:

```
EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
   WHERE e.deptno = d.deptno
   AND e.ename='benoit';
```

Display the plan using the DBMS_XPLAN.DISPLAY table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
```

This query produces the following output:

```
Plan hash value: 3693697075
-------------------------------------------------------------------------------
| Id  | Operation          | Name | Rows  | Bytes | Cost (%CPU)| Time     |
-------------------------------------------------------------------------------
|   0 | SELECT STATEMENT   |      |     1 |    57 |     6  (34)| 00:00:01 |
|*  1 |  HASH JOIN         |      |     1 |    57 |     6  (34)| 00:00:01 |
|*  2 |   TABLE ACCESS FULL| EMP  |     1 |    37 |     3  (34)| 00:00:01 |
|   3 |   TABLE ACCESS FULL| DEPT |     4 |    80 |     3  (34)| 00:00:01 |
-------------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------
   1 - access("E"."DEPTNO"="D"."DEPTNO")
   2 - filter("E"."ENAME"='benoit')

15 rows selected.
```

Displaying a Cursor Execution Plan Using DBMS_XPLAN.DISPLAY_CURSOR

By default, the table function DISPLAY_CURSOR formats the execution plan for the last SQL statement executed by the session. For example:

```
SELECT ename  FROM  emp e, dept d
   WHERE   e.deptno = d.deptno
   AND   e.empno=7369;

ENAME
----------
SMITH
```

To display the execution plan of the last executed statement for that session:

```
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR);
```

This query produces the following output:

```
Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0
-------------------------------------------------------------------
SELECT ename FROM emp e, dept d WHERE e.deptno = d.deptno
AND e.empno=7369

-------------------------------------------------------------------------------
| Id  | Operation          | Name | Rows  | Bytes | Cost (%CPU)| Time     |
```

```
-------------------------------------------------------------------------
|   0 | SELECT STATEMENT   |      |       |       |            |          |
|*  1 |  HASH JOIN         |      |     1 |    16 |     6  (34)| 00:00:01 |
|*  2 |   TABLE ACCESS FULL| EMP  |     1 |    13 |     3  (34)| 00:00:01 |
|   3 |   TABLE ACCESS FULL| DEPT |     4 |    12 |     3  (34)| 00:00:01 |
-------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------
   1 - access("E"."DEPTNO"="D"."DEPTNO")
   2 - filter("E"."EMPNO"=7369)

21 rows selected.
```

You can also use the table function `DISPLAY_CURSOR` to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:

```
SELECT /* TOTO */ ename, dname
FROM dept d join emp e USING (deptno);
```

Get `sql_id` and `child_number` for the preceding statement:

```
SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE '%TOTO%';

SQL_ID         CHILD_NUMBER
----------     ----------------------------
gwp663cqh5qbf   0
```

Display the execution plan for the cursor:

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR('gwp663cqh5qbf',0));

Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0
-------------------------------------------------------
SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);

-------------------------------------------------------------------------------
| Id  | Operation           | Name | Rows  | Bytes | Cost (%CPU)| Time     |
-------------------------------------------------------------------------------
|   0 | SELECT STATEMENT    |      |       |       |     7 (100)|          |
|   1 |  SORT GROUP BY      |      |     4 |    64 |     7  (43)| 00:00:01 |
|*  2 |   HASH JOIN         |      |    14 |   224 |     6  (34)| 00:00:01 |
|   3 |    TABLE ACCESS FULL| DEPT |     4 |    44 |     3  (34)| 00:00:01 |
|   4 |    TABLE ACCESS FULL| EMP  |    14 |    70 |     3  (34)| 00:00:01 |
-------------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------
   2 - access("E"."DEPTNO"="D"."DEPTNO")
```

Instead of issuing two queries, one to the get the sql_id and child_number pair and one to display the plan, you can combine these in a single query:

Display the execution plan of all cursors matching the string 'TOTO':

```
SELECT t.*
FROM v$sql s, table(DBMS_XPLAN.DISPLAY_CURSOR(s.sql_id, s.child_number)) t WHERE
sql_text LIKE '%TOTO%';
```

Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the display and `display_cursor` table functions. In Displaying a Plan Table Using DBMS_XPLAN.DISPLAY on page 202-5, the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

```
ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
   WHERE e.deptno = d.deptno
   AND e.ename    ='hermann'
   ORDER BY e.empno;
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
Plan hash value: 3693697345
```

```
-------------------------------------------------------------------------------------------------------------
| Id | Operation          | Name    | Rows | Bytes | Cost (%CPU)| Time     | TQ    |INOUT |PQ Distrib   |
-------------------------------------------------------------------------------------------------------------
| 0  | SELECT STATEMENT   |         | 1    | 117   | 6 (50)     | 00:00:01 |       |      |             |
| 1  | PX COORDINATOR     |         |      |       |            |          |       |      |             |

| 8  | PX SEND HASH       |:TQ10001 | 1    | 87    | 2 (50)     | 00:00:01 | Q1,01 | P->P | HASH        |
| 9  | PX BLOCK ITERATOR  |         | 1    | 87    | 2 (50)     | 00:00:01 | Q1,01 | PCWC |             |
|* 10| TABLE ACCESS FULL  | EMP     | 1    | 87    | 2 (50)     | 00:00:01 | Q1,01 | PCWP |             |
| 11 | BUFFER SORT        |         |      |       |            |          | Q1,02 | PCWC |             |
| 12 | PX RECEIVE         |         | 4    | 120   | 3 (34)     | 00:00:01 | Q1,02 | PCWP |             |
| 13 | PX SEND HASH       |:TQ10000 | 4    | 120   | 3 (34)     | 00:00:01 |       | S->P | HASH        |
| 14 | TABLE ACCESS FULL  | DEPT    | 4    | 120   | 3 (34)     | 00:00:01 |       |      |             |
-------------------------------------------------------------------------------------------------------------
Predicate Information (identified by operation id):
---------------------------------------------------
6 - access("E"."DEPTNO"="D"."DEPTNO")
10 - filter("E"."ENAME"='hermann')
---------------------------------------------------
```

When the query is parallel, information related to parallelism is reported: table queue number (`TQ` column), table queue type (`INOUT`) and table queue distribution method (`PQ Distrib`).

By default, if several plans in the plan table match the `statement_id` parameter passed to the display table function (default value is `NULL`), only the plan corresponding to the last `EXPLAIN PLAN` command is displayed. Hence, there is no need to purge the plan table after each `EXPLAIN PLAN`. However, you should purge the plan table regularly to ensure good performance in the execution of the `DISPLAY` table function. If no plan table is created, Oracle uses a global temporary table to store any plan information for

individual users and preserves its content throughout the lifespan of a session. Note that you cannot truncate the content of a global temporary table.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the `EXPLAIN PLAN` command:

Using a View to Display Last Explain Plan

```
# define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);

# display the output of the last explain plan command
SELECT * FROM PLAN;
```

Summary of DBMS_XPLAN Subprograms

Table 202–1 DBMS_XPLAN Package Subprograms

Subprogram	Description
DIFF_PLAN Function on page 202-10	Compares plans
DISPLAY Function on page 202-11	Displays the contents of the plan table
DISPLAY_AWR Function on page 202-14	Displays the contents of an execution plan stored in the AWR
DISPLAY_CURSOR Function on page 202-17	Displays the execution plan of any cursor in the cursor cache
DISPLAY_PLAN Function on page 202-21	Displays the contents of the plan table in a variety of formats with `CLOB` output type
DISPLAY_SQL_PLAN_BASELINE Function on page 202-24	Displays one or more execution plans for the specified SQL handle of a SQL plan baseline
DISPLAY_SQLSET Function on page 202-26	Displays the execution plan of a given statement stored in a SQL tuning set

DIFF_PLAN Function

This function compares plans.

Syntax

```
DBMS_XPLAN.DIFF_PLAN(
   plan1    IN   SPC_SRC,
   plan2    IN   SPC_SRC)
 RETURN VARCHAR2;
```

Parameters

Table 202–2 DIFF_PLAN Function Parameters

Parameter	Description
plan_1	First plan
plan_2	Second plan

DISPLAY Function

This table function displays the contents of the plan table.

In addition, you can use this table function to display any plan (with or without statistics) stored in a table as long as the columns of this table are named the same as columns of the plan table (or V$SQL_PLAN_STATISTICS_ALL if statistics are included). You can apply a predicate on the specified table to select rows of the plan to display.

Syntax

```
DBMS_XPLAN.DISPLAY(
   table_name    IN  VARCHAR2  DEFAULT 'PLAN_TABLE',
   statement_id  IN  VARCHAR2  DEFAULT  NULL,
   format        IN  VARCHAR2  DEFAULT  'TYPICAL',
   filter_preds  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 202–3 DISPLAY Function Parameters

Parameter	Description
table_name	Specifies the table name where the plan is stored. This parameter defaults to PLAN_TABLE, which is the default plan table for the EXPLAIN PLAN command. If NULL is specified it also defaults to PLAN_TABLE.
statement_id	Specifies the statement_id of the plan to be displayed. This parameter defaults to NULL, which is the default when the EXPLAIN PLAN command is executed without a set statement_id clause.If no statement_id is specified, the function shows you the plan of the most recent explained statement.

Table 202–3 (Cont.) DISPLAY Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts four values: ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: ■ ROWS - if relevant, shows the number of rows estimated by the optimizer ■ BYTES - if relevant, shows the number of bytes estimated by the optimizer ■ COST - if relevant, shows optimizer cost information ■ PARTITION - if relevant, shows partition pruning information ■ PARALLEL - if relevant, shows PX information (distribution method and table queue information) ■ PREDICATE - if relevant, shows the predicate section ■ PROJECTION -if relevant, shows the projection section ■ ALIAS - if relevant, shows the "Query Block Name / Object Alias" section ■ REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information. If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).

Table 202–3 (Cont.) DISPLAY Function Parameters

Parameter	Description
filter_preds	SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is NULL (the default), the plan displayed corresponds to the last executed explain plan. For example: filter_preds=>'plan_id = 10' Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see **WARNING** under Usage Notes)

Usage Notes

Here are some ways you might use variations on the format parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

WARNING: Application developers should expose the filter_preds parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, filter_preds can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

Examples

To display the result of the last EXPLAIN PLAN command stored in the plan table:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY);
```

To display from other than the default plan table, "my_plan_table":

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('my_plan_table'));
```

To display the minimum plan information:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));
```

To display the plan for a statement identified by 'foo', such as statement_id='foo':

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', 'foo'));
```

DISPLAY_AWR Function

This table function displays the contents of an execution plan stored in the AWR.

Syntax

```
DBMS_XPLAN.DISPLAY_AWR(
   sql_id            IN      VARCHAR2,
   plan_hash_value   IN      NUMBER DEFAULT NULL,
   db_id             IN      NUMBER DEFAULT NULL,
   format            IN      VARCHAR2 DEFAULT TYPICAL);
```

Parameters

Table 202–4 DISPLAY_AWR Table Function Parameters

Parameter	Description
sql_id	Specifies the SQL_ID of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column SQL_ID in DBA_HIST_SQLTEXT.
plan_hash_value	Specifies the PLAN_HASH_VALUE of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given SQL_ID.
db_id	Specifies the database_id for which the plan of the SQL statement, identified by SQL_ID should be displayed. If not supplied, the database_id of the local database is used, as shown in V$DATABASE.
format	Controls the level of details for the plan. It accepts four values: ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).

Table 202–4 (Cont.) DISPLAY_AWR Table Function Parameters

Parameter	Description
	For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: ■ ROWS - if relevant, shows the number of rows estimated by the optimizer ■ BYTES - if relevant, shows the number of bytes estimated by the optimizer ■ COST - if relevant, shows optimizer cost information ■ PARTITION - if relevant, shows partition pruning information ■ PARALLEL - if relevant, shows PX information (distribution method and table queue information) ■ PREDICATE - if relevant, shows the predicate section ■ PROJECTION -if relevant, shows the projection section ■ ALIAS - if relevant, shows the "Query Block Name / Object Alias" section ■ REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.

Usage Notes

- To use the DISPLAY_AWR functionality, the calling user must have SELECT or READ privilege on DBA_HIST_SQL_PLAN, DBA_HIST_SQLTEXT, and V$DATABASE, otherwise it shows an appropriate error message.
- Here are some ways you might use variations on the format parameter:
  - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
  - Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
  - Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
  - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the different execution plans associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```

To display all execution plans of all stored SQL statements containing the string 'TOTO':

```
SELECT tf.* FROM DBA_HIST_SQLTEXT ht, table
```

```
   (DBMS_XPLAN.DISPLAY_AWR(ht.sql_id,null, null,  'ALL' )) tf
WHERE ht.sql_text like '%TOTO%';
```

DISPLAY_CURSOR Function

This table function displays the explain plan of any cursor loaded in the cursor cache. In addition to the explain plan, various plan statistics (such as. I/O, memory and timing) can be reported (based on the V$SQL_PLAN_STATISTICS_ALL VIEWS).

Syntax

```
DBMS_XPLAN.DISPLAY_CURSOR(
   sql_id            IN  VARCHAR2  DEFAULT  NULL,
   cursor_child_no   IN  NUMBER    DEFAULT  0,
   format            IN  VARCHAR2  DEFAULT  'TYPICAL');
```

Parameters

Table 202–5 DISPLAY_CURSOR Function Parameters

Parameter	Description
sql_id	Specifies the SQL_ID of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column SQL_ID in V$SQL or V$SQLAREA. Alternatively, you could choose the column PREV_SQL_ID for a specific session out of V$SESSION. This parameter defaults to NULL in which case the plan of the last cursor executed by the session is displayed.
cursor_child_no	Child number of the cursor to display. If not supplied, the execution plan of all cursors matching the supplied sql_id parameter are displayed. The child_number can be specified only if sql_id is specified.

Table 202–5 (Cont.) DISPLAY_CURSOR Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts five values: ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). ■ ADAPTIVE: - Displays the final plan, or the current plan if the execution has not completed. This section includes notes about runtime optimizations that affect the plan, such as switching from a Nested Loops join to a Hash join. - Plan lineage. This section shows the plans that were run previously due to automatic reoptimization. It also shows the default plan, if the plan changed due to dynamic plans. - Recommended plan. In reporting mode, the plan is chosen based on execution statistics displayed. Note that displaying the recommended plan for automatic reoptimization requires re-compiling the query with the optimizer adjustments collected in the child cursor. Displaying the recommended plan for a dynamic plan does not require this. - Dynamic plans. This summarizes the portions of the plan that differ from the default plan chosen by the optimizer. For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE).

Table 202–5 (Cont.) DISPLAY_CURSOR Function Parameters

Parameter	Description
	Format keywords must be separated by either a comma or a space: ■ ROWS - if relevant, shows the number of rows estimated by the optimizer ■ BYTES - if relevant, shows the number of bytes estimated by the optimizer ■ COST - if relevant, shows optimizer cost information ■ PARTITION - if relevant, shows partition pruning information ■ PARALLEL - if relevant, shows PX information (distribution method and table queue information) ■ PREDICATE - if relevant, shows the predicate section ■ PROJECTION -if relevant, shows the projection section ■ ALIAS - if relevant, shows the "Query Block Name / Object Alias" section ■ REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ NOTE - if relevant, shows the note section of the explain plan ■ IOSTATS - assuming that basic plan statistics are collected when SQL statements are executed (either by using the gather_plan_statistics hint or by setting the parameter statistics_level to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor. ■ MEMSTATS - Assuming that PGA memory management is enabled (that is, pga_aggregate_target parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. ■ ALLSTATS - A shortcut for 'IOSTATS MEMSTATS' ■ LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution. The following two formats are deprecated but supported for backward compatibility: ■ RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor. ■ RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.

Usage Notes

- To use the DISPLAY_CURSOR functionality, the calling user must have SELECT or READ privilege on the fixed views V$SQL_PLAN_STATISTICS_ALL, V$SQL and V$SQL_PLAN, otherwise it shows an appropriate error message.
- Here are some ways you might use variations on the format parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan of the last SQL statement executed by the current session:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_CURSOR);
```

To display the execution plan of all children associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp'));
```

To display runtime statistics for the cursor included in the preceding statement:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', NULL, 'ALLSTATS LAST');
```

DISPLAY_PLAN Function

This table function displays the contents of the plan table in a variety of formats with CLOB output type.

Syntax

```
DBMS_XPLAN.DISPLAY_PLAN (
   table_name       IN    VARCHAR2   DEFAULT 'PLAN_TABLE',
   statement_id     IN    VARCHAR2   DEFAULT NULL,
   format           IN    VARCHAR2   DEFAULT 'TYPICAL',
   filter_preds     IN    VARCHAR2   DEFAULT NULL,
   type             IN    VARCHAR2   DEFAULT 'TEXT')
  RETURN CLOB;
```

Parameters

Table 202–6 DISPLAY_PLAN Function Parameters

Parameter	Description
table_name	Specifies the table name where the plan is stored. This parameter defaults to PLAN_TABLE, which is the default plan table for the EXPLAIN PLAN command. If NULL is specified it also defaults to PLAN_TABLE.
statement_id	Specifies the statement_id of the plan to be displayed. This parameter defaults to NULL, which is the default when the EXPLAIN PLAN command is executed without a set statement_id clause.If no statement_id is specified, the function shows you the plan of the most recent explained statement.
filter_preds	SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is NULL (the default), the plan displayed corresponds to the last executed explain plan. For example: filter_preds=>'plan_id = 10' Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see **WARNING** under Usage Notes)

Table 202–6 (Cont.) DISPLAY_PLAN Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts five values: ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). ■ ADAPTIVE: Displays the default plan, and for each dynamic subplan (if stipulated): - A list of the rowsources from the original which may be replaced, and the rowsources to replace them - If outline display is specified in the format argument, the hints for each option in the dynamic subplan are displayed For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: ■ ROWS - if relevant, shows the number of rows estimated by the optimizer ■ BYTES - if relevant, shows the number of bytes estimated by the optimizer ■ COST - if relevant, shows optimizer cost information ■ PARTITION - if relevant, shows partition pruning information ■ PARALLEL - if relevant, shows PX information (distribution method and table queue information) ■ PREDICATE - if relevant, shows the predicate section ■ PROJECTION -if relevant, shows the projection section ■ ALIAS - if relevant, shows the "Query Block Name / Object Alias" section ■ REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.

Table 202–6 (Cont.) DISPLAY_PLAN Function Parameters

Parameter	Description
	If the target plan table (see `table_name` parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view `V$SQL_PLAN_STATISTICS_ALL`), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are `IOSTATS`, `MEMSTATS`, `ALLSTATS` and `LAST` (see the DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).
`type`	Output type, one of: `'TEXT'`, `'ACTIVE'`, `'HTML'`, or `'XML'` (see Usage Notes regarding type ACTIVE).'

Return Values

Returns the requested report as `CLOB`

Usage Notes

Active reports have a rich, interactive user interface akin to that found in Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

WARNING: Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

DISPLAY_SQL_PLAN_BASELINE Function

This table function displays one or more execution plans for the specified SQL handle of a SQL plan baseline.

