cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<B cattributes>ctext</B>
```

BR Function

This function generates the <BR> tag which begins a new line of text. It performs the same operation as the NL Function.

Syntax

```
HTF.BR(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–14 BR Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

CENTER Function

This function generates the <CENTER> and </CENTER> tags which center a section of text within a Web page.

Syntax

```
HTF.CENTER (
   ctext          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 207–15 CENTER Parameters

Parameter	Description
ctext	The text that goes between the tags.

Examples

This function generates

```
<CENTER>ctext</CENTER>
```

CENTERCLOSE Function

This function generates the </CENTER> tag which marks the end of a section of text to center. You mark the beginning of a of a section of text to center by means of the CENTEROPEN Function.

Syntax

```
HTF.CENTERCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</CENTER>
```

CENTEROPEN Function

This function generates the <CENTER> tag which mark the beginning of a section of text to center.You mark the beginning of a of a section of text to center by means of the CENTERCLOSE Function.

Syntax

```
HTF.CENTEROPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<CENTER>
```

CITE Function

This function generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation.

Syntax

```
HTF.CITE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–16 CITE Function Parameters

Parameter	Description
ctext	The text to render as citation.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<CITE cattributes>ctext</CITE>
```

CODE Function

This function generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTF.CODE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–17 CODE Function Parameters

Parameter	Description
ctext	The text to render as code.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<CODE cattributes>ctext</CODE>
```

COMMENT Function

This function generates the comment tags.

Syntax

```
HTF.COMMENT (
   ctext           IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 207–18 COMMENT Function Parameters

Parameter	Description
ctext	The comment.

Examples

This function generates

```
<!-- ctext -->
```

DFN Function

This function generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTF.DFN (
   ctext           IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 207–19 DFN Function Parameters

Parameter	Description
ctext	The text to render in italics.

Examples

This function generates

```
<DFN>ctext</DFN>
```

DIRLISTCLOSE Function

This function generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

Syntax

```
HTF.DIRLISTCLOSE
  RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Function so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This function generates

```
</DIR>
```

DIRLISTOPEN Function

This function generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

Syntax

```
HTF.DIRLISTOPEN
  RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Function so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This function generates

```
<DIR>
```

DIV Function

This function generates the <DIV> tag which creates document divisions.

Syntax

```
HTF.DIV (
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–20 DIV Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DIV ALIGN="calign" cattributes>
```

DLISTCLOSE Function

This function generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Function.

Syntax

```
HTF.DLISTCLOSE
  RETURN VARCHAR2;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples

This function generates

```
</DL>
```

DLISTDEF Function

This function generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

Syntax

```
HTF.DLISTDEF (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–21 DLISTDEF Function Parameters

Parameter	Description
ctext	The definition of the term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DD CLEAR="cclear" cattributes>ctext
```

DLISTOPEN Function

This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

Syntax

```
HTF.DLISTOPEN (
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–22 DLISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples

This function generates

```
<DL CLEAR="cclear" cattributes>
```

DLISTTERM Function

This function generates the <DT> tag which defines a term in a definition list <DL>.

Syntax

```
HTF.DLISTTERM (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–23 DLISTTERM Function Parameters

Parameter	Description
ctext	The term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DT CLEAR="cclear" cattributes>ctext
```

EM Function

This function generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the EMPHASIS Function.

Syntax

```
HTF.EM(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–24 EM Function Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

EMPHASIS Function

This function generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the EM Function.

Syntax

```
HTF.EMPHASIS(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–25 EMPHASIS Function Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

ESCAPE_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:

- `&` to `&`
- `"` to `&quot:`
- `<` to `<`
- `>` to `>`

This function performs the same operation as HTP. PRINTS Procedure and HTP. PS Procedure.

Syntax

```
HTF.ESCAPE_SC(
     ctext           IN       VARCHAR2);
```

Parameters

Table 207–26 ESCAPE_SC Function Parameters

Parameter	Description
`ctext`	The text string to convert.

ESCAPE_URL Function

> **Note:** This procedure, deprecated in Release 10*g*, and provided here only for reasons of backward compatibility, does not comply with the Internet Engineering Task Force (IETF) Request for Comments (RFC) standards of URL encoding. If you need to encode URLs, it is recommended you use the ESCAPE Functionin the UTL_URL package.

This function replaces characters that have special meaning in HTML and HTTP with their escape sequences. The following characters are converted:

- `&` to `&`
- `"` to `&quot:`
- `<` to `<`
- `>` to `>`
- `%` to `&25`

Syntax

```
HTF.ESCAPE_URL(
     p_url          IN       VARCHAR2);
```

Parameters

Table 207–27 ESCAPE_URL Function Parameters

Parameter	Description
p_url	The string to convert.

FONTCLOSE Function

This function generates the</FONT> tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the FONTOPEN Function.

Syntax

```
HTF.FONTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

</FONT>

FONTOPEN Function

This function generates the <FONT> which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the FONTCLOSE Function.

Syntax

```
HTF.FONTOPEN(
   ccolor          IN       VARCHAR2   DEFAULT NULL,
   cface           IN       VARCHAR2   DEFAULT NULL,
   csize           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–28 FONTOPEN Function Parameters

Parameter	Description
ccolor	The value for the COLOR attribute.
cface	The value for the FACE attribute
csize	The value for the SIZE attribute
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

FORMAT_CELL Function

This function formats column values inside an HTML table using the TABLEDATA Function. It allows for better control over the HTML tables.

Syntax

```
HTF.FORMAT_CELL(
   columnValue          IN       VARCHAR2
   format_numbers       IN       VARCHAR2   DEFAULT NULL
 RETURN VARCHAR2;
```

Parameters

Table 207–29 FORMAT_CELL Function Parameters

Parameter	Description
`columnValue`	The value that needs to be formatted in an HTML table.
`format_numbers`	The format that numeric data is displayed in. If the value of this parameter is not `NULL`, the number fields are right-justified and rounded to two decimal places.

Examples

This function generates

```
<TD >columnValue</TD>
```

FORMCHECKBOX Function

This function generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

Syntax

```
HTF.FORMCHECKBOX(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT 'ON',
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–30 FORMCHECKBOX Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMCLOSE Function

This function generates the </FORM> tag which marks the end of a form section in an HTML document.You mark the beginning of the form section by means of the FORMOPEN Function.

Syntax

```
HTF.FORMCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</FORM>
```

FORMFILE Function

This function generates the <INPUT> tag with TYPE="file" which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTF.FORMFILE(
   cname          IN       VARCHAR2,
   caccept        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–31 FORMFILE Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
caccept	A comma-delimited list of MIME types for upload.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

FORMHIDDEN Function

This function generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTF.FORMHIDDEN(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–32 FORMHIDDEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

FORMIMAGE Function

This function generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

Syntax

```
HTF.FORMIMAGE(
   cname          IN       VARCHAR2,
   csrc           IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–33 FORMIMAGE Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csrc	The value for the SRC attribute that specifies the image file.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

FORMOPEN Function

This function generates the <FORM> tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the FORMCLOSE Function.

Syntax

```
HTF.FORMOPEN(
   curl           IN       VARCHAR2,
   cmethod        IN       VARCHAR2   DEFAULT 'POST',
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cenctype       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–34 FORMOPEN Function Parameters

Parameter	Description
curl	The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required.
cmethod	The value for the METHOD attribute. The value can be "GET" or "POST".
ctarget	The value for the TARGET attribute.
cenctype	The value for the ENCTYPE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype"
cattributes>
```

FORMPASSWORD Function

This function generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTF.FORMPASSWORD(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–35 FORMPASSWORD Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```

FORMRADIO Function

This function generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTF.FORMRADIO(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2,
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–36 FORMRADIO Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMRESET Function

This function generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTF.FORMRESET(
   cvalue         IN       VARCHAR2   DEFAULT 'Reset',
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–37 FORMRESET Function Parameters

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

FORMSELECTCLOSE Function

This function generates the `</SELECT>` tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Function.The values are inserted using FORMSELECTOPTION Function.

Syntax

```
HTF.FORMSELECTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</SELECT>
```

as shown under Examples of the FORMSELECTOPEN Function.

FORMSELECTOPEN Function

This function generates the <SELECT> tags which begins a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Function.The values are inserted using FORMSELECTOPTION Function.

Syntax

```
HTF.FORMSELECTOPEN(
   cname          IN       VARCHAR2,
   cprompt        IN       VARCHAR2   DEFAULT NULL,
   nsize          IN       INTEGER    DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–38 FORMSELECTOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTF.FORMSELECTOPEN('greatest_player';
    'Pick the greatest player:');
HTF.FORMSELECTOPTION('Messier');
HTF.FORMSELECTOPTION('Howe');
HTF.FORMSELECTOPTION('Gretzky');.
HTF.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

FORMSELECTOPTION Function

This function generates the <OPTION> tag which represents one choice in a Select element.

Syntax

```
HTF.FORMSELECTOPTION(
   cvalue         IN       VARCHAR2,
   cselected      IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–39 FORMSELECTOPTION Function Parameters

Parameter	Description
cvalue	The text for the option.
cvalue	If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the FORMSELECTOPEN Function.

FORMSUBMIT Function

This function generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form. If the button has a NAME attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTF.FORMSUBMIT(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT 'Submit',
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–40 FORMSUBMIT Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

FORMTEXT Function

This function generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text.

Syntax

```
HTF.FORMTEXT(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2   DEFAULT NULL,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–41 FORMTEXT Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue"
cattributes>
```

FORMTEXTAREA Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA2 Function which in addition has the cwrap parameter that lets you specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–42 FORMTEXTAREA Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"
cattributes></TEXTAREA>
```

FORMTEXTAREA2 Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.The same operation is performed by the FORMTEXTAREA Function except that in that case you cannot specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–43 FORMTEXTAREA2 Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

FORMTEXTAREACLOSE Function

This function generates the </TEXTAREA> tag which ends a text area form element. You open a text area element by means of eitherFORMTEXTAREAOPEN Function or FORMTEXTAREAOPEN2 Function.

Syntax

```
HTF.FORMTEXTAREACLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</TEXTAREA>
```

FORMTEXTAREAOPEN Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN2 Function which in addition has the cwrap parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```
HTF.FORMTEXTAREAOPEN(
   cname           IN       VARCHAR2,
   nrows           IN       INTEGER,
   ncolumns        IN       INTEGER,
   calign          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–44 FORMTEXTAREAOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

FORMTEXTAREAOPEN2 Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN Function except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```
HTF.FORMTEXTAREAOPEN2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–45 FORMTEXTAREAOPEN2 Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

FRAME Function

This function generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```
HTF.FRAME(
   csrc           IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cmarginwidth   IN       VARCHAR2   DEFAULT NULL,
   cmarginheight  IN       VARCHAR2   DEFAULT NULL,
   cscrolling     IN       VARCHAR2   DEFAULT NULL,
   cnoresize      IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–46 FRAME Function Parameters

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

FRAMESETCLOSE Function

This function generates the </FRAMESET> tag which ends a frameset section. You mark the beginning of a frameset section by means of the FRAMESETOPEN Function.

Syntax

```
HTF.FRAMESETCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</FRAMESET>
```

FRAMESETOPEN Function

This function generates the <FRAMESET> tag which define a frameset section. You mark the end of a frameset section by means of the FRAMESETCLOSE Function.

Syntax

```
HTF.FRAMESETOPEN(
   crows          IN       VARCHAR2   DEFAULT NULL,
   ccols          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–47 FRAMESETOPEN Function Parameters

Parameter	Description
crows	The value for the ROWS attribute.
ccols	The value for the COLS attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

HEADCLOSE Function

This function generates the </HEAD> tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the HEADOPEN Function.

Syntax

```
HTF.HEADCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</HEAD>
```

HEADER Function

This function generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

Syntax

```
HTF.HEADER(
   nsize          IN       INTEGER,
   cheader        IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–48 HEADER Function Parameters

Parameter	Description
nsize	The the heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

```
HTF.header (1,'Overview')
  RETURN VARCHAR2;
```

produces:

```
<H1>Overview</H1>
```

HEADOPEN Function

This function generates the <HEAD> tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the HEADCLOSE Function.

Syntax

```
HTF.HEADOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<HEAD>
```

HR Function

This function generates the <HR> tag, which generates a line in the HTML document.This subprogram performs the same operation as the LINE Function.

Syntax

```
HTF.HR(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–49 HR Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

HTMLCLOSE Function

This function generates the `</HTML>` tag which marks the end of an HTML document. You use the HTMLOPEN Function to mark the beginning of an HTML document.

Syntax

```
HTF.HTMLCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</HTML>
```

HTMLOPEN Function

This function generates the <HTML> tag which marks the beginning of an HTML document. You use the HTMLCLOSE Function to mark the end of the an HTML document.

Syntax

```
HTF.HTMLOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<HTML>
```

IMG Function

This function generates the <IMG> tag which directs the browser to load an image onto the HTML page. The IMG2 Function performs the same operation but additionally uses the cusemap parameter.

Syntax

```
HTF.IMG(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–50 IMG Function Parameters

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

IMG2 Function

This function generates the <IMG> tag, which directs the browser to load an image onto the HTML page. The IMG Function performs the same operation but does not use the `cusemap` parameter.

Syntax

```
HTF.IMG2(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2   DEFAULT NULL,
   cusemap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–51 IMG2 Function Parameters

Parameter	Description
`curl`	The value for the SRC attribute.
`calign`	The value for the `ALIGN` attribute.
`calt`	The value for the `ALT` attribute which specifies alternative text to display if the browser does not support images.
`cismap`	If the value for this parameter is not `NULL`, the `ISMAP` attribute is added to the tag. The attribute indicates that the image is an imagemap.
`cusemap`	The value for the `USEMAP` attribute which specifies a client-side image map.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

ISINDEX Function

This function creates a single entry field with a prompting text, such as "*enter value,*" then sends that value to the URL of the page or program.

Syntax

```
HTF.ISINDEX(
   cprompt        IN       VARCHAR2    DEFAULT NULL,
   curl           IN       VARCHAR2    DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–52 ISINDEX Function Parameters

Parameter	Description
cprompt	The value for the PROMPT attribute.
curl	The value for the HREF attribute.

Examples

This function generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

ITALIC Function

This function generates the <I> and </I> tags which direct the browser to render the text in italics.

Syntax

```
HTF.ITALIC(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–53 ITALIC Function Parameters

Parameter	Description
ctext	The text to be rendered in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<I cattributes>ctext</I>
```

KBD Function

This function generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KEYBOARD Function.

Syntax

```
HTF.KBD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–54 KBD Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

KEYBOARD Function

This function generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KBD Function.

Syntax

```
HTF.KEYBOARD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–55 KEYBOARD Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

LINE Function

This function generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the HR Function.

Syntax

```
HTF.LINE(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–56 LINE Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

LINKREL Function

This function generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present. This is the opposite of LINKREV Function. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```
HTF.LINKREL(
   crel           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–57 LINKREL Function Parameters

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This function generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

LINKREV Function

This function generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the LINKREL Function. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```
HTF.LINKREV(
   crev           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–58 LINKREV Function Parameters

Parameter	Description
crev	The value for the REV attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This function generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

LISTHEADER Function

This function generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

Syntax

```
HTF.LISTHEADER(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–59 LISTHEADER Function Parameters

Parameter	Description
ctext	The text to place between <LH> and </LH>.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<LH cattributes>ctext</LH>
```

LISTINGCLOSE Function

This function generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Function.

Syntax

```
HTF.LISTINGCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</LISTING>
```

LISTINGOPEN Function

This function generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Function.

Syntax

```
HTF.LISTINGOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<LISTING>
```

LISTITEM Function

This function generates the <LI> tag, which indicates a list item.

Syntax

```
HTF.LISTITEM(
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cdingbat       IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–60 LISTITEM Function Parameters

Parameter	Description
ctext	The text for the list item.
cclear	The value for the CLEAR attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

MAILTO Function

This function generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTF.MAILTO(
   caddress       IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–61 MAILTO Function Parameters

Parameter	Description
caddress	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

MAPCLOSE Function

This function generates the </MAP> tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Function.

Syntax

```
HTF.MAPCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</MAP>
```

MAPOPEN Function

This function generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Function.

Syntax

```
HTF.MAPOPEN(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–62 MAPOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<MAP NAME="cname" cattributes>
```

MENULISTCLOSE Function

This function generates the </MENU> tag which ends a list that presents one line for each item. To begin a list of this kind, use the MENULISTOPEN Function. The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```
HTF.MENULISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</MENU>
```

MENULISTOPEN Function

This function generates the <MENU> tag which begins a list that presents one line for each item. To end a list of this kind, use the MENULISTCLOSE Function.The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```
HTF.MENULISTOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<MENU>
```

META Function

This function generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTF.META(
   chttp_equiv    IN       VARCHAR2,
   cname          IN       VARCHAR2,
   ccontent       IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 207–63 META Function Parameters

Parameter	Description
chttp_equiv	The value for the CHTTP_EQUIV attribute.
cname	The value for the NAME attribute.
ccontent	The value for the CONTENT attribute.

Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

NL Function

This function generates the <BR> tag which begins a new line of text. It performs the same operation as the BR Function.

Syntax

```
HTF.NL(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–64 NL Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

NOBR Function

This function generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text.

Syntax

```
HTF.NOBR(
ctext        IN        VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 207–65 NOBR Function Parameters

Parameter	Description
ctext	The text that is to be rendered on one line.

Examples

This function generates

```
<NOBR>ctext</NOBR>
```

NOFRAMESCLOSE Function

This function generates the </NOFRAMES> tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the FRAMESETOPEN Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

```
HTF.NOFRAMESCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</NOFRAMES>
```

NOFRAMESOPEN Function

This function generates the <NOFRAMES> tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the FRAMESETCLOSE Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

```
HTF.NOFRAMESOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<NOFRAMES>
```

OLISTCLOSE Function

This function generates the </OL> tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the OLISTOPEN Function. Numbered items are added using LISTITEM Function.

Syntax

```
HTF.OLISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</OL>
```

OLISTOPEN Function

This function generates the <OL> tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the OLISTCLOSE Function. Numbered items are added using LISTITEM Function.

Syntax

```
HTF.OLISTOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwrap           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–66 OLISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

PARA Function

This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the PARAGRAPH Function.

Syntax

```
HTF.PARA
  RETURN VARCHAR2;
```

Examples

This function generates

```
<P>
```

PARAGRAPH Function

You can use this function to add attributes to the <P> tag created by the PARA Function.

Syntax

```
HTF.PARAGRAPH(
   calign          IN       VARCHAR2   DEFAULT NULL,
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–67 PARAGRAPH Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

PARAM Function

This function generates the <PARAM> tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Function to begin the invocation. Use one PARAM Function for each desired name-value pair, and use APPLETCLOSE Function to end the applet invocation.

Syntax

```
HTF.PARAM(
   cname           IN       VARCHAR2
   cvalue          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 207–68 PARAM Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

Examples

This function generates

```
<PARAM NAME=cname VALUE="cvalue">
```

PLAINTEXT Function

This function generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTF.PLAINTEXT(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–69 PLAINTEXT Function Parameters

Parameter	Description
ctext	The text to be rendered in fixed-width font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

PRECLOSE Function

This function generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the PREOPEN Function.

Syntax

```
HTF.PRECLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</PRE>
```

PREOPEN Function

This function generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Function.

Syntax

```
HTF.PREOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwidth          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–70 PREOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

PRINT Functions

These functions generate the specified parameter as a string terminated with the \n newline character. The PRN Functions performs the same operation but does not terminate with a newline character.

Syntax

```
HTF.PRINT (
   cbuf      IN       VARCHAR2)
  RETURN VARCHAR2;

HTF.PRINT (
   dbuf      IN       DATE)
  RETURN VARCHAR2;

HTF.PRINT (
   nbuf      IN       NUMBER)
  RETURN VARCHAR2;
```

Parameters

Table 207–71 PRINT Function Parameters

Parameter	Description
cbuf	The string to generate terminated by a newline.
dbuf	The string to generate terminated by a newline.
nbuf	The string to generate terminated by a newline.

Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These functions do not have function equivalents.

PRN Functions

These functions generate the specified parameter as a string. Unlike the PRINT Functions the string is not terminated with the \n newline character.

Syntax

```
HTF.PRN (
   cbuf       IN       VARCHAR2)
  RETURN VARCHAR2;

HTF.PRN (
   dbuf       IN       DATE)
  RETURN VARCHAR2;

HTF.PRN (
   nbuf       IN       NUMBER)
  RETURN VARCHAR2;
```

Parameters

Table 207–72 PRN Function Parameters

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

Usage Notes

These functions do not have function equivalents.

S Function

This function generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as STRIKE Function.

Syntax

```
HTF.S (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–73 S Function Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<S cattributes>ctext</S>
```

SAMPLE Function

This function generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTF.SAMPLE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–74 SAMPLE Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SAMP cattributes>ctext</SAMP>
```

SCRIPT Function

This function generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTF.SCRIPT (
   cscript        IN       VARCHAR2,
   clanguage      IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–75 SCRIPT Function Parameters

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

Examples

This function generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTF.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

SMALL Function

This function generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTF.SMALL (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–76 SMALL Function Parameters

Parameter	Description
ctext	The text to be rendered in small font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SMALL cattributes>ctext</SMALL>
```

STRIKE Function

This function generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as S Function.

Syntax

```
STRIKE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–77 STRIKE Function Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```

STRONG Function

This function generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined.

Syntax

```
HTF.STRONG(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–78 STRONG Function Parameters

Parameter	Description
ctext	The text to be emphasized.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<STRONG cattributes>ctext</STRONG>
```

STYLE Function

This function generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page. You can get more information about style sheets at http://www.w3.org. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTF.STYLE(
   cstyle          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 207–79 STYLE Function Parameters

Parameter	Description
cstyle	The the style information to include.

Examples

This function generates

```
<STYLE>cstyle</STYLE>
```

SUB Function

This function generates the _{and} tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTF.SUB(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–80 SUB Function Parameters

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

SUP Function

This function generates the ^{and} tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTF.SUP(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–81 SUP Function Parameters

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

TABLECAPTION Function

This function generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table.

Syntax

```
HTF.TABLECAPTION(
   ccaption       IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–82 TABLECAPTION Function Parameters

Parameter	Description
ctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

TABLECLOSE Function

This function generates the </TABLE> tag which marks the end of an HTML table. To define the beginning of an HTML table, use the TABLEOPEN Function on page 207-127.

Syntax

```
HTF.TABLECLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

TABLEDATA Function

This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```
HTF.TABLEDATA(
   cvalue          IN       VARCHAR2   DEFAULT NULL,
   calign          IN       VARCHAR2   DEFAULT NULL,
   cdp             IN       VARCHAR2   DEFAULT NULL,
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   crowspan        IN       VARCHAR2   DEFAULT NULL,
   ccolspan        IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–83 TABLEDATA Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

TABLEHEADER Function

This function generates the <TH> and </TH> tags which insert a header cell in an HTML table. The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTF.TABLEHEADER(
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   crowspan       IN       VARCHAR2   DEFAULT NULL,
   ccolspan       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–84 TABLEHEADER Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the TABLECLOSE Function.

Syntax

```
HTF.TABLEOPEN(
   cborder        IN       VARCHAR2   DEFAULT NULL
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–85 TABLEOPEN Function Parameters

Parameter	Description
border	The value for the BORDER attribute.
calign	The value for the ALIGN attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

TABLEROWCLOSE Function

This function generates the </TR> tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the TABLEROWOPEN Function.

Syntax

```
HTF.TABLEROWCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

TABLEROWOPEN Function

This function generates the <TR> tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the TABLEROWCLOSE Function.

Syntax

```
HTF.TABLEROWOPEN(
   calign          IN       VARCHAR2   DEFAULT NULL,
   cvalign         IN       VARCHAR2   DEFAULT NULL,
   cdp             IN       VARCHAR2   DEFAULT NULL,
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–86 TABLEROWOPEN Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cvalign	The value for the VALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

TELETYPE Function

This function generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTF.TELETYPE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–87 TELETYPE Function Parameters

Parameter	Description
ctext	The text to render in a fixed width typewriter font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TT cattributes>ctext</TT>
```

TITLE Function

This function generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTF.TITLE(
   ctitle          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 207–88 TITLE Function Parameters

Parameter	Description
ctitle	The text to display in the titlebar of the browser window.

Examples

This function generates

```
<TITLE>ctitle</TITLE>
```

ULISTCLOSE Function

This function generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the ULISTOPEN Function. Add list items with LISTITEM Function.

Syntax

```
HTF.ULISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</UL>
```

ULISTOPEN Function

This function generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the ULISTCLOSE Function. Add list items with LISTITEM Function.

Syntax

```
HTF.ULISTOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwrap           IN       VARCHAR2   DEFAULT NULL,
   cdingbat        IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–89 ULISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

UNDERLINE Function

This function generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTF.UNDERLINE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–90 UNDERLINE Function Parameters

Parameter	Description
ctext	The text to render with an underline.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<U cattributes>ctext</U>
```

VARIABLE Function

This function generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTF.VARIABLE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 207–91 VARIABLE Function Parameters

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<VAR cattributes>ctext</VAR>
```

WBR Function

This function generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTF.WBR
  RETURN VARCHAR2;
```

Examples

This function generates

```
<WBR>
```

208

HTP

The HTP (hypertext procedures) and HTF (hypertext functions) packages generate HTML tags. For example, the HTP.ANCHOR procedure generates the HTML anchor tag, <A>.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

Using HTP

Operational Notes

For every HTP procedure that generates one or more HTML tags, there is a corresponding HTF function with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is a ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.
- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTP.`PRINT` procedure. It then prints its parameters to the generated Web page.

Rules and Limits

If you use values of the LONG datatype in procedures such as HTP.PRINT, HTP.PRN, HTP.PRINTS, HTP.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 datatype in the procedure.

Examples

The following commands generate a simple HTML document:

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
    HTP.HTMLOPEN;           -- generates <HTML>
    HTP.HEADOPEN;           -- generates <HEAD>
    HTP.TITLE('Hello');     -- generates <TITLE>Hello</TITLE>
    HTP.HEADCLOSE;          -- generates </HEAD>
    HTP.BODYOPEN;           -- generates <BODY>
    HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
    HTP.BODYCLOSE;          -- generates </BODY>
    HTP.HTMLCLOSE;          -- generates </HTML>
END;
```

Summary of Tags

HTML, HEAD, and BODY Tags

HTMLOPEN Procedure, HTMLCLOSE Procedure - generate <HTML> and </HTML>

HEADOPEN Procedure, HEADCLOSE Procedure - generate <HEAD> and </HEAD>

BODYOPEN Procedure, BODYCLOSE Procedure - generate <BODY> and </BODY>

Comment Tag

COMMENT Procedure - generates <!-- and -->

Tags in the <HEAD> Area

BASE Procedure - generates <BASE>

LINKREL Procedure - generates <LINK> with the REL attribute

LINKREV Procedure - generates <LINK> with the REV attribute

TITLE Procedure - generates <TITLE>

META Procedure - generates <META>

SCRIPT Procedure - generates <SCRIPT>

STYLE Procedure - generates <STYLE>

ISINDEX Procedure - generates <ISINDEX>

Applet Tags

APPLETOPEN Procedure, APPLETCLOSE Procedure - generate <APPLET> and </APPLET>

PARAM Procedure - generates <PARAM>

List Tags

OLISTOPEN Procedure, OLISTCLOSE Procedure - generate <OL> and </OL>

ULISTOPEN Procedure, ULISTCLOSE Procedure - generate <UL> and </UL>

DLISTOPEN Procedure, DLISTCLOSE Procedure- generate <DL> and </DL>

DLISTTERM Procedure - generates <DT>

DLISTDEF Procedure - generates <DD>

DIRLISTOPEN Procedure, DIRLISTCLOSE Procedure - generate <DIR> and </DIR>

LISTHEADER Procedure - generates <LH>

LISTINGOPEN Procedure, LISTINGCLOSE Procedure - generate <LISTING> and </LISTING>

MENULISTOPEN Procedure - generate <MENU> and </MENU>

LISTITEM Procedure - generates <LI>

Form Tags

FORMOPEN Procedure, FORMCLOSE Procedure - generate <FORM> and </FORM>

FORMCHECKBOX Procedure - generates <INPUT TYPE="CHECKBOX">

FORMHIDDEN Procedure - generates <INPUT TYPE="HIDDEN">

FORMIMAGE Procedure - generates <INPUT TYPE="IMAGE">

FORMPASSWORD Procedure - generates <INPUT TYPE="PASSWORD">

FORMRADIO Procedure - generates <INPUT TYPE="RADIO">

FORMSELECTOPEN Procedure, FORMSELECTCLOSE Procedure - generate <SELECT> and </SELECT>

FORMSELECTOPTION Procedure - generates <OPTION>

FORMTEXT Procedure - generates <INPUT TYPE="TEXT">

FORMTEXTAREA Procedure - generate <TEXTAREA>

FORMTEXTAREAOPEN Procedure, FORMTEXTAREACLOSE Procedure - generate <TEXTAREA> and </TEXTAREA>