Syntax

```
DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE (
   sql_handle      IN VARCHAR2 := NULL,
   plan_name       IN VARCHAR2 := NULL,
   format          IN VARCHAR2 := 'TYPICAL')
 RETURN dbms_xplan_type_table;
```

Parameters

Table 202–7 DISPLAY_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
`sql_handle`	SQL statement handle. It identifies a SQL statement whose plan(s) are to be displayed.
`plan_name`	Plan name. It identifies a specific plan. Default NULL means all plans associated with identified SQL statement are explained and displayed.
`format`	Format string determines what information stored in the plan displayed. One of three format values ('BASIC', 'TYPICAL', 'ALL') can be used, each representing a common use case.

Return Values

A PL/SQL type table

Usage Notes

This procedure uses plan information stored in the plan baseline to explain and display the plans.It is possible that the `plan_id` stored in the SQL management base may not match with the `plan_id` of the generated plan. A mismatch between stored `plan_id` and generated `plan_id` means that it is a non-reproducible plan. Such a plan is deemed invalid and is bypassed by the optimizer during SQL compilation.

Examples

Display all plans of a SQL statement identified by the SQL handle 'SYS_SQL_ b1d49f6074ab95af' using TYPICAL format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
  FROM TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(
                'SYS_SQL_b1d49f6074ab95af')) t;
```

Display all plans of one or more SQL statements containing the string 'HR2' using BASIC format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
   FROM (SELECT DISTINCT sql_handle FROM dba_sql_plan_baselines
```

```
 WHERE sql_text like '%HR2%') pb,
TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(pb.sql_handle, NULL,
                                           'BASIC')) t;
```

DISPLAY_SQLSET Function

This table function displays the execution plan of a given statement stored in a SQL tuning set.

Syntax

```
DBMS_XPLAN.DISPLAY_SQLSET(
   sqlset_name      IN  VARCHAR2,
   sql_id           IN  VARCHAR2,
   plan_hash_value  IN NUMBER := NULL,
   format           IN  VARCHAR2  := 'TYPICAL',
   sqlset_owner     IN  VARCHAR2  := NULL)
  RETURN DBMS_XPLAN_TYPE_TABLE PIPELINED;
```

Parameters

Table 202–8 DISPLAY_SQLSET Function Parameters

Parameter	Description
sqlset_name	Name of the SQL Tuning Set
sql_id	Specifies the sql_id value for a SQL statement having its plan stored in the SQL tuning set. You can find all stored SQL statements by querying table function DBMS_SQLTUNE.SELECT_SQLSET
plan_hash_value	Optional parameter. Identifies a specific stored execution plan for a SQL statement. If suppressed, all stored execution plans are shown.
format	Controls the level of details for the plan. It accepts four values: ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).

Table 202–8 (Cont.) DISPLAY_SQLSET Function Parameters

Parameter	Description
	For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as `PARTITION`) or logical additions to the base plan table output (such as `PREDICATE`). Format keywords must be separated by either a comma or a space: ■ `ROWS` - if relevant, shows the number of rows estimated by the optimizer ■ `BYTES` - if relevant, shows the number of bytes estimated by the optimizer ■ `COST` - if relevant, shows optimizer cost information ■ `PARTITION` - if relevant, shows partition pruning information ■ `PARALLEL` - if relevant, shows PX information (distribution method and table queue information) ■ `PREDICATE` - if relevant, shows the predicate section ■ `PROJECTION` -if relevant, shows the projection section ■ `ALIAS` - if relevant, shows the "Query Block Name / Object Alias" section ■ `REMOTE` - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ `NOTE` - if relevant, shows the note section of the explain plan ■ `IOSTATS` - assuming that basic plan statistics are collected when SQL statements are executed (either by using the `gather_plan_statistics` hint or by setting the parameter statistics_level to ALL), this format shows IO statistics for `ALL` (or only for the `LAST` as shown below) executions of the cursor. ■ `MEMSTATS` - Assuming that PGA memory management is enabled (that is, `pga_aggregate_target` parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. ■ `ALLSTATS` - A shortcut for `'IOSTATS MEMSTATS'` ■ `LAST` - By default, plan statistics are shown for all executions of the cursor. The keyword `LAST` can be specified to see only the statistics for the last execution. The following two formats are deprecated but supported for backward compatibility: ■ `RUNSTATS_TOT` - Same as `IOSTATS`, that is, displays IO statistics for all executions of the specified cursor. ■ `RUNSTATS_LAST` - Same as `IOSTATS LAST`, that is, displays the runtime statistics for the last execution of the cursor Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, `'-PROJECTION'` excludes projection information.
`sqlset_owner`	The owner of the SQL tuning set. The default is the current user.

Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use '`ALL -PROJECTION -NOTE`' to display everything except the projection and note sections.
- Use '`TYPICAL PROJECTION`' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply '`PROJECTION`' is equivalent.
- Use '`-BYTES -COST -PREDICATE`' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use '`BASIC ROWS`' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan for the SQL statement associated with SQL ID '`gwp663cqh5qbf`' and `PLAN HASH 3693697075` in the SQL Tuning Set called '`OLTP_optimization_0405`":

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_SQLSET(
       'OLTP_optimization_0405','gwp663cqh5qbf', 3693697075));
```

To display all execution plans of the SQL ID '`atfwcg8anrykp`' stored in the SQL tuning set:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_SQLSET(
      'OLTP_optimization_0405','gwp663cqh5qbf'));
```

To display runtime statistics for the SQL statement included in the preceding statement:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_SQLSET(
      'OLTP_optimization_0405', 'gwp663cqh5qbf', NULL, 'ALLSTATS LAST');
```

203

DBMS_XSLPROCESSOR

The DBMS_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

This chapter contains the following topics:

See Also:

- *Oracle XML DB Developer's Guide*

Using DBMS_XSLPROCESSOR

This section contains topics which relate to using the `DBMS_XSLPROCESSOR` package.

Overview

The DBMS_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

Standards

This PL/SQL implementation of the XSL processor follows the W3C XSLT working draft rev WD-xslt-19990813 and includes the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

Concepts

The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree.

Implementation

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM programmatic interface
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails

Security Model

Owned by XDB, the DBMS_XSLPROCESSOR package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Summary of DBMS_XSLPROCESSOR Subprograms

Table 203–1 DBMS_XSLPROCESSOR Package Subprograms

Method	Description
CLOB2FILE Procedure on page 203-6	Writes content of a CLOB into a file
FREEPROCESSOR Procedure on page 203-7	Frees a processor object
FREESTYLESHEET Procedure on page 203-8	Frees a stylesheet object
NEWPROCESSOR Function on page 203-8	Returns a new processor instance
NEWSTYLESHEET Functions on page 203-10	Creates a new stylesheet from input and reference URLs
PROCESSXSL Functions and Procedures on page 203-11	Transforms an input XML document
READ2CLOB Function on page 203-13	Reads content of the file into a CLOB
REMOVEPARAM Procedure on page 203-14	Removes a top-level stylesheet parameter
RESETPARAMS Procedure on page 203-15	Resets the top-level stylesheet parameters
SELECTNODES Function on page 203-16	Selects nodes from a DOM tree that match a pattern
SELECTSINGLENODE Function on page 203-17	Selects the first node from the tree that matches a pattern
SETERRORLOG Procedure on page 203-18	Sets errors to be sent to the specified file
SETPARAM Procedure on page 203-19	Sets a top-level parameter in the stylesheet
SHOWWARNINGS Procedure on page 203-20	Turns warnings on or off
TRANSFORMNODE Function on page 203-21	Transforms a node in a DOM tree using a stylesheet
VALUEOF Function and Procedure on page 203-22	Gets the value of the first node that matches a pattern

CLOB2FILE Procedure

This procedure writes content of a CLOB into a file.

Syntax

```
DBMS_XSLPROCESSOR.CLOB2FILE(
  cl          IN  CLOB;
  flocation   IN  VARCHAR2,
  fname       IN  VARCHAR2,
  csid        IN  NUMBER:=0);
```

Parameters

Table 203–2 CLOB2FILE Procedure Parameters

Parameter	Description
CLOB	File directory
flocation	File directory
fname	File name
csid	Character set id of the file ■ Must be a valid Oracle id; otherwise returns an error ■ If 0, content of the output file will be in the database character set

FREEPROCESSOR Procedure

This procedure Frees a `Processor` object.

Syntax

```
DBMS_XSLPROCESSOR.FREEPROCESSOR(
  p  IN  Processor);
```

Parameters

Table 203–3 FREEPROCESSOR Procedure Parameters

Parameter	Description
p	Processor

FREESTYLESHEET Procedure

This procedure frees a `Stylesheet` object.

Syntax

```
DBMS_XSLPROCESSOR.FREESTYLESHEET(
  ss  IN  Stylesheet);
```

Parameters

Table 203–4 FREESTYLESHEET Procedure Parameters

Parameter	Description
ss	Stylesheet

NEWPROCESSOR Function

This function returns a new `Processor` instance. The function must be called before the default behavior of `Processor` can be changed and if other processor methods need to be used.

Syntax

```
DBMS_XSLPROCESSOR.NEWPROCESSOR
 RETURN Processor;
```

NEWSTYLESHEET Functions

This function creates and returns a new `Stylesheet` instance. The options are described in the following table.

Syntax

Creates and returns a new stylesheet instance using the given `DOMDOCUMENT` and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(
   xmldoc  IN   DOMDOCUMENT,
   ref     IN   VARCHAR2)
 RETURN Stylesheet;
```

Creates and returns a new `Stylesheet` instance using the given input and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(
   inp    IN   VARCHAR2,
   ref    IN   VARCHAR2)
 RETURN Stylesheet;
```

Parameters

Table 203–5 NEWSTYLESHEET Function Parameters

Parameter	Description
`xmldoc`	`DOMDocument` to use for construction
`inp`	Input URL to use for construction
`ref`	Reference URL

PROCESSXSL Functions and Procedures

This function transforms input XMLDocument. Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails.

Syntax

Transforms input XMLDocument using given DOMDocument and stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p      IN   Processor,
   ss     IN   Stylesheet,
   xmldoc IN   DOMDOCUMENT),
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as URL and the Stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p     IN   Processor,
   ss    IN   Stylesheet,
   url   IN   VARCHAR2,
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as CLOB and the Stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p     IN   Processor,
   ss    IN  Stylesheet,
   clb   IN  CLOB)
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given DOMDOCUMENT and the stylesheet, and writes the output to the specified file:

```
DBMS_XSLPROCESSOR.DBMS_XSLPROCESSOR.(
   p           IN    Processor,
   ss          IN    Stylesheet,
   xmldoc      IN    DOMDOCUMENT,
   dir         IN    VARCHAR2,
   fileName    IN    VARCHAR2);
```

Transforms input XMLDocument using given URL and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN    Processor,
   ss         IN    Stylesheet,
   url        IN    VARCHAR2,
   dir        IN    VARCHAR2,
   fileName   IN    VARCHAR2);
```

Transforms input XMLDocument using given DOMDOCUMENT and the stylesheet, and writes the output to a CLOB:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN      Processor,
```

```
   ss          IN      Stylesheet,
   xmldoc      IN      DOMDOCUMENT,
   cl          IN OUT  CLOB);
```

Transforms input `XMLDocument` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN    Processor,
   ss         IN    Stylesheet,
   xmldf      IN    DOMDOCUMENTFRAGMENT)
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocumentFragment` using given `DOMDocumentFragment` and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN    Processor,
   ss         IN    Stylesheet,
   xmldf      IN    DOMDOCUMENTFRAGMENT,
   dir        IN    VARCHAR2,
   filename   IN    VARCHAR2);
```

Transforms input `XMLDocumentFragment` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and writes the output to a buffer:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p           IN       Processor,
   ss          IN       Stylesheet,
   xmldf       IN       DOMDOCUMENTFRAGMENT,
   buf         IN OUT   VARCHAR2);
```

Transforms input `XMLDocumentFragment` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and writes the output to a `CLOB`:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p           IN      Processor,
   ss          IN      Stylesheet,
   xmldf       IN      DOMDOCUMENTFRAGMENT,
   cl          IN OUT  CLOB);
```

Parameters

Table 203–6 PROCESSXSL Function and Procedure Parameters

Parameter	Description
`p`	`Processor` instance
`ss`	`Stylesheet` instance
`xmldoc`	XML document being transformed
`url`	URL for the information being transformed
`clb`	`CLOB` containing information to be transformed
`dir`	Directory where processing output file is saved
`filename`	Processing output file
`cl`	`CLOB` to which the processing output is saved
`xmldf`	`XMLDocumentFragment` being transformed

READ2CLOB Function

This function reads content of a file into a CLOB.

Syntax

```
DBMS_XSLPROCESSOR.READ2CLOB(
   flocation     IN   VARCHAR2,
   fname         IN   VARCHAR2,
   csid          IN   NUMBER:=0)
 RETURN CLOB;
```

Parameters

Table 203–7 READ2CLOB Function Parameters

Parameter	Description
flocation	File directory
fname	File name
csid	Character set id of the file ■ Must be a valid Oracle id; otherwise returns an error ■ If 0, input file is assumed to be in the database character set

REMOVEPARAM Procedure

This procedure removes a top level stylesheet parameter.

Syntax

```
DBMS_XSLPROCESSOR.REMOVEPARAM(
   ss     IN  Stylesheet,
   name   IN  VARCHAR2);
```

Parameters

Table 203–8 REMOVEPARAM Procedure Parameters

Parameter	Description
`ss`	`Stylesheet` instance
`name`	Name of the parameter

RESETPARAMS Procedure

This procedure resets the top-level stylesheet parameters.

Syntax

```
DBMS_XSLPROCESSOR.RESETPARAMS(
   ss  IN   Stylesheet);
```

Parameters

Table 203–9 RESETPARAMS Procedure Parameters

Parameter	Description
ss	`Stylesheet` instance

SELECTNODES Function

This function selects nodes which match the supplied path expression from a DOM tree, and returns the result of the selection.

Syntax

```
DBMS_XSLPROCESSOR.SELECTNODES(
   n           IN   DBMS_XMLDOM.DOMNODE,
   pattern     IN   VARCHAR2,
   namespace   IN VARCHAR2 := NULL)
 RETURN DBMS_XMLDOM.DOMNODELIST;
```

Parameters

Table 203–10 SELECTNODES Function Parameters

Parameter	Description
`n`	Root `DOMNode` of the tree
`pattern`	Pattern to use
`namespace`	Namespace declared

SELECTSINGLENODE Function

This function selects the first node from the tree that match the supplied path expression, and returns that node.

Syntax

```
DBMS_XSLPROCESSOR.SELECTSINGLENODE(
   n           IN   DBMS_XMLDOM.DOMNODE,
   pattern     IN   VARCHAR2,
   namespace   IN VARCHAR2 := NULL)
 RETURN DBMS_XMLDOM.DOMNODE;
```

Parameters

Table 203–11 SELECTSINGLENODE Function Parameters

Parameter	Description
n	Root DOMNode of the tree
pattern	Pattern to use
namespace	Namespace declared

SETERRORLOG Procedure

This procedure sets errors to be sent to the specified file.

> **Note:** This subprogram has been deprecated, and is included only for reasons of backward compatibility.

Syntax

```
DBMS_XSLPROCESSOR.SETERRORLOG(
   p         IN   Processor,
   fileName  IN   VARCHAR2);
```

Parameters

Table 203–12 SETERRORLOG Procedure Parameters

Parameter	Description
`p`	`Processor` instance
`fileName`	Complete path of the file to use as the error log

SETPARAM Procedure

This procedure sets a top level parameter in the stylesheet. The parameter value must be a valid `XPath` expression. Literal string values must be quoted.

Syntax

```
DBMS_XSLPROCESSOR.SETPARAM(
   ss      IN   Stylesheet,
   name    IN   VARCHAR2,
   value   IN   VARCHAR2);
```

Parameters

Table 203–13 SETPARAM Procedure Parameters

Parameter	Description
`ss`	`Stylesheet` instance
`name`	Name of the parameter
`value`	Value of the parameter

SHOWWARNINGS Procedure

This procedure turns warnings on (TRUE) or off (FALSE).

Syntax

```
DBMS_XSLPROCESSOR.SHOWWARNINGS(
   p     IN   Processor,
   yes   IN   BOOLEAN);
```

Parameters

Table 203–14 SHOWWARNINGS Procedure Parameters

Parameter	Description
p	Processor instance
yes	Mode to set: TRUE to show warnings, FALSE otherwise

TRANSFORMNODE Function

This function transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a `DOMDocumentFragment`.

Syntax

```
DBMS_XSLPROCESSOR.TRANSFORMNODE(
   n    IN  DOMNODE,
   ss   IN  Stylesheet)
 RETURN DOMDocumentFragment;
```

Parameters

Table 203–15 TRANSFORMNODE Function Parameters

Parameter	Description
`n`	`DOMNode` to transform
`ss`	Stylesheet to use

VALUEOF Function and Procedure

This subprogram retrieves the value of the first node from the tree that matches the given pattern. You can use either a function or a procedure.

Syntax

```
DBMS_XSLPROCESSOR.VALUEOF(
  n           IN    DBMS_XMLDOM.DOMNODE,
  pattern     IN    VARCHAR2,
  namespace   IN    VARCHAR2 := NULL)
 RETURN VARCHAR2;

DBMS_XSLPROCESSOR.VALUEOF(
  n           IN    DBMS_XMLDOM.DOMNODE,
  pattern     IN    VARCHAR2,
  val         OUT   VARCHAR2,
  namespace   IN    VARCHAR2 := NULL);
```

Parameters

Table 203–16 VALUEOF Function and Procedure Parameters

Parameter	Description
n	Node whose value is being retrieved
pattern	Pattern to use
val	Retrieved value
namespace	Namespace to use

204

DBMS_XSTREAM_ADM

This `DBMS_XSTREAM_ADM` package provides interfaces for streaming database changes between an Oracle database and other systems. XStream enables applications to stream out or stream in database changes.

This chapter contains the following topic:

See Also:

- *Oracle Database XStream Guide*
- *Oracle Call Interface Programmer's Guide*
- *Oracle Database XStream Java API Reference*

Using DBMS_XSTREAM_ADM

This section contains topics which relate to using the `DBMS_XSTREAM_ADM` package.

Overview

The package provides interfaces for configuring outbound servers that stream database changes from an Oracle database to other systems. The package also provides interfaces for configuring inbound servers that stream database changes from other systems to an Oracle database. In both cases, the database changes are encapsulated in logical change records (LCRs). Also, the other systems can be Oracle systems or a non-Oracle systems, such as non-Oracle databases or file systems.

XStream outbound servers can stream out LCRs from an Oracle database programmatically using C or Java. After receiving the LCRs, the other system can process them in any customized way. For example, the other system can save the contents of the LCRs to a file, send the LCRs to an Oracle database through an XStream inbound server, or generate SQL statements and execute them on any Oracle or non-Oracle databases.

XStream inbound servers accept LCRs from another system and either apply them to an Oracle database or process them in a customized way using apply handlers.

XStream can be used in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

See Also:

- *Oracle Database XStream Guide, Chapter 4, "XStream Out"*
- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs

Security Model

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an XStream administrator and connect as the XStream administrator when using this package.

An administrator must be granted the `DBA` role when the administrator is performing any of the following actions:

- Running the `ADD_OUTBOUND` procedure while connected as a user that is different from the configured connect user for an outbound server
- Running the `ALTER_OUTBOUND` procedure to change the capture user for a capture process or the connect user for an outbound server
- Running the `CREATE_OUTBOUND` procedure, because this procedure creates a capture process
- Running the `ALTER_INBOUND` procedure to change the apply user for an inbound server
- Running the `ADD_INBOUND` procedure while connected as a user that is different from the configured apply user for an inbound server

When the administrator does not need to perform the preceding tasks, the `DBA` role is not required.

See Also:

- GRANT_ADMIN_PRIVILEGE Procedure on page 205-6
- *Oracle Database XStream Guide*, *Chapter 4, "XStream Out and Security"* for more information about XStream and security.

Operational Notes

Some subprograms in the DBMS_APPLY_ADM package can manage XStream outbound servers, and some subprograms in the DBMS_APPLY_ADM package can manage XStream inbound servers.

> **See Also:** Chapter 23, "DBMS_APPLY_ADM" for details about which subprograms can manage outbound servers and inbound servers

Summary of DBMS_XSTREAM_ADM Subprograms

Table 204–1 DBMS_XSTREAM_ADM Package Subprograms

Subprogram	Description
ADD_COLUMN Procedure on page 204-9	Either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule
ADD_GLOBAL_PROPAGATION_RULES Procedure on page 204-12	Either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_GLOBAL_RULES Procedure on page 204-16	Adds global rules to either the positive or negative rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist
ADD_OUTBOUND Procedure on page 204-21	Creates an XStream outbound server that dequeues LCRs from the specified queue
ADD_SCHEMA_PROPAGATION_RULES Procedure on page 204-26	Either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SCHEMA_RULES Procedure on page 204-30	Adds rules to a rule set of XStream clients.
ADD_SUBSET_OUTBOUND_RULES Procedure on page 204-35	Adds subset rules to an outbound server configuration
ADD_SUBSET_PROPAGATION_RULES Procedure on page 204-38	Adds subset rules to the positive rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SUBSET_RULES Procedure on page 204-42	Adds subset rules to the positive rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist
ADD_TABLE_PROPAGATION_RULES Procedure on page 204-47	Either adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_TABLE_RULES Procedure on page 204-52	This procedure adds rules to a rule set of an XStream client.
ALTER_INBOUND Procedure on page 204-58	Modifies an XStream inbound server
ALTER_OUTBOUND Procedure on page 204-59	Modifies an XStream outbound server
CREATE_INBOUND Procedure on page 204-64	Creates an XStream inbound server and its queue
CREATE_OUTBOUND Procedure on page 204-66	Creates an XStream outbound server, queue, and capture process to enable XStream client applications to stream out Oracle database changes encapsulated in LCRs

Table 204–1 (Cont.) DBMS_XSTREAM_ADM Package Subprograms

Subprogram	Description
DELETE_COLUMN Procedure on page 204-71	Either adds or removes a declarative rule-based transformation which deletes a column from a row LCR that satisfies the specified rule
DROP_INBOUND Procedure on page 204-73	Removes an inbound server configuration
DROP_OUTBOUND Procedure on page 204-74	Removes an outbound server configuration
ENABLE_GG_XSTREAM_FOR_ STREAMS Procedure on page 204-75	Enables XStream performance optimizations for Oracle Streams components
GET_MESSAGE_TRACKING Function on page 204-77	Returns the tracking label for the current session
GET_TAG Function on page 204-78	Gets the binary tag for all redo entries generated by the current session
IS_GG_XSTREAM_FOR_STREAMS Function on page 204-79	Returns `TRUE` if XStream performance optimizations are enabled for Oracle Streams components, or returns `FALSE` if XStream performance optimizations are disabled for Oracle Streams components
KEEP_COLUMNS Procedure	Either adds or removes a declarative rule-based transformation which keeps a list of columns in a row LCR that satisfies the specified rule
MERGE_STREAMS Procedure on page 204-83	Merges a stream flowing from one capture process with a stream flowing from another capture process
MERGE_STREAMS_JOB Procedure on page 204-86	Determines whether the original capture process and the cloned capture are within the specified merge threshold and, if they are, runs the `MERGE_STREAMS` procedure to merge the two streams
PURGE_SOURCE_CATALOG Procedure on page 204-89	Removes all Oracle Streams data dictionary information at the local database for the specified object
RECOVER_OPERATION Procedure on page 204-91	Provides options for a split and merge operation that stopped because it encountered an error. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.
REMOVE_QUEUE Procedure on page 204-93	Removes the specified `ANYDATA` queue
REMOVE_RULE Procedure on page 204-94	Removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.
REMOVE_SUBSET_OUTBOUND_RULES Procedure on page 204-95	Removes subset rules from an outbound server configuration
REMOVE_XSTREAM_ CONFIGURATION Procedure on page 204-96	Removes the XStream configuration at the local database
RENAME_COLUMN Procedure on page 204-98	Either adds or removes a declarative rule-based transformation which renames a column in a row LCR that satisfies the specified rule

Table 204–1 (Cont.) DBMS_XSTREAM_ADM Package Subprograms

Subprogram	Description
RENAME_SCHEMA Procedure on page 204-101	Either adds or removes a declarative rule-based transformation which renames a schema in a row LCR that satisfies the specified rule
RENAME_TABLE Procedure on page 204-103	Either adds or removes a declarative rule-based transformation which renames a table in a row LCR that satisfies the specified rule
SET_MESSAGE_TRACKING Procedure on page 204-105	Sets the tracking label for logical change records (LCRs) produced by the current session
SET_PARAMETER Procedure on page 204-106	Sets a parameter for an outbound server, an inbound server, or an outbound server's capture process
SET_TAG Procedure on page 204-108	Sets the binary tag for all redo entries subsequently generated by the current session
SET_UP_QUEUE Procedure on page 204-109	Creates a queue table and a queue for use with the capture, propagate, and apply functionality of XStream
SPLIT_STREAMS Procedure on page 204-111	Splits one stream flowing from a capture process off from all of the other streams flowing from the capture process
START_OUTBOUND Procedure on page 204-116	Starts an XStream outbound server
STOP_OUTBOUND Procedure on page 204-117	Stops an XStream outbound server

Note: All subprograms commit unless specified otherwise.

ADD_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_value` and `column_function` parameters are mutually exclusive.

Note:

- `ADD_COLUMN` transformations cannot add columns of the following data types: `BLOB`, `CLOB`, `NCLOB`, `BFILE`, `LONG`, `LONG RAW`, `ROWID`, user-defined types (including object types, `REF`s, varrays, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also: *Oracle Database XStream Guide* for more information about declarative rule-based transformations

Syntax

```
DBMS_XSTREAM_ADM.ADD_COLUMN(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   column_value  IN  ANYDATA,
   value_type    IN  VARCHAR2     DEFAULT 'NEW',
   step_number   IN  NUMBER       DEFAULT 0,
   operation     IN  VARCHAR2     DEFAULT 'ADD');

DBMS_XSTREAM_ADM.ADD_COLUMN(
   rule_name        IN  VARCHAR2,
   table_name       IN  VARCHAR2,
   column_name      IN  VARCHAR2,
   column_function  IN  VARCHAR2,
   value_type       IN  VARCHAR2     DEFAULT 'NEW',
   step_number      IN  NUMBER       DEFAULT 0,
   operation        IN  VARCHAR2     DEFAULT 'ADD');
```

Parameters

Table 204–2 ADD_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name*.]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table to which the column is added in the row LCR, specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
column_name	The name of the column added to each row LCR that satisfies the rule.
column_value	The value of the added column. Specify the appropriate ANYDATA function for the column datatype and the column value. For example, if the datatype of the column being added is NUMBER and the value is NULL, then specify the ANYDATA.ConvertNumber(NULL) function. This parameter cannot be specified if the column_function parameter is specified.
column_function	Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function. The 'SYSDATE' SQL function places the current date and time set for the operating system on which the database resides. The datatype of the returned value is DATE, and the format returned depends on the value of the NLS_DATE_FORMAT initialization parameter. The 'SYSTIMESTAMP' SQL function returns the system date, including fractional seconds and time zone, of the system on which the database resides. The return type is TIMESTAMP WITH TIME ZONE. The function executes when the rule evaluates to TRUE. This parameter cannot be specified if the column_value parameter is specified.
value_type	Specify 'NEW' to add the column to the new values in the row LCR. Specify 'OLD' to add the column to the old values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD_COLUMN procedures when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all add column transformations for the specified rule.

table_name	column_name	step_number	Result
NULL	NULL	non-NULL	Remove all add column transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all add column transformations with the specified column_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all add column transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all add column transformations with the specified column_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all add column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all add column transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all add column transformations with the specified table_name, column_name, and step_number for the specified rule.

ADD_GLOBAL_PROPAGATION_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES(
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES(
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 204–3 ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`streams_name`	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If `NULL` and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If `NULL` and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

Table 204–3 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 204–3 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. The source database is where the changes originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 275, "Logical Change Record TYPEs"

Table 204–3 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. The procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_GLOBAL_RULES Procedure

This procedure adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to an entire database.

  This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying all logical change records (LCRs) it receives. The rules can specify that the LCRs must be from a particular source database.

  This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Caution: If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not support by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
   streams_type           IN   VARCHAR2,
   streams_name           IN   VARCHAR2  DEFAULT NULL,
   queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml            IN   BOOLEAN   DEFAULT TRUE,
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
   source_database        IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name          OUT  VARCHAR2,
   ddl_rule_name          OUT  VARCHAR2,
   inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
   and_condition          IN   VARCHAR2  DEFAULT NULL,
   source_root_name       IN   VARCHAR2  DEFAULT NULL,
   source_container_name  IN   VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
   streams_type           IN   VARCHAR2,
   streams_name           IN   VARCHAR2  DEFAULT NULL,
   queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml            IN   BOOLEAN   DEFAULT TRUE,
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
   source_database        IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
   and_condition          IN   VARCHAR2  DEFAULT NULL,
```

```
   source_root_name       IN   VARCHAR2  DEFAULT NULL,
   source_container_name  IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 204–4 ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
streams_type	The type of XStream client: ■ Specify capture for a capture process. ■ Specify apply for an apply process.
streams_name	The name of the capture process or apply process. Do not specify an owner. If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process must have a unique name.
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

Table 204–4 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.

Table 204–4 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the XStream client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the XStream client. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 275, "Logical Change Record TYPEs"
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the

sequence number is too long, then the database name is truncated. A capture process or apply process uses the rules for filtering.

See Also:

- "Operational Notes" on page 204-5
- "Security Model" on page 204-4

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_OUTBOUND Procedure

This procedure creates an XStream outbound server that dequeues LCRs from the specified queue. The outbound server streams out the LCRs to an XStream client application.

This procedure creates neither a capture process nor a queue. To create an outbound server, a capture process, and a queue with one procedure call, use the CREATE_OUTBOUND Procedure.

To create the capture process individually, use one of the following packages:

- DBMS_XSTREAM_ADM
- DBMS_CAPTURE_ADM

To create a queue individually, use the SET_UP_QUEUE procedure in the DBMS_XSTREAM_ADM package.

This procedure is overloaded. One table_names parameter is type VARCHAR2 and the other table_names parameter is type DBMS_UTILITY.UNCL_ARRAY. Also, one schema_names parameter is type VARCHAR2 and the other schema_names parameter is type DBMS_UTILITY.UNCL_ARRAY. These parameters enable you to enter the lists of tables and schemas in different ways and are mutually exclusive.

Note:

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
- This procedure enables the outbound server that it creates.
- Starting with Oracle Database 11*g* Release 2 (11.2.0.2), the capture_name, start_scn, and start_time parameters are included in this procedure.

Syntax

```
DBMS_XSTREAM_ADM.ADD_OUTBOUND(
   server_name            IN  VARCHAR2,
   queue_name             IN  VARCHAR2   DEFAULT NULL,
   source_database        IN  VARCHAR2   DEFAULT NULL,
   table_names            IN  DBMS_UTILITY.UNCL_ARRAY,
   schema_names           IN  DBMS_UTILITY.UNCL_ARRAY,
   connect_user           IN  VARCHAR2   DEFAULT NULL,
   comment                IN  VARCHAR2   DEFAULT NULL,
   capture_name           IN  VARCHAR2   DEFAULT NULL,
   start_scn              IN  NUMBER     DEFAULT NULL,
   start_time             IN  TIMESTAMP  DEFAULT NULL,
   include_dml            IN  BOOLEAN   DEFAULT TRUE,
   include_ddl            IN  BOOLEAN   DEFAULT FALSE,
   source_root_name       IN  VARCHAR2  DEFAULT NULL,
   source_container_name  IN  VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_OUTBOUND(
```

```
   server_name            IN  VARCHAR2,
   queue_name             IN  VARCHAR2   DEFAULT NULL,
   source_database        IN  VARCHAR2   DEFAULT NULL,
   table_names            IN  VARCHAR2   DEFAULT NULL,
   schema_names           IN  VARCHAR2   DEFAULT NULL,
   connect_user           IN  VARCHAR2   DEFAULT NULL,
   comment                IN  VARCHAR2   DEFAULT NULL,
   capture_name           IN  VARCHAR2   DEFAULT NULL,
   start_scn              IN  NUMBER     DEFAULT NULL,
   start_time             IN  TIMESTAMP  DEFAULT NULL,
   include_dml            IN  BOOLEAN   DEFAULT TRUE,
   include_ddl            IN  BOOLEAN   DEFAULT FALSE,
   source_root_name       IN  VARCHAR2  DEFAULT NULL,
   source_container_name  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 204–5 ADD_OUTBOUND Procedure Parameters

Parameter	Description
server_name	The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client. **Note:** The server_name setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.
queue_name	The name of the local queue from which the outbound server dequeues LCRs, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named xstream_queue in the xstrmadmin schema, enter xstrmadmin.xstream_queue for this parameter. If the schema is not specified, then the current user is the default. If NULL, the procedure raises an error.
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.

Table 204–5 (Cont.) ADD_OUTBOUND Procedure Parameters

Parameter	Description
table_names	The tables for which data manipulation language (DML) and data definition language (DDL) changes are streamed out to the XStream client application. The tables can be specified in the following ways: ▪ Comma-delimited list of type VARCHAR2. ▪ A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL. Each table should be specified as [*schema_name*.]*table_name*. For example, you can specify hr.employees. If the schema is not specified, then the current user is the default. **See Also:** "Usage Notes" on page 204-24 for more information about this parameter
schema_names	The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways: ▪ Comma-delimited list of type VARCHAR2. ▪ A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL. **Note:** This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (*schema_name.table_name*). **See Also:** "Usage Notes" on page 204-24 for more information about this parameter
connect_user	The user who can attach to the specified outbound server to retrieve the LCR stream. The client application must attach to the outbound server as the specified connect user. See "CREATE_OUTBOUND Procedure" on page 204-66 for information about the privileges required by a connect user. If NULL, then the current user is the default.
comment	An optional comment associated with the outbound server.
capture_name	The name of the capture process configured to capture changes for the outbound server. Do not specify an owner. If the specified name matches the name of an existing capture process for another outbound server, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set. If the specified name matches the name of an existing capture process for an apply process, then an error is raised. If the specified name does not match the name of an existing capture process, then an error is raised. If NULL, then the outbound server is created without a capture process.
start_scn	A valid system change number (SCN) for the database from which the capture process starts capturing changes. If the capture_name parameter is NULL, then this parameter is ignored. If NULL and the capture_name parameter is non-NULL, then the start SCN of the capture process is not changed. An error is returned if an invalid SCN is specified. The start_scn and start_time parameters are mutually exclusive.

Table 204–5 (Cont.) ADD_OUTBOUND Procedure Parameters

Parameter	Description
start_time	A valid time from which the capture process starts capturing changes. If the capture_name parameter is NULL, then this parameter is ignored. If NULL and the capture_name parameter is non-NULL, then the start SCN of the capture process is not changed. The start_scn and start_time parameters are mutually exclusive.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then the outbound server streams all DML and DDL changes to the client application.

  This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.

- If both the table_names and schema_names parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the table_names parameter is specified and the schema_names parameter is NULL or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the table_names parameter is NULL or empty and the schema_names parameter is specified, then the outbound server streams DML and DDL changes for the specified schemas.

For the procedure that uses the DBMS_UTILITY.UNCL_ARRAY type for the table_names and schema_names parameters, both parameters must be specified. To specify only tables, the schema_names parameter must be specified and empty. To specify only schemas, the table_names parameter must be specified and empty.

Note: An empty array includes one `NULL` entry.

ADD_SCHEMA_PROPAGATION_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES(
   schema_name             IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES(
   schema_name             IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 204–6 ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema. For example, `hr`.
`streams_name`	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If `NULL` and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If `NULL` and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

Table 204–6 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 204–6 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 275, "Logical Change Record TYPEs"

Table 204–6 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_SCHEMA_RULES Procedure

This procedures adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified schema.

  This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database.

  This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Caution: If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not support by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES(
   schema_name            IN   VARCHAR2,
   streams_type           IN   VARCHAR2,
   streams_name           IN   VARCHAR2  DEFAULT NULL,
   queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml            IN   BOOLEAN   DEFAULT TRUE,
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
   source_database        IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name          OUT  VARCHAR2,
   ddl_rule_name          OUT  VARCHAR2,
   inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
   and_condition          IN   VARCHAR2  DEFAULT NULL,
   source_root_name       IN  VARCHAR2  DEFAULT NULL,
   source_container_name  IN  VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES(
   schema_name            IN   VARCHAR2,
   streams_type           IN   VARCHAR2,
   streams_name           IN   VARCHAR2  DEFAULT NULL,
   queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml            IN   BOOLEAN   DEFAULT TRUE,
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
```

```
  source_database        IN   VARCHAR2  DEFAULT NULL,
  inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
  and_condition          IN   VARCHAR2  DEFAULT NULL,
  source_root_name       IN  VARCHAR2  DEFAULT NULL,
  source_container_name  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 204–7 ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
schema_name	The name of the schema. For example, hr. You can specify a schema that does not yet exist, because Oracle Streams does not validate the existence of the schema.
streams_type	The type of XStream client: ■ Specify capture for a capture process. ■ Specify apply for an apply process.
streams_name	The name of the capture process or apply process. Do not specify an owner. If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process must have a unique name.
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.

Table 204–7 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.

Table 204–7 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the XStream client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the XStream client. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 275, "Logical Change Record TYPEs"
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A capture process or apply process uses the rules for filtering.

See Also:

- "Operational Notes" on page 204-5
- "Security Model" on page 204-4

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_SUBSET_OUTBOUND_RULES Procedure

This procedure adds subset rules to an outbound server configuration. Subset rules instruct the outbound server to stream out a subset of the changes to the specified tables. Outbound servers can stream out a subset of both rows and columns.

This procedure is overloaded. One `column_list` parameter is type `VARCHAR2` and the other `column_list` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

Note: This procedure does not add rules to the outbound server's capture process.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES(
   server_name      IN VARCHAR2,
   table_name       IN VARCHAR2,
   condition        IN VARCHAR2  DEFAULT NULL,
   column_list      IN DBMS_UTILITY.LNAME_ARRAY,
   keep             IN BOOLEAN   DEFAULT TRUE,
   source_database  IN VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES(
   server_name      IN VARCHAR2,
   table_name       IN VARCHAR2,
   condition        IN VARCHAR2  DEFAULT NULL,
   column_list      IN VARCHAR2  DEFAULT NULL,
   keep             IN BOOLEAN   DEFAULT TRUE,
   source_database  IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 204–8 ADD_SUBSET_OUTBOUND_RULES Procedure Parameters

Parameter	Description
`server_name`	The name of the outbound server to which rules are being added. Specify an existing outbound server. Do not specify an owner.
`table_name`	The name of the table specified as `[`*`schema_name`*`.]`*`object_name`*. For example, you can specify `hr.employees`. If the schema is not specified, then the current user is the default. If the outbound server configuration uses a local capture process, then the table must exist at the local source database. If the outbound server configuration uses a downstream capture process, then the table must exist at both the source database and at the downstream capture database. The specified table cannot have any LOB, `LONG`, or `LONG RAW` columns currently or in the future.

Table 204–8 (Cont.) ADD_SUBSET_OUTBOUND_RULES Procedure Parameters

Parameter	Description
condition	The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition: ' salary > 4000 and job_id = ''SA_MAN'' ' If NULL, then the procedure raises an error. **Note:** The quotation marks in the preceding example are all single quotation marks.
column_list	The list of columns either to include in the outbound server configuration or to exclude from the outbound server configuration. Whether the columns are included or excluded depends on the setting for the keep parameter. The columns can be specified in the following ways: ▪ Comma-delimited list of type VARCHAR2. ▪ A PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY, where each element is the name of a column. Specify the first column in position 1. The last position must be NULL. To include or exclude all of the columns in a table, specify each column in the table in the list or array. If NULL, then the procedure raises an error.
keep	If TRUE, then the columns specified in the column_list parameter are kept as part of the outbound server configuration. Therefore, changes to these columns that satisfy the condition in the condition parameter are streamed to the outbound server's client application. If FALSE, then the columns specified in the column_list parameter are excluded from the outbound server configuration. Therefore, changes to these columns are not streamed to the outbound server's client application. **See Also:** "Usage Notes" on page 204-36
source_database	The global name of the container where the specified table_names and schema_names are located. If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.

Usage Notes

When the keep parameter is set to TRUE, this procedure creates a keep columns declarative rule-based transformation for the columns listed in column_list.

When the keep parameter is set to FALSE, this procedure creates a delete column declarative rule-based transformation for each column listed in column_list.

See Also: *Oracle Database XStream Guide* for information about declarative rule-based transformations

ADD_SUBSET_PROPAGATION_RULES Procedure

This procedures adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES(
   table_name                IN   VARCHAR2,
   dml_condition             IN   VARCHAR2,
   streams_name              IN   VARCHAR2  DEFAULT NULL,
   source_queue_name         IN   VARCHAR2,
   destination_queue_name    IN   VARCHAR2,
   include_tagged_lcr        IN   BOOLEAN   DEFAULT FALSE,
   source_database           IN   VARCHAR2  DEFAULT NULL,
   insert_rule_name          OUT  VARCHAR2,
   update_rule_name          OUT  VARCHAR2,
   delete_rule_name          OUT  VARCHAR2,
   queue_to_queue            IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES(
   table_name                IN   VARCHAR2,
   dml_condition             IN   VARCHAR2,
   streams_name              IN   VARCHAR2  DEFAULT NULL,
   source_queue_name         IN   VARCHAR2,
   destination_queue_name    IN   VARCHAR2,
   include_tagged_lcr        IN   BOOLEAN   DEFAULT FALSE,
   source_database           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue            IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 204–9 ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, `LONG`, `LONG RAW`, or `XMLType` columns currently or in the future.
`dml_condition`	The subset condition. Specify this condition similar to the way you specify conditions in a `WHERE` clause in SQL. For example, to specify rows in the `hr.employees` table where the `salary` is greater than `4000` and the `job_id` is `SA_MAN`, enter the following as the condition: `' salary > 4000 and job_id = ''SA_MAN'' '` **Note:** The quotation marks in the preceding example are all single quotation marks.

Table 204–9 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_tagged_lcr	If TRUE, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database. If FALSE, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.

Table 204–9 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts.
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only row LCRs that satisfy the condition specified for the dml_condition parameter are propagated. For UPDATE statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified dml_condition, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified dml_condition, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified dml_condition, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified dml_condition, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the propagation are not affected. Additional rules can be added using either the DBMS_XSTREAM_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

Attention: Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

Examples

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the dml_condition is region_id = 2, the table_name is hr.regions, and the source_database is dbs1.net:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

ADD_SUBSET_RULES Procedure

This procedure adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table.

  This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database.

  This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
   table_name             IN   VARCHAR2,
   dml_condition          IN   VARCHAR2,
   streams_type           IN   VARCHAR2 DEFAULT 'apply',
   streams_name           IN   VARCHAR2 DEFAULT NULL,
   queue_name             IN   VARCHAR2 DEFAULT 'streams_queue',
   include_tagged_lcr     IN   BOOLEAN  DEFAULT FALSE,
   source_database        IN   VARCHAR2 DEFAULT NULL,
   insert_rule_name       OUT  VARCHAR2,
   update_rule_name       OUT  VARCHAR2,
   delete_rule_name       OUT  VARCHAR2,
   source_root_name       IN  VARCHAR2  DEFAULT NULL,
   source_container_name  IN  VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
   table_name             IN   VARCHAR2,
   dml_condition          IN   VARCHAR2,
   streams_type           IN   VARCHAR2 DEFAULT 'apply',
   streams_name           IN   VARCHAR2 DEFAULT NULL,
   queue_name             IN   VARCHAR2 DEFAULT 'streams_queue',
   include_tagged_lcr     IN   BOOLEAN  DEFAULT FALSE,
   source_database        IN   VARCHAR2 DEFAULT NULL,
   source_root_name       IN  VARCHAR2  DEFAULT NULL,
   source_container_name  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 204–10 ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the capture process or apply process. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.
dml_condition	The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition: ' salary > 4000 and job_id = ''SA_MAN'' ' **Note:** The quotation marks in the preceding example are all single quotation marks.
streams_type	The type of XStream client: ■ Specify capture for a capture process. ■ Specify apply for an apply process.
streams_name	The name of the capture process or apply process. Do not specify an owner. If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process must have a unique name.

Table 204–10 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.
include_tagged_lcr	If TRUE, then the XStream client performs its action regardless of the tag: ■ A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag. ■ An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-NULL tag. If FALSE, then an XStream client performs its action only when the tag is NULL: ■ A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag. ■ An LCR is considered for apply by an apply process only if the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts.

Table 204–10 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

Running this procedure generates three rules for the specified capture process or apply process: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the dml_condition parameter are captured or applied. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified dml_condition, then the DML change is captured or applied without any changes.
- If neither the new or old values in a DML change satisfy the specified dml_condition, then the DML change is not captured or applied.
- If the old values for a DML change satisfy the specified dml_condition, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified dml_condition, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process or apply process uses the rules for filtering. If the XStream client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the DBMS_XSTREAM_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the

table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

Attention: Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

Examples

The following is an example of a rule condition created for filtering DML changes containing an update operation when the dml_condition is region_id = 2, the table_name is hr.regions, and the source_database is dbs1.net:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

ADD_TABLE_PROPAGATION_RULES Procedure

This procedures adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES(
   table_name              IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES(
   table_name              IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 204–11 ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[`*`schema_name`*`.]`*`table_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`streams_name`	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If `NULL` and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If `NULL` and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

Table 204–11 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	The name of the source queue, specified as [*schema_name*.]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name*.]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.

Table 204–11 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.

Table 204–11 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 275, "Logical Change Record TYPEs"
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The

sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a table rule condition created for filtering DML statements:

```
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_TABLE_RULES Procedure

This procedure adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified table.

  This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database.

  This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_RULES(
   table_name             IN   VARCHAR2,
   streams_type           IN   VARCHAR2,
   streams_name           IN   VARCHAR2  DEFAULT NULL,
   queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml            IN   BOOLEAN   DEFAULT TRUE,
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
   source_database        IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name          OUT  VARCHAR2,
   ddl_rule_name          OUT  VARCHAR2,
   inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
   and_condition          IN   VARCHAR2  DEFAULT NULL,
   source_root_name       IN  VARCHAR2   DEFAULT NULL,
   source_container_name  IN  VARCHAR2   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_TABLE_RULES(
   table_name             IN   VARCHAR2,
   streams_type           IN   VARCHAR2,
   streams_name           IN   VARCHAR2  DEFAULT NULL,
   queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml            IN   BOOLEAN   DEFAULT TRUE,
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
   source_database        IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
   and_condition          IN   VARCHAR2  DEFAULT NULL,
   source_root_name       IN  VARCHAR2   DEFAULT NULL,
   source_container_name  IN  VARCHAR2   DEFAULT NULL);
```

Parameters

Table 204–12 ADD_TABLE_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. You can specify a table that does not yet exist, because Oracle Streams does not validate the existence of the table.
streams_type	The type of XStream client: ■ Specify capture for a capture process. ■ Specify apply for an apply process.
streams_name	The name of the capture process or apply process. Do not specify an owner. If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process must have a unique name.
queue_name	The name of the local queue, specified as [*schema_name.*]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.
include_dml	If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.

Table 204–12 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
include_ddl	If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry, session, or LCR has a non-NULL tag. If the rules are added to the positive rule set for the XStream client, then the XStream client performs its action regardless of the tag: ■ A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag. ■ An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the XStream client, then whether a database change is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry, session, or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for an XStream client, then the XStream client performs its action only when the tag is NULL: ■ A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag. ■ An LCR is considered for apply by an apply process only if the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the XStream client, then a database change can be discarded only if it has a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 204–12 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the XStream client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the XStream client. In either case, the system creates the rule set if it does not exist.

Table 204–12 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 275, "Logical Change Record TYPEs"
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process or apply process uses the rules for filtering.

See Also:

- "Operational Notes" on page 204-5
- "Security Model" on page 204-4

Examples

The following is an example of a table rule condition created for DML changes:

```
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ALTER_INBOUND Procedure

This procedure modifies an XStream inbound server.

Syntax

```
DBMS_XSTREAM_ADM.ALTER_INBOUND(
   server_name IN VARCHAR2,
   apply_user  IN VARCHAR2  DEFAULT NULL,
   comment     IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 204–13 ALTER_INBOUND Procedure Parameters

Parameter	Description
server_name	The name of the inbound server being altered. Specify an existing inbound server. Do not specify an owner.
apply_user	The user who applies all DML and DDL changes that satisfy the inbound server rule sets, who runs user-defined apply handlers, and who runs custom rule-based transformations configured for inbound server rules. The client application must attach to the inbound server as the apply user. Specify a user to change the apply user. In this case, the user who invokes the ALTER_INBOUND procedure must be granted the DBA role. Only the SYS user can set the apply_user to SYS. If NULL, then the apply user is not changed. See "CREATE_INBOUND Procedure" on page 204-64 for information about the required privileges for an apply user.
comment	An optional comment associated with the inbound server. If non-NULL, then the specified comment replaces the existing comment. If NULL, then the existing comment is not changed.

ALTER_OUTBOUND Procedure

This procedure modifies an XStream outbound server configuration.

This procedure always alters the specified outbound server. This procedure can also alter the outbound server's capture process when either of the following conditions is met:

- The capture process was created by the CREATE_OUTBOUND procedure in this package.
- The queue used by the capture process was created by the CREATE_OUTBOUND procedure.

To check whether this procedure can alter the outbound server's capture process, query the CAPTURE_NAME column in the ALL_XSTREAM_OUTBOUND view. When the name of the capture process appears in the CAPTURE_NAME column of this view, the ALTER_OUTBOUND procedure can manage the capture process's rules or change the capture user for the capture process. When the CAPTURE_NAME column of this view is NULL, the ALTER_OUTBOUND procedure cannot manage the capture process.

This procedure is overloaded. One table_names parameter is type VARCHAR2 and the other table_names parameter is type DBMS_UTILITY.UNCL_ARRAY. Also, one schema_names parameter is type VARCHAR2 and the other schema_names parameter is type DBMS_UTILITY.UNCL_ARRAY. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

Note: Starting with Oracle Database 11*g* Release 2 (11.2.0.2), the start_scn and start_time parameters are included in this procedure.

Syntax

```
DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
   server_name           IN VARCHAR2,
   table_names           IN DBMS_UTILITY.UNCL_ARRAY,
   schema_names          IN DBMS_UTILITY.UNCL_ARRAY,
   add                   IN BOOLEAN    DEFAULT TRUE,
   capture_user          IN VARCHAR2   DEFAULT NULL,
   connect_user          IN VARCHR2    DEFAULT NULL,
   comment               IN VARCHAR2   DEFAULT NULL,
   inclusion_rule        IN BOOLEAN    DEFAULT TRUE,
   start_scn             IN NUMBER     DEFAULT NULL,
   start_time            IN TIMESTAMP  DEFAULT NULL,
   include_dml           IN BOOLEAN    DEFAULT TRUE,
   include_ddl           IN BOOLEAN    DEFAULT FALSE,
   source_database       IN VARCHAR2   DEFAULT NULL,
   source_container_name IN VARCHAR2   DEFAULT NULL);

DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
   server_name           IN VARCHAR2,
   table_names           IN VARCHAR2   DEFAULT NULL,
   schema_names          IN VARCHAR2   DEFAULT NULL,
   add                   IN BOOLEAN    DEFAULT TRUE,
   capture_user          IN VARCHAR2   DEFAULT NULL,
   connect_user          IN VARCHAR2   DEFAULT NULL,
   comment               IN VARCHAR2   DEFAULT NULL,
   inclusion_rule        IN BOOLEAN    DEFAULT TRUE,
   start_scn             IN NUMBER     DEFAULT NULL,
   start_time            IN TIMESTAMP  DEFAULT NULL,
```

```
   include_dml           IN BOOLEAN    DEFAULT TRUE,
   include_ddl           IN BOOLEAN    DEFAULT FALSE,
   source_database       IN VARCHAR2   DEFAULT NULL,
   source_container_name IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 204–14 ALTER_OUTBOUND Procedure Parameters

Parameter	Description
server_name	The name of the outbound server being altered. Specify an existing outbound server. Do not specify an owner.
table_names	The tables that are either added to or removed from the XStream Out configuration. Whether the tables are added or removed depends on the setting for the add parameter. The tables can be specified in the following ways: ■ Comma-delimited list of type VARCHAR2. ■ A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL. Each table should be specified as [*schema_name.*]*table_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. **See Also:** "Usage Notes" on page 204-63 for more information about this parameter
schema_names	The schemas that are either added to or removed from the XStream Out configuration. Whether the schemas are added or removed depends on the setting for the add parameter. The schemas can be specified in the following ways: ■ Comma-delimited list of type VARCHAR2. ■ A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL. **Note:** This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (*schema_name.table_name*). **See Also:** "Usage Notes" on page 204-63 for more information about this parameter
add	If TRUE, then the procedure adds to the XStream Out configuration the tables specified in the table_names parameter and the schemas specified in the schema_names parameter. If FALSE, then the procedure removes from the XStream Out configuration the tables specified in the table_names parameter and the schemas specified in the schema_names parameter.

Table 204–14 (Cont.) ALTER_OUTBOUND Procedure Parameters

Parameter	Description
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. Specify a user to change the capture user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS. If NULL, then the capture user is not changed. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user. Ensure that the capture user is granted the other required privileges. See "CREATE_OUTBOUND Procedure" on page 204-66 for information about the privileges required by a capture user. The capture process is stopped and restarted automatically when you change the value of this parameter. **Note:** If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.
connect_user	The user who can attach to the specified outbound server to retrieve the change stream. The XStream client application must attach to the outbound server as the specified connect user. Specify a user to change the connect user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the connect_user to SYS. If NULL, then the connect user is not changed. If you change the connect user, then this procedure grants the new connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user. Ensure that the connect user is granted the other required privileges. See "CREATE_OUTBOUND Procedure" on page 204-66 for information about the privileges required by a connect user.
comment	An optional comment associated with the outbound server. If non-NULL, then the specified comment replaces the existing comment. If NULL, then the existing comment is not changed.

Table 204–14 (Cont.) ALTER_OUTBOUND Procedure Parameters

Parameter	Description
inclusion_rule	If TRUE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter to the positive rule sets in the XStream Out configuration. When rules for tables and schemas are in positive rule sets, the XStream Out configuration streams DML and DDL changes to the tables and schemas out to the client application. If TRUE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter from the positive rule sets in the XStream Out configuration. If FALSE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter to the negative rule sets in the XStream Out configuration. When rules for tables and schemas are in negative rule sets, the XStream Out configuration does not stream changes to the tables and schemas out to the client application. If FALSE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter from the negative rule sets in the XStream Out configuration.
start_scn	A valid SCN for the database from which the capture process starts capturing changes. To be valid, the SCN value must be greater than or equal to the first SCN for the capture process. If a valid SCN is specified, then the capture process captures changes from the specified SCN when it is restarted. An error is returned if an invalid SCN is specified. If NULL and the start_time parameter is NULL, then the start SCN is not changed. If NULL and the start_time parameter is non-NULL, then the start SCN is changed to match the specified start time. The start_scn and start_time parameters are mutually exclusive. **Note:** If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_scn parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_scn parameter is non-NULL.
start_time	A valid time from which the capture process starts capturing changes. To be valid, the time must correspond to an SCN value that is greater than or equal to the first SCN for the capture process. If a valid time is specified, then the capture process captures changes from the specified time when it is restarted. An error is returned if an invalid time is specified. If NULL and the start_scn parameter is NULL, then the start time is not changed. If NULL and the start_scn parameter is non-NULL, then the start time is changed to match the specified start SCN. The start_scn and start_time parameters are mutually exclusive. **Note:** If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_time parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_time parameter is non-NULL.

Table 204–14 (Cont.) ALTER_OUTBOUND Procedure Parameters

Parameter	Description
include_dml	If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
source_database	The global name of the container where the specified table_names and schema_names are located. If source_database is non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then no rules are changed for the XStream Out configuration.

  This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.

- If both the table_names and schema_names parameters are specified, then the rules for the tables and schemas are added to or removed from the XStream Out configuration, depending on the setting of the add parameter.

- If the table_names parameter is specified and the schema_names parameter is NULL or empty, then the rules for the tables are added to or removed from the XStream Out configuration, depending on the setting of the add parameter. The existing rules for schemas are not changed for the XStream Out configuration.

- If the table_names parameter is NULL or empty and the schema_names parameter is specified, then the rules for the schemas are added to or removed from the XStream Out configuration, depending on the setting of the add parameter. The existing rules for tables are not changed for the XStream Out configuration.

For the procedure that uses the DBMS_UTILITY.UNCL_ARRAY type for the table_names and schema_names parameters, both parameters must be specified. To specify only tables, the schema_names parameter must be specified and empty. To specify only schemas, the table_names parameter must be specified and empty.

Note: An empty array includes one NULL entry.

CREATE_INBOUND Procedure

This procedure creates an XStream inbound server and its queue.

> **Note:** A client application can create multiple sessions. Each session can attach to only one inbound server, and each inbound server can serve only one session at a time. However, different client application sessions can connect to different inbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an inbound server.