FORMRESET Procedure - generates <INPUT TYPE="RESET">

FORMSUBMIT Procedure - generates <INPUT TYPE="SUBMIT">

Table Tags

TABLEOPEN Procedure, TABLECLOSE Procedure - generate <TABLE> and </TABLE>

TABLECAPTION Procedure - generates <CAPTION>

TABLEROWOPEN Procedure, TABLEROWCLOSE Procedure - generate <TR> and </TR>

TABLEHEADER Procedure - generates <TH>

TABLEDATA Procedure - generates <TD>

IMG, HR, and A Tags

HR Procedure, LINE Procedure - generate <HR>

IMG Procedure, IMG2 Procedure - generate <IMG>

ANCHOR Procedure, ANCHOR2 Procedure - generate <A>

MAPOPEN Procedure, MAPCLOSE Procedure - generate <MAP> and </MAP>

Paragraph Formatting Tags

HEADER Procedure - generates heading tags (<H1> to <H6>)

PARA Procedure, PARAGRAPH Procedure - generate <P>

PRN Procedures, PRINT Procedures - generate any text that is passed in

PRINTS Procedure, PS Procedure - generate any text that is passed in; special characters in HTML are escaped

PREOPEN Procedure, PRECLOSE Procedure - generate <PRE> and </PRE>

BLOCKQUOTEOPEN Procedure, BLOCKQUOTECLOSE Procedure - generate <BLOCKQUOTE> and </BLOCKQUOTE>

DIV Procedure - generates <DIV>

NL Procedure, BR Procedure - generate

NOBR Procedure - generates <NOBR>

WBR Procedure - generates <WBR>

PLAINTEXT Procedure - generates <PLAINTEXT>

ADDRESS Procedure - generates <ADDRESS>

MAILTO Procedure - generates <A> with the MAILTO attribute

AREA Procedure - generates <AREA>

BGSOUND Procedure - generates <BGSOUND>

Character Formatting Tags

BASEFONT Procedure - generates <BASEFONT>

BIG Procedure - generates <BIG>

BOLD Procedure - generates <B>

CENTER Procedure - generates <CENTER> and </CENTER>

CENTEROPEN Procedure, CENTERCLOSE Procedure - generate <CENTER> and </CENTER>

CITE Procedure - generates <CITE>

CODE Procedure - generates <CODE>

DFN Procedure - generates <DFN>

EM Procedure, EMPHASIS Procedure - generate <EM>

FONTOPEN Procedure, FONTCLOSE Procedure - generate <FONT> and </FONT>

ITALIC Procedure - generates <I>

KBD Procedure, KEYBOARD Procedure - generate <KBD> and </KBD>

S Procedure - generates <S>

SAMPLE Procedure - generates <SAMP>

SMALL Procedure - generates <SMALL>

STRIKE Procedure - generates <STRIKE>

STRONG Procedure - generates <STRONG>

SUB Procedure - generates <SUB>

SUP Procedure - generates <SUP>

TELETYPE Procedure - generates <TT>

UNDERLINE Procedure - generates <U>

VARIABLE Procedure - generates <VAR>

Frame Tags

FRAME Procedure - generates <FRAME>

FRAMESETOPEN Procedure, FRAMESETCLOSE Procedure - generate <FRAMESET> and </FRAMESET>

NOFRAMESOPEN Procedure, NOFRAMESCLOSE Procedure - generate <NOFRAMES> and </NOFRAMES>

Summary of HTP Subprograms

Table 208–1 HTP Package Subprograms

Subprogram	Description
ADDRESS Procedure on page 208-15	Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document
ANCHOR Procedure on page 208-16	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
ANCHOR2 Procedure on page 208-17	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
APPLETCLOSE Procedure on page 208-18	Closes the applet invocation with the </APPLET> tag
APPLETOPEN Procedure on page 208-19	Generates the <APPLET> tag which begins the invocation of a Java applet
AREA Procedure on page 208-20	Generates the <AREA> tag, which defines a client-side image map
BASE Procedure on page 208-21	Generates the <BASE> tag which records the URL of the document
BASEFONT Procedure on page 208-22	Generates the <BASEFONT> tag which specifies the base font size for a Web page
BGSOUND Procedure on page 208-23	Generates the <BGSOUND> tag which includes audio for a Web page
BIG Procedure on page 208-24	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
BLOCKQUOTECLOSE Procedure on page 208-25	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
BLOCKQUOTEOPEN Procedure on page 208-26	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
BODYCLOSE Procedure on page 208-27	Generates the </BODY> tag which marks the end of a body section of an HTML document
BODYOPEN Procedure on page 208-28	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
BOLD Procedure on page 208-29	Generates the <B> and </B> tags which direct the browser to display the text in boldface
BR Procedure on page 208-30	Generates the tag which begins a new line of text
CENTER Procedure on page 208-31	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page
CENTERCLOSE Procedure on page 208-32	Generates the </CENTER> tag which marks the end of a section of text to center
CENTEROPEN Procedure on page 208-33	Generates the <CENTER> tag which mark the beginning of a section of text to center
CITE Procedure on page 208-34	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
CODE Procedure on page 208-35	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically

Table 208–1 (Cont.) HTP Package Subprograms

Subprogram	Description
COMMENT Procedure on page 208-36	Generates procedure generates the comment tags <!-- ctext -->
DFN Procedure on page 208-37	Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
DIRLISTCLOSE Procedure on page 208-38	Generates the </DIR> tag which ends a directory list section
DIRLISTOPEN Procedure on page 208-39	Generates the <DIR> which starts a directory list section
DIV Procedure on page 208-40	Generates the <DIV> tag which creates document divisions
DLISTCLOSE Procedure on page 208-41	Generates the </DL> tag which ends a definition list
DLISTDEF Procedure on page 208-42	Generates the <DD> tag, which inserts definitions of terms
DLISTOPEN Procedure on page 208-43	Generates the <DL> tag which starts a definition list
DLISTTERM Procedure on page 208-44	Generates the <DT> tag which defines a term in a definition list <DL>
EM Procedure on page 208-45	Generates the <EM> and </EM> tags, which define text to be emphasized
EMPHASIS Procedure on page 208-46	Generates the <EM> and </EM> tags, which define text to be emphasized
ESCAPE_SC Procedure on page 208-47	Replaces characters that have special meaning in HTML with their escape sequences
FONTCLOSE Procedure on page 208-48	Generates the </FONT> tag which marks the end of a section of text with the specified font characteristics
FONTOPEN Procedure on page 208-49	Generates the <FONT> which marks the beginning of section of text with the specified font characteristics
FORMCHECKBOX Procedure on page 208-50	Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form
FORMCLOSE Procedure on page 208-51	Generates the </FORM> tag which marks the end of a form section in an HTML document
FORMOPEN Procedure on page 208-52	Generates the <FORM> tag which marks the beginning of a form section in an HTML document
FORMFILE Procedure on page 208-53	Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page
FORMHIDDEN Procedure on page 208-54	Generates the <INPUT> tag with TYPE="hidden"which inserts a hidden form element
FORMIMAGE Procedure on page 208-55	Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately
FORMPASSWORD Procedure on page 208-56	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
FORMRADIO Procedure on page 208-57	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form

Table 208–1 (Cont.) HTP Package Subprograms

Subprogram	Description
FORMRESET Procedure on page 208-58	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
FORMSELECTCLOSE Procedure on page 208-59	Generates the </SELECT> tag which marks the end of a Select form element
FORMSELECTOPEN Procedure on page 208-60	Generates the </SELECT> tag which marks the beginning of a Select form element
FORMSELECTOPTION Procedure on page 208-61	Generates the <OPTION> tag which represents one choice in a Select element
FORMSUBMIT Procedure on page 208-62	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
FORMTEXT Procedure on page 208-63	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
FORMTEXTAREA Procedure on page 208-64	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
FORMTEXTAREA2 Procedure on page 208-65	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
FORMTEXTAREACLOSE Procedure on page 208-66	Generates the </TEXTAREA> tag which ends a text area form element
FORMTEXTAREAOPEN Procedure on page 208-67	Generates the <TEXTAREA> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Procedure on page 208-68	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Procedure on page 208-69	Generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag
FRAMESETCLOSE Procedure on page 208-70	Generates the </FRAMESET> tag which ends a frameset section
FRAMESETOPEN Procedure on page 208-71	Generates the </FRAMESET> tag which begins a frameset section
HEADCLOSE Procedure on page 208-72	Generates the </HEAD> tag which marks the end of an HTML document head section
HEADER Procedure on page 208-73	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
HEADOPEN Procedure on page 208-74	Generates the <HEAD> tag which marks the beginning of the HTML document head section
HR Procedure on page 208-75	Generates the <HR> tag, which generates a line in the HTML document
HTMLCLOSE Procedure on page 208-76	Generates the </HTML> tag which marks the end of an HTML document
HTMLOPEN Procedure on page 208-77	Generates the <HTML> tag which marks the beginning of an HTML document
IMG Procedure on page 208-78	Generates the <IMG> tag which directs the browser to load an image onto the HTML page
IMG2 Procedure on page 208-79	Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute

Table 208–1 (Cont.) HTP Package Subprograms

Subprogram	Description
ISINDEX Procedure on page 208-80	Creates a single entry field with a prompting text, such as "*enter value*," then sends that value to the URL of the page or program
ITALIC Procedure on page 208-81	Generates the <I> and </I> tags which direct the browser to render the text in italics
KBD Procedure on page 208-82	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
KEYBOARD Procedure on page 208-83	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
LINE Procedure on page 208-84	Generates the <HR> tag, which generates a line in the HTML document
LINKREL Procedure on page 208-85	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
LINKREV Procedure on page 208-86	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
LISTHEADER Procedure on page 208-87	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
LISTINGCLOSE Procedure on page 208-88	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
LISTINGOPEN Procedure on page 208-89	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
LISTITEM Procedure on page 208-90	Generates the <LI> tag, which indicates a list item
MAILTO Procedure on page 208-91	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
MAPCLOSE Procedure on page 208-92	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
MAPOPEN Procedure on page 208-93	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
MENULISTCLOSE Procedure on page 208-94	Generates the </MENU> tag which ends a list that presents one line for each item
MENULISTOPEN Procedure on page 208-95	Generates the <MENU> tag which begins a list that presents one line for each item
META Procedure on page 208-96	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers
NL Procedure on page 208-97	Generates the tag which begins a new line of text
NOBR Procedure on page 208-98	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
NOFRAMESCLOSE Procedure on page 208-99	Generates the </NOFRAMES> tag which marks the end of a no-frames section
NOFRAMESOPEN Procedure on page 208-100	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
OLISTCLOSE Procedure on page 208-101	Generates the </OL> tag which defines the end of an ordered list

Table 208–1 (Cont.) HTP Package Subprograms

Subprogram	Description
OLISTOPEN Procedure on page 208-102	Generates the <OL> tag which marks the beginning of an ordered list
PARA Procedure on page 208-103	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
PARAGRAPH Procedure on page 208-104	Adds attributes to the <P> tag
PARAM Procedure on page 208-105	Generates the <PARAM> tag which specifies parameter values for Java applets
PLAINTEXT Procedure on page 208-106	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
PRECLOSE Procedure on page 208-107	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
PREOPEN Procedure on page 208-108	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
PRINT Procedures on page 208-109	Generates the specified parameter as a string terminated with the \n newline character
PRINTS Procedure on page 208-110	Generates a string and replaces the following characters with the corresponding escape sequence
PRN Procedures on page 208-111	Generates the specified parameter as a string
PS Procedure on page 208-112	Generates a string and replaces the following characters with the corresponding escape sequence.
S Procedure on page 208-113	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
SAMPLE Procedure on page 208-114	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
SCRIPT Procedure on page 208-115	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
SMALL Procedure on page 208-116	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font
STRIKE Procedure on page 208-117	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
STRONG Procedure on page 208-118	Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
STYLE Procedure on page 208-119	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page
SUB Procedure on page 208-120	Generates the _{and} tags which direct the browser to render the text they surround as subscript
SUP Procedure on page 208-121	Generates the ^{and} tags which direct the browser to render the text they surround as superscript
TABLECAPTION Procedure on page 208-122	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
TABLECLOSE Procedure on page 208-123	Generates the </TABLE> tag which marks the end of an HTML table

Table 208–1 (Cont.) HTP Package Subprograms

Subprogram	Description
TABLEDATA Procedure on page 208-124	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
TABLEHEADER Procedure on page 208-125	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
TABLEOPEN Procedure on page 208-126	Generates the <TABLE> tag which marks the beginning of an HTML table
TABLEROWCLOSE Procedure on page 208-127	Generates the </TR> tag which marks the end of a new row in an HTML table
TABLEROWOPEN Procedure on page 208-128	Generates the <TR> tag which marks the beginning of a new row in an HTML table
TELETYPE Procedure on page 208-129	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
TITLE Procedure on page 208-130	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
ULISTCLOSE Procedure on page 208-131	Generates the </UL> tag which marks the end of an unordered list
ULISTOPEN Procedure on page 208-132	Generates the <UL> tag which marks the beginning of an unordered list
UNDERLINE Procedure on page 208-133	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
VARIABLE Procedure on page 208-134	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
WBR Procedure on page 208-135	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

ADDRESS Procedure

This procedure generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTP.ADDRESS (
   cvalue          IN       VARCHAR2
   cnowrap         IN       VARCHAR2   DEFAULT NULL
   cclear          IN       VARCHAR2   DEFAULT NULL
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–2 ADDRESS Procedure Parameters

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

<ADDRESS CLEAR="*cclear*" NOWRAP *cattributes*>*cvalue*</ADDRESS>

ANCHOR Procedure

This procedure and the ANCHOR2 Procedure procedures generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the ANCHOR2 Procedure provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–3 ANCHOR Procedure Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

ANCHOR2 Procedure

This procedure and the ANCHOR Procedure generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this procedures provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR2 (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   ctarget        in       varchar2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–4 ANCHOR2 Procedure Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

APPLETCLOSE Procedure

This procedure closes the applet invocation with the `</APPLET>` tag. You must first invoke the a Java applet using APPLETOPEN Procedure.

Syntax

```
HTP.APPLETCLOSE;
```

APPLETOPEN Procedure

This procedure generates the <APPLET> tag which begins the invocation of a Java applet. You close the applet invocation with APPLETCLOSE Procedure which generates the </APPLET> tag.

Syntax

```
HTP.APPLETOPEN (
   ccode          IN       VARCHAR2,
   cheight        IN       NUMBER,
   cwidth         IN       NUMBER,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–5 APPLETOPEN Procedure Parameters

Parameter	Description
ccode	The the value for the CODE attribute which specifies the name of the applet class.
cheight	The value for the HEIGHT attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTP.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the PARAM Procedure.
- Use the cattributes parameter to specify the CODEBASE attribute since the PL/SQL cartridge does not know where to find the class files. The CODEBASE attribute specifies the virtual path containing the class files.

AREA Procedure

This procedure generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

Syntax

```
HTP.AREA (
   ccoords        IN       VARCHAR2
   cshape         IN       VARCHAR2   DEFAULT NULL,
   chref          IN       VARCHAR2   DEFAULT NULL,
   cnohref        IN       VARCHAR2   DEFAULT NULL,
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–6 AREA Procedure Parameters

Parameter	Description
ccords	The the value for the COORDS attribute.
cshape	The value for the SHAPE attribute.
chref	The value for the HREF attribute.
cnohref	If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget"
cattributes>
```

BASE Procedure

This procedure generates the <BASE> tag which records the URL of the document.

Syntax

```
HTP.BASE (
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–7 BASE Procedure Parameters

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

BASEFONT Procedure

This procedure generates the <BASEFONT> tag which specifies the base font size for a Web page.

Syntax

```
HTP.BASEFONT (
   nsize    IN    INTEGER);
```

Parameters

Table 208–8 BASEFONT Procedure Parameters

Parameter	Description
nsize	The value for the SIZE attribute.

Examples

This procedure generates

```
<BASEFONT SIZE="nsize">
```

BGSOUND Procedure

This procedure generates the <BGSOUND> tag which includes audio for a Web page.

Syntax

```
HTP.BGSOUND (
   csrc           IN       VARCHAR2,
   cloop          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–9 BGSOUND Procedure Parameters

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

<BGSOUND SRC="*csrc*" LOOP="*cloop*" *cattributes*>

BIG Procedure

This procedure generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```
HTP.BIG (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–10 BIG Procedure Parameters

Parameter	Description
ctext	The the text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BIG cattributes>ctext</BIG>
```

BLOCKQUOTECLOSE Procedure

This procedure generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the BLOCKQUOTEOPEN Procedure.

Syntax

```
HTP.BLOCKQUOTECLOSE;
```

Examples

This procedure generates

```
</BLOCKQUOTE>
```

BLOCKQUOTEOPEN Procedure

This procedure generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the BLOCKQUOTECLOSE Procedure.

Syntax

```
HTP.BLOCKQUOTEOPEN (
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–11 BLOCKQUOTEOPEN Procedure Parameters

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

BODYCLOSE Procedure

This procedure generates the </BODY> tag which marks the end of a body section of an HTML document.You mark the beginning of a body section by means of the BODYOPEN Procedure.

Syntax

```
HTP.BODYCLOSE;
```

Examples

This procedure generates

```
</BODY>
```

BODYOPEN Procedure

This procedure generates the <BODY> tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the BODYCLOSE Procedure.

Syntax

```
HTP.BODYOPEN (
   cbackground    IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–12 BODYOPEN Procedure Parameters

Parameter	Description
cbackground	The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTP.BODYOPEN('/img/background.gif');
```

generates:

```
<BODY background="/img/background.gif">
```

BOLD Procedure

This procedure generates the <B> and </B> tags which direct the browser to display the text in boldface.

Syntax

```
HTP.BOLD (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–13 BOLD Procedure Parameters

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

<B *cattributes*>*ctext*</B>

BR Procedure

This procedure generates the <BR> tag which begins a new line of text. It performs the same operation as the NL Procedure.

Syntax

```
HTP.BR(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–14 BR Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

CENTER Procedure

This procedure generates the <CENTER> and </CENTER> tags which center a section of text within a Web page.

Syntax

```
HTP.CENTER (
   ctext          IN       VARCHAR2);
```

Parameters

Table 208–15 CENTER Parameters

Parameter	Description
ctext	The text that goes between the tags.

Examples

This procedure generates

```
<CENTER>ctext</CENTER>
```

CENTERCLOSE Procedure

This procedure generates the </CENTER> tag which marks the end of a section of text to center. You mark the beginning of a of a section of text to center by means of the CENTEROPEN Procedure.

Syntax

```
HTP.CENTERCLOSE;
```

Examples

This procedure generates

```
</CENTER>
```

CENTEROPEN Procedure

This procedure generates the <CENTER> tag which mark the beginning of a section of text to center.You mark the beginning of a of a section of text to center by means of the CENTERCLOSE Procedure.

Syntax

```
HTP.CENTEROPEN;
```

Examples

This procedure generates

```
<CENTER>
```

CITE Procedure

This procedure generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation.

Syntax

```
HTP.CITE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–16 CITE Procedure Parameters

Parameter	Description
ctext	The text to render as citation.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<CITE cattributes>ctext</CITE>
```

CODE Procedure

This procedure generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTP.CODE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–17 CODE Procedure Parameters

Parameter	Description
ctext	The text to render as code.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

<CODE *cattributes*>*ctext*</CODE>

COMMENT Procedure

This procedure generates the comment tags.

Syntax

```
HTP.COMMENT (
   ctext           IN       VARCHAR2);
```

Parameters

Table 208–18 COMMENT Procedure Parameters

Parameter	Description
ctext	The comment.

Examples

This procedure generates

```
<!-- ctext -->
```

DFN Procedure

This procedure generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTP.DFN (
   ctext          IN       VARCHAR2);
```

Parameters

Table 208–19 DFN Procedure Parameters

Parameter	Description
ctext	The text to render in italics.

Examples

This procedure generates

```
<DFN>ctext</DFN>
```

DIRLISTCLOSE Procedure

This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

Syntax

```
HTP.DIRLISTCLOSE;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Procedure so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

```
</DIR>
```

DIRLISTOPEN Procedure

This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

Syntax

```
HTP.DIRLISTOPEN;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Procedure so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

```
<DIR>
```

DIV Procedure

This procedure generates the <DIV> tag which creates document divisions.

Syntax

```
HTP.DIV (
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–20 DIV Procedure Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DIV ALIGN="calign" cattributes>
```

DLISTCLOSE Procedure

This procedure generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Procedure.

Syntax

```
HTP.DLISTCLOSE;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

Examples

This procedure generates

```
</DL>
```

DLISTDEF Procedure

This procedure generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

Syntax

```
HTP.DLISTDEF (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–21 DLISTDEF Procedure Parameters

Parameter	Description
ctext	The definition of the term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DD CLEAR="cclear" cattributes>ctext
```

DLISTOPEN Procedure

This procedure generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Procedure.

Syntax

```
HTP.DLISTOPEN (
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–22 DLISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

Examples

This procedure generates

```
<DL CLEAR="cclear" cattributes>
```

DLISTTERM Procedure

This procedure generates the <DT> tag which defines a term in a definition list <DL>.

Syntax

```
HTP.DLISTTERM (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–23 DLISTTERM Procedure Parameters

Parameter	Description
ctext	The term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DT CLEAR="cclear" cattributes>ctext
```

EM Procedure

This procedure generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the EMPHASIS Procedure.

Syntax

```
HTP.EM(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–24 EM Procedure Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<EM cattributes>ctext</EM>
```

EMPHASIS Procedure

This procedure generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the EM Procedure.

Syntax

```
HTP.EMPHASIS(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–25 EMPHASIS Procedure Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<EM cattributes>ctext</EM>
```

ESCAPE_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:

- `&` to `&`
- `"` to `&quot:`
- `<` to `<`
- `>` to `>`

This procedure performs the same operation as PRINTS Procedures and PS Procedure.

Syntax

```
HTP.ESCAPE_SC(
     ctext          IN       VARCHAR2);
```

Parameters

Table 208–26 ESCAPE_SC Procedure Parameters

Parameter	Description
ctext	The text string to convert.

FONTCLOSE Procedure

This procedure generates the</FONT> tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the FONTOPEN Procedure.

Syntax

```
HTP.FONTCLOSE;
```

Examples

This procedure generates

```
</FONT>
```

FONTOPEN Procedure

This procedure generates the <FONT> which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the FONTCLOSE Procedure.

Syntax

```
HTP.FONTOPEN(
   ccolor          IN       VARCHAR2   DEFAULT NULL,
   cface           IN       VARCHAR2   DEFAULT NULL,
   csize           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–27 FONTOPEN Procedure Parameters

Parameter	Description
ccolor	The value for the COLOR attribute.
cface	The value for the FACE attribute
csize	The value for the SIZE attribute
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

FORMCHECKBOX Procedure

This procedure generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

Syntax

```
HTP.FORMCHECKBOX(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT 'ON',
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–28 FORMCHECKBOX Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMCLOSE Procedure

This procedure generates the </FORM> tag which marks the end of a form section in an HTML document.You mark the beginning of the form section by means of the FORMOPEN Procedure.

Syntax

```
HTP.FORMCLOSE;
```

Examples

This procedure generates

```
</FORM>
```

FORMOPEN Procedure

This procedure generates the <FORM> tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the FORMCLOSE Procedure.

Syntax

```
HTP.FORMOPEN(
   curl           IN       VARCHAR2,
   cmethod        IN       VARCHAR2   DEFAULT 'POST',
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cenctype       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–29 FORMOPEN Procedure Parameters

Parameter	Description
curl	The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required.
cmethod	The value for the METHOD attribute. The value can be "GET" or "POST".
ctarget	The value for the TARGET attribute.
cenctype	The value for the ENCTYPE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype"
cattributes>
```

FORMFILE Procedure

This procedure generates the <INPUT> tag with TYPE="file" which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTP.FORMFILE(
   cname          IN       VARCHAR2,
   caccept        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–30 FORMFILE Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
caccept	A comma-delimited list of MIME types for upload.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

FORMHIDDEN Procedure

This procedure generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTP.FORMHIDDEN(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–31 FORMHIDDEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

FORMIMAGE Procedure

This procedure generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

Syntax

```
HTP.FORMIMAGE(
   cname          IN       VARCHAR2,
   csrc           IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–32 FORMIMAGE Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
csrc	The value for the SRC attribute that specifies the image file.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

FORMPASSWORD Procedure

This procedure generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTP.FORMPASSWORD(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–33 FORMPASSWORD Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```

FORMRADIO Procedure

This procedure generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTP.FORMRADIO(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2,
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–34 FORMRADIO Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMRESET Procedure

This procedure generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTP.FORMRESET(
   cvalue         IN       VARCHAR2   DEFAULT 'Reset',
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–35 FORMRESET Procedure Parameters

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

FORMSELECTCLOSE Procedure

This procedure generates the </SELECT> tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Procedure.The values are inserted using FORMSELECTOPTION Procedure.

Syntax

```
HTP.FORMSELECTCLOSE;
```

Examples

This procedure generates

```
</SELECT>
```

as shown under Examples of the FORMSELECTOPEN Procedure.

FORMSELECTOPEN Procedure

This procedure generates the <SELECT> tags which creates a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Procedure.The values are inserted using FORMSELECTOPTION Procedure.

Syntax

```
FORMSELECTOPEN(
   cname          IN       VARCHAR2,
   cprompt        IN       VARCHAR2   DEFAULT NULL,
   nsize          IN       INTEGER    DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–36 FORMSELECTOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTP.FORMSELECTOPEN('greatest_player';
    'Pick the greatest player:');
HTP.FORMSELECTOPTION('Messier');
HTP.FORMSELECTOPTION('Howe');
HTP.FORMSELECTOPTION('Gretzky');.
HTP.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

FORMSELECTOPTION Procedure

This procedure generates the <OPTION> tag which represents one choice in a Select element.

Syntax

```
HTP.FORMSELECTOPTION(
   cvalue          IN       VARCHAR2,
   cselected       IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–37 FORMSELECTOPTION Procedure Parameters

Parameter	Description
cvalue	The text for the option.
cvalue	If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the FORMSELECTOPEN Procedure.

FORMSUBMIT Procedure

This procedure generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form. If the button has a NAME attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTP.FORMSUBMIT(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cvalue        IN       VARCHAR2   DEFAULT 'Submit',
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–38 FORMSUBMIT Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

FORMTEXT Procedure

This procedure generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text.

Syntax

```
HTP.FORMTEXT(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2   DEFAULT NULL,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–39 FORMTEXT Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue"
cattributes>
```

FORMTEXTAREA Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA2 Procedure which in addition has the cwrap parameter that lets you specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign      , IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–40 FORMTEXTAREA Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"
cattributes></TEXTAREA>
```

FORMTEXTAREA2 Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.The same operation is performed by the FORMTEXTAREA Procedure except that in that case you cannot specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–41 FORMTEXTAREA2 Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

FORMTEXTAREACLOSE Procedure

This procedure generates the </TEXTAREA> tag which ends a text area form element. You open a text area element by means of eitherFORMTEXTAREAOPEN Procedure or FORMTEXTAREAOPEN2 Procedure.

Syntax

```
HTP.FORMTEXTAREACLOSE;
```

Examples

This procedure generates

```
</TEXTAREA>
```

FORMTEXTAREAOPEN Procedure

This procedure generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN2 Procedure which in addition has the cwrap parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

```
HTP.FORMTEXTAREAOPEN(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–42 FORMTEXTAREAOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

FORMTEXTAREAOPEN2 Procedure

This procedure generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN Procedure except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

```
HTP.FORMTEXTAREAOPEN2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–43 FORMTEXTAREAOPEN2 Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

FRAME Procedure

This procedure generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```
HTP.FRAME(
   csrc           IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cmarginwidth   IN       VARCHAR2   DEFAULT NULL,
   cmarginheight  IN       VARCHAR2   DEFAULT NULL,
   cscrolling     IN       VARCHAR2   DEFAULT NULL,
   cnoresize      IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–44 FRAME Procedure Parameters

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

FRAMESETCLOSE Procedure

This procedure generates the </FRAMESET> tag which ends a frameset section. You mark the beginning of a frameset section by means of the FRAMESETOPEN Procedure.

Syntax

```
HTP.FRAMESETCLOSE;
```

Examples

This procedure generates

```
</FRAMESET>
```

FRAMESETOPEN Procedure

This procedure generates the <FRAMESET> tag which define a frameset section. You mark the end of a frameset section by means of the FRAMESETCLOSE Procedure.

Syntax

```
HTP.FRAMESETOPEN(
   crows          IN       VARCHAR2   DEFAULT NULL,
   ccols          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–45 FRAMESETOPEN Procedure Parameters

Parameter	Description
crows	The value for the ROWS attribute.
ccols	The value for the COLS attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

HEADCLOSE Procedure

This procedure generates the </HEAD> tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the HEADOPEN Procedure.

Syntax

```
HTP.HEADCLOSE;
```

Examples

This procedure generates

```
</HEAD>
```

HEADER Procedure

This procedure generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

Syntax

```
HTP.HEADER(
   nsize          IN       INTEGER,
   cheader        IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–46 HEADER Procedure Parameters

Parameter	Description
nsize	The the heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

```
HTP.header (1,'Overview');
```

produces:

```
<H1>Overview</H1>
```

HEADOPEN Procedure

This procedure generates the <HEAD> tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the HEADCLOSE Procedure.

Syntax

```
HTP.HEADOPEN;
```

Examples

This procedure generates

```
<HEAD>
```

HR Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document.This subprogram performs the same operation as the LINE Procedure.