Syntax

```
DBMS_XSTREAM_ADM.CREATE_INBOUND(
   server_name IN VARCHAR2,
   queue_name  IN VARCHAR2,
   apply_user  IN VARCHAR2  DEFAULT NULL,
   comment     IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 204–15 CREATE_INBOUND Procedure Parameters

Parameter	Description
`server_name`	The name of the inbound server being created. A `NULL` specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client. **Note:** The `server_name` setting cannot exceed 30 bytes, and it cannot be altered after the inbound server is created.
`queue_name`	The name of the local queue used by the inbound server, specified as `[`*`schema_name`*`.]`*`queue_name`*. If the specified queue exists, then it is used. If the specified queue does not exist, then the procedure creates it. For example, to specify a queue named `xstream_queue` in the `xstrmadmin` schema, enter `xstrmadmin.xstream_queue` for this parameter. If the schema is not specified, then the current user is the default. **Note:** An inbound server's queue is used only to store error transactions.

Table 204–15 (Cont.) CREATE_INBOUND Procedure Parameters

Parameter	Description
apply_user	The apply user. If NULL, then the current user is the default. The client application must attach to the inbound server as the apply user. The apply user is the user in whose security domain an inbound server evaluates whether LCRs satisfy its rule sets, applies DML and DDL changes directly to database objects, runs custom rule-based transformations configured for inbound server rules, and runs apply handlers configured for the inbound server. This user must have the necessary privileges to perform these actions. This procedure grants the apply user dequeue privileges on the queue used by the inbound server and configures the user as a secure queue user. In addition to the privileges granted by this procedure, you must grant the following privileges to the apply user: ■ The necessary privileges to perform DML and DDL changes on the apply objects ■ EXECUTE privilege on the rule sets used by the inbound server ■ EXECUTE privilege on all rule-based transformation functions used in the rule set ■ EXECUTE privilege on all apply handler procedures You can grant these privileges directly to the apply user, or you can grant them through roles. In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the inbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles. **Note:** If the apply user for an inbound server is dropped using DROP USER . . . CASCADE, then the inbound server is also dropped automatically.
comment	An optional comment associated with the inbound server.

Usage Notes

By default, an inbound server does not use rules or rule sets. Therefore, an inbound server applies all of the LCRs sent to it by an XStream client application. However, to filter the LCRs sent to an inbound server, you can add rules and rule sets to an inbound server using the DBMS_XSTREAM_ADM and DBMS_RULE_ADM packages.

In a CDB, you can execute the CREATE_INBOUND procedure from either the root or a PDB. The inbound server is restricted to receiving LCRs from one source database and only applying the changes to its local container. If the inbound server is at the root level, then the apply user must be a common user.

See Also: *Oracle Database XStream Guide*

CREATE_OUTBOUND Procedure

This procedure creates an XStream outbound server, queue, and capture process to enable client applications to stream out Oracle database changes.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

Note:

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See "OCIXStreamOutAttach()" in the *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
- If the `capture_name` parameter is `NULL`, then this procedure automatically generates a name for the capture process that it creates.
- This procedure automatically generates a name for the queue that it creates.
- This procedure enables both the capture process and outbound server that it creates.
- Starting with Oracle Database 11*g* Release 2 (11.2.0.2), the `capture_name` parameter is included in this procedure.

Syntax

```
DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
   server_name            IN VARCHAR2,
   source_database        IN VARCHAR2  DEFAULT NULL,
   table_names            IN DBMS_UTILITY.UNCL_ARRAY,
   schema_names           IN DBMS_UTILITY.UNCL_ARRAY,
   capture_user           IN VARCHAR2  DEFAULT NULL,
   connect_user           IN VARCHAR2  DEFAULT NULL,
   comment                IN VARCHAR2  DEFAULT NULL,
   capture_name           IN VARCHAR2  DEFAULT NULL,
   include_dml            IN BOOLEAN   DEFAULT TRUE,
   include_ddl            IN BOOLEAN   DEFAULT FALSE,
   source_root_name       IN  VARCHAR2   DEFAULT NULL,
   source_container_name  IN  VARCHAR2   DEFAULT NULL);

DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
   server_name            IN VARCHAR2,
   source_database        IN VARCHAR2  DEFAULT NULL,
   table_names            IN VARCHAR2  DEFAULT NULL,
   schema_names           IN VARCHAR2  DEFAULT NULL,
   capture_user           IN VARCHAR2  DEFAULT NULL,
   connect_user           IN VARCHAR2  DEFAULT NULL,
   comment                IN VARCHAR2  DEFAULT NULL,
   capture_name           IN VARCHAR2  DEFAULT NULL,
```

```
   include_dml             IN BOOLEAN   DEFAULT TRUE,
   include_ddl             IN BOOLEAN   DEFAULT FALSE,
   source_root_name        IN  VARCHAR2   DEFAULT NULL,
   source_container_name   IN  VARCHAR2   DEFAULT NULL);
```

Parameters

Table 204–16 CREATE_OUTBOUND Procedure Parameters

Parameter	Description
server_name	The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client. **Note:** The server_name setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.
source_database	The global name of the source database. The source database is where the changes to be captured originated. If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. In a non-CDB, if non-NULL and the specified name is different from the global name of the current database, then downstream capture is assumed. In this case, configure the transmission of redo data from the source database to the downstream database before running the CREATE_OUTBOUND procedure. See *Oracle Database XStream Guide* for instructions. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.
table_names	The tables for which DML and DDL changes are streamed out to the XStream client application. The tables can be specified in the following ways: ■ Comma-delimited list of type VARCHAR2. ■ A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL. Each table should be specified as [*schema_name*.]*table_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. **See Also:** "Usage Notes" on page 204-70 for more information about this parameter

Table 204–16 (Cont.) CREATE_OUTBOUND Procedure Parameters

Parameter	Description
schema_names	The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways: ▪ Comma-delimited list of type VARCHAR2. ▪ A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL. **Note:** This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (*schema_name.table_name*). **See Also:** "Usage Notes" on page 204-70 for more information about this parameter
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the current user is the default. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user. In addition, ensure that the capture user has the following privileges: ▪ EXECUTE privilege on the rule sets used by the capture process ▪ EXECUTE privilege on all rule-based transformation functions used in the positive rule set You can grant these privileges directly to the apply user, or you can grant them through roles. In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles. Only a user who is granted the DBA role can set a capture user. Only the SYS user can set the capture_user to SYS. A capture user does not require privileges on a database object to capture changes made to it. The capture process can pass these changes to a custom rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.

Table 204–16 (Cont.) CREATE_OUTBOUND Procedure Parameters

Parameter	Description
connect_user	The user who can attach to the specified outbound server to retrieve the change stream. The client application must attach to the outbound server as the specified connect user. If NULL, then the current user is the default. The connect user is the user in whose security domain an outbound server evaluates LCRs against its rule sets and runs custom rule-based transformations configured for outbound server rules. This user must have the necessary privileges to perform these actions. This procedure grants the connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user. In addition to the privileges granted by this procedure, grant the following privileges to the connect user: ■ EXECUTE privilege on the rule sets used by the outbound server ■ EXECUTE privilege on all rule-based transformation functions used in the rule set You can grant these privileges directly to the connect user, or you can grant them through roles. In addition, the connect user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the outbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles.
comment	An optional comment associated with the outbound server.
capture_name	The name of the capture process configured to capture changes for the outbound server. Do not specify an owner. The capture process must not exist. If the specified name matches the name of an existing capture process, then an error is raised. If the name does not match the name of an existing capture process, then the procedure creates a new capture process with the specified name. If NULL, then the system creates a new capture process with a system-generated name. **Note:** The capture process name cannot be altered after the capture process is created.
include_dml	If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

Table 204–16 (Cont.) CREATE_OUTBOUND Procedure Parameters

Parameter	Description
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then the outbound server streams all DML and DDL changes to the client application.

  This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.

- If both the table_names and schema_names parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the table_names parameter is specified and the schema_names parameter is NULL or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the table_names parameter is NULL or empty and the schema_names parameter is specified, then the outbound server streams DML and DDL changes for the specified schema.

For the procedure that uses the DBMS_UTILITY.UNCL_ARRAY type for the table_names and schema_names parameters, both parameters must be specified. To specify only tables, the schema_names parameter must be specified and empty. To specify only schemas, the table_names parameter must be specified and empty.

Note: An empty array includes one NULL entry.

DELETE_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

Note:

- The `DELETE_COLUMN` procedure supports the same data types supported by Oracle Streams capture processes.
- The `DELETE_COLUMN` procedure is useful when you want to delete a relatively small number of columns in a row LCR. To delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the `KEEP_COLUMNS` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also:

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by capture processes
- KEEP_COLUMNS Procedure on page 204-80

Syntax

```
DBMS_XSTREAM_ADM.DELETE_COLUMN(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   value_type    IN  VARCHAR2   DEFAULT '*',
   step_number   IN  NUMBER     DEFAULT 0,
   operation     IN  VARCHAR2   DEFAULT 'ADD');
```

Parameters

Table 204–17 DELETE_COLUMN Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[`*`schema_name`*`.]`*`rule_name`*. If `NULL`, then the procedure raises an error. For example, to specify a rule in the `hr` schema named `employees12`, enter `hr.employees12`. If the schema is not specified, then the current user is the default.
`table_name`	The name of the table from which the column is deleted in the row LCR, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.

Table 204–17 (Cont.) DELETE_COLUMN Procedure Parameters

Parameter	Description
column_name	The name of the column deleted from each row LCR that satisfies the rule.
value_type	Specify 'NEW' to delete the column from the new values in the row LCR. Specify 'OLD' to delete the column from the old values in the row LCR. Specify '*' to delete the column from both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the DELETE_COLUMN procedure when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all delete column transformations for the specified rule.
NULL	NULL	non-NULL	Remove all delete column transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified column_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all delete column transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all delete column transformations with the specified column_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all delete column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all delete column transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified table_name, column_name, and step_number for the specified rule.

DROP_INBOUND Procedure

This procedure removes an inbound server configuration.

This procedure always removes the specified inbound server. This procedure also removes the queue for the inbound server if all of the following conditions are met:

- One call to the `CREATE_INBOUND` procedure created the queue.
- The inbound server is the only subscriber to the queue.

See Also: "CREATE_INBOUND Procedure" on page 204-64

Syntax

```
DBMS_XSTREAM_ADM.DROP_INBOUND(
   server_name IN VARCHAR2);
```

Parameters

Table 204–18 DROP_INBOUND Procedure Parameters

Parameter	Description
`server_name`	The name of the inbound server being removed. Specify an existing inbound server. Do not specify an owner.

DROP_OUTBOUND Procedure

This procedure removes an outbound server configuration.

This procedure always drops the specified outbound server. This procedure also drops the queue used by the outbound server if both of the following conditions are met:

- The queue was created by the `CREATE_OUTBOUND` procedure in this package.
- The outbound server is the only subscriber to the queue.

If either one of the preceding conditions is not met, then the `DROP_OUTBOUND` procedure only drops the outbound server. It does not drop the queue.

This procedure also drops the capture process for the outbound server if both of the following conditions are met:

- The procedure can drop the outbound server's queue.
- The capture process was created by the `CREATE_OUTBOUND` procedure.

If the procedure can drop the queue but cannot manage the capture process, then it drops the queue without dropping the capture process.

See Also:

- "ADD_OUTBOUND Procedure" on page 204-21
- "CREATE_OUTBOUND Procedure" on page 204-66

Syntax

```
DBMS_XSTREAM_ADM.DROP_OUTBOUND(
   server_name IN VARCHAR2);
```

Parameters

Table 204–19 DROP_OUTBOUND Procedure Parameters

Parameter	Description
`server_name`	The name of the outbound server being removed. Specify an existing outbound server. Do not specify an owner.

ENABLE_GG_XSTREAM_FOR_STREAMS Procedure

This procedure enables XStream optimizations and performance optimizations for Oracle Streams components.

This procedure is intended for users of Oracle Streams who want to enable XStream optimizations and optimizations. For example, you can enable the optimizations for an Oracle Streams replication configuration that uses capture processes and apply processes to replicate changes between Oracle databases.

These capabilities and optimizations are enabled automatically for XStream components, such as outbound servers, inbound servers, and capture processes that send changes to outbound servers. It is not necessary to run this procedure for XStream components.

When XStream optimizations are enabled, Oracle Streams components can stream ID key LCRs and sequence LCRs. The XStream performance optimizations improve efficiency in various areas, including:

- LCR processing
- Handling large transactions
- DML execution during apply
- Dependency computation and scheduling
- Capture process parallelism

Syntax

```
DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS(
   enable IN BOOLEAN  TRUE);
```

Parameters

Table 204–20 ENABLE_GG_XSTREAM_FOR_STREAMS Procedure Parameters

Parameter	Description
enable	If TRUE, then enable XStream performance optimizations for Oracle Streams components. If FALSE, then disable XStream performance optimizations for Oracle Streams components.

Usage Notes

The following usage notes apply to this procedure:

- When you run this procedure, all capture processes and apply processes are restarted.
- After you run this procedure, the PURPOSE column in the following views displays XStream Streams:
  - ALL_APPLY
  - DBA_APPLY
  - ALL_CAPTURE
  - DBA_CAPTURE

- A license for the Oracle GoldenGate product is required to enable XStream performance optimizations for Oracle Streams components.

See Also:

- IS_GG_XSTREAM_FOR_STREAMS Function on page 204-79
- *Oracle Database XStream Guide, Chapter 1, Prerequisites for XStream"*

GET_MESSAGE_TRACKING Function

Returns the tracking label for the current session.

See Also: SET_MESSAGE_TRACKING Procedure on page 204-105

Syntax

```
DBMS_STREAMS_ADM.GET_MESSAGE_TRACKING
RETURN VARCHAR2;
```

GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

See Also:

- "SET_TAG Procedure" on page 204-108
- *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
DBMS_STREAMS_ADM.GET_TAG
RETURN RAW;
```

Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON
DECLARE
   raw_tag RAW(2000);
BEGIN
   raw_tag := DBMS_STREAMS_ADM.GET_TAG();
   DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the `DUAL` view:

```
SELECT DBMS_STREAMS_ADM.GET_TAG FROM DUAL;
```

IS_GG_XSTREAM_FOR_STREAMS Function

This function returns `TRUE` if XStream performance optimizations are enabled for Oracle Streams components, or this function returns `FALSE` if XStream performance optimizations are disabled for Oracle Streams components.

See Also: "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75

Syntax

```
DBMS_XSTREAM_ADM.IS_GG_XSTREAM_FOR_STREAMS
RETURN BOOLEAN;
```

KEEP_COLUMNS Procedure

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_list` parameter is type `VARCHAR2` and the `column_table` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

Note:

- The `KEEP_COLUMNS` procedure supports the same data types supported by Oracle Streams capture processes.
- The `KEEP_COLUMNS` procedure is useful when you want to keep a relatively small number of columns in a row LCR. To keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the `DELETE_COLUMN` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also:

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes
- DELETE_COLUMN Procedure on page 204-71

Syntax

```
DBMS_XSTREAM_ADM.KEEP_COLUMNS(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_list   IN  VARCHAR2,
   value_type    IN  VARCHAR2 DEFAULT '*',
   step_number   IN  NUMBER DEFAULT 0,
   operation     IN  VARCHAR2 DEFAULT 'ADD');

DBMS_XSTREAM_ADM.KEEP_COLUMNS(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_table  IN  DBMS_UTILITY.LNAME_ARRAY,
   value_type    IN  VARCHAR2 DEFAULT '*',
   step_number   IN  NUMBER DEFAULT 0,
   operation     IN  VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 204–21 KEEP_COLUMNS Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name*.]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table for which the columns are kept in the row LCR, specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
column_list	The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type VARCHAR2. The transformation removes columns that are not in the list from the row LCR. If this parameter is set to NULL, and the column_table parameter is also set to NULL, then the procedure raises an error.
column_table	The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY, where each element is the name of a column. The first schema should be in position 1. The last position must be NULL. The transformation removes columns that are not in the table from the row LCR. If this parameter is set to NULL, and the column_list parameter is also set to NULL, then the procedure raises an error.
value_type	Specify 'NEW' to keep the columns in the new values in the row LCR. Specify 'OLD' to keep the columns in the old values in the row LCR. Specify '*' to keep the columns in both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_list, column_table, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the KEEP_COLUMNS procedure when one or more of these parameters is NULL:

table_name	column_list/column_table	step_number	Result
NULL	NULL	NULL	Remove all keep columns transformations for the specified rule.
NULL	NULL	non-NULL	Remove all keep columns transformations wi the specified step_number for the specified ru

table_name	column_list/column_table	step_number	Result
NULL	non-NULL	non-NULL	Remove all keep columns transformations with the specified column_list/column_table and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all keep columns transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all keep columns transformations with the specified column_list/column_table for the specified rule.
non-NULL	non-NULL	NULL	Remove all keep columns transformations with the specified table_name and column_list/column_table for the specified rule.
non-NULL	NULL	NULL	Remove all keep columns transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all keep columns transformations with the specified table_name, column_list/column_table, and step_number for the specified rule.

MERGE_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the MERGE_STREAMS_JOB procedure. The MERGE_STREAMS_JOB procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the MERGE_STREAMS_JOB procedure does nothing. Typically, it is best to run the MERGE_STREAMS_JOB procedure instead of running the MERGE_STREAMS procedure directly.

However, you can choose to run the MERGE_STREAMS procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The CAPTURE_MESSAGE_CREATE_TIME in the GV$STREAMS_CAPTURE view of the cloned capture process has caught up to, or nearly caught up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The MERGE_STREAMS procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
   - The acknowledged SCN of the cloned propagation.
   - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

   When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.

5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

See Also:

- MERGE_STREAMS Procedure on page 204-83
- SPLIT_STREAMS Procedure on page 204-111

Syntax

```
DBMS_XSTREAM_ADM.MERGE_STREAMS(
   cloned_propagation_name  IN  VARCHAR2,
   propagation_name         IN  VARCHAR2  DEFAULT NULL,
   queue_name               IN  VARCHAR2  DEFAULT NULL,
   perform_actions          IN  BOOLEAN   DEFAULT TRUE,
   script_name              IN  VARCHAR2  DEFAULT NULL,
   script_directory_object  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 204–22 MERGE_STREAMS Procedure Parameters

Parameter	Description
cloned_propagation_name	The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.
propagation_name	The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. If a non-NULL value is specified, then an error is raised under either of the following conditions: ■ The queue specified in the queue_name parameter does not exist. ■ The queue specified in the queue_name parameter exists but is not used by a capture process.
queue_name	The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.

Table 204–22 (Cont.) MERGE_STREAMS Procedure Parameters

Parameter	Description
perform_actions	If TRUE, then the procedure performs the necessary actions to merge the streams directly. If FALSE, then the procedure does not perform the necessary actions to merge the streams directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ■ script_name ■ script_directory_object
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.

Usage Notes

You can use the MERGE_STREAMS procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

The DBA_STREAMS_SPLIT_MERGE view contains information about split and merge operations.

MERGE_STREAMS_JOB Procedure

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the MERGE_STREAMS procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

If the auto_merge_threshold parameter was set to a positive number in the SPLIT_STREAMS procedure that split the streams, then a merge job runs the MERGE_STREAMS_JOB procedure automatically according to its schedule. The schedule name is specified for the schedule_name parameter, and the merge job name is specified for the merge_job_name parameter when the MERGE_STREAMS_JOB procedure is run automatically. The merge job and its schedule were created by the SPLIT_STREAMS procedure.

If the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams, then you can run the MERGE_STREAMS_JOB procedure manually. In this case, it is not run automatically.

See Also:

- MERGE_STREAMS Procedure on page 204-83
- SPLIT_STREAMS Procedure on page 204-111
- *Oracle Streams Replication Administrator's Guide* for instructions on using the MERGE_STREAMS_JOB procedure

Syntax

```
DBMS_XSTREAM_ADM.MERGE_STREAMS_JOB(
   cloned_propagation_name IN VARCHAR2,
   propagation_name        IN VARCHAR2 DEFAULT NULL,
   queue_name              IN VARCHAR2 DEFAULT NULL,
   merge_threshold         IN NUMBER,
   schedule_name           IN VARCHAR2 DEFAULT NULL,
   merge_job_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 204–23 MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
cloned_propagation_name	The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.

Table 204–23 (Cont.) MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. If a non-NULL value is specified, then an error is raised under either of the following conditions: ▪ The queue specified in the queue_name parameter does not exist. ▪ The queue specified in the queue_name parameter exists but is not used by a capture process.
queue_name	The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.
merge_threshold	The merge threshold in seconds. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$STREAMS_CAPTURE dynamic performance view determines whether the streams are merged. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the MERGE_STREAMS procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing.
schedule_name	The name of the schedule for the merge job. If NULL, then no schedule name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams. Specify NULL if you run this procedure manually.
merge_job_name	The name of the job that merges the streams. If NULL, then no merge job name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams. Specify NULL if you run this procedure manually.

Usage Notes

You can use the MERGE_STREAMS_JOB procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save

resources and improve performance when a single database is running two or more capture processes.

After the MERGE_STREAMS_JOB procedure completes, you can query the DBA_CAPTURE and DBA_PROPAGATION views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the schedule_name and merge_job_name parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

The DBA_STREAMS_SPLIT_MERGE view contains information about split and merge operations.

PURGE_SOURCE_CATALOG Procedure

This procedure removes all Oracle Streams data dictionary information at the local database for the specified object. You can use this procedure to remove Oracle Streams metadata that is not needed currently and will not be needed in the future.

Syntax

```
DBMS_XSTREAM_ADM.PURGE_SOURCE_CATALOG(
   source_database     IN  VARCHAR2,
   source_object_name  IN  VARCHAR2,
   source_object_type  IN  VARCHAR2,
   source_root_name    IN  VARCHAR2);
```

Parameters

Table 204–24 PURGE_SOURCE_CATALOG Procedure Parameters

Parameter	Description
source_database	In a non-CDB, specify the global name of the source database containing the database object. In a CDB, specify the global name of the container containing the database object. The container can be the root or a PDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
source_object_name	The name of the object specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
source_object_type	Type of the object. Currently, TABLE is the only possible object type.
source_root_name	The global name of the source root containing the object in a CDB. The source root is where the changes being captured originated in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. If the source_root_name parameter is NULL, then the global name of the local root is the default. **Note:** This parameter only applies to a CDB.

Usage Notes

The global name of the source database containing the object must be specified for the source_database parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the hr.employees table at the dbs1.net source database are being applied to the hr.employees table at the dbs2.net destination database. Also, suppose hr.employees at dbs2.net is not a source at all. In this case, specifying dbs2.net as the source_database for this table results in an error. However, specifying dbs1.net as the source_database for this table while running the PURGE_

SOURCE_CATALOG procedure at the dbs2.net database removes data dictionary information about the table at dbs2.net.

Do not run this procedure at a database if either of the following conditions is true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

Note: These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.

RECOVER_OPERATION Procedure

This procedure provides options for split and merge operations that stopped because they encountered an errors. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation. Split and merge operations might be run in an XStream Out environment in which multiple outbound servers use the same capture process.

This procedure only can perform these actions for split and merge operations using the `split_threshold` and `merge_threshold` capture process parameters set to non-`NULL` values to enable automatic split and merge.

Information about the operation is stored in the following data dictionary views when the operation is in process:

- `DBA_RECOVERABLE_SCRIPT`
- `DBA_RECOVERABLE_SCRIPT_PARAMS`
- `DBA_RECOVERABLE_SCRIPT_BLOCKS`
- `DBA_RECOVERABLE_SCRIPT_ERRORS`

The data dictionary views are populated at the database that contains the capture process.

When the operation completes successfully, metadata about the operation is moved from the `DBA_RECOVERABLE_SCRIPT` view to the `DBA_RECOVERABLE_SCRIPT_HIST` view. The other views, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or purge the metadata about the operation using the `RECOVER_OPERATION` procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in `DBA_RECOVERABLE_SCRIPT_ERRORS` before proceeding.

Run the `RECOVER_OPERATION` procedure at the database that contains the capture process.

Note: To run the `RECOVER_OPERATION` procedure, both databases must be Oracle Database 10*g* Release 2 or later databases.

- "SPLIT_STREAMS Procedure" on page 204-111
- "MERGE_STREAMS Procedure" on page 204-83
- "MERGE_STREAMS_JOB Procedure" on page 204-86
- *Oracle Streams Replication Administrator's Guide*

Syntax

```
DBMS_XSTREAM_ADM.RECOVER_OPERATION(
   script_id       IN  RAW,
   operation_mode  IN  VARCHAR2  DEFAULT 'FORWARD');
```

Parameters

Table 204–25 RECOVER_OPERATION Procedure Parameters

Parameter	Description
script_id	The operation id of the operation that is being rolled forward, rolled back, or purged. Query the SCRIPT_ID column of the DBA_RECOVERABLE_SCRIPT data dictionary view to determine the operation id.
operation_mode	If FORWARD, then the procedure rolls forward the operation. Specify FORWARD to try to complete the operation. If ROLLBACK, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view. The other views retain information about the operation for 30 days. If PURGE, then the procedure moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view without rolling the operation back. The other views retain information about the operation for 30 days.

REMOVE_QUEUE Procedure

This procedure removes the specified ANYDATA queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the drop_unused_queue_table parameter is set to TRUE, then drops the queue table if it is empty and no other queues are using it.
5. If the cascade parameter is set to TRUE, then drops all of the XStream clients that are using the queue.

> **Note:** The specified queue must be a ANYDATA queue.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_QUEUE(
   queue_name                IN  VARCHAR2,
   cascade                   IN  BOOLEAN  DEFAULT FALSE,
   drop_unused_queue_table   IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 204–26 REMOVE_QUEUE Procedure Parameters

Parameter	Description
queue_name	The name of the queue to remove, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the current user is the default.
cascade	If TRUE, then the procedure drops any XStream clients that use the queue. If FALSE, then the procedure raises an error if there are any XStream clients that use the queue. Before you run this procedure with the cascade parameter set to FALSE, make sure no XStream clients are using the queue currently.
drop_unused_queue_table	If TRUE and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue. If FALSE, then the procedure does not drop the queue table.

REMOVE_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.

> **Note:** If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the `DBMS_RULE_ADM.DROP_RULE` procedure. If you use the `DBMS_RULE_ADM.DROP_RULE` procedure, then some metadata about the rule might remain.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_RULE(
   rule_name         IN  VARCHAR2,
   streams_type      IN  VARCHAR2,
   streams_name      IN  VARCHAR2,
   drop_unused_rule  IN  BOOLEAN  DEFAULT TRUE,
   inclusion_rule    IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 204–27 REMOVE_RULE Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule to remove, specified as `[`*`schema_name`*`.]`*`rule_name`*. If `NULL`, then the procedure removes all rules from the specified capture process, apply process, or propagation rule set. For example, to specify a rule in the `hr` schema named `prop_rule1`, enter `hr.prop_rule1`. If the schema is not specified, then the current user is the default.
`streams_type`	The type of XStream client: ■ Specify `capture` for a capture process. ■ Specify `propagation` for a propagation. ■ Specify `apply` for an apply process.
`streams_name`	The name of the XStream client, which can be a capture process, propagation, or apply process. Do not specify an owner. If the specified XStream client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata. If the specified XStream client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.
`drop_unused_rule`	If `TRUE` and the rule is not in any rule set, then the procedure drops the rule from the database. If `TRUE` and the rule exists in any rule set, then the procedure does not drop the rule from the database. If `FALSE`, then the procedure does not drop the rule from the database.
`inclusion_rule`	If `inclusion_rule` is `TRUE`, then the procedure removes the rule from the positive rule set for the XStream client. If `inclusion_rule` is `FALSE`, then the procedure removes the rule from the negative rule set for the XStream client.

REMOVE_SUBSET_OUTBOUND_RULES Procedure

This procedure removes subset rules from an outbound server configuration.

The names of the specified insert, update, and delete rules must match those generated by the ADD_SUBSET_OUTBOUND_RULES procedure. To view the rule names for subset rules, run the following query:

```
SELECT RULE_OWNER, SUBSETTING_OPERATION, RULE_NAME
   FROM ALL_XSTREAM_RULES
   WHERE SUBSETTING_OPERATION IS NOT NULL;
```

Note:

- This procedure removes the declarative rule-based transformation associated with each rule it removes.
- This procedure does not remove rules from the outbound server's capture process.

See Also: "ADD_SUBSET_OUTBOUND_RULES Procedure" on page 204-35

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_SUBSET_OUTBOUND_RULES(
   server_name      IN VARCHAR2,
   insert_rule_name IN VARCHAR2,
   update_rule_name IN VARCHAR2,
   delete_rule_name IN VARCHAR2);
```

REMOVE_XSTREAM_CONFIGURATION Procedure

This procedure removes the XStream configuration at the local database.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_XSTREAM_CONFIGURATION(
   container IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 204–28 REMOVE_XSTREAM_CONFIGURATION Procedure Parameters

Parameter	Description
container	If CURRENT, then the XStream configuration is removed from the current container. CURRENT can be specified while connected to the root or to a PDB in a CDB. If ALL, then the XStream configuration is removed from all of the containers in the CDB. To specify ALL, the procedure must be invoked in the root. If a container name, then the XStream configuration is removed from the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. **Note:** This parameter only applies to a CDB.

Usage Notes

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes
- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the ABORT_TABLE_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package
- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the ABORT_SCHEMA_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the ABORT_GLOBAL_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package
- Drops propagations that were created using either the DBMS_XSTREAM_ADM package or the DBMS_PROPAGATION_ADM package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the DBMS_AQADM package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers

- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the `SET_MESSAGE_NOTIFICATION` procedure in the `DBMS_XSTREAM_ADM` package
- Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rule sets and rules that were created using the `DBMS_XSTREAM_ADM` package.
- Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the `DBMS_XSTREAM_ADM` package or the `DBMS_RULE_ADM` package.

This procedure stops capture processes and apply processes before it drops them.

This procedure does not drop rule sets or rules if they meet both of the following conditions:

- The rule sets or rules were created using the `DBMS_RULE_ADM` package.
- The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.

Attention: Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire XStream configuration at a database. If an Oracle Streams configuration exists at the database, then this procedure also removes the entire Oracle Streams configuration.

Note:

- Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
- This procedure commits multiple times.

RENAME_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

Note:

- The `RENAME_COLUMN` procedure supports the same data types supported by Oracle Streams capture processes.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also: *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes

Syntax

```
DBMS_XSTREAM_ADM.RENAME_COLUMN(
   rule_name         IN  VARCHAR2,
   table_name        IN  VARCHAR2,
   from_column_name  IN  VARCHAR2,
   to_column_name    IN  VARCHAR2,
   value_type        IN  VARCHAR2  DEFAULT '*',
   step_number       IN  NUMBER    DEFAULT 0,
   operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 204–29 RENAME_COLUMN Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[`*`schema_name`*`.]`*`rule_name`*. If `NULL`, then the procedure raises an error. For example, to specify a rule in the `hr` schema named `employees12`, enter `hr.employees12`. If the schema is not specified, then the current user is the default.
`table_name`	The name of the table in which the column is renamed in the row LCR, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`from_column_name`	The name of the column to be renamed in each row LCR that satisfies the rule.
`to_column_name`	The new name of the column in each row LCR that satisfies the rule.

Table 204–29 (Cont.) RENAME_COLUMN Procedure Parameters

Parameter	Description
value_type	Specify 'NEW' to rename the column in the new values in the row LCR. Specify 'OLD' to rename the column in the old values in the row LCR. Specify '*' to rename the column in both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_COLUMN procedure when one or more of these parameters is NULL:

table_name	from_column_name	to_column_name	step_number	Result
NULL	NULL	NULL	NULL	Remove all rename column transformations for the specified rule.
NULL	NULL	NULL	non-NULL	Remove all rename column transformations with the specified step_number for the specified rule.
NULL	NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified to_column_name and step_number for the specified rule.
NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified table_name and step_number for the specified rule.
NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified column_name for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name and column_name for the specified rule.
NULL	non-NULL	NULL	NULL	Remove all rename column transformations with the specified table_name for the specified rule.

table_name	from_column_name	to_column_name	step_number	Result
NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.

RENAME_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

> **Note:** Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

> **See Also:** *Oracle Database XStream Guide* for more information about declarative rule-based transformations

Syntax

```
DBMS_XSTREAM_ADM.RENAME_SCHEMA(
   rule_name         IN  VARCHAR2,
   from_schema_name  IN  VARCHAR2,
   to_schema_name    IN  VARCHAR2,
   step_number       IN  NUMBER    DEFAULT 0,
   operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 204–30 RENAME_SCHEMA Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[`*`schema_name`*`.]`*`rule_name`*. If `NULL`, then the procedure raises an error. For example, to specify a rule in the `hr` schema named `employees12`, enter `hr.employees12`. If the schema is not specified, then the current user is the default.
`from_schema_name`	The name of the schema to be renamed in each row LCR that satisfies the rule.
`to_schema_name`	The new name of the schema in each row LCR that satisfies the rule.
`step_number`	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
`operation`	Specify `'ADD'` to add the transformation to the rule. Specify `'REMOVE'` to remove the transformation from the rule.

Usage Notes

When `'REMOVE'` is specified for the `operation` parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified `from_schema_name`, `to_schema_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_SCHEMA` procedure when one or more of these parameters is `NULL`:

from_schema_name	to_schema_name	step_number	Result
NULL	NULL	NULL	Remove all rename schema transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename schema transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified to_schema_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all rename schema transformations with the specified to_schema_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename schema transformations with the specified from_schema_name and to_schema_name for the specified rule.
non-NULL	NULL	NULL	Remove all rename schema transformations with the specified from_schema_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name, to_schema_name, and step_number for the specified rule.

RENAME_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

Note: Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also: *Oracle Database XStream Guide* for more information about declarative rule-based transformations

Syntax

```
DBMS_XSTREAM_ADM.RENAME_TABLE(
   rule_name        IN  VARCHAR2,
   from_table_name  IN  VARCHAR2,
   to_table_name    IN  VARCHAR2,
   step_number      IN  NUMBER    DEFAULT 0,
   operation        IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 204–31 RENAME_TABLE Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[schema_name.]rule_name`. If `NULL`, then the procedure raises an error. For example, to specify a rule in the `hr` schema named `employees12`, enter `hr.employees12`. If the schema is not specified, then the current user is the default.
`from_table_name`	The name of the table to be renamed in each row LCR that satisfies the rule, specified as `[schema_name.]object_name`. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`to_table_name`	The new name of the table in each row LCR that satisfies the rule, specified as `[schema_name.]object_name`. For example, `humres.staff`. The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default.
`step_number`	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
`operation`	Specify `'ADD'` to add the transformation to the rule. Specify `'REMOVE'` to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified from_table_name, to_table_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_TABLE procedure when one or more of these parameters is NULL:

from_table_name	to_table_name	step_number	Result
NULL	NULL	NULL	Remove all rename table transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename table transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified to_table_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename table transformations with the specified from_table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all rename table transformations with the specified to_table_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename table transformations with the specified from_table_name and to_table_name for the specified rule.
non-NULL	NULL	NULL	Remove all rename table transformations with the specified from_table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified from_table_name, to_table_name, and step_number for the specified rule.

SET_MESSAGE_TRACKING Procedure

Sets the tracking label for logical change records (LCRs) produced by the current session. This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

Note: The tracking label set by this procedure does not track non-LCR messages.

See Also: KAWGET_MESSAGE_TRACKING

Syntax

```
DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING(
   tracking_label IN VARCHAR2  DEFAULT 'Streams_tracking',
   actions        IN NUMBER    DEFAULT DBMS_XSTREAM_ADM.ACTION_MEMORY);
```

Parameters

Table 204–32 SET_MESSAGE_TRACKING Procedure Parameters

Parameter	Description
tracking_label	The label used to track the LCRs produced by the session. Set this parameter to NULL to stop message tracking in the current session. The size limit for a label is 4,000 bytes.
actions	When DBMS_XSTREAM_ADM.ACTION_MEMORY is specified, the LCRs are tracked in memory, and the V$STREAMS_MESSAGE_TRACKING dynamic performance view is populated with information about the LCRs. Currently, DBMS_XSTREAM_ADM.ACTION_MEMORY is the only valid setting for this parameter. The value specified for this parameter is an enumerated constant. Enumerated constants must be prefixed with the package name.

SET_PARAMETER Procedure

This procedure sets a parameter for an outbound server, an inbound server, or an outbound server's capture process.

Syntax

```
DBMS_XSTREAM_ADM.SET_PARAMETER(
   streams_name    IN  VARCHAR2,
   streams_type    IN  VARCHAR2,
   parameter       IN  VARCHAR2,
   value           IN  VARCHAR2  DEFAULT NULL,
   no_wait         IN  BOOLEAN   DEFAULT FALSE,
   source_database IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 204–33 SET_PARAMETER Procedure Parameters

Parameter	Description
streams_type	The type of XStream client: ▪ Specify capture for a capture process. ▪ Specify apply for an outbound server or inbound server.
streams_name	The name of the capture process, outbound server, or inbound server. Do not specify an owner.
parameter	The name of the parameter you are setting. See "Capture Process Parameters" on page 34-42 for information about capture process parameters. See "Apply Component Parameters" on page 23-56 for information about outbound server and inbound server parameters.
value	The value to which the parameter is set. If NULL, then the parameter is set to its default value.
no_wait	If TRUE, then the parameter is set immediately. If FALSE, then the parameter is set after synchronizing with the running capture process, inbound server, or outbound server. When you modify multiple parameters for the same process consecutively, setting this parameter to TRUE speeds up each call. However, if the process is currently running, you must set this parameter to FALSE in the last to the procedure to ensure that the process uses the modified parameter values. If the no_wait parameter is set to TRUE for the last call to the procedure, the running process might not detect the parameter changes.