Syntax

```
HTP.HR(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–47 HR Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

HTMLCLOSE Procedure

This procedure generates the </HTML> tag which marks the end of an HTML document. You use the HTMLOPEN Procedure to mark the beginning of an HTML document.

Syntax

```
HTP.HTMLCLOSE;
```

Examples

This procedure generates

```
</HTML>
```

HTMLOPEN Procedure

This procedure generates the <HTML> tag which marks the beginning of an HTML document. You use the HTMLCLOSE Procedure to mark the end of the an HTML document.

Syntax

```
HTP.HTMLOPEN;
```

Examples

This procedure generates

```
<HTML>
```

IMG Procedure

This procedure generates the <IMG> tag which directs the browser to load an image onto the HTML page. The IMG2 Procedure performs the same operation but additionally uses the cusemap parameter.

Syntax

```
HTP.IMG(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2  DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–48 IMG Procedure Parameters

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

IMG2 Procedure

This procedure generates the <IMG> tag, which directs the browser to load an image onto the HTML page. The IMG Procedure performs the same operation but does not use the `cusemap` parameter.

Syntax

```
HTP.IMG2(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2  DEFAULT NULL,
   cusemap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–49 IMG2 Procedure Parameters

Parameter	Description
`curl`	The value for the SRC attribute.
`calign`	The value for the `ALIGN` attribute.
`calt`	The value for the `ALT` attribute which specifies alternative text to display if the browser does not support images.
`cismap`	If the value for this parameter is not `NULL`, the `ISMAP` attribute is added to the tag. The attribute indicates that the image is an imagemap.
`cusemap`	The value for the `USEMAP` attribute which specifies a client-side image map.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as "*enter value,*" then sends that value to the URL of the page or program.

Syntax

```
HTP.ISINDEX(
   cprompt        IN       VARCHAR2    DEFAULT NULL,
   curl           IN       VARCHAR2    DEFAULT NULL);
```

Parameters

Table 208–50 ISINDEX Procedure Parameters

Parameter	Description
cprompt	The value for the PROMPT attribute.
curl	The value for the HREF attribute.

Examples

This procedure generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

ITALIC Procedure

This procedure generates the <I> and </I> tags which direct the browser to render the text in italics.

Syntax

```
HTP.ITALIC(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–51 ITALIC Procedure Parameters

Parameter	Description
ctext	The text to be rendered in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<I cattributes>ctext</I>
```

KBD Procedure

This procedure generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KEYBOARD Procedure.

Syntax

```
HTP.KBD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–52 KBD Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

<KBD *cattributes*>*ctext*</KBD>

KEYBOARD Procedure

This procedure generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KBD Procedure.

Syntax

```
HTP.KEYBOARD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–53 KEYBOARD Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

<KBD *cattributes*>*ctext*</KBD>

LINE Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the HR Procedure.

Syntax

```
HTP.LINE(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–54 LINE Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

LINKREL Procedure

This procedure generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present. This is the opposite of LINKREV Procedure. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```
HTP.LINKREL(
   crel           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–55 LINKREL Procedure Parameters

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This procedure generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

LINKREV Procedure

This procedure generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the LINKREL Procedure. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```
HTP.LINKREV(
   crev           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–56 LINKREV Procedure Parameters

Parameter	Description
crel	The value for the REV attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This procedure generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

LISTHEADER Procedure

This procedure generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

Syntax

```
HTP.LISTHEADER(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–57 LISTHEADER Procedure Parameters

Parameter	Description
ctext	The text to place between <LH> and </LH>.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

<LH *cattributes*>*ctext*</LH>

LISTINGCLOSE Procedure

This procedure generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Procedure.

Syntax

```
HTP.LISTINGCLOSE;
```

Examples

This procedure generates

```
</LISTING>
```

LISTINGOPEN Procedure

This procedure generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Procedure.

Syntax

```
HTP.LISTINGOPEN;
```

Examples

This procedure generates

```
<LISTING>
```

LISTITEM Procedure

This procedure generates the <LI> tag, which indicates a list item.

Syntax

```
HTP.LISTITEM(
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cdingbat       IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–58 LISTITEM Procedure Parameters

Parameter	Description
ctext	The text for the list item.
cclear	The value for the CLEAR attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

MAILTO Procedure

This procedure generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTP.MAILTO(
   caddress       IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–59 MAILTO Procedure Parameters

Parameter	Description
caddress	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

MAPCLOSE Procedure

This procedure generates the </MAP> tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Procedure.

Syntax

```
HTP.MAPCLOSE;
```

Examples

This procedure generates

```
</MAP>
```

MAPOPEN Procedure

This procedure generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Procedure.

Syntax

```
HTP.MAPOPEN(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–60 MAPOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<MAP NAME="cname" cattributes>
```

MENULISTCLOSE Procedure

This procedure generates the </MENU> tag which ends a list that presents one line for each item. To begin a list of this kind, use the MENULISTOPEN Procedure. The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

```
HTP.MENULISTCLOSE;
```

Examples

This procedure generates

```
</MENU>
```

MENULISTOPEN Procedure

This procedure generates the <MENU> tag which begins a list that presents one line for each item. To end a list of this kind, use the MENULISTCLOSE Procedure.The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

```
HTP.MENULISTOPEN;
```

Examples

This procedure generates

```
<MENU>
```

META Procedure

This procedure generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTP.META(
   chttp_equiv    IN       VARCHAR2,
   cname          IN       VARCHAR2,
   ccontent       IN       VARCHAR2);
```

Parameters

Table 208–61 META Procedure Parameters

Parameter	Description
chttp_equiv	The value for the CHTTP_EQUIV attribute.
cname	The value for the NAME attribute.
ccontent	The value for the CONTENT attribute.

Examples

This procedure generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTP.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

NL Procedure

This procedure generates the <BR> tag which begins a new line of text. It performs the same operation as the BR Procedure.

Syntax

```
HTP.NL(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–62 NL Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

NOBR Procedure

This procedure generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text.

Syntax

```
HTP.NOBR(
ctext         IN        VARCHAR2);
```

Parameters

Table 208–63 NOBR Procedure Parameters

Parameter	Description
ctext	The text that is to be rendered on one line.

Examples

This procedure generates

```
<NOBR>ctext</NOBR>
```

NOFRAMESCLOSE Procedure

This procedure generates the </NOFRAMES> tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the FRAMESETOPEN Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

```
HTP.NOFRAMESCLOSE;
```

Examples

This procedure generates

```
</NOFRAMES>
```

NOFRAMESOPEN Procedure

This procedure generates the <NOFRAMES> tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the FRAMESETCLOSE Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

```
HTP.NOFRAMESOPEN;
```

Examples

This procedure generates

```
<NOFRAMES>
```

OLISTCLOSE Procedure

This procedure generates the </OL> tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the OLISTOPEN Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

```
HTP.OLISTCLOSE;
```

Examples

This procedure generates

```
</OL>
```

OLISTOPEN Procedure

This procedure generates the <OL> tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the OLISTCLOSE Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

```
HTP.OLISTOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwrap           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–64 OLISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

PARA Procedure

This procedure generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the PARAGRAPH Procedure.

Syntax

```
HTP.PARA;
```

Examples

This procedure generates

```
<P>
```

PARAGRAPH Procedure

You can use this procedure to add attributes to the <P> tag created by the PARA Procedure.

Syntax

```
HTP.PARAGRAPH(
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–65 PARAGRAPH Procedure Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

PARAM Procedure

This procedure generates the <PARAM> tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Procedure to begin the invocation. Use one PARAM Procedure for each desired name-value pair, and use APPLETCLOSE Procedure to end the applet invocation.

Syntax

```
HTP.PARAM(
   cname          IN       VARCHAR2
   cvalue         IN       VARCHAR2);
```

Parameters

Table 208–66 PARAM Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

Examples

This procedure generates

```
<PARAM NAME=cname VALUE="cvalue">
```

PLAINTEXT Procedure

This procedure generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTP.PLAINTEXT(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–67 PLAINTEXT Procedure Parameters

Parameter	Description
ctext	The text to be rendered in fixed-width font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

PRECLOSE Procedure

This procedure generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the PREOPEN Procedure.

Syntax

```
HTP.PRECLOSE;
```

Examples

This procedure generates

```
</PRE>
```

PREOPEN Procedure

This procedure generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Procedure.

Syntax

```
HTP.PREOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwidth          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–68 PREOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

PRINT Procedures

These procedures generate the specified parameter as a string terminated with the \n newline character. The PRN Procedures performs the same operation but does not terminate with a newline character.

Syntax

```
HTP.PRINT (
   cbuf      IN       VARCHAR2);

HTP.PRINT (
   dbuf      IN       DATE);

HTP.PRINT (
   nbuf      IN       NUMBER);
```

Parameters

Table 208–69 PRINT Procedure Parameters

Parameter	Description
cbuf	The string to generate terminated by a newline.
dbuf	The string to generate terminated by a newline.
nbuf	The string to generate terminated by a newline.

Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These procedures do not have function equivalents.

PRINTS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- < to <
- > to >
- " to "
- & to &

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure an the PS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PRINTS (
   ctext      IN       VARCHAR2);
```

Parameters

Table 208–70 PRINTS Procedure Parameters

Parameter	Description
ctext	The string where to perform character substitution.

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes on page 208-3 for the HTF implementation).

PRN Procedures

These procedures generate the specified parameter as a string. Unlike the PRINT Procedures the string is not terminated with the \n newline character.

Syntax

```
HTP.PRN (
   cbuf       IN       VARCHAR2);

HTP.PRN (
   dbuf       IN       DATE);

HTP.PRN (
   nbuf       IN       NUMBER);
```

Parameters

Table 208–71 PRN Procedure Parameters

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

Usage Notes

These procedures do not have function equivalents.

PS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- < to <
- > to >
- " to "
- & to &

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the PRINTS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PS (
   ctext      IN       VARCHAR2);
```

Parameters

Table 208–72 PS Procedure Parameters

Parameter	Description
ctext	The string where to perform character substitution.

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes on page 208-3 for the HTF implementation).

S Procedure

This procedure generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as STRIKE Procedure.

Syntax

```
HTP.S (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–73 S Procedure Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<S cattributes>ctext</S>
```

SAMPLE Procedure

This procedure generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTP.SAMPLE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–74 SAMPLE Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SAMP cattributes>ctext</SAMP>
```

SCRIPT Procedure

This procedure generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTP.SCRIPT (
   cscript        IN       VARCHAR2,
   clanguage      IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–75 SCRIPT Procedure Parameters

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

Examples

This procedure generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

SMALL Procedure

This procedure generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTP.SMALL (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–76 SMALL Procedure Parameters

Parameter	Description
ctext	The text to be rendered in small font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

<SMALL *cattributes*>*ctext*</SMALL>

STRIKE Procedure

This procedure generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as S Procedure.

Syntax

```
HTP.STRIKE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–77 STRIKE Procedure Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

<STRIKE *cattributes*>*ctext*</STRIKE>

STRONG Procedure

This procedure generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined.

Syntax

```
HTP.STRONG(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–78 STRONG Procedure Parameters

Parameter	Description
ctext	The text to be emphasized.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

<STRONG *cattributes*>*ctext*</STRONG>

STYLE Procedure

This procedure generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page. You can get more information about style sheets at http://www.w3.org. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTP.STYLE(
   cstyle          IN       VARCHAR2);
```

Parameters

Table 208–79 STYLE Procedure Parameters

Parameter	Description
cstyle	The the style information to include.

Examples

This procedure generates

```
<STYLE>cstyle</STYLE>
```

SUB Procedure

This procedure generates the _{and} tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTP.SUB(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–80 SUB Procedure Parameters

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

SUP Procedure

This procedure generates the ^{and} tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTP.SUP(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–81 SUP Procedure Parameters

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

TABLECAPTION Procedure

This procedure generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table.

Syntax

```
HTP.TABLECAPTION(
   ccaption       IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–82 TABLECAPTION Procedure Parameters

Parameter	Description
ctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

TABLECLOSE Procedure

This procedure generates the </TABLE> tag which marks the end of an HTML table. To define the beginning of an HTML table, use the TABLEOPEN Procedure.

Syntax

```
HTP.TABLECLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

TABLEDATA Procedure

This procedure generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```
HTP.TABLEDATA(
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   crowspan       IN       VARCHAR2   DEFAULT NULL,
   ccolspan       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–83 TABLEDATA Procedure Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

TABLEHEADER Procedure

This procedure generates the <TH> and </TH> tags which insert a header cell in an HTML table. The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTP.TABLEHEADER(
   cvalue          IN       VARCHAR2   DEFAULT NULL,
   calign          IN       VARCHAR2   DEFAULT NULL,
   cdp             IN       VARCHAR2   DEFAULT NULL,
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   crowspan        IN       VARCHAR2   DEFAULT NULL,
   ccolspan        IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–84 TABLEHEADER Procedure Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

TABLEOPEN Procedure

This procedure generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the TABLECLOSE Procedure.

Syntax

```
HTP.TABLEOPEN(
   cborder        IN       VARCHAR2   DEFAULT NULL
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–85 TABLEOPEN Procedure Parameters

Parameter	Description
border	The value for the BORDER attribute.
calign	The value for the ALIGN attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

TABLEROWCLOSE Procedure

This procedure generates the </TR> tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the TABLEROWOPEN Procedure.

Syntax

```
HTP.TABLEROWCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

TABLEROWOPEN Procedure

This procedure generates the <TR> tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the TABLEROWCLOSE Procedure.

Syntax

```
HTP.TABLEROWOPEN(
   calign         IN       VARCHAR2   DEFAULT NULL,
   cvalign        IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–86 TABLEROWOPEN Procedure Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cvalign	The value for the VALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

TELETYPE Procedure

This procedure generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTP.TELETYPE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–87 TELETYPE Procedure Parameters

Parameter	Description
ctext	The text to render in a fixed width typewriter font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

<TT *cattributes*>*ctext*</TT>

TITLE Procedure

This procedure generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTP.TITLE(
   ctitle          IN       VARCHAR2);
```

Parameters

Table 208–88 TITLE Procedure Parameters

Parameter	Description
ctitle	The text to display in the titlebar of the browser window.

Examples

This procedure generates

```
<TITLE>ctitle</TITLE>
```

ULISTCLOSE Procedure

This procedure generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the ULISTOPEN Procedure. Add list items with LISTITEM Procedure.

Syntax

```
HTP.ULISTCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

ULISTOPEN Procedure

This procedure generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the ULISTCLOSE Procedure. Add list items with LISTITEM Procedure.

Syntax

```
HTP.ULISTOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwrap           IN       VARCHAR2   DEFAULT NULL,
   cdingbat        IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–89 ULISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

UNDERLINE Procedure

This procedure generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTP.UNDERLINE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–90 UNDERLINE Procedure Parameters

Parameter	Description
ctext	The text to render with an underline.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<U cattributes>ctext</U>
```

VARIABLE Procedure

This procedure generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTP.VARIABLE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 208–91 VARIABLE Procedure Parameters

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<VAR cattributes>ctext</VAR>
```

WBR Procedure

This procedure generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTP.WBR;
```

Examples

This procedure generates

```
<WBR>
```

209

ORD_DICOM

This Oracle Multimedia package supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILEs rather than in an ORDDicom object type. See *Oracle Multimedia DICOM Developer's Guide* for a complete description of the ORDDicom object type.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other content, such as single-frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

The Oracle Multimedia `ORD_DICOM` package provides functions and procedures in the DICOM relational interface to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM content. This Oracle Multimedia package also provides functions and procedures to check DICOM content for conformance based on a set of user-specified conformance rules, and to make DICOM content anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

The Oracle Multimedia `ORD_DICOM` package also provides functions and procedures in the DICOM data model utility interface to operate on the DICOM data model repository. See *Oracle Multimedia DICOM Developer's Guide* for a complete description of the DICOM data model utility interface.

Documentation of ORD_DICOM

For a complete description of this package within the context of Oracle Multimedia, see `ORD_DICOM` in the *Oracle Multimedia DICOM Developer's Guide*.

210

ORD_DICOM_ADMIN

This Oracle Multimedia package is used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository.

The DICOM data model repository is a collection of documents. An initial set of documents is loaded during installation. After installation, DICOM administrators can use the procedures and functions provided in the data model repository API of the Oracle Multimedia `ORD_DICOM_ADMIN` package to obtain document content as well as to insert, edit, and delete documents in the data model repository.

Documentation of ORD_DICOM_ADMIN

For a complete description of this package within the context of Oracle Multimedia, see `ORD_DICOM_ADMIN` in the *Oracle Multimedia DICOM Developer's Guide*.

211

OWA_CACHE

The `OWA_CACHE` package provides an interface that enables the `PL/SQL Gateway` cache to improve the performance of PL/SQL Web applications.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

Using OWA_CACHE

- Constants

Constants

- `system_level CONSTANT VARCHAR(6) := 'SYSTEM';`
- `user_level CONSTANT VARCHAR(4) := 'USER';`

Summary of OWA_CACHE Subprograms

Table 211–1 OWA_CACHE Package Subprograms

Subprogram	Description
DISABLE Procedure on page 211-5	Disables the cache for this particular request
GET_ETAG Function on page 211-6	Returns the tag associated with the cached content (used in the Validation technique model only)
GET_LEVEL Function on page 211-7	Returns the caching level (used in the Validation technique model only)
SET_CACHE Procedure on page 211-8	Sets up the cache headers for validation model cache type
SET_EXPIRES Procedure on page 211-9	Sets up the cache headers for expires model cache type
SET_NOT_MODIFIED Procedure on page 211-10	Sets up the headers for a not modified cache hit (used in the Validation technique model only)
SET_SURROGATE_CONTROL Procedure on page 211-11	Sets up the headers for a surrogate-control header for Web cache

DISABLE Procedure

This procedure disables the cache for this particular request.

Syntax

```
OWA_CACHE.DISABLE;
```

GET_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.GET_ETAG
  RETURN VARCHAR2;
```

Return Values

The tag for cache hit, otherwise `NULL`.

GET_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

Syntax

```
OWA_CACHE.GET_LEVEL
  RETURN VARCHAR2;
```

Return Values

The caching level string ('USER' or 'SYSTEM') for cache hit, otherwise NULL.

SET_CACHE Procedure

This sets up the cache headers for validation model cache type.

Syntax

```
OWA_CACHE.SET_CACHE(
   p_etag        IN       VARCHAR2,
   p_level       IN       VARCHAR2);
```

Parameters

Table 211–2 SET_CACHE Procedure Parameters

Parameter	Description
p_etag	The etag associated with this content
p_level	The caching level ('USER' or 'SYSTEM').

Exceptions

VALUE_ERROR is thrown if

- p_etag is greater than 55
- p_level is not 'USER' or 'SYSTEM'

SET_EXPIRES Procedure

This procedure sets up the cache headers for expires model cache type.

Syntax

```
OWA_CACHE.SET_EXPIRES(
   p_expires      IN       NUMBER,
   p_level        IN       VARCHAR2);
```

Parameters

Table 211–3 SET_EXPIRES Procedure Parameters

Parameter	Description
p_expires	The number of minutes this content is valid.
p_level	The caching level ('USER' or 'SYSTEM').

Exceptions

VALUE_ERROR is thrown if

- p_expires is negative or zero
- p_level is not 'USER' or 'SYSTEM'
- p_expires is > 525600 (1 year)

SET_NOT_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.SET_NOT_MODIFIED;
```

Exceptions

`VALUE_ERROR` is thrown if If the `etag` was not passed in

SET_SURROGATE_CONTROL Procedure

This procedure sets the headers for a surrogate-control header for Web cache

Syntax

```
OWA_CACHE.SET_SURROGATE_CONTROL(
   p_value        IN       VARCHAR2);
```

Parameters

Table 211–4 SET_SURROGATE_CONTROL Procedure Parameters

Parameter	Description
p_value	The value to be passed as the Surrogate-Control header.

Exceptions

VALUE_ERROR is thrown if If p_value is greater than 55 in length.

212

OWA_COOKIE

The OWA_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client's browser.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

Using OWA_COOKIE

Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client's sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA_CUSTOM package.

Types

This datatype contains cookie name-value pairs. Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL `RECORD` holding all values associated with a given cookie name.

```
TYPE vc_arr IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER.

TYPE COOKIE IS RECORD (
   name           VARCHAR2(4000),
   vals           vc_arr,
   num_vals       INTEGER);
```

Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.

Summary of OWA_COOKIE Subprograms

Table 212–1 OWA_COOKIE Package Subprograms

Subprogram	Description
GET Function on page 212-7	Gets the value of the specified cookie
GET_ALL Procedure on page 212-8	Gets all cookie name-value pairs
REMOVE Procedure on page 212-9	Removes the specified cookie
SEND procedure on page 212-10	Generates a "Set-Cookie" line in the HTTP header

GET Function

This function returns the values associated with the specified cookie. The values are returned in a OWA_COOKIE.COOKIE DATA TYPE.

Syntax

```
OWA_COOKIE.GET(
    name            IN       VARCHAR2)
  RETURN COOKIE;
```

Parameters

Table 212–2 GET Function Parameters

Parameter	Description
name	The name of the cookie.

Return Values

OWA_COOKIE.COOKIE DATA TYPE.

GET_ALL Procedure

This procedure returns all cookie names and their values from the client's browser. The values appear in the order in which they were sent from the browser.

Syntax

```
OWA_COOKIE.GET_ALL(
   names          OUT      vc_arr,
   vals           OUT      vc_arr,
   num_vals       OUT      INTEGER);
```

Parameters

Table 212–3 GET_ALL Procedure Parameters

Parameter	Description
names	The names of the cookies.
vals	The values of the cookies.
num_vals	The number of cookie-value pairs.

REMOVE Procedure

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990". This procedure must be called within the context of an HTTP header.

Syntax

```
OWA_COOKIE.REMOVE(
   name           IN       VARCHAR2,
   val            IN       VARCHAR2,
   path           IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 212–4 REMOVE Procedure Parameters

Parameter	Description
`name`	The name of the cookie to expire.
`val`	The value of the cookie.
`path`	[Currently unused]

SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client. This procedure must occur in the context of an HTTP header.

Syntax

```
OWA_COOKIE.SEND(
   name           in       varchar2,
   value          in       varchar2,
   expires        in       date       DEFAULT NULL,
   path           in       varchar2   DEFAULT NULL,
   domain         in       varchar2   DEFAULT NULL,
   secure         in       varchar2   DEFAULT NULL);
```

Parameters

Table 212–5 SEND Procedure Parameters

Parameter	Description
`name`	The name of the cookie.
`value`	The value of the cookie.
`expires`	The date at which the cookie will expire
`path`	The value for the path field.
`domain`	The value for the domain field.
`secure`	If the value of this parameter is not `NULL`, the "secure" field is added to the line.

213

OWA_CUSTOM

The OWA_CUSTOM package provides a Global PLSQL Agent Authorization callback function. It is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA_CUSTOM package.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

Using OWA_CUSTOM

- Constants

Constants

- `dbms_server_timezone CONSTANT VARCHAR2(3) := 'PST';`
- `dbms_server_gmtdiff CONSTANT NUMBER := NULL;`

Summary of OWA_CUSTOM Subprograms

Table 213–1 OWA_CUSTOM Package Subprograms

Subprogram	Description
AUTHORIZE Function on page 213-5	Provides a Global PLSQL Agent Authorization callback function

AUTHORIZE Function

This function is used when PLSQL Agent's authorization scheme is set to `GLOBAL` or `CUSTOM` when there is no overriding `OWA_CUSTOM` package.

Syntax

```
OWA_CUSTOM.AUTHORIZE
  RETURN BOOLEAN;
```

214

OWA_IMAGE

The `OWA_IMAGE` package provides an interface to access the coordinates where a user clicked on an image.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

Using OWA_IMAGE

Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.

Types

This datatype (`point`) contain the `X` and `Y` values of a coordinate, and so provides the coordinates of a user's click on an imagemap. It is defined as:

```
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```

Variables

This package variable (`null_point`) of `TYPE POINT` is used to default point parameters. Both the X and the Y fields of this variable are `NULL`.

Examples

```
CREATE OR REPLACE PROCEDURE process_image
    (my_img in OWA_IMAGE.POINT)
    AS
    x integer := OWA_IMAGE.GET_X(my_img);
    y integer := OWA_IMAGE.GET_Y(my_img);
BEGIN
    /* process the coordinate */
END
```

Summary of OWA_IMAGE Subprograms

Table 214–1 OWA_IMAGE Package Subprograms

Subprogram	Description
GET_X Function on page 214-8	Gets the X value of a point type
GET_Y Function on page 214-9	Gets the Y value of a point type

GET_X Function

This function returns the X coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_X(
   p         IN        point)
 RETURN INTEGER;
```

Parameters

Table 214–2 GET_X Function Parameters

Parameter	Description
p	The point where the user clicked.

Return Values

The X coordinate as an integer.

GET_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_Y(
   p        IN        point)
 RETURN INTEGER;
```

Parameters

Table 214–3 GET_Y Function Parameters

Parameter	Description
p	The point where the user clicked.

Return Values

The Y coordinate as an integer.

215

OWA_OPT_LOCK

The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

Using OWA_OPT_LOCK

Overview

The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The `OWA_OPT_LOCK` package gives you two ways of dealing with the lost update problem:

- The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the owa_opt_lock.store_values procedure.
- The checksum method stores a checksum rather than the values themselves. To use this method, call the owa_opt_lock.checksum function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.

Types

This datatype is a PL/SQL table intended to hold ROWIDs.

```
TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
```

Note that this is different from the `OWA_TEXT.VC_ARR DATA TYPE`.

Summary of OWA_OPT_LOCK Subprograms

Table 215–1 OWA_OPT_LOCK Package Subprograms

Subprogram	Description
CHECKSUM Functions on page 215-6	Returns the checksum value
GET_ROWID Function on page 215-7	Returns the ROWID value
STORE_VALUES Procedure on page 215-8	Stores unmodified values in hidden fields for later verification
VERIFY_VALUES Function on page 215-9	Verifies the stored values against modified values

CHECKSUM Functions

This function returns a `checksum` value for a specified string, or for a row in a table. For a row in a table, the function calculates the `checksum` value based on the values of the columns in the row. This function comes in two versions.

The first version returns a `checksum` based on the specified string. This is a "pure" 32-bit `checksum` executed by the database and based on the Internet 1 protocol.

The second version returns a `checksum` based on the values of a row in a table. This is a "impure" 32-bit checksum based on the Internet 1 protocol.

Syntax

```
OWA_OPT_LOCK.CHECKSUM(
   p_buff        IN       VARCHAR2)
 RETURN NUMBER;

OWA_OPT_LOCK.CHECKSUM(
   p_owner       IN      VARCHAR2,
   p_tname       IN       VARCHAR2,
   p_rowid       IN       ROWID)
  RETURN NUMBER;
```

Parameters

Table 215–2 CHECKSUM Function Parameters

Parameter	Description
`p_buff`	The nstring where you want to calculate the `checksum`.
`p_owner`	The owner of the table.
`p_tname`	The table name.
`p_rowid`	The row in `p_tname` where you want to calculate the `checksum` value. Use the GET_ROWID Function to convert `VCARRAY` values to proper rowids.

GET_ROWID Function

This function returns the ROWID datatype from the specified OWA_OPT_LOCK.VCARRAY DATA TYPE.

Syntax

```
OWA_OPT_LOCK.GET_ROWID(
   p_old_values      IN      vcarray)
 RETURN ROWID;
```

Parameters

Table 215–3 GET_ROWID Function Parameters

Parameter	Description
p_old_values	This parameter is usually passed in from an HTML form.

STORE_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

Syntax

```
OWA_OPT_LOCK.STORE_VALUES(
   p_owner        IN       VARCHAR2,
   p_tname        IN       VARCHAR2,
   p_rowid        IN       ROWID);
```

Parameters

Table 215–4 STORE_VALUES Procedure Parameters

Parameter	Description
p_owner	The owner of the table.
p_tname	The name of the table.
p_rowid	The row where you want to store values.

Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "*old*_p_tname", where p_tname is the name of the table. The value of the element is the owner name.
- One hidden form element is created for the table name. The name of the element is "*old*_p_tname", where p_tname is the name of the table. The value of the element is the table name.
- One element is created for each column in the row. The name of the element is "*old*_p_tname", where p_tname is the name of the table. The value of the element is the column value.

See also the VERIFY_VALUES Function.

VERIFY_VALUES Function

This function verifies whether values in the specified row have been updated since the last query. Use this function with the STORE_VALUES Procedure.

Syntax

```
OWA_OPT_LOCK.VERIFY_VALUES(
   p_old_values IN vcarray)
 RETURN BOOLEAN;
```

Parameters

Table 215–5 VERIFY_VALUES Function Parameters

Parameter	Description
p_old_values	A PL/SQL table containing the following information: ■ p_old_values(1) specifies the owner of the table. ■ p_old_values(2) specifies the table. ■ p_old_values(3) specifies the rowid of the row to verify. The remaining indexes contain values for the columns in the table. Typically, this parameter is passed in from the HTML form, where you have previously called the STORE_VALUES Procedure to store the row values on hidden form elements.

Return Values

TRUE if no other update has been performed, otherwise FALSE.

216

OWA_PATTERN

The OWA_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

Using OWA_PATTERN

Types

You can use a pattern as both an input and output parameter. Thus, you can pass the same regular expression to `OWA_PATTERN` function calls, and it only has to be parsed once.