Table 204–33 (Cont.) SET_PARAMETER Procedure Parameters

Parameter	Description
source_database	If CURRENT, then the parameter is set only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB. If ALL, then the parameter is set in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root. If a container name, then the parameter is set in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. **Note:** This parameter only applies to CDBs. Also, a non-null value can be specified only for the following parameters: ■ include_objects capture parameter ■ excludetag capture or apply parameter ■ excludetrans capture or apply parameter ■ excludeuser capture or apply parameter ■ excludeuserid capture or apply parameter ■ getreplicates capture or apply parameter ■ getapplops capture or apply parameter

SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session. Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
DBMS_XSTREAM_ADM.SET_TAG(
   tag  IN RAW  DEFAULT NULL);
```

Parameters

Table 204–34 SET_TAG Procedure Parameters

Parameter	Description
tag	The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_XSTREAM_ADM.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

> **See Also:** BUILD Procedure on page 34-18

SET_UP_QUEUE Procedure

This procedure creates a queue table and a ANYDATA queue.

Syntax

```
DBMS_XSTREAM_ADM.SET_UP_QUEUE(
   queue_table     IN  VARCHAR2  DEFAULT 'streams_queue_table',
   storage_clause  IN  VARCHAR2  DEFAULT NULL,
   queue_name      IN  VARCHAR2  DEFAULT 'streams_queue',
   queue_user      IN  VARCHAR2  DEFAULT NULL,
   comment         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 204–35 SET_UP_QUEUE Procedure Parameters

Parameter	Description
queue_table	The name of the queue table specified as [*schema_name.*]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner. Queue table names can be a maximum of 24 bytes.
storage_clause	The storage clause for queue table The storage parameter is included in the CREATE TABLE statement when the queue table is created. You can specify any valid table storage clause. If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause. If NULL, then the procedure uses the storage characteristics of the tablespace in which the queue table is created. **See Also:** *Oracle Database SQL Language Reference* for more information about storage clauses
queue_name	The name of the queue that will function as the ANYDATA queue, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue. If the schema is not specified for this parameter, and the queue table owner is not specified in queue_table, then the current user is the default. Queue names can be a maximum of 24 bytes.

Table 204–35 (Cont.) SET_UP_QUEUE Procedure Parameters

Parameter	Description
queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
comment	The comment for the queue

Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the CREATE_QUEUE_TABLE procedure in the DBMS_AQADM package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer ANYDATA queue that is both a secure queue and a transactional queue.

  Also, if the database is Oracle Database 10*g* release 2 or later, the sort_list setting in CREATE_QUEUE_TABLE is set to commit_time. If the database is a release before Oracle Database 10*g* release 2, the sort_list setting in CREATE_QUEUE_TABLE is set to enq_time.
- If the specified queue table exists, then the queue uses the properties of the existing queue table.
- If the specified queue name does not exist, then this procedure runs the CREATE_QUEUE procedure in the DBMS_AQADM package to create the queue.
- This procedure starts the queue.
- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants ENQUEUE and DEQUEUE privileges on the queue to the specified queue user.

  To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not exist. If an agent with this name exists and is associated with the queue user only, then it is used. SET_UP_QUEUE then runs the ENABLE_DB_ACCESS procedure in the DBMS_AQADM package, specifying the agent and the user.

Note: If the agent that SET_UP_QUEUE tries to create exists and is associated with a user other than the user specified by queue_user, then the procedure raises an error. In this case, rename or remove the existing agent, and retry SET_UP_QUEUE.

See Also: *Oracle Streams Concepts and Administration* for more information about secure queue users

SPLIT_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Streams replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill LCRs to the hard disk, degrading the performance of the Oracle Streams environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.
2. Creates a new propagation that propagates LCRs from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.
3. Stops the capture process.
4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.
5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the acknowledged SCN queried in Step 4. The cloned capture process uses the same rule set as the original capture process.
6. Drops the original propagation.
7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.
8. If the `auto_merge_threshold` parameter is set to a positive number, then creates an Oracle Scheduler job to run the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the `MERGE_STREAMS_JOB` procedure runs the `MERGE_STREAMS` procedure to merge the streams automatically.

After the `SPLIT_STREAMS` procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the `START_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

The `DBA_STREAMS_SPLIT_MERGE` view contains the name of each cloned component and information about the split and merge operation.

Note: If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

See Also:

- "MERGE_STREAMS Procedure" on page 204-83
- "MERGE_STREAMS_JOB Procedure" on page 159-133
- *Oracle Streams Replication Administrator's Guide* for instructions on using the `SPLIT_STREAMS` procedure

Syntax

```
DBMS_XSTREAM_ADM.SPLIT_STREAMS(
   propagation_name         IN      VARCHAR2,
   cloned_propagation_name  IN      VARCHAR2  DEFAULT NULL,
   cloned_queue_name        IN      VARCHAR2  DEFAULT NULL,
   cloned_capture_name      IN      VARCHAR2  DEFAULT NULL,
   perform_actions          IN      BOOLEAN   DEFAULT TRUE,
   script_name              IN      VARCHAR2  DEFAULT NULL,
   script_directory_object  IN      VARCHAR2  DEFAULT NULL,
   auto_merge_threshold     IN      NUMBER    DEFAULT NULL,
   schedule_name            IN OUT  VARCHAR2,
   merge_job_name           IN OUT  VARCHAR2);
```

Parameters

Table 204–36 SPLIT_STREAMS Procedure Parameters

Parameter	Description
`propagation_name`	The name of the propagation that cannot send LCRs to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.
`cloned_propagation_name`	The name of the new propagation created by this procedure for the stream that is split off. If `NULL`, then the system generates a propagation name.
`cloned_queue_name`	The name of the new queue created by this procedure for the stream that is split off. If `NULL`, then the system generates a queue name.
`cloned_capture_name`	The name of the new capture process created by this procedure for the stream that is split off. If `NULL`, then the system generates a capture process name.

Table 204–36 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
perform_actions	If TRUE, then the procedure performs the necessary actions to split the stream directly. If FALSE, then the procedure does not perform the necessary actions to split the stream directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ■ script_name ■ script_directory_object
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to split the stream directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.

Table 204–36 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
auto_merge_threshold	If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the MERGE_STREAMS_JOB procedure at set intervals according to its schedule. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$STREAMS_CAPTURE dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for the auto_merge_threshold parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream. If NULL or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the MERGE_STREAM procedure manually when the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process catches up to, or nearly catches up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process. The CAPTURE_MESSAGE_CREATE_TIME records the time when a captured change was recorded in the redo log.
schedule_name	The Oracle Scheduler schedule name, specified as [*schema_name*.]*schedule_name*. For example, strmadmin.merge_schedule. If the schema is not specified, then the current user is the default. If auto_merge_threshold is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name to adhere to naming conventions or to track the schedule more easily. If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a schedule name. If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL. If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run. If an existing schedule name is specified, an error is raised.
merge_job_name	The Oracle Scheduler job name, specified as [*schema_name*.]*merge_job_name*. For example, strmadmin.merge_job. If the schema is not specified, then the current user is the default. If auto_merge_threshold is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name to adhere to naming conventions or to track the job more easily. If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a job name. If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL. If an existing job name is specified, an error is raised.

See Also: *Oracle Database Administrator's Guide* for information about Oracle Scheduler

START_OUTBOUND Procedure

This procedure starts an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

Syntax

```
DBMS_XSTREAM_ADM.START_OUTBOUND(
   server_name      IN  VARCHAR2);
```

Parameters

Table 204–37 START_OUTBOUND Procedure Parameters

Parameter	Description
server_name	The name of the outbound server being started. A NULL specification is not allowed. Do not specify an owner.

STOP_OUTBOUND Procedure

This procedure stops an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

Syntax

```
DBMS_XSTREAM_ADM.STOP_OUTBOUND(
   server_name  IN  VARCHAR2,
   force        IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 204–38 STOP_OUTBOUND Procedure Parameters

Parameter	Description
server_name	The name of the outbound server being stopped. A NULL specification is not allowed. Do not specify an owner.
force	If TRUE, then the procedure stops the outbound server and its capture process as soon as possible. If FALSE, then the procedure stops the outbound server after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply component depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply component parameter.

205

DBMS_XSTREAM_AUTH

The `DBMS_XSTREAM_AUTH` package provides subprograms for granting privileges to and revoking privileges from XStream administrators.

This chapter contains the following topic:

- Using DBMS_XSTREAM_AUTH
  - Overview
  - Security Model
- Summary of DBMS_XSTREAM_AUTH Subprograms

See Also: GRANT_ADMIN_PRIVILEGE Procedure on page 205-6

Using DBMS_XSTREAM_AUTH

This section contains topics which relate to using the `DBMS_XSTREAM_AUTH` package.

Overview

This package provides subprograms for granting privileges to XStream administrators and revoking privileges from XStream administrators.

Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

Summary of DBMS_XSTREAM_AUTH Subprograms

Table 205–1 DBMS_XSTREAM_AUTH Package Subprograms

Subprogram	Description
GRANT_ADMIN_PRIVILEGE Procedure on page 205-6	Either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges
GRANT_REMOTE_ADMIN_ACCESS Procedure on page 205-10	Enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link
REVOKE_ADMIN_PRIVILEGE Procedure on page 205-11	Either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges
REVOKE_REMOTE_ADMIN_ACCESS Procedure on page 205-14	Disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link

Note: All subprograms commit unless specified otherwise.

GRANT_ADMIN_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges.

See Also: "GRANT_ADMIN_PRIVILEGE Procedure" on page 205-6

Syntax

```
DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE(
   grantee                     IN  VARCHAR2,
   privilege_type              IN  VARCHAR2  DEFAULT '*',
   grant_select_privileges     IN  BOOLEAN   DEFAULT FALSE,
   do_grants                   IN  BOOLEAN   DEFAULT TRUE,
   file_name                   IN  VARCHAR2  DEFAULT NULL,
   directory_name              IN  VARCHAR2  DEFAULT NULL
   grant_optional_privileges   IN  VARCHAR2  DEFAULT NULL,
   container                   IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 205–2 GRANT_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
grantee	The user to whom privileges are granted
privilege_type	Specify one of the following values: ■ CAPTURE Specifying CAPTURE grants the minimum privileges required by the user to administer capture processes. ■ APPLY Specifying APPLY grants the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes. ■ * Specifying * grants the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes.
grant_select_privileges	If TRUE, then the procedure grants a set of privileges, including SELECT_CATALOG_ROLE, to the user. If FALSE, then the procedure does not grant the set of privileges to the user. SELECT_CATALOG_ROLE enables the user to select from the data dictionary. Set this parameter to TRUE for the XStream trusted user model. Set this parameter to FALSE for the XStream untrusted user model.

Table 205–2 (Cont.) GRANT_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
do_grants	If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view with YES for both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fails, then the procedure raises an error. If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error.
file_name	The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file. If NULL, then the procedure does not generate a file.
directory_name	The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.
grant_optional_privileges	A comma-separated list of optional privileges to grant to the grantee, such as the DV_XSTREAM_ADMIN and DV_GOLDENGATE_ADMIN privileges
container	If CURRENT, then grants privileges to the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB. If ALL, then grants privileges to the grantee in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root. If a container name, then grants privileges to the grantee only in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. **Note:** This parameter only applies to CDBs.

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The RESTRICTED SESSION system privilege
- EXECUTE on the following packages:
  - DBMS_APPLY_ADM
  - DBMS_AQ

  - DBMS_AQADM
  - DBMS_AQIN
  - DBMS_AQELM
  - DBMS_CAPTURE_ADM
  - DBMS_FLASHBACK
  - DBMS_LOCK
  - DBMS_PROPAGATION_ADM
  - DBMS_RULE_ADM
  - DBMS_STREAMS_ADM
  - DBMS_STREAMS_ADVISOR_ADM
  - DBMS_STREAMS_HANDLER_ADM
  - DBMS_STREAMS_MESSAGING
  - DBMS_TRANSFORM
  - DBMS_XSTREAM_ADM
- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  - Evaluation contexts
  - Rule sets
  - Rules

  In addition, the grantee can grant these privileges to other users.
- SELECT_CATALOG_ROLE
- SELECT or READ privilege on data dictionary views related to XStream and Oracle Streams
- The ability to allow a remote XStream administrator to perform administrative actions through a database link by connecting to the grantee

  This ability is enabled by running the GRANT_REMOTE_ADMIN_ACCESS procedure in this package.

Note:

- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- This procedure grants only the privileges necessary to configure and administer an XStream environment. You can grant additional privileges to the grantee if necessary.

See Also:

- "GRANT_REMOTE_ADMIN_ACCESS Procedure" on page 205-10
- *Oracle Database SQL Language Reference* for information about the `CREATE DIRECTORY` SQL statement

GRANT_REMOTE_ADMIN_ACCESS Procedure

This procedure enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

Syntax

```
DBMS_XSTREAM_AUTH.GRANT_REMOTE_ADMIN_ACCESS(
   grantee  IN  VARCHAR2);
```

Parameters

Table 205–3 GRANT_REMOTE_ADMIN_ACCESS Procedure Parameter

Parameter	Description
grantee	The user who allows remote access. The procedure adds the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES.

Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The XStream administrator at a downstream capture database administers the source database using this connection.

Note: The GRANT_ADMIN_PRIVILEGE procedure in this package runs this procedure.

See Also: "GRANT_ADMIN_PRIVILEGE Procedure" on page 205-6

REVOKE_ADMIN_PRIVILEGE Procedure

This procedure either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges.

Syntax

```
DBMS_XSTREAM_AUTH.REVOKE_ADMIN_PRIVILEGE(
   grantee                     IN  VARCHAR2,
   privilege_type              IN  VARCHAR2  DEFAULT '*',
   revoke_select_privileges    IN  BOOLEAN   DEFAULT FALSE,
   do_revokes                  IN  BOOLEAN   DEFAULT TRUE,
   file_name                   IN  VARCHAR2  DEFAULT NULL,
   directory_name              IN  VARCHAR2  DEFAULT NULL
   revoke_optional_privileges  IN  VARCHAR2  DEFAULT NULL,
   container                   IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 205–4 REVOKE_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
grantee	The user from whom privileges are revoked
privilege_type	Specify one of the following values: ■ CAPTURE Specifying CAPTURE revokes the minimum privileges required by the user to administer capture processes. ■ APPLY Specifying APPLY revokes the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes. ■ * Specifying * revokes the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes.
revoke_select_ privileges	If TRUE, then the procedure revokes a set of privileges, including SELECT_CATALOG_ROLE, to the user. If FALSE, then the procedure does not revoke the set of privileges to the user. SELECT_CATALOG_ROLE enables the user to select from the data dictionary.

Table 205–4 (Cont.) REVOKE_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
do_revokes	If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fails, then the procedure raises an error. A revoke statement fails if the user is not granted the privilege that is being revoked. If FALSE, then the procedure does not revoke the privileges from the specified user directly, and does not remove the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.
file_name	The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then the procedure does not generate a file.
directory_name	The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.
revoke_optional_privileges	A comma-separated list of optional privileges to revoke from the grantee, such as the DV_XSTREAM_ADMIN and DV_GOLDENGATE_ADMIN privileges
container	If CURRENT, then revokes privileges from the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB. If ALL, then revokes privileges from the grantee in all containers in the CDB. To specify ALL, the procedure must be invoked in the root. If a container name, then revokes privileges from the grantee only in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. **Note:** This parameter only applies to CDBs.

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT_ADMIN_PRIVILEGE procedure in this package.

> **Note:** To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

See Also:

- "GRANT_ADMIN_PRIVILEGE Procedure" on page 205-6
- *Oracle Database SQL Language Reference* for information about the `CREATE DIRECTORY` SQL statement

REVOKE_REMOTE_ADMIN_ACCESS Procedure

This procedure disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link.

Note: The `REVOKE_ADMIN_PRIVILEGE` procedure in this package runs this procedure.

See Also: "REVOKE_ADMIN_PRIVILEGE Procedure" on page 205-11

Syntax

```
DBMS_XSTREAM_AUTH.REVOKE_REMOTE_ADMIN_ACCESS(
   grantee  IN  VARCHAR2);
```

Parameters

Table 205–5 REVOKE_REMOTE_ADMIN_ACCESS Procedure Parameter

Parameter	Description
`grantee`	The user for whom access from a remote XStream administrator is disabled. If a row for the grantee exists in the `DBA_XSTREAM_ADMINISTRATOR` data dictionary view, then the procedure updates the `ACCESS_FROM_REMOTE` column for the grantee to `NO`. If, after this update, both the `LOCAL_PRIVILEGES` column and the `ACCESS_FROM_REMOTE` column are `NO` for the grantee, then the procedure removes the grantee from the view. If no row for the grantee exists in the `DBA_XSTREAM_ADMINISTRATOR` data dictionary view, then the procedure does not update the view and does not raise an error.

206

DEBUG_EXTPROC

The DEBUG_EXTPROC package enables you to start up the extproc agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

Using DEBUG_EXTPROC

Security Model

Your Oracle account must have `EXECUTE` privileges on the package and `CREATE LIBRARY` privileges.

Operational Notes

To install the package, run the script DBGEXTP.SQL.

- Install/load this package in the Oracle USER where you want to debug the 'extproc' process.
- Ensure that you have execute privileges on package DEBUG_EXTPROC

```
SELECT SUBSTR(OBJECT_NAME, 1, 20)
FROM USER_OBJECTS
WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
```

- You can install this package as any other user, as long as you have EXECUTE privileges on the package.

> **Note:** These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

Having installed the package, proceed accordingly:

- Start a new Oracle session through SQL*Plus or OCI program by connecting to ORACLE.
- Execute procedure DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT to startup the extproc agent in this session; for example, execute DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT; Do not exit this session, because that terminates the extproc agent.
- Determine the PID of the extproc agent that was started up for this session.
- Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.
- Set a breakpoint on function 'pextproc' and let the debugger continue with its execution.
- Now execute your external procedure in the same session where you first executed DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT
- Your debugger should now break in function 'pextproc'. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, 'share' in gdb)

- The debugger should now break in your C function. Its assumed that you had built the shared library with debugging symbols.
- Now proceed with your debugging.

Rules and Limits

Note: `DEBUG_EXTPROC` works only on platforms with debuggers that can attach to a running process.

Summary of DEBUG_EXTPROC Subprograms

Table 206–1 DEBUG_EXTPROC Package Subprograms

Subprogram	Description
STARTUP_EXTPROC_AGENT Procedure on page 206-7	Starts up the extproc agent process in the session

STARTUP_EXTPROC_AGENT Procedure

This procedure starts up the extproc agent process in the session.This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

Syntax

```
DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;
```

207

HTF

The HTF (hypertext functions) and HTP (hypertext procedures) packages generate HTML tags. For example, the HTF.ANCHOR function generates the HTML anchor tag, <A>.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

Using HTF

Deprecated Subprograms

> **Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprogram is deprecated with Oracle Database 10*g*:

- ESCAPE_URL Function

Operational Notes

For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is a ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.
- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTF.`PRINT` function. It then prints its parameters to the generated Web page.

Rules and Limits

If you use values of the LONG datatype in functions such as `HTF.PRINT`, `HTF.PRN`, `HTF.PA` or `OWA_UTIL.CELLSPRINT`, only the first 32 K of the `LONG` data is used. The `LONG` data is bound to a `VARCHAR2` datatype in the function.

Examples

The following commands generate a simple HTML document:

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
   HTP.P (HTF.HTMLOPEN); -- generates <HTML>
   HTP.P (HTF.HEADOPEN); -- generates <HEAD>
   HTP.P (HTF.TITLE('Hello')); -- generates <TITLE>Hello</TITLE>
   HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
   HTP.P (HTF.BODYOPEN); -- generates <BODY>
   HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
   HTP.P (HTF.BODYCLOSE); -- generates </BODY>
   HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
END;
```