- `OWA_PATTERN.PATTERN`

Operational Notes

The OWA_PATTERN subprograms are overloaded. Specifically, there are six versions of `MATCH`, and four each of `AMATCH` and `CHANGE`. The subprograms use the following parameters:

- `line` - This is the target to be examined for a match. It can be more than one line of text or a owa_text.multi_line datatype.
- `pat` - This is the pattern that the subprograms attempt to locate in line. The pattern can contain regular expressions. In the owa_pattern.change function and procedure, this parameter is called `from_str`.
- `flags` - This specifies whether the search is case-sensitive or if substitutions are done globally.

Use regular expressions with the subprograms in this package. You Specify a regular expression by creating the string you want to match interspersed with various wildcard tokens and quantifiers.

- Wildcards
- Quantifiers
- Flags

Wildcards

Wildcard tokens match something other than themselves:

Table 216–1 Wildcard tokens recognized by OWA_PATTERN package

Token	Description
^	Matches newline or the beginning of the target
$	Matches newline or the end of the target
\n	Matches newline
.	Matches any character except newline
\t	Matches tab
\d	Matches digits [0-9]
\D	Matches non-digits [not 0-9]
\w	Matches word characters (0-9, a-z, A-Z, or _)
\W	Matches non-word characters (not 0-9, a-z, A-Z, or _)
\s	Matches whitespace characters (blank, tab, or newline).
\S	Matches non-whitespace characters (not blank, tab, or newline)
\b	Matches "word" boundaries (between \w and \W)
\x<HEX>	Matches the value in the current character set of the two hexadecimal digits
\<OCT>	Matches the value in the current character set of the two or three octal digits
\	Followed by any character not covered by another case matches that character
&	Applies only to `CHANGE`. This causes the string that matched the regular expression to be included in the string that replaces it. This differs from the other tokens in that it specifies how a target is changed rather than how it is matched. This is explained further under CHANGE Functions and Procedures.

Quantifiers

Any tokens except & can have their meaning extended by any of the following quantifiers. You can also apply these quantifiers to literals:

Table 216–2 Quantifiers

Quantifier	Description
?	0 or 1 occurrence(s)
*	0 or more occurrences
+	1 or more occurrence(s)
{n}	Exactly *n* occurrences
(n,}	At least *n* occurrences
{n,m}	At least *n*, but not more than *m*, occurrences

Flags

In addition to targets and regular expressions, the OWA_PATTERN functions and procedures use flags to affect how they are interpreted.

Table 216–3 Flags

Flag	Description
i	This indicates a case-insensitive search.
g	This applies only to CHANGE. It indicates a global replace. That is, all portions of the target that match the regular expression are replaced.

Summary of OWA_PATTERN Subprograms

Table 216–4 OWA_PATTERN Package Subprograms

Subprogram	Description
AMATCH Function on page 216-7	Determines if a string contains the specified pattern. It lets you specify where in the string the match has to occur
CHANGE Functions and Procedures on page 216-9	Replaces a pattern within a string. If you call it as a function it returns the number of times the regular expression was found and replaced
GETPAT Procedure on page 216-11	Generates a pattern datatype from a `VARCHAR2` type
MATCH Function on page 216-12	Determines if a string contains the specified pattern

AMATCH Function

This function specifies if a pattern occurs in a particular location in a string. There are four versions to this function:

- The first and second versions of the function do not save the matched tokens (these are saved in the `backrefs` parameters in the third and fourth versions). The difference between the first and second versions is the `pat` parameter, which can be a `VARCHAR2` or a pattern datatype.
- The third and fourth versions of the function save the matched tokens in the `backrefs` parameter. The difference between the third and fourth versions is the `pat` parameter, which can be a VARCHAR2 or a pattern datatype.

> **Note:** If multiple overlapping strings match the regular expression, this function takes the longest match.

Syntax

```
OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2,
   from_loc       IN       INTEGER,
   pat            IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2,
   from_loc       IN       INTEGER,
   pat            IN OUT   PATTERN,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2
   from_loc       IN       INTEGER
   pat            in       varchar2
   backrefs       OUT      owa_text.vc_arr
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2
   from_loc       IN       INTEGER
   pat            IN OUT   PATTERN
   backrefs       OUT      owa_text.vc_arr
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;
```

Parameters

Table 216–5 AMATCH Function Parameters

Parameter	Description
`line`	The text to search in.

Table 216–5 (Cont.) AMATCH Function Parameters

Parameter	Description
from_loc	The location (in number of characters) in `line` where the search is to begin.
`pat`	The string to match. It can contain regular expressions. This can be either a `VARCHAR2` or a pattern. If it is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the `OWA_TEXT.VC_ARR DATA TYPE` PL/SQL table.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

Return Values

The index of the character after the end of the match, counting from the beginning of `line`. If there was no match, the function returns `0`.

CHANGE Functions and Procedures

This function or procedure searches and replaces a string or `multi_line` datatype. If multiple overlapping strings match the regular expression, this subprogram takes the longest match.

Syntax

```
OWA_PATTERN.CHANGE(
   line           IN OUT    VARCHAR2,
   from_str       IN        VARCHAR2,
   to_str         IN        VARCHAR2,
   flags          IN        VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.CHANGE(
   line           IN OUT   VARCHAR2,
   from_str       IN       VARCHAR2,
   to_str         IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL);

owa_pattern.change(
   mline          IN OUT   owa_text.multi_line,
   from_str       IN       VARCHAR2,
   to_str         IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.CHANGE(
   mline          IN OUT   owa_text.multi_line,
   from_str       IN       VARCHAR2,
   to_str         IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216–6 CHANGE Procedure Parameters

Parameter	Description
`line`	The text to search in. The output value of this parameter is the altered string.
mline	The text to search in. This is a `owa_text.multi_line datatype`. The output value of this parameter is the altered string.
`from_str`	The regular expression to replace.
to_str	The substitution pattern.
flags	Whether or not the search is case-sensitive, and whether or not changes are to be made globally. If "`i`" is specified, the search is case-insensitive. If "`g`" is specified, changes are made to all matches. Otherwise, the function stops after the first substitution is made.

Return Values

As a function, it returns the number of substitutions made. If the flag "g" is not used, this number can only be 0 or 1 and only the first match is replaced. The flag "g" specifies to replace all matches with the regular expression.

Examples

```
OWA_PATTERN.CHANGE('Cats in pajamas', 'C.+in', '& red ')
```

The regular expression matches the substring "`Cats in`". It then replaces this string with "& red". The ampersand character "`&`" indicates "`Cats in`" because that is what matched the regular expression. Thus, this procedure replaces the string "`Cats in pajamas`" with "`Cats in red`" If you call this as a function instead of a procedure, the value returned is 1, indicating that a single substitution has been made.

Example 2:

```
CREATE OR REPLACE PROCEDURE test_pattern as theline VARCHAR2(256);
num_found     INTEGER;
   BEGIN
       theline := 'what is the goal?';
       num_found := OWA_PATTERN.CHANGE(theline, 'goal', 'idea', 'g');
       HTP.PRINT(num_found); -- num_found is 1
       HTP.PRINT(theline); -- theline is 'what is the idea?'
   END;
/
SHOW ERRORS
```

GETPAT Procedure

This procedure converts a VARCHAR2 string into an `OWA_PATTERN.PATTERN DATA TYPE`.

Syntax

```
OWA_PATTERN.GETPAT(
   arg      IN          VARCHAR2,
   pat      IN OUT      pattern);
```

Parameters

Table 216–7 GETPAT Procedure Parameters

Parameter	Description
`arg`	The string to convert.
pat	the `OWA_PATTERN.PATTERN DATA TYPE` initialized with `arg`.

MATCH Function

This function determines if a string contains the specified pattern. The pattern can contain regular expressions. If multiple overlapping strings can match the regular expression, this function takes the longest match.

Syntax

```
owa_pattern.match(
   line           IN       VARCHAR2,
   pat            IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

owa_pattern.match(
   line           IN       VARCHAR2,
   pat            IN OUT   PATTERN,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

owa_pattern.match(
   line           IN       VARCHAR2,
   pat            IN       VARCHAR2,
   backrefs       OUT      owa_text.vc_arr,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

OWA_PATTERN.MATCH(
   line           IN       VARCHAR2,
   pat            IN OUT   PATTERN,
   backrefs       OUT      owa_text.vc_arr,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

owa_pattern.match(
   mline          IN       owa_text.multi_line,
   pat            IN       VARCHAR2,
   rlist          OUT      owa_text.row_list,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

OWA_PATTERN.MATCH(
   mline          IN       owa_text.multi_line,
   pat            IN OUT   pattern,
   rlist          OUT      owa_text.row_list,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;
```

Parameters

Table 216–8 MATCH Function Parameters

Parameter	Description
`line`	The line to search in.
`mline`	The text to search in. This is a `owa_text.multi_line` `datatype`..

Table 216–8 (Cont.) MATCH Function Parameters

Parameter	Description
pat	The pattern to match. This is either a VARCHAR2 or a OWA_PATTERN.PATTERN DATA TYPE. It is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression.
rlist	An output parameter containing a list of matches.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

Return Values

TRUE if a match was found, FALSE otherwise.

Examples

KAZOO is the target where it is searching for the zoo.* regular expression. The period indicates any character other than newline, and the asterisk matches 0 or more of the preceding characters. In this case, it matches any character other than the newline.

Therefore, this regular expression specifies that a matching target consists of zoo, followed by any set of characters neither ending in nor including a newline (which does not match the period). The i flag indicates to ignore case in the search. In this case, the function returns TRUE, which indicates that a match had been found.

```
boolean foundMatch;
foundMatch := owa_pattern.match('KAZOO', 'zoo.*', 'i');
```

The following example searches for the string "goal" followed by any number of characters in sometext. If found,

```
sometext  VARCHAR2(256);
pat       VARCHAR2(256);

sometext    := 'what is the goal?'
pat         := 'goal.*';
IF OWA_PATTERN.MATCH(sometext, pat)
   THEN
      HTP.PRINT('Match found');
   ELSE
     HTP.PRINT('Match not found');
END IF;
```

Operational Notes

- The regular expression in this function can be either a VARCHAR2 or an OWA_PATTERN.PATTERN DATA TYPE. Create AN OWA_PATTERN.PATTERN DATA TYPE from a string using the OWA_PATTERN.GETPAT procedure.
- Create a MULTI_LINE DATA TYPE from a long string using the OWA_TEXT.STREAM2MULTI procedure. If a multi_line is used, the rlist parameter specifies a list of chunks where matches were found.

- If the line is a string and not a `multi_line`, you can add an optional output parameter called `backrefs`. This parameter is a `row_list` that holds each string in the target that was matched by a sequence of tokens in the regular expression.

217

OWA_SEC

The OWA_SEC package provides an interface for custom authentication.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

Using OWA_SEC

Operational Notes

Parameters that have default values are optional.

Summary of OWA_SEC Subprograms

Table 217–1 OWA_SEC Package Subprograms

Subprogram	Description
GET_CLIENT_HOSTNAME Function on page 217-5	Returns the client's hostname
GET_CLIENT_IP Function on page 217-6	Returns the client's IP address
GET_PASSWORD Function on page 217-7	Returns the password that the user entered
GET_USER_ID Function on page 217-8	Returns the username that the user entered
SET_AUTHORIZATION Procedure on page 217-9	Enables the PL/SQL application to use custom authentication
SET_PROTECTION_REALM Procedure on page 217-10	Defines the realm that the page is in

GET_CLIENT_HOSTNAME Function

This function returns the hostname of the client.

Syntax

```
OWA_SEC.GET_CLIENT_HOSTNAME
 RETURN VARCHAR2;
```

Return Values

The hostname.

GET_CLIENT_IP Function

This function returns the IP address of the client.

Syntax

```
OWA_SEC.GET_CLIENT_IP
  RETURN OWA_UTIL.IP_ADDRESS;
```

Return Values

The IP address. The `owa_util.ip_address datatype` is a PL/SQL table where the first four elements contain the four numbers of the IP address. For example, if the IP address is `123.45.67.89` and the variable `ipaddr` is of the owa_util.ip_address datatype, the variable would contain the following values:

```
ipaddr(1) = 123
ipaddr(2) = 45
ipaddr(3) = 67
ipaddr(4) = 89
```

GET_PASSWORD Function

This function returns the password that the user used to log in.

Syntax

```
OWA_SEC.GET_PASSWORD
  RETURN VARCHAR2;
```

Return Values

The password.

Usage Notes

For security reasons, this function returns a true value only when custom authentication is used. If you call this function when you are not using custom authentication, the function returns an undefined value. Thus, the database passwords are not exposed.

GET_USER_ID Function

This function returns the username that the user used to log in.

Syntax

```
OWA_SEC.GET_USER_ID
  RETURN VARCHAR2;
```

Return Values

The username.

SET_AUTHORIZATION Procedure

This procedure, called in the initialization portion of the OWA_CUSTOM package, sets the authorization scheme for the PL/SQL Gateway. This implements your `authorize` function, which authorizes the user before his requested procedure is run. The placement of the `authorize` function depends on the scheme you select.

Syntax

```
OWA_SEC.SET_AUTHORIZATION(
    scheme          IN       INTEGER);
```

Parameters

Table 217–2 SET_AUTHORIZATION Procedure Parameters

Parameter	Description

`scheme`	The authorization scheme. It is one of the following schemes for `SET_AUTHORIZATION`:
	■ `OWA_SEC.NO_CHECK` - Specifies that the PL/SQL application is not to do any custom authentication. This is the default.
	■ `OWA_SEC.GLOBAL` - Defines an authorize function that is called for all users and all procedures. This is the `OWA_CUSTOM`.AUTHORIZE Function in the "`sys`" schema.
	■ `OWA_SEC.PER_PACKAGE` - Define an `authorize` function that is called when procedures in a package or anonymous procedures are called. If the procedures are in a package, the package.`AUTHORIZE` function in the user's schema is called to authorize the user. If the procedures are not in a package, then the anonymous `authorize` function in the user's schema is called.
	■ `OWA_SEC.CUSTOM` - Implements different authorize functions for each user. The function `OWA_CUSTOM`.AUTHORIZE Function in the user's schema is called to authorize the user. If the user's schema does not contain an `OWA_CUSTOM`.AUTHORIZE Function, the PL/SQL Gateway looks for it in the "sys" schema.
	The custom `authorize` function has the following signature:
	`FUNCTION AUTHORIZE`
	`  RETURN BOOLEAN;`
	If the function returns `TRUE`, authentication succeeded. If it returns `FALSE`, authentication failed. If the `authorize` function is not defined, the Gateway returns an error and fails.

SET_PROTECTION_REALM Procedure

This procedure sets the realm of the page that is returned to the user. The user enters a username and login that already exist in the realm.

Syntax

```
OWA_SEC.SET_PROTECTION_REALM(
   realm      IN      VARCHAR2);
```

Parameters

Table 217–3 SET_PROTECTION_REALM Procedure Parameters

Parameter	Description
realm	The realm where the page belongs. This string is displayed to the user.

218

OWA_TEXT

The OWA_TEXT package contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

Using OWA_TEXT

- Types

Types

MULTI_LINE DATA TYPE

This datatype is a PL/SQL record that holds large amounts of text. The rows field, of type OWA_TEXT.VC_ARR DATA TYPE, contains the text data in the record.

```
TYPE multi_line IS RECORD (
   rows           vc_arr,
   num_rows       INTEGER,
   partial_row    BOOLEAN);
```

ROW_LIST DATA TYPE

This is the datatype for holding data to be processed.

```
TYPE row_list IS RECORD (
   rows           int_arr,
   num_rows       INTEGER);

int_arr IS DEFINED AS:

TYPE int_arr IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

VC_ARR DATA TYPE

This is a component of the MULTI_LINE DATA TYPE and is used for holding large amounts of text.

```
TYPE vc_arr IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

Summary of OWA_TEXT Subprograms

Table 218–1 OWA_TEXT Package Subprograms

Subprogram	Description
ADD2MULTI Procedure on page 218-5	Adds text to an existing `multi_line` type
NEW_ROW_LIST Function and Procedure on page 218-6	Creates a new `row_list`
PRINT_MULTI Procedure on page 218-7	Prints out the contents of a `multi_list`
PRINT_ROW_LIST Procedure on page 218-8	Prints out the contents of a `row_list`
STREAM2MULTI Procedure on page 218-9	Converts a varchar2 to a `multi_line` type

ADD2MULTI Procedure

This procedure adds content to an existing MULTI_LINE DATA TYPE.

Syntax

```
OWA_TEXT.ADD2MULTI(
   stream          IN       VARCHAR2,
   mline           IN OUT   multi_line,
  continue      IN      BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 218–2 ADD2MULTI Procedure Parameters

Parameter	Description
`stream`	The text to add.
`mline`	The `OWA_TEXT.MULTI_LINE DATA TYPE`. The output of this parameter contains *stream*.
`continue`	If `TRUE`, the procedure appends *stream* within the previous final row (assuming it is less than 32K). If `FALSE`, the procedure places *stream* in a new row.

NEW_ROW_LIST Function and Procedure

This function or procedure creates a new OWA_TEXT.ROW_LIST DATA TYPE. The function version uses no parameters and returns a new empty row_list. The procedure version creates the row_list datatype as an output parameter.

Syntax

```
OWA_TEXT.NEW_ROW_LIST
  RETURN ROW_LIST;

OWA_TEXT.NEW_ROW_LIST(
  rlist    OUT     row_list);
```

Parameters

Table 218–3 NEW_ROW_LIST Procedure Parameters

Parameter	Description
rlist	This is an output parameter containing the new row_list datatype

Return Values

The function version returns the new row_list datatype.

PRINT_MULTI Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the OWA_TEXT.MULTI_LINE DATA TYPE.

Syntax

```
OWA_TEXT.PRINT_MULTI(
   mline       IN       multi_line);
```

Parameters

Table 218–4 PRINT_MULTI Procedure Parameters

Parameter	Description
mline	The multi_line datatype to print.

Return Values

The contents of the multi_line.

PRINT_ROW_LIST Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the `OWA_TEXT.ROW_LIST DATA TYPE`.

Syntax

```
OWA_TEXT.PRINT_ROW_LIST(
   rlist       IN       multi_line);
```

Parameters

Table 218–5 PRINT_ROW_LIST Procedure Parameters

Parameter	Description
`rlist`	The row_list datatype to print.

Return Values

The contents of the `row_list`.

STREAM2MULTI Procedure

This procedure converts a string to a `multi_line` datatype.

Syntax

```
OWA_TEXT.STREAM2MULTI(
   stream          IN       VARCHAR2
   mline           OUT      multi_line);
```

Parameters

Table 218–6 STREAM2MULTI Procedure Parameters

Parameter	Description
`stream`	The string to convert.
`mline`	The stream in `OWA_TEXT.MULTI_LINE DATA TYPE` format

219

OWA_UTIL

The `OWA_UTIL` package contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

Using OWA_UTIL

Overview

The OWA_UTIL package contains three types of utility subprograms.

- Dynamic SQL Utilities enable you to produce pages with dynamically generated SQL code.
- HTML utilities enable you to retrieve the values of CGI environment variables and perform URL redirects.
- Date utilities enable correct date-handling. Date values are simple strings in HTML, but are treated as a datatype by the Oracle database.

Types

DATETYPE Datatype

The TODATE Function converts an item of this type to the type `DATE`, which is understood and properly handled as data by the database. The procedure CHOOSE_DATE Procedure enables the user to select the desired date.

```
TYPE dateType IS TABLE OF VARCHAR2(10) INDEX BY BINARY_INTEGER;
```

IDENT_ARR Datatype

This datatype is used for an array.

```
TYPE ident_arr IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

IP_ADDRESS Datatype

This datatype is used by the GET_CLIENT_IP Function in the "OWA_SEC" package on on page 217-1.

```
TYPE ip_address IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

Summary of OWA_UTIL Subprograms

Table 219–1 OWA_UTIL Package Subprograms

Subprogram	Description
BIND_VARIABLES Function on page 219-6	Prepares a SQL query and binds variables to it
CALENDARPRINT Procedures on page 219-7	Prints a calendar
CELLSPRINT Procedures on page 219-8	Prints the contents of a query in an HTML table
CHOOSE_DATE Procedure on page 219-10	Generates HTML form elements that allow the user to select a date
GET_CGI_ENV Function on page 219-11	Returns the value of the specified CGI environment variable
GET_OWA_SERVICE_PATH Function on page 219-12	Returns the full virtual path for the PL/SQL Gateway
GET_PROCEDURE Function on page 219-13	Returns the name of the procedure that is invoked by the PL/SQL Gateway
HTTP_HEADER_CLOSE Procedure on page 219-14	Closes the HTTP header
LISTPRINT Procedure on page 219-15	Generates a HTML form element that contains data from a query
MIME_HEADER Procedure on page 219-16	Generates the Content-type line in the HTTP header
PRINT_CGI_ENV Procedure on page 219-17	Generates a list of all CGI environment variables and their values
REDIRECT_URL Procedure on page 219-18	Generates the Location line in the HTTP header
SHOWPAGE Procedure on page 219-19	Prints a page generated by the HTP and HTF packages in SQL*Plus
SHOWSOURCE Procedure on page 219-20	Prints the source for the specified subprogram
SIGNATURE procedure on page 219-21	Prints a line that says that the page is generated by the PL/SQL Agent
STATUS_LINE Procedure on page 219-22	Generates the Status line in the HTTP header
TABLEPRINT Function on page 219-23	Prints the data from a table in the database as an HTML table
TODATE Function on page 219-26	Converts dateType data to the standard PL/SQL date type
WHO_CALLED_ME Procedure on page 219-27	Returns information on the caller of the procedure.

BIND_VARIABLES Function

This function prepares a SQL query by binding variables to it, and stores the output in an opened cursor. Use this function as a parameter to a procedure sending a dynamically generated query. Specify up to 25 bind variables.

Syntax

```
OWA_UTIL.BIND_VARIABLES(
   theQuery       IN       VARCHAR2   DEFAULT NULL,
   bv1Name        IN       VARCHAR2   DEFAULT NULL,
   bv1Value       IN       VARCHAR2   DEFAULT NULL,
   bv2Name        IN       VARCHAR2   DEFAULT NULL,
   bv2Value       IN       VARCHAR2   DEFAULT NULL,
   bv3Name        IN       VARCHAR2   DEFAULT NULL,
   bv3Value       IN       VARCHAR2   DEFAULT NULL,
        ...
   bv25Name       IN       VARCHAR2   DEFAULT NULL,
   bv25Value      IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;
```

Parameters

Table 219–2 BIND_VARIABLES Function Parameters

Parameter	Description
theQuery	The SQL query statement which must be a SELECT statement
bv1Name	The name of the variable
bv1Value	The value of the variable

Return Values

An integer identifying the opened cursor.

CALENDARPRINT Procedures

These procedures creates a calendar in HTML with a visible border. Each date in the calendar can contain any number of hypertext links.

This procedure has 2 versions.

- Version 1 uses a hard-coded query stored in a varchar2 string.
- Version 2 uses a dynamic query prepared with the BIND_VARIABLES Function.

Syntax

```
OWA_UTIL.CALENDARPRINT(
   p_query        IN       VARCHAR2,
   p_mf_only      IN       VARCHAR2   DEFAULT 'N');

OWA_UTIL.CALENDARPRINT(
   p_cursor       IN       INTEGER,
   p_mf_only      IN       VARCHAR2   DEFAULT 'N');
```

Parameters

Table 219–3 CALENDARPRINT Procedure Parameters

Parameter	Description
p_query	A PL/SQL query.
p_cursor	A PL/SQL cursor containing the same format as p_query.
p_mf_only	If "N" (the default), the generated calendar includes Sunday through Saturday. Otherwise, it includes Monday through Friday only.

Usage Notes

Design your query as follows:

- The first column is a DATE. This correlates the information produced by the query with the calendar output generated by the procedure.
- The query output must be sorted on this column using ORDER BY.
- The second column contains the text, if any, that you want printed for that date.
- The third column contains the destination for generated links. Each item in the second column becomes a hypertext link to the destination given in this column. If this column is omitted, the items in the second column are simple text, not links.

CELLSPRINT Procedures

This procedure generates an HTML table from the output of a SQL query. SQL atomic data items are mapped to HTML cells and SQL rows to HTML rows. You must write the code to begin and end the HTML table. There are nine versions of this procedure:

- The first version passes the results of a query into an index table. Perform the query and CELLSPRINT does the formatting. To have more control in generating an HTML table from the output of an SQL query, use the FORMAT_CELL Function in the "HTF" package on page 207-1.
- The second and third versions display rows (up to the specified maximum) returned by the query or cursor.
- The fourth and fifth versions exclude a specified number of rows from the HTML table. Use the fourth and fifth versions to scroll through result sets by saving the last row seen in a hidden form element.
- The sixth through ninth versions are the same as the first four versions, except that they return a row count output parameter.

Syntax

```
OWA_UTIL.CELLSPRINT(
   p_colCnt          IN    INTEGER,
   p_resultTbl       IN    vc_arr,
  p_format_numbers IN    VARCHAR2   DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  iN    VARCHAR2   DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER      DEFAULT 0,
   p_more_data       OUT   BOOLEAN);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER     DEFAULT 0,
   p_more_data       OUT   BOOLEAN);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_reccnt          OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
```

```
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_reccnt          OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER     DEFAULT 0,
   p_more_data       OUT   BOOLEAN
   p_reccnt          OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER     DEFAULT 0,
   p_more_data       OUT   BOOLEAN,
   p_reccnt          OUT   NUMBER);
```

Parameters

Table 219–4 CELLSPRINT Procedure Parameters

Parameter	Description
p_query	A PL/SQL query.
p_colCnt	The number of columns in the table.
p_theQuery	A SQL SELECT statement.
p_theCursor	A cursor ID. This can be the return value from the BIND_VARIABLES Function.
p_max_rows	The maximum number of rows to print.
p_format_numbers	If the value of this parameter is not NULL, number fields are right justified and rounded to two decimal places.
p_skip_rec	The number of rows to exclude from the HTML table.
p_more_data	TRUE if there are more rows in the query or cursor, FALSE otherwise.
p_reccnt	The number of rows that have been returned by the query. This value does not include skipped rows (if any).
p_resultTbl	The index table which will contain the result of the query. Each entry in the query will correspond to one column value.

Examples

This procedure generates

```
<tr><td>QueryResultItem</td><td>QueryResultItem</td></tr>...
```

CHOOSE_DATE Procedure

This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

Syntax

```
OWA_UTIL.CHOOSE_DATE(
   p_name         IN       VARCHAR2,
   p_date         IN       DATE       DEFAULT SYSDATE);
```

Parameters

Table 219–5 CHOOSE_DATE Procedure Parameters

Parameter	Description
p_name	The name of the form elements.
p_date	The initial date that is selected when the HTML page is displayed.

Usage Notes

- The parameter in the procedure that receives the data from these elements must be a GET_CGI_ENV Function.
- Use the TODATE Function to convert the GET_CGI_ENV Function value to the standard Oracle DATE datatype.

Examples

```
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">1
     ...
<OPTION value="31">31
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">JAN
     ...
<OPTION value="12">DEC
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="1992">1992
     ...
<OPTION value="2002">2002
</SELECT>
```

GET_CGI_ENV Function

This function returns the value of the specified CGI environment variable.

Syntax

```
OWA_UTIL.GET_CGI_ENV(
   param_name       IN      VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 219–6 GET_CGI_ENV Function Parameters

Parameter	Description
param_name	The name of the CGI environment variable. It is case-insensitive.

Return Values

The value of the specified CGI environment variable. If the variable is not defined, the function returns NULL.

GET_OWA_SERVICE_PATH Function

This function returns the full virtual path of the PL/SQL Gateway that is handling the request.

Syntax

```
OWA_UTIL.GET_OWA_SERVICE_PATH
 RETURN VARCHAR2;
```

Return Values

A virtual path of the PL/SQL Gateway that is handling the request.

GET_PROCEDURE Function

This function returns the name of the procedure that is being invoked by the PL/SQL Gateway.

Syntax

```
OWA_UTIL.GET_PROCEDURE
 RETURN VARCHAR2;
```

Return Values

The name of a procedure, including the package name if the procedure is defined in a package.

HTTP_HEADER_CLOSE Procedure

This procedure generates a newline character to close the HTTP header.

Syntax

```
OWA_UTIL.HTTP_HEADER_CLOSE;
```

Return Values

A newline character, which closes the HTTP header.

Usage Notes

- Use this procedure if you have not closed the header by using the `bclose_header` parameter in calls such as MIME_HEADER Procedure, REDIRECT_URL Procedure, or STATUS_LINE Procedure
- The HTTP header must be closed before any `HTP.PRINT` or `HTP.PRN` calls.

LISTPRINT Procedure

This procedure generates an HTML selection list form element from the output of a SQL query. There are two versions of this procedure.

- The first version contains a hard-coded SQL query.
- The second version uses a dynamic query prepared with the BIND_VARIABLES Function.

Syntax

```
OWA_UTIL.LISTPRINT(
   p_theQuery     IN       VARCHAR2,
   p_cname        IN       VARCHAR2,
   p_nsize        IN       NUMBER,
   p_multiple     IN       BOOLEAN   DEFAULT FALSE);

OWA_UTIL.LISTPRINT(
   p_theCursor    IN    INTEGER,
   p_cname        IN       VARCHAR2,
   p_nsize        IN       NUMBER,
   p_multiple     IN       BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 219–7 LISTPRINT Procedure Parameters

Parameter	Description
p_theQuery	The SQL query.
p_theCursor	The cursor ID. This can be the return value from the BIND_VARIABLES Function.
p_cname	The name of the HTML form element.
p_nsize	The size of the form element (this controls how many items the user can see without scrolling).
p_multiple	Whether multiple selection is permitted.

Usage Notes

The columns in the output of the query are handled in the following manner:

- The first column specifies the values that are sent back. These values are for the VALUE attribute of the OPTION tag.
- The second column specifies the values that the user sees.
- The third column specifies whether or not the row is marked as SELECTED in the OPTION tag. If the value is not NULL, the row is selected.

Examples

```
<SELECT NAME="p_cname" SIZE="p_nsize">
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
     ...
</SELECT>
```

MIME_HEADER Procedure

This procedure changes the default MIME header that the script returns. This procedure must come before any HTP.PRINT or HTP.PRN calls to direct the script not to use the default MIME header.

Syntax

```
OWA_UTIL.MIME_HEADER(
   ccontent_type    IN       VARCHAR2   DEFAULT 'text/html',
   bclose_header    IN       BOOLEAN    DEFAULT TRUE,
   ccharset         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 219–8 MIME_HEADER Procedure Parameters

Parameter	Description
ccontent_type	The MIME type to generate
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.
ccharset	The character set to use.The character set only makes sense if the MIME type is of type 'text'. Therefore, the character set is only tagged on to the Content-Type header only if the MIME type passed in is of type 'text'. Any other MIME type, such as 'image', will not have any character set tagged on.

Examples

```
Content-type: <ccontent_type>; charset=<ccharset>
```

so that

```
owa_util.mime_header('text/plain', false, 'ISO-8859-4')
```

generates

```
Content-type: text/plain; charset=ISO-8859-4\n
```

PRINT_CGI_ENV Procedure

This procedure generates all the CGI environment variables and their values made available by the PL/SQL Gateway to the stored procedure.

Syntax

```
OWA_UTIL.PRINT_CGI_ENV;
```

Examples

This procedure generates a list in the following format:

```
cgi_env_var_name = value\n
```

REDIRECT_URL Procedure

This procedure specifies that the application server is to visit the specified URL. The URL may specify either a Web page to return or a program to execute.

Syntax

```
OWA_UTIL.REDIRECT_URL(
   curl           IN       VARCHAR2
   bclose_header  IN       BOOLEAN    DEFAULT TRUE);
```

Parameters

Table 219–9 REDIRECT_URL Procedure Parameters

Parameter	Description
curl	The URL to visit.
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

Usage Notes

This procedure must come before any HTP procedure or HTF function call.

Examples

This procedure generates

```
Location: <curl>\n\n
```

SHOWPAGE Procedure

This procedure prints out the HTML output of a procedure in SQL*Plus. The procedure must use the HTP or HTF packages to generate the HTML page, and this procedure must be issued after the HTP or HTF page-generating subprogram has been called and before any other HTP or HTF subprograms are directly or indirectly called.

Syntax

```
OWA_UTIL.SHOWPAGE;
```

Usage Notes

- This method is useful for generating pages filled with static data.
- This procedure uses the DBMS_OUTPUT package and is limited to 32767 characters for each line and an overall buffer size of 1,000,000 bytes.

Examples

The output of htp procedure is displayed in SQL*Plus, SQL*DBA, or Oracle Server Manager. For example:

```
SQL> set serveroutput on
SQL> spool gretzky.html
SQL> execute hockey.pass("Gretzky")
SQL> execute owa_util.showpage
SQL> exit
```

This would generate an HTML page that could be accessed from Web browsers.

SHOWSOURCE Procedure

This procedure prints the source of the specified procedure, function, or package. If a procedure or function which belongs to a package is specified, then the entire package is displayed.

Syntax

```
OWA_UTIL.SHOWSOURCE (
   cname      IN     VARCHAR2);
```

Parameters

Table 219–10 SHOWSOURCE Procedure Parameters

Parameter	Description
cname	The function or procedure whose source you want to show.

SIGNATURE procedure

This procedure generates an HTML line followed by a signature line on the HTML document. If a parameter is specified, the procedure also generates a hypertext link to view the PL/SQL source for that procedure. The link calls the SHOWSOURCE Procedure.

Syntax

```
OWA_UTIL.SIGNATURE;

OWA_UTIL.SIGNATURE (
   cname        IN        VARCHAR2);
```

Parameters

Table 219–11 SIGNATURE Procedure Parameters

Parameter	Description
cname	The function or procedure whose source you want to show.

Examples

Without a parameter, the procedure generates a line that looks like the following:

```
This page was produced by the PL/SQL Agent on August 9, 2001 09:30.
```

With a parameter, the procedure generates a signature line in the HTML document that looks like the following:

```
This page was produced by the PL/SQL Agent on 8/09/01 09:30
View PL/SQL Source
```

STATUS_LINE Procedure

This procedure sends a standard HTTP status code to the client. This procedure must come before any `htp.print` or `htp.prn` calls so that the status code is returned as part of the header, rather than as "content data".

Syntax

```
OWA_UTIL.STATUS_LINE(
   nstatus        IN       INTEGER,
   creason        IN       VARCHAR2   DEFAULT NULL,
   bclose_header  IN       BOOLEAN    DEFAULT TRUE);
```

Parameters

Table 219–12 STATUS_LINE Procedure Parameters

Parameter	Description
`nstatus`	The status code.
`creason`	The string for the status code.
`bclose_header`	Whether or not to close the HTTP header. If `TRUE`, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

Examples

This procedure generates

`Status: <`*`nstatus`*`> <`*`creason`*`>\n\n`

TABLEPRINT Function

This function generates either preformatted tables or HTML tables (depending on the capabilities of the user's browser) from database tables.

Syntax

```
OWA_UTIL.TABLEPRINT(
   ctable         IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL,
   ntable_type    IN       INTEGER    DEFAULT HTML_TABLE,
   ccolumns       IN       VARCHAR2   DEFAULT '*',
   cclauses       IN    VARCHAR2   DEFAULT NULL,
   ccol_aliases   IN       VARCHAR2   DEFAULT NULL,
   nrow_min       IN       NUMBER     DEFAULT 0,
   nrow_max       IN       NUMBER     DEFAULT NULL)
 RETURN BOOLEAN;
```

Parameters

Table 219–13 TABLEPRINT Function Parameters

Parameter	Description
ctable	The database table.
cattributes	Other attributes to be included as-is in the tag.
ntable_type	How to generate the table. Specify HTML_TABLE to generate the table using <TABLE> tags or PRE_TABLE to generate the table using the <PRE> tags. These are constants: ■ HTML_TABLE CONSTANT INTEGER := 1; ■ PRE_TABLE CONSTANT INTEGER := 2;
ccolumns	A comma-delimited list of columns from ctable to include in the generated table.
cclauses	WHERE or ORDER BY clauses, which specify which rows to retrieve from the database table, and how to order them.
ccol_aliases	A comma-delimited list of headings for the generated table.
nrow_min	The first row, of those retrieved, to display.
nrow_max	The last row, of those retrieved, to display.

Return Values

Returns TRUE if there are more rows beyond the nrow_max requested, FALSE otherwise.

Usage Notes

- RAW columns are supported, but LONG RAW columns are not. References to LONG RAW columns will print the result 'Not Printable'.
- Note that in this function, cattributes is the second rather than the last parameter.

Examples

For browsers that do not support HTML tables, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps IS
  ignore_more BOOLEAN;
BEGIN
  ignore_more := OWA_UTIL.TABLEPRINT('emp', 'BORDER', OWA_UTIL.PRE_TABLE);
END;
```

Requesting a URL such as

```
http://myhost:7777/pls/hr/showemps
```

returns to the following to the client:

```
<PRE>
---------------------------------------------------------------------
| EMPNO |ENAME |JOB      |MGR   |HIREDATE   | SAL | COMM | DEPTNO |
---------------------------------------------------------------------
| 7369| SMITH  | CLERK   | 7902 | 17-DEC-80 | 800 |      | 20 |
| 7499| ALLEN  | SALESMAN| 7698 | 20-FEB-81 | 1600 | 300 | 30 |
| 7521| WARD   | SALESMAN| 7698 | 22-FEB-81 | 1250 | 500 | 30 |
| 7566| JONES  | MANAGER | 7839 | 02-APR-81 | 2975 |     | 20 |
| 7654| MARTIN | SALESMAN| 7698 | 28-SEP-81 | 1250 | 1400| 30 |
| 7698| BLAKE  | MANAGER | 7839 | 01-MAY-81 | 2850 |     | 30 |
| 7782| CLARK  | MANAGER | 7839 | 09-JUN-81 | 2450 |     | 10 |
| 7788| SCOTT  | ANALYST | 7566 | 09-DEC-82 | 3000 |     | 20 |
| 7839| KING   | PRESIDENT |    | 17-NOV-81 | 5000 |     | 10 |
| 7844| TURNER | SALESMAN| 7698 | 08-SEP-81 | 1500 | 0   | 30 |
| 7876| ADAMS  | CLERK   | 7788 | 12-JAN-83 | 1100 |     | 20 |
| 7900| JAMES  | CLERK   | 7698 | 03-DEC-81 | 950  |     | 30 |
| 7902| FORD   | ANALYST | 7566 | 03-DEC-81 | 3000 |     | 20 |
| 7934| MILLER | CLERK   | 7782 | 23-JAN-82 | 1300 |     | 10 |
---------------------------------------------------------------------
</PRE>
```

To view the employees in department 10, and only their employee ids, names, and salaries, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps_10 IS
 ignore_more BOOLEAN;
begin
 ignore_more := OWA_UTIL.TABLEPRINT
    ('EMP', 'BORDER', OWA_UTIL.PRE_TABLE,
     'empno, ename, sal', 'WHERE deptno=10 ORDER BY empno',
     'Employee Number, Name, Salary');
END;
```

A request for a URL like

```
http://myhost:7777/pls/hr/showemps_10
```

would return the following to the client:

```
<PRE>
-------------------------------------
| Employee Number |Name    | Salary |
-------------------------------------
| 7782            | CLARK  | 2450   |
| 7839            | KING   | 5000   |
| 7934            | MILLER | 1300   |
-------------------------------------
</PRE>
```

For browsers that support HTML tables, to view the department table in an HTML table, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showdept IS
 ignore_more BOOLEAN;
BEGIN
 ignore_more := oWA_UTIL.TABLEPRINT('dept', 'BORDER');
END;
```

A request for a URL like

```
http://myhost:7777/pls/hr/showdept
```

would return the following to the client:

```
<TABLE BORDER>
<TR>
<TH>DEPTNO</TH>
<TH>DNAME</TH>
<TH>LOC</TH>
</TR>
<TR>
<TD ALIGN="LEFT">10</TD>
<TD ALIGN="LEFT">ACCOUNTING</TD>
<TD ALIGN="LEFT">NEW YORK</TD>
</TR>
<TR>
<TD ALIGN="LEFT">20</TD>
<TD ALIGN="LEFT">RESEARCH</TD>
<TD ALIGN="LEFT">DALLAS</TD>
</TR>
<TR>
<TD ALIGN="LEFT">30</TD>
<TD ALIGN="LEFT">SALES</TD>
<TD ALIGN="LEFT">CHICAGO</TD>
</TR>
<TR>
<TD ALIGN="LEFT">40</TD>
<TD ALIGN="LEFT">OPERATIONS</TD>
<TD ALIGN="LEFT">BOSTON</TD>
</TR>
</TABLE>
```

A Web browser would format this to look like the following table:

DEPTNO	DNAME	LOC
10	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS
30	SALES	CHICAGO

TODATE Function

This function converts the DATETYPE Datatype to the standard Oracle DATE type.

Syntax

```
OWA_UTIL.TODATE(
   p_dateArray      IN     dateType)
 RETURN DATE;
```

Parameters

Table 219–14 TODATE Function Parameters

Parameter	Description
p_dateArray	The value to convert.

WHO_CALLED_ME Procedure

This procedure returns information (in the form of output parameters) about the PL/SQL code unit that invoked it.

Syntax

```
OWA_UTIL.WHO_CALLED_ME(
   owner          OUT      VARCHAR2,
   name           OUT      VARCHAR2,
   lineno         OUT      NUMBER,
   caller_t       OUT      VARCHAR2);
```

Parameters

Table 219–15 WHO_CALLED_ME Procedure Parameters

Parameter	Description
owner	The owner of the program unit.
name	The name of the program unit. This is the name of the package, if the calling program unit is wrapped in a package, or the name of the procedure or function if the calling program unit is a standalone procedure or function. If the calling program unit is part of an anonymous block, this is NULL.
lineno	The line number within the program unit where the call was made.
caller_t	The type of program unit that made the call. The possibilities are: package body, anonymous block, procedure, and function. Procedure and function are only for standalone procedures and functions.

220

SDO_CS

The SDO_CS package contains functions and procedures for working with coordinate systems. You can perform explicit coordinate transformations on a single geometry or an entire layer of geometries (that is, all geometries in a specified column in a table).

Documentation of SDO_CS

For a complete description of this package within the context of Oracle Spatial, see `SDO_CS` in the *Oracle Spatial and Graph Developer's Guide*.

221

SDO_CSW_PROCESS

The SDO_CSW_PROCESS package contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW).

Documentation of SDO_CSW_PROCESS

For a complete description of this package within the context of Oracle Spatial, see `SDO_CSW_PROCESS` in the *Oracle Spatial and Graph Developer's Guide*.

222

SDO_GCDR

The SDO_GCDR package contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.

Documentation of SDO_GCDR

For a complete description of this package within the context of Oracle Spatial, see SDO_GCDR in *Oracle Spatial and Graph Developer's Guide*.

223

SDO_GEOM

The SDO_GEOM package contains the geometry functions, which can be grouped into the following categories (with examples of each):

- Relationship (True/False) between two objects: RELATE, WITHIN_DISTANCE
- Validation: VALIDATE_GEOMETRY_WITH_CONTEXT, VALIDATE_LAYER_WITH_CONTEXT
- Single-object operations: SDO_ARC_DENSIFY, SDO_AREA, SDO_BUFFER, SDO_CENTROID, SDO_CONVEXHULL, SDO_LENGTH, SDO_MBR, SDO_POINTONSURFACE
- Two-object operations: SDO_DISTANCE, SDO_DIFFERENCE, SDO_INTERSECTION, SDO_UNION, SDO_XOR

This chapter contains the following topic:

Documentation of SDO_GEOM

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOM` in the *Oracle Spatial and Graph Developer's Guide.*

224

SDO_GEOR

The SDO_GEOR package contains functions and procedures for the Oracle Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated spatial vector geometry data and metadata.

Documentation of SDO_GEOR

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

225

SDO_GEOR_ADMIN

The SDO_GEOR_ADMIN package contains subprograms for administrative operations related to GeoRaster.

Documentation of SDO_GEOR_ADMIN

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_ADMIN` in the *Oracle Spatial and Graph GeoRaster Developer's Guide.*

226

SDO_GEOR_AGGR

The SDO_GEOR_AGGR package provides an interface to the SDO_GEOR_AGGR package for performing aggregate operations on GeoRaster objects.

Documentation of SDO_GEOR_AGGR

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_AGGR` in the *Oracle Spatial and Graph GeoRaster Developer's Guide.*

227

SDO_GEOR_RA

The SDO_GEOR_RA package provides an interface to the SDO_GEOR_RA package for performing raster algebra and analytic operations related to GeoRaster.

- Documentation of SDO_GEOR_RA

Documentation of SDO_GEOR_RA

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_RA` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

228

SDO_GEOR_UTL

The SDO_GEOR_UTL package contains utility functions and procedures for the Oracle Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.

Documentation of SDO_GEOR_UTL

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_UTL` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

229

SDO_LRS

The SDO_LRS package contains functions that create, modify, query, and convert linear referencing elements.

Documentation of SDO_LRS

For a complete description of this package within the context of Oracle Spatial, see `SDO_LRS` in the *Oracle Spatial and Graph Developer's Guide.*

230

SDO_MIGRATE

The SDO_MIGRATE package lets you upgrade geometry tables from previous releases of Oracle Spatial.

- Documentation of SDO_MIGRATE

Documentation of SDO_MIGRATE

For a complete description of this package within the context of Oracle Spatial, see `SDO_MIGRATE` in the *Oracle Spatial and Graph Developer's Guide*.

231

SDO_NET

The SDO_NET package contains functions and procedures for working with data modeled as nodes and links in a network.

- Documentation of SDO_NET

Documentation of SDO_NET

For a complete description of this package within the context of Oracle Spatial, see `SDO_NET` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide.*

232

SDO_OLS

The SDO_OLS package contains subprograms for Spatial OpenLS support.

- Documentation of SDO_OLS

Documentation of SDO_OLS

For a complete description of this package within the context of Oracle Spatial, see `SDO_OLS` in the *Oracle Spatial and Graph Developer's Guide.*

233

SDO_PC_PKG

The SDO_PC_PKG package contains subprograms to support the use of point clouds in Spatial.

- Documentation of SDO_PC_PKG

Documentation of SDO_PC_PKG

For a complete description of this package within the context of Oracle Spatial, see `SDO_PC_PKG` in the *Oracle Spatial and Graph Developer's Guide*.

234

SDO_SAM

The SDO_SAM package contains functions and procedures for spatial analysis and data mining.

Documentation of SDO_SAM

For a complete description of this package within the context of Oracle Spatial, see `SDO_SAM` in the *Oracle Spatial and Graph Developer's Guide.*

235

SDO_TIN_PKG

The SDO_TIN_PKG package contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial.

Documentation of SDO_TIN_PKG

For a complete description of this package within the context of Oracle Spatial, see `SDO_TIN_PKG` in the *Oracle Spatial and Graph Developer's Guide*.

236

SDO_TOPO

The SDO_TOPO package contains subprograms for creating and managing Oracle Spatial topologies.

Documentation of SDO_TOPO

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide.*

237

SDO_TOPO_MAP

The SDO_TOPO_MAP package contains subprograms for editing Oracle Spatial topologies using a cache (TopoMap object).

Documentation of SDO_TOPO_MAP

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO_MAP` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide.*

238

SDO_TUNE

The SDO_TUNE package contains Spatial tuning functions and procedures.

- Documentation of SDO_TUNE

Documentation of SDO_TUNE

For complete description of this package within the context of Oracle Spatial, see `SDO_TUNE` in the *Oracle Spatial and Graph Developer's Guide.*

239

SDO_UTIL

The SDO_UTIL package contains the utility functions and procedures for Oracle Spatial.

- Documentation of SDO_UTIL

Documentation of SDO_UTIL

For complete description of this package within the context of Oracle Spatial, see `SDO_UTIL` in the *Oracle Spatial and Graph Developer's Guide.*

240

SDO_WFS_LOCK

The SDO_WFS_LOCK package contains subprograms for WFS support for registering and unregistering feature tables. Registering a feature table enables the table for WFS transaction locking; unregistering a feature table disables the table for WFS transaction locking.

Documentation of SDO_WFS_LOCK

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_LOCK` in the *Oracle Spatial and Graph Developer's Guide*.

241

SDO_WFS_PROCESS

The SDO_WFS_PROCESS package contains subprograms for various processing operations related to support for Web Feature Services.

Documentation of SDO_WFS_PROCESS

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_PROCESS` in the *Oracle Spatial and Graph Developer's Guide*.

242

SEM_APIS

The `SEM_APIS` package contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.

Documentation of SEM_APIS

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_APIS` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

243

SEM_OLS

The SEM_OLS package provides an interface to the SEM_OLS package for providing triple-level security to RDF data, using Oracle Label Security (OLS).

Documentation of SEM_OLS

For a complete description of this package, see `SEM_OLS` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

244

SEM_PERF

The `SEM_PERF` package contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database.

Documentation of SEM_PERF

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_PERF` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

245

SEM_RDFCTX

The SEM_RDFCTX package contains subprograms for managing extractor policies and semantic indexes created for documents.

- Documentation of SEM_RDFCTX

Documentation of SEM_RDFCTX

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFCTX` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

246

SEM_RDFSA

The SEM_RDFSA package contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS).

Documentation of SEM_RDFSA

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFSA` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

247

UTL_CALL_STACK

The `UTL_CALL_STACK` package provides an interface to provide information about currently executing subprograms. Functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. Other functions return error stack information.

See Also:

- *Oracle Database PL/SQL Language Reference* regarding Conditional Compilation
- *Oracle Database Development Guide* regarding Using PL/Scope and Using the PL/SQL Hierarchical Profiler

This chapter contains the following topics:

Using UTL_CALL_STACK

Overview

The UTL_CALL_STACK package provides an interface for PL/SQL programmers to obtain information about currently executing programs including the subprogram name from dynamic and lexical stacks and the depths of those stacks. Individual functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. More functions return error stack information. Such information can be used to create more revealing error logs and application execution traces.

Dynamic Depth

The dynamic depth of an executing instance of a PL/SQL subprogram is defined recursively.

- The dynamic depth of the currently executing subprogram instance is one.
- Otherwise, the dynamic depth of the subprogram instance is one more than the dynamic depth of the subprogram it invoked.
- If there is a SQL, Java, or other non-PL/SQL context that invoked or was invoked by an executing subprogram, it occupies a level on the call stack as if it were a subprogram.

In the case of a call stack in which A calls B, which calls C, which calls D, which calls E, which calls F, which calls E, this stack can be written as a line with the dynamic depths underneath:

```
A B C D E F E
7 6 5 4 3 2 1
```

Lexical Depth

The lexical depth of a PL/SQL subprogram is defined recursively.

- The lexical depth of a unit, an anonymous block, trigger, or ADT is one (1).
- The lexical depth of a subprogram defined within another object is one plus the lexical depth of that object.

Blocks do not affect lexical depth.

Error Depth

The error depth is the number of errors on the error stack.

For example, consider the following anonymous block.

```
BEGIN
  BEGIN
    ... (1)
    raise zero_divide;
  EXCEPTION
    when others then
      raise no_data_found;
  END;
EXCEPTION
  WHEN others THEN
    ... (2)
END;
```

The error depth at (1) is zero and at (2) is two.

Backtrace

The backtrace is a trace from where the exception was thrown to where the backtrace was examined.

Consider a call stack in which A calls B which calls C and C raises an exception. If the backtrace was examined in C, the backtrace would have one unit, C, and the backtrace depth would be one. If it was examined in A, it would have three units, A, B and C, and backtrace depth would be three.

The depth of a backtrace is zero in the absence of an exception.

Security Model

EXECUTE on UTL_CALL_STACK is granted to PUBLIC.

The UTL_CALL_STACK package does not show wrapped program units. For example, consider a call stack in which program unit A calls B, which calls C, and in turn calls UTL_CALL_STACK to determine the subprogram list. If program unit B is wrapped, then the subprogram list onlys shows program unit C.

Operational Notes

Compiler optimizations can change lexical, dynamic and backtrace depth.

`UTL_CALL_STACK` is not supported past RPC boundaries. For example, if A calls remote procedure B, B will not be able to obtain information about A using `UTL_CALL_STACK`.

Lexical unit information is available through the PL/SQL conditional compilation feature and is therefore not exposed through `UTL_CALL_STACK`.

Exceptions

The following table lists the exceptions raised by UTL_CALL_STACK.

Table 247–1 Exceptions Raised by UTL_CALL_STACK

Exception	Error Code	Description
BAD_DEPTH_INDICATOR	64610	This exception is raised when a provided depth is out of bounds. Dynamic and lexical depth are positive integer values. Error and backtrace depths are non-negative integer values and are zero only in the absence of an exception.

Data Structures

The `UTL_CALL_STACK` package defines a `VARRAY` type, `UNIT_QUALIFIED_NAME`.

VARRAY Type

- UNIT_QUALIFIED_NAME

UNIT_QUALIFIED_NAME

```
TYPE UNIT_QUALIFIED_NAME IS VARRAY(256) OF VARCHAR2(32767);
```

This data structure is a varray whose individual elements are, in order, the unit name, any lexical parents of the subprogram, and the subprogram name.

Example

Consider the following contrived PL/SQL procedure:

```
PROCEDURE topLevel IS
  FUNCTION localFunction(...) RETURNS VARCHAR2 IS
    FUNCTION innerFunction(...) RETURNS VARCHAR2 IS
      BEGIN
        DECLARE
          localVar PLS_INTEGER;
        BEGIN
          ... (1)
        END;
      END;
  BEGIN
    ...
  END;
```

The unit qualified name at (1) would be

```
["topLevel", "localFunction", "innerFunction"]
```

If the unit were an anonymous block, the unit name would be `"__anonymous_block"`

Summary of UTL_CALL_STACK Subprograms

Table 247–2 UTL_CALL_STACK Package Subprograms

Subprogram	Description
BACKTRACE_DEPTH Function on page 247-11	Returns the number of backtrace items in the backtrace
BACKTRACE_LINE Function on page 247-12	Returns the line number of the unit at the specified backtrace depth
BACKTRACE_UNIT Function on page 247-13	Returns the name of the unit at the specified backtrace depth
CURRENT_EDITION Function on page 247-14	Returns the current edition name of the unit of the subprogram at the specified dynamic depth
CONCATENATE_ SUBPROGRAM Function on page 247-15	Returns a concatenated form of a unit-qualified name
DYNAMIC_DEPTH Function on page 247-16	Returns the number of subprograms on the call stack
ERROR_DEPTH Function on page 247-17	Returns the number of errors on the error stack
ERROR_MSG Function on page 247-18	Returns the error message of the error at the specified error depth
ERROR_NUMBER Function on page 247-19	Returns the error number of the error at the specified error depth
LEXICAL_DEPTH Function on page 247-20	Returns the lexical nesting level of the subprogram at the specified dynamic depth
OWNER Function on page 247-21	Returns the owner name of the unit of the subprogram at the specified dynamic depth
UNIT_LINE Function on page 247-22	Returns the line number of the unit of the subprogram at the specified dynamic depth
SUBPROGRAM Function on page 247-23	Returns the unit-qualified name of the subprogram at the specified dynamic depth

BACKTRACE_DEPTH Function

This function returns the number of backtrace items in the backtrace.

Syntax

```
UTL_CALL_STACK.BACKTRACE_DEPTH
 RETURN PLS_INTEGER;
```

Return Values

The number of backtrace items in the backtrace, zero in the absence of an exception.

BACKTRACE_LINE Function

This function returns the line number of the unit at the specified backtrace depth.

Syntax

```
UTL_CALL_STACK.BACKTRACE_LINE (
   backtrace_depth   IN   PLS_INTEGER)
 RETURN PLS_INTEGER;
```

Parameters

Table 247–3 BACKTRACE_LINE Function Parameters

Parameter	Description
backtrace_depth	Depth in backtrace

Return Values

The line number of the unit at the specified backtrace depth

BACKTRACE_UNIT Function

This function returns the name of the unit at the specified backtrace depth.