Summary of Tags

HTML, HEAD, and BODY Tags

HTMLOPEN Function, HTMLCLOSE Function - generate <HTML> and </HTML>

HEADOPEN Function, HEADCLOSE Function - generate <HEAD> and </HEAD>

BODYOPEN Function, BODYCLOSE Function - generate <BODY> and </BODY>

Comment Tag

COMMENT Function - generates <!-- and -->

http://www.w3.org.BASE Function - generates <BASE>

LINKREL Function - generates <LINK> with the REL attribute

LINKREV Function - generates <LINK> with the REV attribute

TITLE Function - generates <TITLE>

META Function - generates <META>

SCRIPT Function - generates <SCRIPT>

STYLE Function - generates <STYLE>

ISINDEX Function - generates <ISINDEX>

Applet Tags

APPLETOPEN Function, APPLETCLOSE Function - generate <APPLET> and </APPLET>

PARAM Function - generates <PARAM>

List Tags

OLISTOPEN Function, OLISTCLOSE Function - generate <OL> and </OL>

ULISTOPEN Function, ULISTCLOSE Function - generate <UL> and </UL>

DLISTOPEN Function, DLISTCLOSE Function- generate <DL> and </DL>

DLISTTERM Function - generates <DT>

DLISTDEF Function - generates <DD>

DIRLISTOPEN Function, DIRLISTCLOSE Function - generate <DIR> and </DIR>

LISTHEADER Function - generates <LH>

LISTINGOPEN Function, LISTINGCLOSE Function - generate <LISTING> and </LISTING>

MENULISTOPEN Function - generate <MENU> and </MENU>

LISTITEM Function - generates <LI>

Form Tags

FORMOPEN Function, FORMCLOSE Function - generate <FORM> and </FORM>

FORMCHECKBOX Function - generates <INPUT TYPE="CHECKBOX">

FORMHIDDEN Function - generates <INPUT TYPE="HIDDEN">

FORMIMAGE Function - generates <INPUT TYPE="IMAGE">

FORMPASSWORD Function - generates <INPUT TYPE="PASSWORD">

FORMRADIO Function - generates <INPUT TYPE="RADIO">

FORMSELECTOPEN Function, FORMSELECTCLOSE Function - generate <SELECT> and </SELECT>

FORMSELECTOPTION Function - generates <OPTION>

FORMTEXT Function - generates <INPUT TYPE="TEXT">

FORMTEXTAREA Function - generate <TEXTAREA>

FORMTEXTAREAOPEN Function, FORMTEXTAREACLOSE Function - generate <TEXTAREA> and </TEXTAREA>

FORMRESET Function - generates <INPUT TYPE="RESET">

FORMSUBMIT Function - generates <INPUT TYPE="SUBMIT">

Table Tags

TABLEOPEN Function, TABLECLOSE Function - generate <TABLE> and </TABLE>

TABLECAPTION Function - generates <CAPTION>

TABLEROWOPEN Function, TABLEROWCLOSE Function - generate <TR> and </TR>

TABLEHEADER Function - generates <TH>

TABLEDATA Function - generates <TD>

IMG, HR, and A Tags

HR Function, LINE Function - generate <HR>

IMG Function, IMG2 Function - generate <IMG>

ANCHOR Function, ANCHOR2 Function - generate <A>

MAPOPEN Function, MAPCLOSE Function - generate <MAP> and </MAP>

Paragraph Formatting Tags

HEADER Function - generates heading tags (<H1> to <H6>)

PARA Function, PARAGRAPH Function - generate <P>

PRN Functions, PRINT Functions - generate any text that is passed in

PRN Functions, S Function - generate any text that is passed in; special characters in HTML are escaped

PREOPEN Function, PRECLOSE Function - generate <PRE> and </PRE>

BLOCKQUOTEOPEN Function, BLOCKQUOTECLOSE Function - generate <BLOCKQUOTE> and </BLOCKQUOTE>

DIV Function - generates <DIV>

NL Function, BR Function - generate

NOBR Function - generates <NOBR>

WBR Function - generates <WBR>

PLAINTEXT Function - generates <PLAINTEXT>

ADDRESS Function - generates <ADDRESS>

MAILTO Function - generates <A> with the MAILTO attribute

AREA Function - generates <AREA>

BGSOUND Function - generates <BGSOUND>

Character Formatting Tags

BASEFONT Function - generates <BASEFONT>

BIG Function - generates <BIG>

BOLD Function - generates <B>

CENTER Function - generates <CENTER> and </CENTER>

CENTEROPEN Function, CENTERCLOSE Function - generate <CENTER> and </CENTER>

CITE Function - generates <CITE>

CODE Function - generates <CODE>

DFN Function - generates <DFN>

EM Function, EMPHASIS Function - generate <EM>

FONTOPEN Function, FONTCLOSE Function - generate <FONT> and </FONT>

ITALIC Function - generates <I>

KBD Function, KEYBOARD Function - generate <KBD> and </KBD>

S Function - generates <S>

SAMPLE Function - generates <SAMP>

SMALL Function - generates <SMALL>

STRIKE Function - generates <STRIKE>

STRONG Function - generates <STRONG>

SUB Function - generates <SUB>

SUP Function - generates <SUP>

TELETYPE Function - generates <TT>

UNDERLINE Function - generates <U>

VARIABLE Function - generates <VAR>

Frame Tags

FRAME Function - generates <FRAME>

FRAMESETOPEN Function, FRAMESETCLOSE Function - generate <FRAMESET> and </FRAMESET>

NOFRAMESOPEN Function, NOFRAMESCLOSE Function - generate <NOFRAMES> and </NOFRAMES>

Summary of HTF Subprograms

Table 207–1 HTF Package Subprograms

Subprogram	Description
ADDRESS Function on page 207-16	Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document
ANCHOR Function on page 207-17	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
ANCHOR2 Function on page 207-18	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
APPLETCLOSE Function on page 207-19	Closes the applet invocation with the </APPLET> tag
APPLETOPEN Function on page 207-20	Generates the <APPLET> tag which begins the invocation of a Java applet
AREA Function on page 207-21	Generates the <AREA> tag, which defines a client-side image map
BASE Function on page 207-22	Generates the <BASE> tag which records the URL of the document
BASEFONT Function on page 207-23	Generates the <BASEFONT> tag which specifies the base font size for a Web page
BGSOUND Function on page 207-24	Generates the <BGSOUND> tag which includes audio for a Web page
BIG Function on page 207-25	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
BLOCKQUOTECLOSE Function on page 207-26	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
BLOCKQUOTEOPEN Function on page 207-27	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
BODYCLOSE Function on page 207-28	Generates the </BODY> tag which marks the end of a body section of an HTML document
BODYOPEN Function on page 207-29	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
BOLD Function on page 207-30	Generates the <B> and </B> tags which direct the browser to display the text in boldface
BR Function on page 207-31	Generates the tag which begins a new line of text
CENTER Function on page 207-32	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page
CENTERCLOSE Function on page 207-33	Generates the </CENTER> tag which marks the end of a section of text to center
CENTEROPEN Function on page 207-34	Generates the <CENTER> tag which mark the beginning of a section of text to center
CITE Function on page 207-35	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
CODE Function on page 207-36	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically

Table 207–1 (Cont.) HTF Package Subprograms

Subprogram	Description
COMMENT Function on page 207-37	Generates the comment tags <!-- ctext -->
DFN Function on page 207-38	Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
DIRLISTCLOSE Function on page 207-39	Generates the </DIR> tag which ends a directory list section
DIRLISTOPEN Function on page 207-40	Generates the <DIR> which starts a directory list section
DIV Function on page 207-41	Generates the <DIV> tag which creates document divisions
DLISTCLOSE Function on page 207-42	Generates the </DL> tag which ends a definition list
DLISTDEF Function on page 207-43	Generates the <DD> tag, which inserts definitions of terms
DLISTOPEN Function on page 207-44	Generates the <DL> tag which starts a definition list
DLISTTERM Function on page 207-45	Generates the <DT> tag which defines a term in a definition list <DL>
EM Function on page 207-46	Generates the <EM> and </EM> tags, which define text to be emphasized
EMPHASIS Function on page 207-47	Generates the <EM> and </EM> tags, which define text to be emphasized
ESCAPE_SC Function on page 207-48	Replaces characters that have special meaning in HTML with their escape sequences
ESCAPE_URL Function on page 207-49	Replaces characters that have special meaning in HTML and HTTP with their escape sequences
FONTCLOSE Function on page 207-51	Generates the </FONT> tag which marks the end of a section of text with the specified font characteristics
FONTOPEN Function on page 207-51	Generates the <FONT> which marks the beginning of section of text with the specified font characteristics
FORMAT_CELL Function on page 207-52	formats column values inside an HTML table using the TABLEDATA Function
FORMCHECKBOX Function on page 207-53	Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form
FORMCLOSE Function on page 207-54	Generates the </FORM> tag which marks the end of a form section in an HTML document
FORMFILE Function on page 207-55	Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page
FORMHIDDEN Function on page 207-56	Generates the <INPUT> tag with TYPE="hidden"which inserts a hidden form element
FORMIMAGE Function on page 207-57	Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately
FORMOPEN Function on page 207-58	Generates the <FORM> tag which marks the beginning of a form section in an HTML document

Table 207–1 (Cont.) HTF Package Subprograms

Subprogram	Description
FORMPASSWORD Function on page 207-59	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
FORMRADIO Function on page 207-60	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
FORMRESET Function on page 207-61	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
FORMSELECTCLOSE Function on page 207-62	Generates the </SELECT> tag which marks the end of a Select form element
FORMSELECTOPEN Function on page 207-63	Generates the </SELECT> tag which marks the beginning of a Select form element
FORMSELECTOPTION Function on page 207-64	Generates the <OPTION> tag which represents one choice in a Select element
FORMSUBMIT Function on page 207-65	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
FORMTEXT Function on page 207-66	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
FORMTEXTAREA Function on page 207-67	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
FORMTEXTAREA2 Function on page 207-68	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
FORMTEXTAREACLOSE Function on page 207-69	Generates the </TEXTAREA> tag which ends a text area form element
FORMTEXTAREAOPEN Function on page 207-70	Generates the <TEXTAREA> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Function on page 207-71	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Function on page 207-72	Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag
FRAMESETCLOSE Function on page 207-73	Generates the </FRAMESET> tag which ends a frameset section
FRAMESETOPEN Function on page 207-74	Generates the </FRAMESET> tag which begins a frameset section
HEADCLOSE Function on page 207-75	Generates the </HEAD> tag which marks the end of an HTML document head section
HEADER Function on page 207-76	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
HEADOPEN Function on page 207-77	Generates the <HEAD> tag which marks the beginning of the HTML document head section
HR Function on page 207-78	Generates the <HR> tag, which generates a line in the HTML document
HTMLCLOSE Function on page 207-80	Generates the </HTML> tag which marks the end of an HTML document
HTMLOPEN Function on page 207-80	Generates the <HTML> tag which marks the beginning of an HTML document

Table 207–1 (Cont.) HTF Package Subprograms

Subprogram	Description
IMG Function on page 207-81	Generates the <IMG> tag which directs the browser to load an image onto the HTML page
IMG2 Function on page 207-82	Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute
ISINDEX Function on page 207-83	Creates a single entry field with a prompting text, such as "*enter value*," then sends that value to the URL of the page or program
ITALIC Function on page 207-84	Generates the <I> and </I> tags which direct the browser to render the text in italics
KBD Function on page 207-85	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
KEYBOARD Function on page 207-86	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
LINE Function on page 207-87	Generates the <HR> tag, which generates a line in the HTML document
LINKREL Function on page 207-88	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
LINKREV Function on page 207-89	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
LISTHEADER Function on page 207-90	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
LISTINGCLOSE Function on page 207-91	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
LISTINGOPEN Function on page 207-92	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
LISTITEM Function on page 207-93	Generates the <LI> tag, which indicates a list item
MAILTO Function on page 207-94	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
MAPCLOSE Function on page 207-95	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
MAPOPEN Function on page 207-96	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
MENULISTCLOSE Function on page 207-97	Generates the </MENU> tag which ends a list that presents one line for each item
MENULISTOPEN Function on page 207-98	Generates the <MENU> tag which begins a list that presents one line for each item
META Function on page 207-99	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers
NL Function on page 207-87	Generates the tag which begins a new line of text
NOBR Function on page 207-101	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
NOFRAMESCLOSE Function on page 207-102	Generates the </NOFRAMES> tag which marks the end of a no-frames section

Table 207–1 (Cont.) HTF Package Subprograms

Subprogram	Description
NOFRAMESOPEN Function on page 207-103	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
OLISTCLOSE Function on page 207-104	Generates the </OL> tag which defines the end of an ordered list
OLISTOPEN Function on page 207-105	Generates the <OL> tag which marks the beginning of an ordered list
PARA Function on page 207-106	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
PARAGRAPH Function on page 207-107	Adds attributes to the <P> tag
PARAM Function on page 207-108	Generates the <PARAM> tag which specifies parameter values for Java applets
PLAINTEXT Function on page 207-109	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
PRECLOSE Function on page 207-110	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
PREOPEN Function on page 207-111	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
PRINT Functions on page 207-112	Generates the specified parameter as a string terminated with the \n newline character
PRN Functions on page 207-113	Generates the specified parameter as a string
S Function on page 207-114	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
SAMPLE Function on page 207-115	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
SCRIPT Function on page 207-116	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
SMALL Function on page 207-117	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font
STRIKE Function on page 207-118	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
STRONG Function on page 207-119	Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
STYLE Function on page 207-120	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page
SUB Function on page 207-121	Generates the _{and} tags which direct the browser to render the text they surround as subscript
SUP Function on page 207-122	Generates the ^{and} tags which direct the browser to render the text they surround as superscript
TABLECAPTION Function on page 207-123	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
TABLECLOSE Function on page 207-124	Generates the </TABLE> tag which marks the end of an HTML table

Table 207–1 (Cont.) HTF Package Subprograms

Subprogram	Description
TABLEDATA Function on page 207-125	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
TABLEHEADER Function on page 207-126	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
TABLEOPEN Function on page 207-127	Generates the <TABLE> tag which marks the beginning of an HTML table
TABLEROWCLOSE Function on page 207-128	Generates the </TR> tag which marks the end of a new row in an HTML table
TABLEROWOPEN Function on page 207-129	Generates the <TR> tag which marks the beginning of a new row in an HTML table
TELETYPE Function on page 207-130	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
TITLE Function on page 207-131	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
ULISTCLOSE Function on page 207-132	Generates the </UL> tag which marks the end of an unordered list
ULISTOPEN Function on page 207-133	Generates the <UL> tag which marks the beginning of an unordered list
UNDERLINE Function on page 207-134	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
VARIABLE Function on page 207-135	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
WBR Function on page 207-136	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

ADDRESS Function

This function generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTF.ADDRESS (
   cvalue         IN       VARCHAR2
   cnowrap        IN       VARCHAR2   DEFAULT NULL
   cclear         IN       VARCHAR2   DEFAULT NULL
   cattributes    IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 207–2 ADDRESS Function Parameters

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

ANCHOR Function

This function and the ANCHOR2 Function functions generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the ANCHOR2 Function provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR (
   curl            IN       VARCHAR2,
   ctext           IN       VARCHAR2,
   cname           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 207–3 ANCHOR Function Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

ANCHOR2 Function

This function and the ANCHOR Function generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this functions provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR2 (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   ctarget        in       varchar2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 207–4 ANCHOR2 Function Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

APPLETCLOSE Function

This function closes the applet invocation with the </APPLET> tag. You must first invoke the a Java applet using APPLETOPEN Function on page 207-20

Syntax

```
HTF.APPLETCLOSE
 RETURN VARCHAR2;
```

APPLETOPEN Function

This function generates the <APPLET> tag which begins the invocation of a Java applet. You close the applet invocation with APPLETCLOSE Function on page 207-19 which generates the </APPLET> tag.

Syntax

```
HTF.APPLETOPEN (
   ccode          IN       VARCHAR2,
   cheight        IN       NUMBER,
   cwidth         IN       NUMBER,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–5 APPLETOPEN Function Parameters

Parameter	Description
ccode	The the value for the CODE attribute which specifies the name of the applet class.
cheight	The value for the HEIGHT attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the PARAM Function function on page 207-108.
- Use the cattributes parameter to specify the CODEBASE attribute since the PL/SQL cartridge does not know where to find the class files. The CODEBASE attribute specifies the virtual path containing the class files.

AREA Function

This function generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

Syntax

```
HTF.AREA (
   ccoords        IN       VARCHAR2
   cshape         IN       VARCHAR2   DEFAULT NULL,
   chref          IN       VARCHAR2   DEFAULT NULL,
   cnohref        IN       VARCHAR2   DEFAULT NULL,
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–6 AREA Function Parameters

Parameter	Description
ccords	The the value for the COORDS attribute.
cshape	The value for the SHAPE attribute.
chref	The value for the HREF attribute.
cnohref	If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget"
cattributes>
```

BASE Function

This function generates the <BASE> tag which records the URL of the document.

Syntax

```
HTF.BASE (
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–7 BASE Function Parameters

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

BASEFONT Function

This function generates the <BASEFONT> tag which specifies the base font size for a Web page.

Syntax

```
HTF.BASEFONT (
   nsize    IN    INTEGER)
  RETURN VARCHAR2;
```

Parameters

Table 207–8 BASEFONT Function Parameters

Parameter	Description
nsize	The value for the SIZE attribute.

Examples

This function generates

```
<BASEFONT SIZE="nsize">
```

BGSOUND Function

This function generates the <BGSOUND> tag which includes audio for a Web page.

Syntax

```
HTF.BGSOUND (
   csrc           IN       VARCHAR2,
   cloop          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–9 BGSOUND Function Parameters

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

BIG Function

This function generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```
HTF.BIG (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–10 BIG Function Parameters

Parameter	Description
ctext	The the text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BIG cattributes>ctext</BIG>
```

BLOCKQUOTECLOSE Function

This function generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the BLOCKQUOTEOPEN Function.

Syntax

```
HTF.BLOCKQUOTECLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</BLOCKQUOTE>
```

BLOCKQUOTEOPEN Function

This function generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the BLOCKQUOTECLOSE Function.

Syntax

```
HTF.BLOCKQUOTEOPEN (
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–11 BLOCKQUOTEOPEN Function Parameters

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

BODYCLOSE Function

This function generates the </BODY> tag which marks the end of a body section of an HTML document.You mark the beginning of a body section by means of the BODYOPEN Function.

Syntax

```
HTF.BODYCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</BODY>
```

BODYOPEN Function

This function generates the <BODY> tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the BODYCLOSE Function.

Syntax

```
HTF.BODYOPEN (
   cbackground    IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–12 BODYOPEN Function Parameters

Parameter	Description
cbackground	The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTF.BODYOPEN('/img/background.gif')
  RETURN VARCHAR2;
```

generates:

```
<BODY background="/img/background.gif">
```

BOLD Function

This function generates the <B> and </B> tags which direct the browser to display the text in boldface.

Syntax

```
HTF.BOLD (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–13 BOLD Function Parameters

Parameter	Description
ctext	The text that goes between the tags.