Syntax

```
UTL_CALL_STACK.BACKTRACE_UNIT (
   backtrace_depth   IN   PLS_INTEGER)
 RETURN VARCHAR2;
```

Parameters

Table 247–4 BACKTRACE_UNIT Function Parameters

Parameter	Description
backtrace_depth	Depth in backtrace

Return Values

The name of the unit at the specified backtrace depth

CURRENT_EDITION Function

This function returns the current edition name of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.CURRENT_EDITION (
   dynamic_depth    IN    PLS_INTEGER)
 RETURN VARCHAR2;
```

Parameters

Table 247–5 CURRENT_EDITION Function Parameters

Parameter	Description
dynamic_depth	Depth in the error stack

Return Values

The current edition name of the unit of the subprogram at the specified dynamic depth

CONCATENATE_SUBPROGRAM Function

This function returns a concatenated form of a unit-qualified name.

Syntax

```
UTL_CALL_STACK.CONCATENATE_SUBPROGRAM (
   qualified_name    IN    UNIT_QUALIFIED_NAME)
 RETURN VARCHAR2;
```

Parameters

Table 247–6 CONCATENATE_SUBPROGRAM Function Parameters

Parameter	Description
qualified_name	A unit-qualified name

Return Values

A string of the form UNIT.SUBPROGRAM.LOCAL_SUBPROGRAM

DYNAMIC_DEPTH Function

This function returns the number of subprograms on the call stack.

Syntax

```
UTL_CALL_STACK.DYNAMIC_DEPTH
 RETURN PLS_INTEGER;
```

Return Values

The number of subprograms on the call stack

ERROR_DEPTH Function

This function returns the number of errors on the error stack.

Syntax

```
UTL_CALL_STACK.ERROR_DEPTH
 RETURN PLS_INTEGER;
```

Return Values

The number of errors on the error stack

ERROR_MSG Function

This function returns the error message of the error at the specified error depth.

Syntax

```
UTL_CALL_STACK.ERROR_MSG (
   error_depth    IN    PLS_INTEGER)
 RETURN VARCHAR2;
```

Parameters

Table 247–7 ERROR_MSG Function Parameters

Parameter	Description
error_depth	Depth in the error stack

Return Values

The error message of the error at the specified error depth.

ERROR_NUMBER Function

This function returns the error number of the error at the specified error depth.

Syntax

```
UTL_CALL_STACK.ERROR_NUMBER (
   error_depth    IN    PLS_INTEGER)
 RETURN PLS_INTEGER;
```

Parameters

Table 247–8 ERROR_NUMBER Function Parameters

Parameter	Description
error_depth	Depth in the call stack

Return Values

The error number of the error at the specified error depth

LEXICAL_DEPTH Function

This function returns the lexical nesting level of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.LEXICAL_DEPTH (
   dynamic_depth    IN    PLS_INTEGER)
 RETURN PLS_INTEGER;
```

Parameters

Table 247–9 LEXICAL_DEPTH Function Parameters

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

The lexical nesting level of the subprogram at the specified dynamic depth

OWNER Function

This function returns the owner name of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.OWNER (
   dynamic_depth    IN    PLS_INTEGER)
 RETURN VARCHAR2;
```

Parameters

Table 247–10 OWNER Function Parameters

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

The owner name of the unit of the subprogram at the specified dynamic depth

UNIT_LINE Function

This function returns the line number of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.UNIT_LINE (
   dynamic_depth    IN    PLS_INTEGER)
 RETURN PLS_INTEGER;
```

Parameters

Table 247–11 UNIT_LINE Function Parameters

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

The line number of the unit of the subprogram at the specified dynamic depth

SUBPROGRAM Function

This function returns the unit-qualified name of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.SUBPROGRAM (
   dynamic_depth    IN    PLS_INTEGER)
 RETURN UNIT_QUALIFIED_NAME;
```

Parameters

Table 247–12 SUBPROGRAM Function Parameters

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

Returns the unit-qualified name of the subprogram at the specified dynamic depth

248

UTL_COLL

The UTL_COLL package lets PL/SQL programs use collection locators to query and update.

This chapter contains the following topics:

Summary of UTL_COLL Subprograms

Table 248–1 UTL_COLL Package Subprograms

Subprogram	Description
IS_LOCATOR Function on page 248-3	Determines whether a collection item is actually a locator or not

IS_LOCATOR Function

This function determines whether a collection item is actually a locator or not.

Syntax

```
UTL_COLL.IS_LOCATOR (
   coln IN STANDARD)
  RETURNS BOOLEAN;
```

Pragmas

Asserts `WNDS`, `WNPS` and `RNPS` pragmas

Parameters

Table 248–2 IS_LOCATOR Function Parameters

Parameter	Description
`coln`	Nested table or varray item.

Return Values

Table 248–3 IS_LOCATOR Function Return Values

Return Value	Description
`1`	Collection item is indeed a locator.
`0`	Collection item is not a locator.

Examples

```
CREATE OR REPLACE TYPE list_t as TABLE OF VARCHAR2(20);
/

CREATE OR REPLACE TYPE phone_book_t AS OBJECT (
  pno  number,
  ph   list_t );
/

CREATE TABLE phone_book OF phone_book_t
      NESTED TABLE ph STORE AS nt_ph;
CREATE TABLE phone_book1 OF phone_book_t
      NESTED TABLE ph STORE AS nt_ph_1 RETURN LOCATOR;

INSERT INTO phone_book VALUES(1, list_t('650-633-5707','650-323-0953'));
INSERT INTO phone_book1 VALUES(1, list_t('415-555-1212'));

CREATE OR REPLACE PROCEDURE chk_coll IS
  plist list_t;
  plist1 list_t;
BEGIN
  SELECT ph INTO plist FROM phone_book WHERE pno=1;

  SELECT ph INTO plist1 FROM phone_book1 WHERE pno=1;

  IF (UTL_COLL.IS_LOCATOR(plist)) THEN
```

```
    DBMS_OUTPUT.PUT_LINE('plist is a locator');
  ELSE
    DBMS_OUTPUT.PUT_LINE('plist is not a locator');
  END IF;

  IF (UTL_COLL.IS_LOCATOR(plist1)) THEN
    DBMS_OUTPUT.PUT_LINE('plist1 is a locator');
  ELSE
    DBMS_OUTPUT.PUT_LINE('plist1 is not a locator');
  END IF;

END chk_coll;

SET SERVEROUTPUT ON
EXECUTE chk_coll;
```

249

UTL_COMPRESS

The `UTL_COMPRESS` package provides a set of data compression utilities.

This chapter contains the following topics:

Using UTL_COMPRESS

Constants

Define max number of handles for piecewise operations:

```
UTLCOMP_MAX_HANDLE   CONSTANT  PLS_INTEGER := 5;
```

Exceptions

Table 249–1 UTL_COMPRESS Exceptions

Exception	Description
BUFFER_TOO_SMALL	The compressed representation is too big.
DATA_ERROR	The input or output data stream was found to be an invalid format.
INVALID_ARGUMENT	One of the arguments was an invalid type or value.
INVALID_HANDLE	Invalid handle for piecewise compress or uncompress.
STREAM_ERROR	An error occurred during compression or uncompression of the data stream

Operational Notes

- It is the caller's responsibility to free the temporary LOB returned by the LZ* functions with DBMS_LOB.FREETEMPORARY call.
- A BFILE passed into LZ_COMPRESS* or lZ_UNCOMPRESS* has to be opened by DBMS_LOB.FILEOPEN.
- Under special circumstances (especially if the input has already been compressed) the output produced by one of the UTL_COMPRESS subprograms may be the same size, or even slightly larger than, the input.
- The output of the UTL_COMPRESS compressed data is compatible with gzip(with -n option)/gunzip on a single file.

Summary of UTL_COMPRESS Subprograms

Table 249–2 UTL_COMPRESS Package Subprograms

Subprogram	Description
ISOPEN Function on page 249-7	Checks to see if the handle to a piecewise (un)compress context is open or closed
LZ_COMPRESS Functions and Procedures on page 249-8	Compresses data using Lempel-Ziv compression algorithm
LZ_COMPRESS_ADD Procedure on page 249-10	Adds a piece of compressed data
LZ_COMPRESS_CLOSE on page 249-11	Closes and finishes piecewise compress operation
LZ_COMPRESS_OPEN on page 249-12	Initializes a piecewise context that maintains the compress state and data
LZ_UNCOMPRESS Functions and Procedures on page 249-13	Accepts compressed input, verifies it to be a valid and uncompresses it
LZ_UNCOMPRESS_EXTRACT Procedure on page 249-14	Extracts a piece of uncompressed data
LZ_UNCOMPRESS_OPEN Function on page 249-15	Initializes a piecewise context that maintains the uncompress state and data
LZ_UNCOMPRESS_CLOSE Procedure on page 249-16	Closes and finishes the piecewise uncompress

ISOPEN Function

This function checks to see if the handle to a piecewise (un)compress context is open or closed.

Syntax

```
UTL_COMPRESS.ISOPEN(
   handle in binary_integer)
 RETURN BOOLEAN;
```

Parameters

Table 249–3 ISOPEN Function Parameters

Parameter	Description
handle	The handle to a piecewise uncompress context.

Return Values

TRUE if the given piecewise handle is opened, otherwise FALSE.

Examples

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) then
   UTL_COMPRESS.LZ_COMPRESS_CLOSE(myhandle, lob_1);
END IF;
```

Alternatively:

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) THEN
   UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(myhandle);
END IF;
```

LZ_COMPRESS Functions and Procedures

These functions and procedures compress data using Lempel-Ziv compression algorithm.

Syntax

This function accept a RAW as input, compress it and return the compressed RAW result and metadata:

```
UTL_COMPRESS.LZ_COMPRESS (
   src       IN           RAW,
   quality   IN           BINARY_INTEGER DEFAULT 6)
 RETURN RAW;
```

This function accept a BLOB as input, compress it and returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
  src       IN           BLOB,
  quality   IN           BINARY_INTEGER DEFAULT 6)
 RETURN BLOB;
```

This procedure returns the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
  src      IN            BLOB,
  dst      IN OUT NOCOPY BLOB,
  quality  IN            BINARY_INTEGER DEFAULT 6);
```

This function returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
   src     IN            BFILE,
   quality IN            BINARY_INTEGER DEFAULT 6)
 RETURN BLOB;
```

This procedure will return the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
   src     IN            BFILE,
   dst     IN OUT NOCOPY BLOB,
   quality IN            BINARY_INTEGER DEFAULT 6);
```

Parameters

Table 249–4 LZ_COMPRESS Function and Procedures Parameters

Parameter	Description
src	Data (RAW, BLOB or BFILE) to be compressed.
dst	Destination for compressed data
quality	An integer in the range 1 to 9, 1=fast compression, 9=best compression, default=6

Usage Notes

- `quality` is an optional compression tuning value. It allows the `UTL_COMPRESS` user to choose between speed and compression quality, meaning the percentage of reduction in size. A faster compression speed will result in less compression of the data. A slower compression speed will result in more compression of the data. Valid values are [1..9], with 1=fastest and 9=slowest. The default 'quality' value is 6.

LZ_COMPRESS_ADD Procedure

This procedure adds a piece of compressed data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_ADD (
   handle IN             BINARY_INTEGER,
   dst    IN OUT NOCOPY  BLOB,
   src    IN             RAW);
```

Parameters

Table 249–5 LZ_COMPRESS_ADD Procedure Parameters

Parameter	Description
handle	The handle to a piecewise compress context.
dst	The opened LOB from LZ_COMPRESS_OPEN to store compressed data.
src	The input data to be compressed.

Exceptions

- invalid_handle - out of range invalid or unopened handle.
- invalid_argument - NULL handle, src, dst, or invalid dst.

LZ_COMPRESS_CLOSE

This procedure closes and finishes piecewise compress operation.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_CLOSE (
   handle IN             BINARY_INTEGER,
   dst    IN OUT NOCOPY  BLOB);
```

Parameters

Table 249–6 LZ_COMPRESS_CLOSE Procedure Parameters

Parameter	Description
handle	The handle to a piecewise compress context.
dst	The opened LOB from LZ_COMPRESS_OPEN to store compressed data.

Exceptions

- invalid_handle - out of range invalid or uninitialized handle.
- invalid_argument - NULL handle, dst, or invalid dst.

LZ_COMPRESS_OPEN

This function initializes a piecewise context that maintains the compress state and data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_OPEN (
   dst       IN OUT NOCOPY BLOB,
   quality   IN            BINARY_INTEGER DEFAULT 6)
 RETURN BINARY_INTEGER;
```

Parameters

Table 249–7 LZ_COMPRESS_OPEN Function Parameters

Parameter	Description
`dst`	User supplied LOB to store compressed data.
`quality`	Speed versus efficiency of resulting compressed output. ■ Valid values are the range 1..9, with a default value of 6. ■ 1=fastest compression, 9=slowest compression and best compressed file size.

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - `NULL dst` or invalid quality specified.

Usage Notes

Close the opened handle with `LZ_COMPRESS_CLOSE`

- once the piecewise compress is completed
- in the event of an exception in the middle of process

because lack of doing so will cause these handles to leak.

LZ_UNCOMPRESS Functions and Procedures

This procedure accepts as input a RAW, BLOB or BFILE compressed string, verifies it to be a valid compressed value, uncompresses it using Lempel-Ziv compression algorithm, and returns the uncompressed RAW or BLOB result.

Syntax

This function returns uncompressed data as RAW:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  RAW)
  RETURN RAW;
```

This function returns uncompressed data as a temporary BLOB:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  BLOB)
  RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst), which will be trimmed to the uncompressed data size:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  BLOB,
   dst  IN OUT NOCOPY BLOB);
```

This function returns a temporary BLOB for the uncompressed data:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN BFILE)
 RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst). The original dst data will be overwritten.

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  BFILE,
   dst  IN OUT NOCOPY BLOB);
```

Parameters

Table 249–8 LZ_UNCOMPRESS Function and Procedures Parameters

Parameter	Description
src	Compressed data.
dst	Destination for uncompressed data.

LZ_UNCOMPRESS_EXTRACT Procedure

This procedure extracts a piece of uncompressed data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_EXTRACT(
   handle  IN          BINARY_INTEGER,
   dst     OUT NOCOPY  RAW);
```

Parameters

Table 249–9 LZ_UNCOMPRESS_EXTRACT Function Parameters

Parameter	Description
`handle`	The handle to a piecewise uncompress context.
`dst`	The uncompressed data.

Exceptions

- `no_data_found` - finished uncompress.
- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle.

LZ_UNCOMPRESS_OPEN Function

This function initializes a piecewise context that maintains the uncompress state and data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_OPEN(
   src  IN  BLOB)
  RETURN BINARY_INTEGER;
```

Parameters

Table 249–10 LZ_UNCOMPRESS_OPEN Function Parameters

Parameter	Description
src	The input data to be uncompressed.

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- invalid_handle - invalid handle, too many open handles.
- invalid_argument - NULL src.

Usage Notes

Close the opened handle with LZ_UNCOMPRESS_CLOSE

- once the piecewise uncompress is completed
- in the event of an exception in the middle of process

because lack of doing so will cause these handles to leak.

LZ_UNCOMPRESS_CLOSE Procedure

This procedure closes and finishes the piecewise uncompress.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(
   handle  IN   BINARY_INTEGER);
```

Parameters

Table 249–11 LZ_UNCOMPRESS_CLOSE Procedure Parameters

Parameter	Description
handle	The handle to a piecewise uncompress context.

Exceptions

- invalid_handle - out of range invalid or uninitialized handle.
- invalid_argument - NULL handle.

250

UTL_ENCODE

The UTL_ENCODE package provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts. You can use UTL_ENCODE functions to encode the body of email text. The package also contains the decode counterpart functions of the encode functions. The functions follow published standards for encoding to accommodate non-Oracle utilities on the sending or receiving ends.

This chapter contains the following topic:

Summary of UTL_ENCODE Subprograms

Table 250–1 UTL_ENCODE Package Subprograms

Subprogram	Description
BASE64_DECODE Function on page 250-3	Reads the base 64-encoded `RAW` input string and decodes it to its original `RAW` value
BASE64_ENCODE Function on page 250-4	Encodes the binary representation of the `RAW` value into base 64 elements and returns it in the form of a `RAW` string
MIMEHEADER_DECODE Function on page 250-5	Decodes a string from mime header format
MIMEHEADER_ENCODE Function on page 250-6	Encodes a string into mime header format
QUOTED_PRINTABLE_ DECODE Function on page 250-7	Reads the `varchar2` quoted printable format input string and decodes it to the corresponding `RAW` string
QUOTED_PRINTABLE_ ENCODE Function on page 250-8	Reads the `RAW` input string and encodes it to the corresponding quoted printable format string
TEXT_DECODE Function on page 250-9	Decodes a character set sensitive text string
TEXT_ENCODE Function on page 250-10	Encodes a character set sensitive text string
UUDECODE Function on page 250-11	Reads the `RAW` uuencode format input string and decodes it to the corresponding `RAW` string
UUENCODE Function on page 250-12	Reads the `RAW` input string and encodes it to the corresponding uuencode format string

BASE64_DECODE Function

This function reads the base 64-encoded `RAW` input string and decodes it to its original `RAW` value.

Syntax

```
UTL_ENCODE.BASE64_DECODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 250–2 BASE64_DECODE Function Parameters

Parameter	Description
`r`	The RAW string containing base 64-encoded data. There are no defaults or optional parameters.

Return Values

Table 250–3 BASE64_DECODE Function Return Values

Return	Description
`RAW`	Contains the decoded string

BASE64_ENCODE Function

This function encodes the binary representation of the RAW value into base 64 elements and returns it in the form of a RAW string.

Syntax

```
UTL_ENCODE.BASE64_ENCODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_encode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 250–4 BASE64_ENCODE Function Parameters

Parameter	Description
r	The RAW value to be encoded. There are no defaults or optional parameters.

Return Values

Table 250–5 BASE64_ENCODE Function Return Values

Return	Description
RAW	Contains the encoded base 64 elements

MIMEHEADER_DECODE Function

This function accepts as input an "encoded word" of the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some encoded text?=
```

The <encoded text> is encapsulated in mime header tags which give the MIMEHEADER_DECODE function information about how to decode the string. The mime header metadata tags are stripped from the input string and the <encoded text> is converted to the base database character set as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

The string is decoded using either quoted-printable or base64 decoding, as specified by the <encoding> metadata tag in the encoded word. The resulting converted and decoded text is returned to the caller as a VARCHAR2 string.

Syntax

```
UTL_ENCODE.MIMEHEADER_DECODE (
   buf    IN   VARCHAR2 CHARACTER SET ANY_CS)
  RETURN data VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 250–6 MIMEHEADER_DECODE Function Parameters

Parameter	Description
buf	The encoded text data with mime header format tags.

Return Values

Table 250–7 MIMEHEADER_DECODE Function Return Values

Return	Description
data	The encoded text data with mime header format tags

Examples

```
v2:=utl_encode.mimeheader_decode('=?ISO-8859-1?Q?Here is some encoded text?=');
```

MIMEHEADER_ENCODE Function

This function returns as an output an "encoded word" of the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some text?=
```

The buf input parameter is the text to be encoded and becomes the <encoded text>.

The <encoding> value is either "Q" or "B" for quoted-printable encode or base64 encoding respectively. The ENCODING input parameter accepts as valid values UTL_ENCODE.QUOTED_PRINTABLE or UTL_ENCODE.BASE64 or NULL. If NULL, quoted-printable encoding is selected as a default value.

The <charset> value is specified as the input parameter encode_charset. If NULL, the database character set is selected as a default value.

The mimeheader encoding process includes conversion of the buf input string to the character set specified by the encode_charset parameter. The converted string is encoded to either quoted-printable or base64 encoded format. The mime header tags are appended and prepended.

Finally, the string is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed.

Syntax

```
UTL_ENCODE.MIMEHEADER_ENCODE (
   buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
   encode_charset IN  VARCHAR2 DEFAULT NULL,
   encoding       IN  PLS_INTEGER DEFAULT NULL)
 RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 250–8 MIMEHEADER_ENCODE Function Parameters

Parameter	Description
buf	The text data.
encode_charset	The target character set.
encoding	The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL

Return Values

Table 250–9 MIMEHEADER_ENCODE Function Return Values

Return	Description
string	A VARCHAR2 encoded string with mime header format tags.

QUOTED_PRINTABLE_DECODE Function

This function reads the varchar2 quoted printable format input string and decodes it to the corresponding RAW string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_DECODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 250–10 QUOTED_PRINTABLE_DECODE Function Parameters

Parameters	Description
r	The RAW string containing a quoted printable data string. There are no defaults or optional parameters.

Return Values

Table 250–11 QUOTED_PRINTABLE_DECODE Function Return Values

Return	Description
RAW	The decoded string

QUOTED_PRINTABLE_ENCODE Function

This function reads the RAW input string and encodes it to the corresponding quoted printable format string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_ENCODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_encode, WNDS, RNDS,WNPS, RNPS);
```

Parameters

Table 250–12 QUOTED_PRINTABLE_ENCODE Function Parameters

Parameter	Description
r	The RAW string. There are no defaults or optional parameters.

Return Values

Table 250–13 QUOTED_PRINTABLE_ENCODE Function Return Values

Return	Description
RAW	Contains the quoted printable string

TEXT_DECODE Function

This function converts the input text to the target character set as specified by the encode_charset parameter, if not NULL. The encoded text is converted to the base character set of database, as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

You can decode from either quoted-printable or base64 format, with regard to each encoding parameter. If NULL, quoted-printable is selected as a default decoding format. If encode_charset is not NULL, you convert the string from the specified character set to the database character set. The resulting decoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_DECODE(
   buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
   encode_charset IN  VARCHAR2 DEFAULT NULL,
   encoding       IN  PLS_INTEGER DEFAULT NULL)
 RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 250–14 TEXT_DECODE Function Parameters

Parameter	Description
buf	The encoded text data.
encode_charset	The source character set.
encoding	The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL.

Return Values

Table 250–15 TEXT_DECODE Function Return Values

Return	Description
string	A VARCHAR2 decoded text string.

Examples

```
v2:=UTL_ENCODE.TEXT_DECODE(
     'Here is some text',
      WE8ISO8859P1,
      UTL_ENCODE.BASE64);
```

TEXT_ENCODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not `NULL`. The text is encoded to either base64 or quoted-printable format, as specified by the `encoding` parameter. Quoted-printable is selected as a default if ENCODING is NULL.

The encoded text is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed

The resulting encoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_ENCODE (
   buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
   encode_charset IN  VARCHAR2 DEFAULT NULL,
   encoding       IN  PLS_INTEGER DEFAULT NULL)
 RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 250–16 TEXT_ENCODE Function Parameters

Parameter	Description
`buf`	The text data.
`encode_charset`	The target character set.
`encoding`	The encoding format. Valid values are `UTL_ENCODE.BASE64`, `UTL_ENCODE.QUOTED_PRINTABLE` and `NULL`

Return Values

Table 250–17 TEXT_ENCODE Function Return Values

Return	Description
`string`	A `VARCHAR2` encoded string with mime header format tags.

Examples

```
v2:=utl_encode.text_encode(
   'Here is some text',
   'WE8ISO8859P1',
    UTL_ENCODE.BASE64);
```

UUDECODE Function

This function reads the RAW uuencode format input string and decodes it to the corresponding RAW string. See "UUENCODE Function" on page 250-12 for discussion of the cumulative nature of UUENCODE and UUDECODE for data streams.

Syntax

```
UTL_ENCODE.UUDECODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uudecode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 250–18 UUDECODE Function Parameters

Parameter	Description
r	The RAW string containing the uuencoded data string. There are no defaults or optional parameters.

Return Values

Table 250–19 UUDECODE Function Return Values

Return	Description
RAW	The decoded RAW string

UUENCODE Function

This function reads the RAW input string and encodes it to the corresponding uuencode format string. The output of this function is cumulative, in that it can be used to encode large data streams, by splitting the data stream into acceptably sized RAW values, encoded, and concatenated into a single encoded string.

Syntax

```
UTL_ENCODE.UUENCODE (
   r          IN RAW,
   type       IN PLS_INTEGER DEFAULT 1,
   filename   IN VARCHAR2 DEFAULT NULL,
   permission IN VARCHAR2 DEFAULT NULL) RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uuencode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 250–20 UUENCODE Function Parameters

Parameter	Description
r	RAW string
type	Optional number parameter containing the type of uuencoded output. Options: complete—a defined PL/SQL constant with a value of 1. (default) header_piece ...middle_piece ...end_piece
filename	Optional varchar2 parameter containing the uuencode filename; the default is uuencode.txt
permission	Optional varchar2 parameter containing the permission mode; the default is 0 (a text string zero).

Return Values

Table 250–21 UUENCODE Function Return Values

Return	Description
RAW	Contains the uuencode format string

251

UTL_FILE

With the `UTL_FILE` package, PL/SQL programs can read and write operating system text files. `UTL_FILE` provides a restricted version of operating system stream file I/O.

This chapter contains the following topics:

Using UTL_FILE

Security Model

The set of files and directories that are accessible to the user through UTL_FILE is controlled by a number of factors and database parameters. Foremost of these is the set of directory objects that have been granted to the user. The nature of directory objects is discussed in the *Oracle Database SQL Language Reference*.

Assuming the user has both READ and WRITE access to the directory object USER_DIR, the user can open a file located in the operating system directory described by USER_DIR, but not in subdirectories or parent directories of this directory.

Lastly, the client (text I/O) and server implementations are subject to operating system file permission checking.

UTL_FILE provides file access both on the client side and on the server side. When run on the server, UTL_FILE provides access to all operating system files that are accessible from the server. On the client side, as in the case for Forms applications, UTL_FILE provides access to operating system files that are accessible from the client.

In the past, accessible directories for the UTL_FILE functions were specified in the initialization file using the UTL_FILE_DIR parameter. However, UTL_FILE_DIR access is no longer recommended. Oracle recommends that you instead use the directory object feature, which replaces UTL_FILE_DIR. Directory objects offer more flexibility and granular control to the UTL_FILE application administrator, can be maintained dynamically (that is, without shutting down the database), and are consistent with other Oracle tools. CREATE ANY DIRECTORY privilege is granted only to SYS and SYSTEM by default.

Note: Use the CREATE DIRECTORY feature instead of UTL_FILE_DIR for directory access verification.

Note that neither hard nor symbolic links are supported.

On UNIX systems, the owner of a file created by the FOPEN function is the owner of the shadow process running the instance. Normally, this owner is ORACLE. Files created using FOPEN are always writable and readable using the UTL_FILE subprograms. However, non-privileged operating system users who need to read these files outside of PL/SQL may need access from a system administrator.

Caution: The privileges needed to access files in a directory object are operating system specific. UTL_FILE directory object privileges give you read and write access to all files within the specified directory.

Operational Notes

The file location and file name parameters are supplied to the FOPEN function as separate strings, so that the file location can be checked against the list of accessible directories as specified by the ALL_DIRECTORIES view of accessible directory objects. Together, the file location and name must represent a legal filename on the system, and the directory must be accessible. A subdirectory of an accessible directory is not necessarily also accessible; it too must be specified using a complete path name matching an ALL_DIRECTORIES object.

UTL_FILE implicitly interprets line terminators on read requests, thereby affecting the number of bytes returned on a GET_LINE call. For example, the len parameter of UTL_FILE.GET_LINE specifies the requested number of bytes of character data. The number of bytes actually returned to the user will be the lesser of:

- The GET_LINE len parameter, or
- The number of bytes until the next line terminator character, or
- The max_linesize parameter specified by UTL_FILE.FOPEN

The FOPEN max_linesize parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies a default value of 1024. The GET_LINE len parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies the default value of max_linesize. If max_linesize and len are defined to be different values, then the lesser value takes precedence.

UTL_FILE.GET_RAW ignores line terminators.

UTL_FILE expects that files opened by UTL_FILE.FOPEN in text mode are encoded in the database character set. It expects that files opened by UTL_FILE.FOPEN_NCHAR in text mode are encoded in the UTF8 character set. If an opened file is not encoded in the expected character set, the result of an attempt to read the file is indeterminate. When data encoded in one character set is read and Globalization Support is told (such as by means of NLS_LANG) that it is encoded in another character set, the result is indeterminate. If NLS_LANG is set, it should therefore be the same as the database character set.

Rules and Limits

Operating system-specific parameters, such as C-shell environment variables under UNIX, cannot be used in the file location or file name parameters.

UTL_FILE I/O capabilities are similar to standard operating system stream file I/O (OPEN, GET, PUT, CLOSE) capabilities, but with some limitations. For example, you call the FOPEN function to return a file handle, which you use in subsequent calls to GET_LINE or PUT to perform stream I/O to a file. When file I/O is done, you call FCLOSE to complete any output and free resources associated with the file.

Note: The UTL_FILE package is similar to the client-side TEXT_IO package currently provided by Oracle Procedure Builder. Restrictions for a server implementation require some API differences between UTL_FILE and TEXT_IO. In PL/SQL file I/O, errors are returned using PL/SQL exceptions.

Exceptions

Table 251–1 UTL_FILE Package Exceptions

Exception Name	Description
INVALID_PATH	File location is invalid.
INVALID_MODE	The open_mode parameter in FOPEN is invalid.
INVALID_FILEHANDLE	File handle is invalid.
INVALID_OPERATION	File could not be opened or operated on as requested.
READ_ERROR	Destination buffer too small, or operating system error occurred during the read operation
WRITE_ERROR	Operating system error occurred during the write operation.
INTERNAL_ERROR	Unspecified PL/SQL error
CHARSETMISMATCH	A file is opened using FOPEN_NCHAR, but later I/O operations use nonchar functions such as PUTF or GET_LINE.
FILE_OPEN	The requested operation failed because the file is open.
INVALID_MAXLINESIZE	The MAX_LINESIZE value for FOPEN() is invalid; it should be within the range 1 to 32767.
INVALID_FILENAME	The filename parameter is invalid.
ACCESS_DENIED	Permission to access to the file location is denied.
INVALID_OFFSET	Causes of the INVALID_OFFSET exception: ■ ABSOLUTE_OFFSET = NULL and RELATIVE_OFFSET = NULL, or ■ ABSOLUTE_OFFSET < 0, or ■ Either offset caused a seek past the end of the file
DELETE_FAILED	The requested file delete operation failed.
RENAME_FAILED	The requested file rename operation failed.

Procedures in UTL_FILE can also raise predefined PL/SQL exceptions such as NO_DATA_FOUND or VALUE_ERROR.

Examples

Example 1

Note: The examples are UNIX-specific.

Given the following:

```
SQL> CREATE DIRECTORY log_dir AS '/appl/gl/log';
SQL> GRANT READ ON DIRECTORY log_dir TO DBA;
SQL> GRANT WRITE ON DIRECTORY log_dir TO DBA;

SQL> CREATE DIRECTORY USER_DIR AS '/appl/gl/user'';
SQL> GRANT READ ON DIRECTORY USER_DIR TO PUBLIC;
SQL> GRANT WRITE ON DIRECTORY USER_DIR TO PUBLIC;
```

The following file locations and filenames are valid and accessible as follows:

File Location	Filename	READ and WRITE
/appl/gl/log	L12345.log	Users with DBA privilege
/appl/gl/user	u12345.tmp	All users

The following file locations and filenames are invalid:

File Location	Filename	Invalid Because
/appl/gl/log/backup	L12345.log	# subdirectories are not accessible
/APPL/gl/log	L12345.log	# directory strings must follow case sensitivity rules as required by the O/S
/appl/gl/log	backup/L1234.log	# filenames may not include portions of directory paths
/user/tmp	L12345.log	# no corresponding CREATE DIRECTORY command has been issued

Example 2

```
DECLARE
  V1 VARCHAR2(32767);
  F1 UTL_FILE.FILE_TYPE;
BEGIN
  -- In this example MAX_LINESIZE is less than GET_LINE's length request
  -- so the number of bytes returned will be 256 or less if a line terminator is
seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R',256);
  UTL_FILE.GET_LINE(F1,V1,32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, FOPEN's MAX_LINESIZE is NULL and defaults to 1024,
  -- so the number of bytes returned will be 1024 or less if a line terminator is
seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R');
  UTL_FILE.GET_LINE(F1,V1,32767);
```

```
  UTL_FILE.FCLOSE(F1);

  -- In this example, GET_LINE doesn't specify a number of bytes, so it defaults
to
  -- the same value as FOPEN's MAX_LINESIZE which is NULL in this case and
defaults to 1024.
  -- So the number of bytes returned will be 1024 or less if a line terminator is
seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R');
  UTL_FILE.GET_LINE(F1,V1);
  UTL_FILE.FCLOSE(F1);
END;
```

Data Structures

The UTL_FILE package defines a RECORD type.

Record Types

- FILETYPE Record Type

FILETYPE Record Type

The contents of FILE_TYPE are private to the UTL_FILE package. You should not reference or change components of this record.

```
TYPE file_type IS RECORD (
   id          BINARY_INTEGER,
   datatype    BINARY_INTEGER,
   byte_mode   BOOLEAN);
```

Fields

Table 251–2 FILE_TYPE Fields

Field	Description
id	A numeric value indicating the internal file handle number
datatype	Indicates whether the file is a CHAR file, Nchar file or other (binary)
byte_mode	Indicates whether the file was open as a binary file, or as a text file

Caution: Oracle does not guarantee the persistence of FILE_TYPE values between database sessions or within a single session. Attempts to clone file handles or use dummy file handles may have inderterminate outcomes.

Summary of UTL_FILE Subprograms

Table 251–3 UTL_FILE Subprograms

Subprogram	Description
FCLOSE Procedure on page 251-13	Closes a file
FCLOSE_ALL Procedure on page 251-14	Closes all open file handles
FCOPY Procedure on page 251-15	Copies a contiguous portion of a file to a newly created file
FFLUSH Procedure on page 251-16	Physically writes all pending output to a file
FGETATTR Procedure on page 251-17	Reads and returns the attributes of a disk file
FGETPOS Function on page 251-18	Returns the current relative offset position within a file, in bytes
FOPEN Function on page 251-19	Opens a file for input or output
FOPEN_NCHAR Function on page 251-21	Opens a file in Unicode for input or output
FREMOVE Procedure on page 251-22	Deletes a disk file, assuming that you have sufficient privileges
FRENAME Procedure on page 251-23	Renames an existing file to a new name, similar to the UNIX `mv` function
FSEEK Procedure on page 251-24	Adjusts the file pointer forward or backward within the file by the number of bytes specified
GET_LINE Procedure on page 251-25	Reads text from an open file
GET_LINE_NCHAR Procedure on page 251-26	Reads text in Unicode from an open file
GET_RAW Procedure on page 251-27	Reads a `RAW` string value from a file and adjusts the file pointer ahead by the number of bytes read
IS_OPEN Function on page 251-28	Determines if a file handle refers to an open file
NEW_LINE Procedure on page 251-29	Writes one or more operating system-specific line terminators to a file
PUT Procedure on page 251-30	Writes a string to a file
PUT_LINE Procedure on page 251-31	Writes a line to a file, and so appends an operating system-specific line terminator
PUT_LINE_NCHAR Procedure on page 251-32	Writes a Unicode line to a file
PUT_NCHAR Procedure on page 251-33	Writes a Unicode string to a file
PUTF Procedure on page 251-34	A `PUT` procedure with formatting

Table 251–3 (Cont.) UTL_FILE Subprograms

Subprogram	Description
PUTF_NCHAR Procedure on page 251-36	A `PUT_NCHAR` procedure with formatting, and writes a Unicode string to a file, with formatting
PUT_RAW Procedure on page 251-37	Accepts as input a `RAW` data value and writes the value to the output buffer

FCLOSE Procedure

This procedure closes an open file identified by a file handle.

Syntax

```
UTL_FILE.FCLOSE (
   file IN OUT FILE_TYPE);
```

Parameters

Table 251–4 FCLOSE Procedure Parameters

Parameter	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call

Usage Notes

If there is buffered data yet to be written when FCLOSE runs, then you may receive a WRITE_ERROR exception when closing a file.

Exceptions

```
WRITE_ERROR
INVALID_FILEHANDLE
```

FCLOSE_ALL Procedure

This procedure closes all open file handles for the session. This should be used as an emergency cleanup procedure, for example, when a PL/SQL program exits on an exception.

Syntax

```
UTL_FILE.FCLOSE_ALL;
```

Usage Notes

Note: `FCLOSE_ALL` does not alter the state of the open file handles held by the user. This means that an `IS_OPEN` test on a file handle after an `FCLOSE_ALL` call still returns `TRUE`, even though the file has been closed. No further read or write operations can be performed on a file that was open before an `FCLOSE_ALL`.

Exceptions

`WRITE_ERROR`

FCOPY Procedure

This procedure copies a contiguous portion of a file to a newly created file. By default, the whole file is copied if the `start_line` and `end_line` parameters are omitted. The source file is opened in read mode. The destination file is opened in write mode. A starting and ending line number can optionally be specified to select a portion from the center of the source file for copying.

Syntax

```
UTL_FILE.FCOPY (
   src_location    IN VARCHAR2,
   src_filename    IN VARCHAR2,
   dest_location   IN VARCHAR2,
   dest_filename   IN VARCHAR2,
   start_line      IN BINARY_INTEGER DEFAULT 1,
   end_line        IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 251–5 FCOPY Procedure Parameters

Parameters	Description
`src_location`	Directory location of the source file, a `DIRECTORY_NAME` from the `ALL_DIRECTORIES` view (case sensitive)
`src_filename`	Source file to be copied
`dest_location`	Destination directory where the destination file is created
`dest_filename`	Destination file created from the source file
`start_line`	Line number at which to begin copying. The default is `1` for the first line
`end_line`	Line number at which to stop copying. The default is `NULL`, signifying end of file

Exceptions

`INVALID_FILENAME`

`INVALID_PATH`

`INVALID_OPERATION`

`INVALID_OFFSET`

`READ_ERROR`

`WRITE_ERROR`

FFLUSH Procedure

FFLUSH physically writes pending data to the file identified by the file handle. Normally, data being written to a file is buffered. The FFLUSH procedure forces the buffered data to be written to the file. The data must be terminated with a newline character.

Flushing is useful when the file must be read while still open. For example, debugging messages can be flushed to the file so that they can be read immediately.

Syntax

```
UTL_FILE.FFLUSH (
   file  IN FILE_TYPE);
```

Parameters

Table 251–6 FFLUSH Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call

Exceptions

INVALID_FILENAME

INVALID_MAXLINESIZE

INVALID_OPERATION

WRITE_ERROR

FGETATTR Procedure

This procedure reads and returns the attributes of a disk file.

Syntax

```
UTL_FILE.FGETATTR(
   location     IN VARCHAR2,
   filename     IN VARCHAR2,
   fexists      OUT BOOLEAN,
   file_length  OUT NUMBER,
   block_size   OUT BINARY_INTEGER);
```

Parameters

Table 251–7 FGETATTR Procedure Parameters

Parameters	Description
location	Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
filename	Name of the file to be examined
fexists	A BOOLEAN for whether or not the file exists
file_length	Length of the file in bytes. NULL if file does not exist.
block_size	File system block size in bytes. NULL if the file does not exist.

Exceptions

INVALID_PATH

INVALID_FILENAME

INVALID_OPERATION

READ_ERROR

ACCESS_DENIED

FGETPOS Function

This function returns the current relative offset position within a file, in bytes.

Syntax

```
UTL_FILE.FGETPOS (
   file IN FILE_TYPE)
 RETURN PLS_INTEGER;
```

Parameters

Table 251–8 FGETPOS Parameters

Parameters	Description
file	Directory location of the source file

Return Values

FGETPOS returns the relative offset position for an open file, in bytes. It raises an exception if the file is not open. It returns 0 for the beginning of the file.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

READ_ERROR

Usage Notes

If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

FOPEN Function

This function opens a file. You can specify the maximum line size and have a maximum of 50 files open simultaneously. See also FOPEN_NCHAR Function on page 251-21.

Syntax

```
UTL_FILE.FOPEN (
   location     IN VARCHAR2,
   filename     IN VARCHAR2,
   open_mode    IN VARCHAR2,
   max_linesize IN BINARY_INTEGER DEFAULT 1024)
  RETURN FILE_TYPE;
```

Parameters

Table 251–9 FOPEN Function Parameters

Parameter	Description
location	Directory location of file. This string is a directory object name and must be specified in upper case. Read privileges must be granted on this directory object for the UTL_FILE user to run FOPEN.
filename	File name, including extension (file type), without directory path. If a directory path is given as a part of the filename, it is ignored by FOPEN. On Unix, the filename cannot end with /.
open_mode	Specifies how the file is opened. Modes include: ■ r -- read text ■ w -- write text ■ a -- append text ■ rb -- read byte mode ■ wb -- write byte mode ■ ab -- append byte mode If you try to open a file specifying 'a' or 'ab' for open_mode but the file does not exist, the file is created in write mode.
max_linesize	Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767). If unspecified, Oracle supplies a default value of 1024.

Return Values

FOPEN returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL_FILE package, and individual components should not be referenced or changed by the UTL_FILE user.

Table 251–10 FOPEN Function Return Values

Return	Description
FILE_TYPE	Handle to open file

Exceptions

`INVALID_MAXILINESIZE`

`INVALID_MODE`

`INVALID_OPERATION`

`INVALID_PATH`

`INVALID_FILENAME`

Usage Notes

The file location and file name parameters must be supplied to the `FOPEN` function as quoted strings so that the file location can be checked against the list of accessible directories as specified by the `ALL_DIRECTORIES` view of accessible directory objects.

FOPEN_NCHAR Function

This function opens a file in national character set mode for input or output, with the maximum line size specified. You can have a maximum of 50 files open simultaneously. With this function, you can read or write a text file in Unicode instead of in the database character set.

Even though the contents of an NVARCHAR2 buffer may be AL16UTF16 or UTF8 (depending on the national character set of the database), the contents of the file are always read and written in UTF8. UTL_FILE converts between UTF8 and AL16UTF16 as necessary.

See also FOPEN Function on page 251-19.

Syntax

```
UTL_FILE.FOPEN_NCHAR (
   location     IN VARCHAR2,
   filename     IN VARCHAR2,
   open_mode    IN VARCHAR2,
   max_linesize IN BINARY_INTEGER DEFAULT 1024)
RETURN FILE_TYPE;
```

Parameters

Table 251–11 FOPEN_NCHAR Function Parameters

Parameter	Description
location	Directory location of file
filename	File name (including extension)
open_mode	Open mode (r,w,a,rb,wb,ab)
max_linesize	Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767)

Return Values

FOPEN_NCHAR returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL_FILE package, and individual components should not be referenced or changed by the UTL_FILE user.

Table 251–12 FOPEN_NCHAR Function Return Values

Return	Description
FILE_TYPE	Handle to open file

Exceptions

INVALID_MAXILINESIZE

INVALID_MODE

INVALID_OPERATION

INVALID_PATH

FREMOVE Procedure

This procedure deletes a disk file, assuming that you have sufficient privileges.

Syntax

```
UTL_FILE.FREMOVE (
   location IN VARCHAR2,
   filename IN VARCHAR2);
```

Parameters

Table 251–13 FREMOVE Procedure Parameters

Parameters	Description
location	Directory location of the file, a DIRECTORY_NAME from ALL_DIRECTORIES (case sensitive)
filename	Name of the file to be deleted

Exceptions

ACCESS_DENIED

DELETE_FAILED

INVALID_FILENAME

INVALID_OPERATION

INVALID_PATH

Usage Notes

The FREMOVE procedure does not verify privileges before deleting a file. The O/S verifies file and directory permissions. An exception is returned on failure.

FRENAME Procedure

This procedure renames an existing file to a new name, similar to the UNIX `mv` function.

Syntax

```
UTL_FILE.FRENAME (
   src_location     IN   VARCHAR2,
   src_filename     IN   VARCHAR2,
   dest_location    IN   VARCHAR2,
   dest_filename    IN   VARCHAR2,
   overwrite        IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 251–14 FRENAME Procedure Parameters

Parameters	Description
`src_location`	Directory location of the source file, a `DIRECTORY_NAME` from the `ALL_DIRECTORIES` view (case sensitive)
`src_filename`	Source file to be renamed
`dest_location`	Destination directory of the destination file, a `DIRECTORY_NAME` from the `ALL_DIRECTORIES` view (case sensitive)
`dest_filename`	New name of the file
`overwrite`	Default is `FALSE`. Permission on both the source and destination directories must be granted. You can use the `overwrite` parameter to specify whether or not to overwrite a file if one exists in the destination directory. The default is `FALSE` for no overwrite.

Exceptions

`ACCESS_DENIED`

`INVALID_FILENAME`

`INVALID_PATH`

`RENAME_FAILED`

FSEEK Procedure

This procedure adjusts the file pointer forward or backward within the file by the number of bytes specified.

Syntax

```
UTL_FILE.FSEEK (
   file             IN OUT  UTL_FILE.FILE_TYPE,
   absolute_offset  IN      PL_INTEGER DEFAULT NULL,
   relative_offset  IN      PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 251–15 FSEEK Procedure Parameters

Parameters	Description
file	File handle
absolute_offset	Absolute location to which to seek; default = NULL
relative_offset	Number of bytes to seek forward or backward; positive = forward, negative integer = backward, zero = current position, default = NULL

Exceptions

INVALID_FILEHANDLE

INVALID_OFFSET

INVALID_OPERATION

READ_ERROR

Usage Notes

- Using FSEEK, you can read previous lines in the file without first closing and reopening the file. You must know the number of bytes by which you want to navigate.
- If relative_offset, the procedure seeks forward. If relative_offset > 0, or backward, if relative_offset < 0, the procedure seeks through the file by the number of relative_offset bytes specified.
- If the beginning of the file is reached before the number of bytes specified, then the file pointer is placed at the beginning of the file. If the end of the file is reached before the number of bytes specified, then an INVALID_OFFSET error is raised.
- If absolute_offset, the procedure seeks to an absolute location specified in bytes.
- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

GET_LINE Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. Text is read up to, but not including, the line terminator, or up to the end of the `len` parameter. It cannot exceed the `max_linesize` specified in `FOPEN`.

Syntax

```
UTL_FILE.GET_LINE (
   file        IN  FILE_TYPE,
   buffer      OUT VARCHAR2,
   len         IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 251–16 GET_LINE Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN` call. The file must be open for reading (mode `r`); otherwise an `INVALID_OPERATION` exception is raised.
`buffer`	Data buffer to receive the line read from the file
`len`	The number of bytes read from the file. Default is `NULL`. If `NULL`, Oracle supplies the value of `max_linesize`.

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`NO_DATA_FOUND`

`READ_ERROR`

Usage Notes

If the line does not fit in the buffer, a `READ_ERROR` exception is raised. If no text was read due to end of file, the `NO_DATA_FOUND` exception is raised. If the file is opened for byte mode operations, the `INVALID_OPERATION` exception is raised.

Because the line terminator character is not read into the buffer, reading blank lines returns empty strings.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`.If unspecified, Oracle supplies a default value of 1024. See also "GET_LINE_NCHAR Procedure" on page 251-26.

GET_LINE_NCHAR Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. With this function, you can read a text file in Unicode instead of in the database character set.

The file must be opened in national character set mode, and must be encoded in the UTF8 character set. The expected buffer datatype is NVARCHAR2. If a variable of another datatype, such as NCHAR, NCLOB, or VARCHAR2 is specified, PL/SQL will perform standard implicit conversion from NVARCHAR2 after the text is read.

See also GET_LINE Procedure on page 251-25

Syntax

```
UTL_FILE.GET_LINE_NCHAR (
   file        IN  FILE_TYPE,
   buffer      OUT NVARCHAR2,
   len         IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 251–17 GET_LINE_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
buffer	Data buffer to receive the line read from the file
len	The number of bytes read from the file. Default is NULL. If NULL, Oracle supplies the value of max_linesize.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

NO_DATA_FOUND

READ_ERROR

GET_RAW Procedure

This procedure reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read. UTL_FILE.GET_RAW ignores line terminators.

Syntax

```
UTL_FILE.GET_RAW (
   file       IN            UTL_FILE.FILE_TYPE,
   buffer     OUT NOCOPY    RAW,
   len        IN            PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 251–18 GET_RAW Procedure Parameters

Parameters	Description
file	File handle
buffer	RAW data
len	The number of bytes read from the file. Default is NULL. If NULL, len is assumed to be the maximum length of RAW.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

LENGTH_MISMATCH

NO_DATA_FOUND

READ_ERROR

Usage Notes

The subprogram will raise No_Data_Found when it attempts to read past the end of the file. Your application should allow for this by catching the exception in its processing loop.

```
PROCEDURE Sys.p (n IN VARCHAR2) IS
      h     UTL_FILE.FILE_TYPE := UTL_FILE.FOPEN('D', n, 'r', 32767);
      Buf   RAW(32767);
      Amnt  CONSTANT PLS_INTEGER := 32767;
    BEGIN
      LOOP
        BEGIN
          Utl_File.Get_Raw(h, Buf, Amnt);
          -- Do something with this chunk
        EXCEPTION WHEN No_Data_Found THEN EXIT; END;
      END LOOP;
      UTL_FILE.FCLOSE (h);
    END;
```

IS_OPEN Function

This function tests a file handle to see if it identifies an open file. IS_OPEN reports only whether a file handle represents a file that has been opened, but not yet closed. It does not guarantee that there will be no operating system errors when you attempt to use the file handle.

Syntax

```
UTL_FILE.IS_OPEN (
   file  IN FILE_TYPE)
  RETURN BOOLEAN;
```

Parameters

Table 251–19 IS_OPEN Function Parameters

Parameter	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call

Return Values

TRUE or FALSE

Exceptions

INVALID_FILEHANDLE

NEW_LINE Procedure

This procedure writes one or more line terminators to the file identified by the input file handle. This procedure is separate from PUT because the line terminator is a platform-specific character or sequence of characters.

Syntax

```
UTL_FILE.NEW_LINE (
   file     IN FILE_TYPE,
   lines    IN BINARY_INTEGER := 1);
```

Parameters

Table 251–20 NEW_LINE Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call
lines	Number of line terminators to be written to the file

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

PUT Procedure

PUT writes the text string stored in the buffer parameter to the open file identified by the file handle. The file must be open for write operations. No line terminator is appended by PUT; use NEW_LINE to terminate the line or use PUT_LINE to write a complete line with a line terminator. See also "PUT_NCHAR Procedure" on page 251-33.

Syntax

```
UTL_FILE.PUT (
   file      IN FILE_TYPE,
   buffer    IN VARCHAR2);
```

Parameters

Table 251–21 PUT Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing.
buffer	Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

PUT_LINE Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. The file must be open for write operations. PUT_LINE terminates the line with the platform-specific line terminator character or characters.

See also "PUT_LINE_NCHAR Procedure" on page 251-32.

Syntax

```
UTL_FILE.PUT_LINE (
   file      IN FILE_TYPE,
   buffer    IN VARCHAR2,
   autoflush IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 251–22 PUT_LINE Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN call
buffer	Text buffer that contains the lines to be written to the file
autoflush	Flushes the buffer to disk after the WRITE

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

Usage Notes

- The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

PUT_LINE_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database character set. This procedure is equivalent to the PUT_NCHAR Procedure, except that the line separator is appended to the written text. See also PUT_LINE Procedure on page 251-31.

Syntax

```
UTL_FILE.PUT_LINE_NCHAR (
   file    IN FILE_TYPE,
   buffer  IN NVARCHAR2);
```

Parameters

Table 251–23 PUT_LINE_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing.
buffer	Text buffer that contains the lines to be written to the file

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

Usage Notes

- The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

PUT_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle.

With this function, you can write a text file in Unicode instead of in the database character set. The file must be opened in the national character set mode. The text string will be written in the UTF8 character set. The expected buffer datatype is NVARCHAR2. If a variable of another datatype is specified, PL/SQL will perform implicit conversion to NVARCHAR2 before writing the text.

See also PUT Procedure on page 251-30

Syntax

```
UTL_FILE.PUT_NCHAR (
   file      IN FILE_TYPE,
   buffer    IN NVARCHAR2);
```

Parameters

Table 251–24 PUT_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
buffer	Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

PUTF Procedure

This procedure is a formatted `PUT` procedure. It works like a limited `printf`(). See also PUTF_NCHAR Procedure on page 251-36.

Syntax

```
UTL_FILE.PUTF (
   file    IN FILE_TYPE,
   format  IN VARCHAR2,
   [arg1   IN VARCHAR2  DEFAULT NULL,
   . . .
   arg5    IN VARCHAR2  DEFAULT NULL]);
```

Parameters

Table 251–25 PUTF Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN` call
`format`	Format string that can contain text as well as the formatting characters `\n` and `%s`
`arg1..arg5`	From one to five operational argument strings. Argument strings are substituted, in order, for the `%s` formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each `%s` for which there is no argument.

Usage Notes

- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.
- The format string can contain any text, but the character sequences `%s` and `\n` have special meaning.

Character Sequence	Meaning
`%s`	Substitute this sequence with the string value of the next argument in the argument list.
`\n`	Substitute with the appropriate platform-specific line terminator.

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

Examples

The following example writes the lines:

```
Hello, world!
I come from Zork with greetings for all earthlings.
```

```
my_world  varchar2(4) := 'Zork';
...
PUTF(my_handle, 'Hello, world!\nI come from %s with %s.\n',
                my_world,
                'greetings for all earthlings');
```

If there are more `%s` formatters in the format parameter than there are arguments, then an empty string is substituted for each `%s` for which there is no matching argument.

PUTF_NCHAR Procedure

This procedure is a formatted version of a PUT_NCHAR Procedure. Using PUTF_NCHAR, you can write a text file in Unicode instead of in the database character set. It accepts a format string with formatting elements \n and %s, and up to five arguments to be substituted for consecutive instances of %s in the format string. The expected datatype of the format string and the arguments is NVARCHAR2.

If variables of another datatype are specified, PL/SQL will perform implicit conversion to NVARCHAR2 before formatting the text. Formatted text is written in the UTF8 character set to the file identified by the file handle. The file must be opened in the national character set mode.

Syntax

```
UTL_FILE.PUTF_NCHAR (
   file    IN FILE_TYPE,
   format  IN NVARCHAR2,
   [arg1   IN NVARCHAR2  DEFAULT NULL,
   . . .
   arg5    IN NVARCHAR2  DEFAULT NULL]);
```

Parameters

Table 251–26 PUTF_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
format	Format string that can contain text as well as the formatting characters \n and %s
arg1..arg5	From one to five operational argument strings. Argument strings are substituted, in order, for the %s formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

Usage Notes

- The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

PUT_RAW Procedure

This procedure accepts as input a RAW data value and writes the value to the output buffer.

Syntax

```
UTL_FILE.PUT_RAW (
   file          IN    UTL_FILE.FILE_TYPE,
   buffer        IN    RAW,
   autoflush     IN    BOOLEAN DEFAULT FALSE);
```

Parameters

Table 251–27 PUT_RAW Procedure Parameters

Parameters	Description
file	File handle
buffer	The RAW data written to the buffer
autoflush	If TRUE, then performs a flush after writing the value to the output buffer; default is FALSE.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

Usage Notes

You can request an automatic flush of the buffer by setting the third argument to TRUE.

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

252

UTL_HTTP

The UTL_HTTP package makes Hypertext Transfer Protocol (HTTP) callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP.

When the package fetches data from a Web site using HTTPS, it requires Oracle Wallet Manager which can be created by either Oracle Wallet Manager or the orapki utility. Non-HTTPS fetches do not require an Oracle wallet.

See Also:

- Chapter 266, "UTL_URL"
- Chapter 263, "UTL_SMTP"
- *Oracle Database Enterprise User Security Administrator's Guide* for more information on Wallet Manager

This chapter contains the following topics:

Using UTL_HTTP

This section contains topics which relate to using the `UTL_HTTP` package.

Overview

With the UTL_HTTP package, you can write PL/SQL programs that communicate with Web (HTTP) servers. And UTL_HTTP contains a function that can be used in SQL queries.

The package supports HTTP over the Secured Socket Layer protocol (SSL), also known as HTTPS. It also supports SSL client authentication by sending the client-certificate in a wallet to authenticate with the remote Web server.

Other Internet-related data-access protocols (such as the File Transfer Protocol (FTP) or the Gopher protocol) are also supported using an HTTP proxy server that supports those protocols.

Security Model

This package is an invoker's rights package and the invoking user will need the `connect` privilege granted in the access control list assigned to the remote network host to which he wants to connect, as well as the `use-client-certificates` or the `use-passwords` privilege to authenticate himself with the remote Web server using the credentials stored in an Oracle wallet.

Note: For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide

Constants

The UTL_HTTP package uses the constants shown in following tables.

- UTL_HTTP Constants - HTTP Versions
- UTL_HTTP Constants - Default Ports
- UTL_HTTP Constants - HTTP 1.1 Status Codes

Table 252–1 UTL_HTTP Constants - HTTP Versions

Name	Type	Value	Description
HTTP_VERSION_1_0	VARCHAR2(10)	'HTTP/1.0'	Denotes HTTP version 1.0 that can be used in the function BEGIN_REQUEST.
HTTP_VERSION_1_1	VARCHAR2(10)	'HTTP/1.1'	Denotes HTTP version 1.1 that can be used in the function BEGIN_REQUEST.

Table 252–2 UTL_HTTP Constants - Default Ports

Name	Type	Value	Description
DEFAULT_HTTP_PORT	PLS_INTEGER	80	The default TCP/IP port (80) at which a Web server or proxy server listens
DEFAULT_HTTPS_PORT	PLS_INTEGER	443	The default TCP/IP port (443) at which an HTTPS Web server listens

Table 252–3 UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_CONTINUE	PLS_INTEGER	100	The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server.
HTTP_SWITCHING_PROTOCOLS	PLS_INTEGER	101	The server understands and is willing to comply with the client's request, through the Upgrade message header field, for a change in the application protocol being used on this connection. The server will switch protocols to those defined by the response's Upgrade header field immediately after the empty line which terminates the 101 response.
HTTP_OK	PLS_INTEGER	200	The request has succeeded. The information returned with the response is dependent on the method used in the request
HTTP_CREATED CONSTANT	PLS_INTEGER	201	The request has been fulfilled and resulted in a new resource being created.
HTTP_ACCEPTED	PLS_INTEGER	202	The request has been accepted for processing, but the processing has not been completed. The request might or might not eventually be acted upon, as it might be disallowed when processing actually takes place.

Table 252–3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_NON_ AUTHORITATIVE_INFO	PLS_INTEGER	203	The returned metainformation in the entity-header is not the definitive set as available from the origin server, but is gathered from a local or a third-party copy.
HTTP_NO_CONTENT	PLS_INTEGER	204	The server has fulfilled the request but does not need to return an entity-body, and might want to return updated metainformation.
HTTP_RESET_CONTENT	PLS_INTEGER	205	The server has fulfilled the request and the user agent should reset the document view which caused the request to be sent. The response must not include an entity.
HTTP_PARTIAL_CONTENT	PLS_INTEGER	206	The server has fulfilled the partial GET request for the resource.
HTTP_MULTIPLE_CHOICES	PLS_INTEGER	300	The requested resource corresponds to any one of a set of representations, each with its own specific location, and agent-driven negotiation information is being provided so that the user (or user agent) can select a preferred representation and redirect its request to that location.
HTTP_MOVED_ PERMANENTLY	PLS_INTEGER	301	The requested resource has been assigned a new permanent URI and any future references to this resource should use one of the returned URIs.
HTTP_FOUND CONSTANT	PLS_INTEGER	302	The requested resource resides temporarily under a different URI.
HTTP_SEE_OTHER	PLS_INTEGER	303	The response to the request can be found under a different URI and should be retrieved using a GET method on that resource.
HTTP_NOT_MODIFIED	PLS_INTEGER	304	If the client has performed a conditional GET request and access is allowed, but the document has not been modified, the server responds with this status code.
HTTP_USE_PROXY	PLS_INTEGER	305	The requested resource must be accessed through the proxy given by the Location field. The Location field gives the URI of the proxy.
HTTP_TEMPORARY_ REDIRECT	PLS_INTEGER	307	The requested resource resides temporarily under a different URI.
HTTP_BAD_REQUEST	PLS_INTEGER	400	The request could not be understood by the server due to malformed syntax.
HTTP_UNAUTHORIZED	PLS_INTEGER	401	The request requires user authentication. The client may repeat the request with a suitable Authorization header field. If the request already included Authorization credentials, then the 401 response indicates that authorization has been refused for those credentials.
HTTP_PAYMENT_REQUIRED	PLS_INTEGER	402	This code is reserved for future use.

Table 252–3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_FORBIDDEN	PLS_INTEGER	403	The server understood the request, but is refusing to fulfill it.
HTTP_NOT_FOUND	PLS_INTEGER	404	The server has not found anything matching the Request-URI.
HTTP_NOT_ACCEPTABLE	PLS_INTEGER	406	The resource identified by the request is only capable of generating response entities which have content characteristics not acceptable according to the accept headers sent in the request.
HTTP_PROXY_AUTH_ REQUIRED	PLS_INTEGER	407	This code is similar to 401 (Unauthorized), but indicates that the client must first authenticate itself with the proxy.
HTTP_REQUEST_TIME_OUT	PLS_INTEGER	408	The client did not produce a request within the time that the server was prepared to wait.
HTTP_CONFLICT	PLS_INTEGER	409	The request could not be completed due to a conflict with the current state of the resource.
HTTP_GONE	PLS_INTEGER	410	The requested resource is no longer available at the server and no forwarding address is known.
HTTP_LENGTH_REQUIRED	PLS_INTEGER	411	The server refuses to accept the request without a defined `Content-Length`.
HTTP_PRECONDITION_ FAILED	PLS_INTEGER	412	The precondition given in one or more of the request-header fields evaluated to false when it was tested on the server.
HTTP_REQUEST_ENTITY_ TOO_LARGE CONSTANT	PLS_INTEGER	413	The server is refusing to process a request because the request entity is larger than the server is willing or able to process.
HTTP_REQUEST_URI_TOO_ LARGE	PLS_INTEGER	414	The server is refusing to service the request because the Request-URI is longer than the server is willing to interpret.
HTTP_UNSUPPORTED_ MEDIA_TYPE	PLS_INTEGER	415	The server is refusing to service the request because the entity of the request is in a format not supported by the requested resource for the requested method.
HTTP_REQ_RANGE_NOT_ SATISFIABLE	PLS_INTEGER	416	A server returns a response with this status code if a request included a Range request-header field, and none of the range-specifier values in this field overlap the current extent of the selected resource, and the request did not include an If-Range request-header field.
HTTP_EXPECTATION_ FAILED	PLS_INTEGER	417	The expectation given in an Expect request-header field could not be met by this server, or, if the server is a proxy, the server has unambiguous evidence that the request could not be met by the next-hop server.

Table 252–3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_NOT_IMPLEMENTED	PLS_INTEGER	501	The server does not support the functionality required to fulfill the request.
HTTP_BAD_GATEWAY	PLS_INTEGER	502	The server, while acting as a gateway or proxy, received an invalid response from the upstream server it accessed in attempting to fulfill the request
HTTP_SERVICE_ UNAVAILABLE	PLS_INTEGER	503	The server is currently unable to handle the request due to a temporary overloading or maintenance of the server.
HTTP_GATEWAY_TIME_OUT	PLS_INTEGER	504	The server, while acting as a gateway or proxy, did not receive a timely response from the upstream server specified by the URI (for example, HTTP, FTP, LDAP) or some other auxiliary server (for example, DNS) it needed to access in attempting to complete the request.
HTTP_VERSION_NOT_ SUPPORTED	PLS_INTEGER	505	The server does not support, or refuses to support, the HTTP protocol version that was used in the request message.

Datatypes

REQ Type

Use this PL/SQL record type to represent an HTTP request.

Syntax

```
TYPE req IS RECORD (
   url           VARCHAR2(32767),
   method        VARCHAR2(64),
   http_version  VARCHAR2(64));
```

Parameters

Table 252–4 REQ Type Parameters

Parameter	Description
`url`	The URL of the HTTP request. It is set after the request is created by `BEGIN_REQUEST`.
`method`	The method to be performed on the resource identified by the URL. It is set after the request is created by `BEGIN_REQUEST`.
`http_version`	The HTTP protocol version used to send the request. It is set after the request is created by `BEGIN_REQUEST`.

Usage Notes

The information returned in `REQ` from the interface `begin_request` is for read-only. Changing the field values in the record has no effect on the request.

There are other fields in `REQ` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

REQUEST_CONTEXT_KEY Type

This type is used to represent the key to a request context. A request context is a context that holds a private wallet and cookie table to make a HTTP request. This private wallet and cookie table, unlike the session-wide ones maintained in the package, will not be shared with other HTTP requests within the database session.

Syntax

```
SUBTYPE request_context_key IS PLS_INTEGER;
```

Usage Notes

To provide enhanced security, `UTL_HTTP` allows PL/SQL programs to create request contexts. A request context is a private context that holds a wallet and a cookie table that will not be shared with other programs in the same database session when

making HTTP requests and receiving HTTP responses. PL/SQL programs should use request contexts when they need to use wallets or cookies that contain sensitive information such as authentication credentials.

RESP Type

This PL/SQL record type is used to represent an HTTP response.

Syntax

```
TYPE resp IS RECORD (
   status_code    PLS_INTEGER,
   reason_phrase  VARCHAR2(256),
   http_version   VARCHAR2(64));
```

Parameters

Table 252–5 RESP Type Parameters

Parameter	Description
status_code	The status code returned by the Web server. It is a 3-digit integer that indicates the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
reason_phrase	The short textual message returned by the Web server that describe the status code. It gives a brief description of the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
http_version	The HTTP protocol version used in the HTTP response. It is set after the response is processed by GET_RESPONSE.

Usage Notes

The information returned in RESP from the interface GET_RESPONSE is read-only. There are other fields in the RESP record type whose names begin with the prefix private_. The fields are private and are intended for use by implementation of the UTL_HTTP package. You should not modify the fields.

COOKIE and COOKIE_TABLE Types

The COOKIE type is the PL/SQL record type that represents an HTTP cookie. The COOKIE_TABLE type is a PL/SQL index-by-table type that represents a collection of HTTP cookies.

Syntax

```
TYPE cookie IS RECORD (
   name  VARCHAR2(256),
   value  VARCHAR2(1024),
   domain  VARCHAR2(256),
   expire  TIMESTAMP WITH TIME ZONE,
   path  VARCHAR2(1024),
   secure  BOOLEAN,
   version  PLS_INTEGER,
   comment  VARCHAR2(1024));

TYPE cookie_table IS TABLE OF cookie INDEX BY binary_integer;
```

Fields of COOKIE Record Type

Table 252–6 shows the fields for the COOKIE and COOKIE_TABLE record types.

Table 252–6 Fields of COOKIE and COOKIE_TABLE Type

Field	Description
name	The name of the HTTP cookie
value	The value of the cookie
domain	The domain for which the cookie is valid
expire	The time by which the cookie will expire
path	The subset of URLs to which the cookie applies
secure	Should the cookie be returned to the Web server using secured means only.
version	The version of the HTTP cookie specification the cookie conforms. This field is NULL for Netscape cookies.
comment	The comment that describes the intended use of the cookie. This field is NULL for Netscape cookies.

Usage Notes

PL/SQL programs do not usually examine or change the cookie information stored in the UTL_HTTP package. The cookies are maintained by the package transparently. They are maintained inside the UTL_HTTP package, and they last for the duration of the database session only. PL/SQL applications that require cookies to be maintained beyond the lifetime of a database session can read the cookies using GET_COOKIES, store them persistently in a database table, and re-store the cookies back in the package using ADD_COOKIES in the next database session. All the fields in the cookie record, except for the comment field, must be stored. Do not alter the cookie information, which can result in an application error in the Web server or compromise the security of the PL/SQL and the Web server applications. See "Retrieving and Restoring Cookies" on page 252-21.

CONNECTION Type

Use the PL/SQL record type to represent the remote hosts and TCP/IP ports of a network connection that is kept persistent after an HTTP request is completed, according to the HTTP 1.1 protocol specification. The persistent network connection may be reused by a subsequent HTTP request to the same host and port. The subsequent HTTP request may be completed faster because the network connection latency is avoided. connection_table is a PL/SQL table of connection.

For a direct HTTP persistent connection to a Web server, the host and port fields contain the host name and TCP/IP port number of the Web server. The proxy_host and proxy_port fields are not set. For an HTTP persistent connection that was previously used to connect to a Web server using a proxy, the proxy_host and proxy_port fields contain the host name and TCP/IP port number of the proxy server. The host and port fields are not set, which indicates that the persistent connection, while connected to a proxy server, is not bound to any particular target Web server. An HTTP persistent connection to a proxy server can be used to access any target Web server that is using a proxy.

The SSL field indicates if Secured Socket Layer (SSL) is being used in an HTTP persistent connection. An HTTPS request is an HTTP request made over SSL. For an HTTPS (SSL) persistent connection connected using a proxy, the host and port fields contain the host name and TCP/IP port number of the target HTTPS Web server and

the fields will always be set. An HTTPS persistent connection to an HTTPS Web server using a proxy server can only be reused to make another request to the same target Web server.

Syntax

```
TYPE connection IS RECORD (
   host  VARCHAR2(256),
   port  PLS_INTEGER,
   proxy_host  VARCHAR2(256),
   proxy_port  PLS_INTEGER,
   ssl  BOOLEAN);

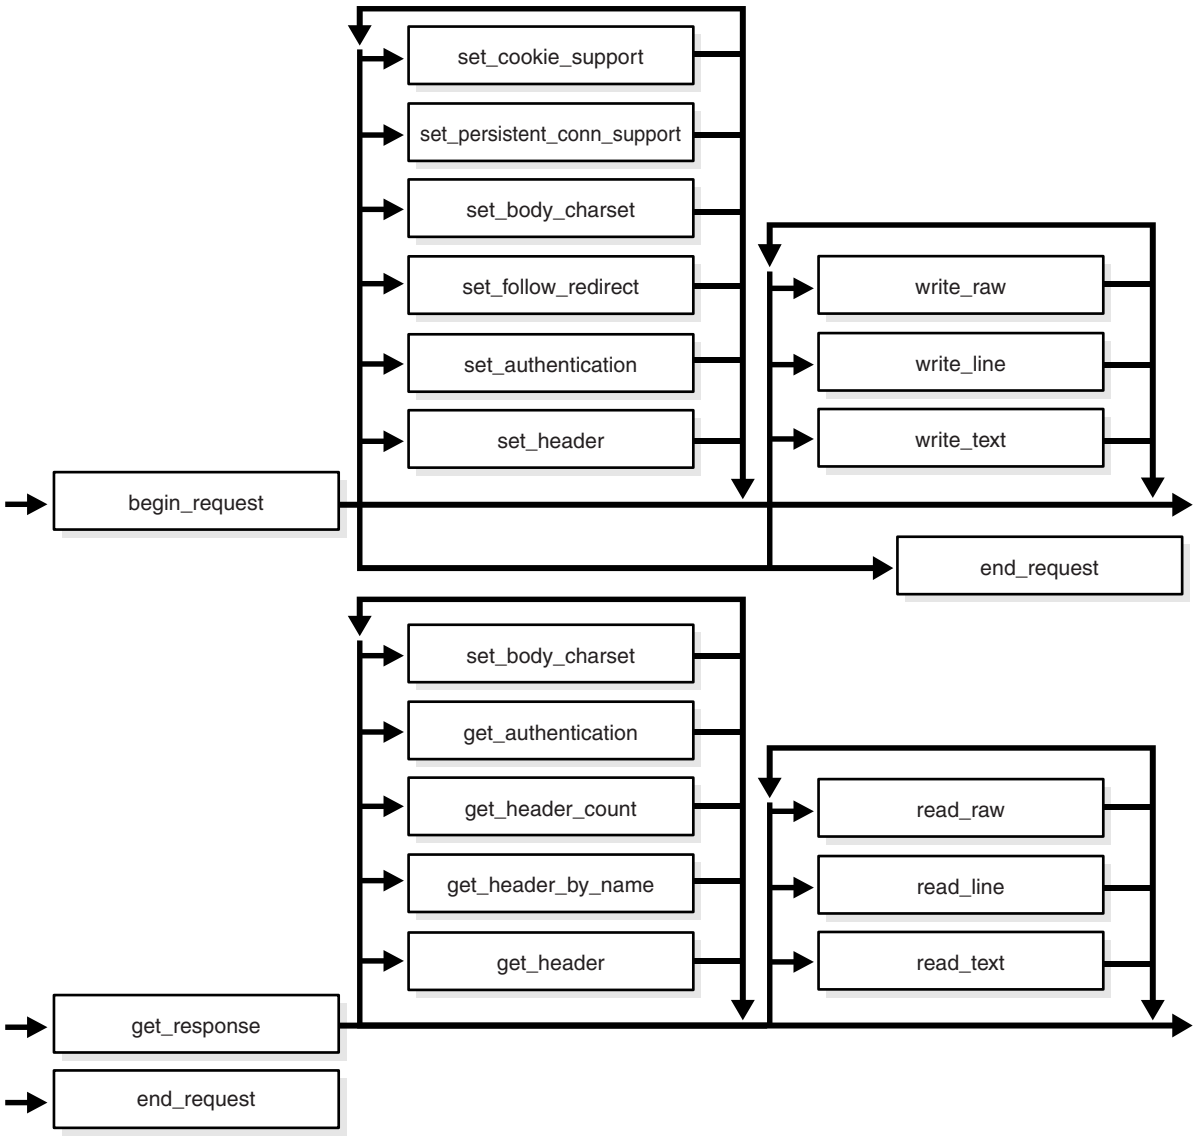
TYPE connection_table IS TABLE OF connection INDEX BY BINARY_INTEGER;
```

Operational Notes

Operational Flow

The `UTL_HTTP` package provides access to the HTTP protocol. The interfaces must be called in the order shown in Figure 252–1, or an exception will be raised.

Figure 252–1 Flow of the Core UTL_HTTP Package



The following can be called at any time:

- Non-protocol interfaces that manipulate cookies
  - `GET_COOKIE_COUNT`
  - `GET_COOKIES`
  - `ADD_COOKIES`
  - `CLEAR_COOKIES`
- Persistent connections
  - `GET_PERSISTENT_CONN_COUNT`
  - `GET_PERSISTENT_CONNS`
  - `CLOSE_PERSISTENT_CONN`
  - `CLOSE_PERSISTENT_CONNS`

- Interfaces that manipulate attributes and configurations of the UTL_HTTP package in the current session
  - SET_PROXY
  - GET_PROXY
  - SET_COOKIE_SUPPORT
  - GET_COOKIE_SUPPORT
  - SET_FOLLOW_REDIRECT
  - GET_FOLLOW_REDIRECT
  - SET_BODY_CHARSET
  - GET_BODY_CHARSET
  - SET_PERSISTENT_CONN_SUPPORT
  - GET_PERSISTENT_CONN_SUPPORT
  - SET_DETAILED_EXCP_SUPPORT
  - GET_DETAILED_EXCP_SUPPORT
  - SET_WALLET
  - SET_TRANSFER_TIMEOUT
  - GET_TRANSFER_TIMEOUT
- Interfaces that retrieve the last detailed exception code and message UTL_HTTP package in the current session
  - GET_DETAILED_SQLCODE
  - GET_DETAILED_SQLERRM

NOTE: Some of the request and response interfaces bear the same name as the interface that manipulates the attributes and configurations of the package in the current session. They are overloaded versions of the interface that manipulate a request or a response.

Simple HTTP Fetches

REQUEST and REQUEST_PIECES take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

You should not expect REQUEST or REQUEST_PIECES to succeed in contacting a URL unless you can contact that URL by using a browser on the same machine (and with the same privileges, environment variables, and so on.)

If REQUEST or REQUEST_PIECES fails (for example, if it raises an exception, or if it returns an HTML-formatted error message, but you believe that the URL argument is correct), then try contacting that same URL with a browser to verify network availability from your machine. You may have a proxy server set in your browser that needs to be set with each REQUEST or REQUEST_PIECES call using the optional proxy parameter.

Note: UTL_HTTP can also use environment variables to specify its proxy behavior. For example, on UNIX, setting the environment variable http_proxy to a URL uses that service as the proxy server for HTTP requests. Setting the environment variable no_proxy to a domain name does not use the HTTP proxy server for URLs in that domain. When the UTL_HTTP package is executed in the Oracle database server, the environment variables are the ones that are set when the database instance is started.

HTTP Requests

The HTTP Requests group of subprograms begin an HTTP request, manipulate attributes, and send the request information to the Web server. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. The settings can be changed by calling the request interface.

See Also: HTTP Requests Subprograms on page 252-27

HTTP Responses

The HTTP Responses group of subprograms manipulate an HTTP response obtained from GET_RESPONSE and receive response information from the Web server. When a response is created for a request, it inherits settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout from the request. Only the body character set can be changed by calling the response interface.

See Also: HTTP Responses Subprograms on page 252-29

HTTP Cookies

The UTL_HTTP package provides subprograms to manipulate HTTP cookies.

See Also: HTTP Cookies Subprograms on page 252-30

HTTP Persistent Connections

The UTL_HTTP package provides subprograms to manipulate persistent connections.

See Also: HTTP Persistent Connections Subprograms on page 252-31

Error Conditions

The UTL_HTTP package provides subprograms to retrieve error information.

See Also: Error Conditions Subprograms on page 252-32

Session Settings

Session settings manipulate the configuration and default behavior of UTL_HTTP when HTTP requests are executed within a database user session. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body

character set, persistent-connection support, and transfer timeout of the current session. Those settings can be changed later by calling the request interface. When a response is created for a request, it inherits those settings from the request. Only the body character set can be changed later by calling the response interface.

See Also: Session Settings Subprograms on page 252-26

Request Context

The `UTL_HTTP` package maintains a common wallet and cookie table within the database session that all HTTP requests and responses share. This makes it easy for users to share the wallet or to maintain application state in the cookies within the session. However, if an application stores private information in the wallet or in the cookies that it does not want to share with other applications in the same database session, it may define a request context to hold its own wallet and cookie table and use this request context to make HTTP requests.

See Also: HTTP Requests Subprograms on page 252-27

External Password Store

The `UTL_HTTP` package allows HTTP password credentials to be stored in an Oracle wallet's external password store. The external password store provides an easy but secure storage for passwords and frees the application developers from the need to maintain their own storage.

See Also: SET_AUTHENTICATION_FROM_WALLET Procedure on page 252-79

Exceptions

Table 252–7 lists the exceptions that the UTL_HTTP package interface can raise. By default, UTL_HTTP raises the exception request_failed when a request fails to execute. If the package is set to raise a detailed exception by set_detailed_excp_support, the rest of the exceptions will be raised directly (except for the exception end_of_body, which will be raised by READ_TEXT, READ_LINE, and READ_RAW regardless of the setting).

Table 252–7 UTL_HTTP Exceptions

Exception	Error Code	Reason	Where Raised
BAD_ARGUMENT	29261	The argument passed to the interface is bad	Any HTTP request or response interface when detailed_exception is enabled
BAD_URL	29262	The requested URL is badly formed	BEGIN_REQUEST, when detailed_exception is enabled
END_OF_BODY	29266	The end of HTTP response body is reached	READ_RAW, READ_TEXT, and READ_LINE, when detailed_exception is enabled
HEADER_NOT_FOUND	29265	The header is not found	GET_HEADER, GET_HEADER_BY_NAME, when detailed_exception is enabled
HTTP_CLIENT_ERROR	29268	From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 4xx range). Or from begin_request, the HTTP proxy returns a status code in the 4xx range when making an HTTPS request through the proxy.	GET_RESPONSE, BEGIN_REQUEST when detailed_exception is enabled
HTTP_SERVER_ERROR	29269	From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 5xx range). Or from begin_request, the HTTP proxy returns a status code in the 5xx range when making an HTTPS request through the proxy.	GET_RESPONSE, BEGIN_REQUEST when detailed_exception is enabled
NETWORK_ACCESS_DENIED	24247	Access to the remote network host or credentials in an Oracle wallet is denied	BEGIN_REQUEST and SET_AUTHENTICATION_FROM_WALLET when detailed_exception is enabled
ILLEGAL_CALL	29267	The call to UTL_HTTP is illegal at the current state of the HTTP request	SET_HEADER, SET_AUTHENTICATION, and SET_PERSISTENT_CONN_SUPPORT, when detailed_exception is enabled
PARTIAL_MULTIBYTE_EXCEPTION	29275	No complete character is read and a partial multibyte character is found at the end of the response body	READ_TEXT and READ_LINE, when detailed_exception is enabled
PROTOCOL_ERROR	29263	An HTTP protocol error occurs when communicating with the Web server	SET_HEADER, GET_RESPONSE, READ_RAW, READ_TEXT, and READ_LINE, when detailed_exception is enabled

Table 252–7 (Cont.) UTL_HTTP Exceptions

Exception	Error Code	Reason	Where Raised
REQUEST_FAILED	29273	The request fails to executes	Any HTTP request or response interface when detailed_exception is disabled
TOO_MANY_REQUESTS	29270	Too many requests or responses are open	BEGIN_REQUEST, when detailed_exception is enabled
TRANSFER_TIMEOUT	29276	No data is read and a read timeout occurred	READ_TEXT and READ_LINE, when detailed_exception is enabled
UNKNOWN_SCHEME	29264	The scheme of the requested URL is unknown	BEGIN_REQUEST and GET_RESPONSE, when detailed_exception is enabled

NOTE: The partial_multibyte_char and transfer_timeout exceptions are duplicates of the same exceptions defined in UTL_TCP. They are defined in this package so that the use of this package does not require the knowledge of the UTL_TCP. As those exceptions are duplicates, an exception handle that catches the partial_multibyte_char and transfer_timeout exceptions in this package also catch the exceptions in the UTL_TCP.

For REQUEST and REQUEST_PIECES, the request_failed exception is raised when any exception occurs and detailed_exception is disabled.

Examples

The following examples demonstrate how to use UTL_HTTP.

- General Usage
- Retrieving HTTP Response Headers
- Handling HTTP Authentication
- Retrieving and Restoring Cookies
- Making HTTP Request with Private Wallet and Cookie Table

General Usage

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
  req   UTL_HTTP.REQ;
  resp  UTL_HTTP.RESP;
  value VARCHAR2(1024);
BEGIN
  UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
  req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
  UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
  resp := UTL_HTTP.GET_RESPONSE(req);
  LOOP
    UTL_HTTP.READ_LINE(resp, value, TRUE);
    DBMS_OUTPUT.PUT_LINE(value);
  END LOOP;
  UTL_HTTP.END_RESPONSE(resp);
EXCEPTION
  WHEN UTL_HTTP.END_OF_BODY THEN
    UTL_HTTP.END_RESPONSE(resp);
END;
```

Retrieving HTTP Response Headers

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
  req   UTL_HTTP.REQ;
  resp  UTL_HTTP.RESP;
  name  VARCHAR2(256);
  value VARCHAR2(1024);
BEGIN
  UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
  req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
  UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
  resp := UTL_HTTP.GET_RESPONSE(req);
  DBMS_OUTPUT.PUT_LINE('HTTP response status code: ' || resp.status_code);
  DBMS_OUTPUT.PUT_LINE('HTTP response reason phrase: ' || resp.reason_phrase);
  FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
    UTL_HTTP.GET_HEADER(resp, i, name, value);
    DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
  END LOOP;
  UTL_HTTP.END_RESPONSE(resp);
END;
```

Handling HTTP Authentication

```
SET serveroutput ON SIZE 40000

CREATE OR REPLACE PROCEDURE get_page (url      IN VARCHAR2,
                                      username IN VARCHAR2 DEFAULT NULL,
                                      password IN VARCHAR2 DEFAULT NULL,
                                      realm    IN VARCHAR2 DEFAULT NULL) AS
  req       UTL_HTTP.REQ;
  resp      UTL_HTTP.RESP;
  my_scheme VARCHAR2(256);
  my_realm  VARCHAR2(256);
  name      VARCHAR2(256);
  value     VARCHAR2(256);
BEGIN
  -- Turn off checking of status code. We will check it by ourselves.
  UTL_HTTP.SET_RESPONSE_ERROR_CHECK(FALSE);
  req := UTL_HTTP.BEGIN_REQUEST(url);
  IF (username IS NOT NULL) THEN
    UTL_HTTP.SET_AUTHENTICATION(req, username, password); -- Use HTTP Basic
Authen. Scheme
  END IF;
  resp := UTL_HTTP.GET_RESPONSE(req);
  IF (resp.status_code = UTL_HTTP.HTTP_UNAUTHORIZED) THEN
    UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, FALSE);
    DBMS_OUTPUT.PUT_LINE('Web proxy server is protected.');
    DBMS_OUTPUT.PUT('Please supplied the required ' || my_scheme || '
authentication username/password for realm ' || my_realm || ' for the proxy
server.');
    UTL_HTTP.END_RESPONSE(resp);
    RETURN;
  ELSIF (resp.status_code = UTL_HTTP.HTTP_PROXY_AUTH_REQUIRED) THEN
    UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, TRUE);
    DBMS_OUTPUT.PUT_LINE('Web page ' || url || ' is protected.');
    DBMS_OUTPUT.PUT('Please supplied the required ' || my_scheme || '
authentication username/password for realm ' || my_realm || ' for the Web page.');
    UTL_HTTP.END_RESPONSE(resp);
    RETURN;
  END IF;
  FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
    UTL_HTTP.GET_HEADER(resp, i, name, value);
    DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
  END LOOP;
  UTL_HTTP.END_RESPONSE(resp);
END;
```

Retrieving and Restoring Cookies

```
CREATE TABLE my_cookies (
    session_id  INTEGER,
    name        VARCHAR2(256),
    value       VARCHAR2(1024),
    domain      VARCHAR2(256),
    expire      DATE,
    path        VARCHAR2(1024),
    secure      VARCHAR2(1),
    version     INTEGER);

CREATE SEQUENCE session_id;
SET SERVEROUTPUT ON SIZE 40000
```

```
REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE FUNCTION save_cookies RETURN PLS_INTEGER AS
  cookies        UTL_HTTP.COOKIE_TABLE;
  my_session_id  PLS_INTEGER;
  secure         VARCHAR2(1);
BEGIN
  /* assume that some cookies have been set in previous HTTP requests. */
  UTL_HTTP.GET_COOKIES(cookies);
  SELECT session_id.nextval INTO my_session_id FROM DUAL;
  FOR i in 1..cookies.count LOOP
    IF (cookies(i).secure) THEN
      secure := 'Y';
    ELSE
      secure := 'N';
    END IF;
    INSERT INTO my_cookies
    VALUES (my_session_id, cookies(i).name, cookies(i).value,
            cookies(i).domain,
            cookies(i).expire, cookies(i).path, secure, cookies(i).version);
  END LOOP;
  RETURN my_session_id;
END;
/

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE PROCEDURE restore_cookies (this_session_id IN PLS_INTEGER)
AS
  cookies        UTL_HTTP.COOKIE_TABLE;
  cookie         UTL_HTTP.COOKIE;
  i              PLS_INTEGER := 0;
  CURSOR c (c_session_id PLS_INTEGER) IS
    SELECT * FROM my_cookies WHERE session_id = c_session_id;
BEGIN
  FOR r IN c(this_session_id) LOOP
    i := i + 1;
    cookie.name     := r.name;
    cookie.value    := r.value;
    cookie.domain   := r.domain;
    cookie.expire   := r.expire;
    cookie.path     := r.path;
    IF (r.secure = 'Y') THEN
      cookie.secure := TRUE;
    ELSE
      cookie.secure := FALSE;
    END IF;
    cookie.version := r.version;
    cookies(i) := cookie;
  END LOOP;
  UTL_HTTP.CLEAR_COOKIES;
  UTL_HTTP.ADD_COOKIES(cookies);
END;
/
```

Making HTTP Request with Private Wallet and Cookie Table

```
SET SERVEROUTPUT ON SIZE 40000

CREATE OR REPLACE PROCEDURE DISPLAY_PAGE(url IN VARCHAR2) AS
  request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
  req             UTL_HTTP.REQ;
```

```
  resp            UTL_HTTP.RESP;
  data            VARCHAR2(1024);

BEGIN

  -- Create a request context with its wallet and cookie table
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
                       wallet_path          => 'file:/oracle/wallets/test/wallet',
                       wallet_password      => '******',
                       enable_cookies       => TRUE,
                       max_cookies          => 300,
                       max_cookies_per_site => 20);

  -- Make a HTTP request using the private wallet and cookie
  -- table in the request context
  req := UTL_HTTP.BEGIN_REQUEST(
           url             => url,
           request_context => request_context);
  resp := UTL_HTTP.GET_RESPONSE(req);

  BEGIN
    LOOP
       UTL_HTTP.READ_TEXT(resp, data);
       DBMS_OUTPUT.PUT(data);
    END LOOP;
  EXCEPTION
      WHEN UTL_HTTP.END_OF_BODY THEN
         UTL_HTTP.END_RESPONSE(resp);
  END;

  -- Destroy the request context
  UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);

END;

BEGIN
  DISPLAY_PAGE('https://www.example.com/');
END;
/
```

Subprogram Groups

`UTL_HTTP` subprograms are grouped by function:

- Simple HTTP Fetches in a Single Call Subprograms
- Session Settings Subprograms
- HTTP Requests Subprograms
- HTTP Request Contexts Subprograms
- HTTP Responses Subprograms
- HTTP Cookies Subprograms
- HTTP Persistent Connections Subprograms
- Error Conditions Subprograms

Simple HTTP Fetches in a Single Call Subprograms

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

Table 252–8 UTL_HTTP Subprograms—Simple HTTP Fetches in a Single Call

Subprogram	Description
REQUEST Function on page 252-73	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.
REQUEST_PIECES Function on page 252-75	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL

Session Settings Subprograms

Table 252–9 UTL_HTTP Subprograms—Session Settings

Subprogram	Description
GET_BODY_CHARSET Procedure on page 252-50	Retrieves the default character set of the body of all future HTTP requests
GET_COOKIE_SUPPORT Procedure on page 252-52	Retrieves the current cookie support settings
GET_DETAILED_EXCP_SUPPORT Procedure on page 252-54	Checks if the `UTL_HTTP` package will raise a detailed exception or not
GET_FOLLOW_REDIRECT Procedure on page 252-57	Retrieves the follow-redirect setting in the current session
GET_PERSISTENT_CONN_SUPPORT Procedure on page 252-62	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session
GET_PROXY Procedure on page 252-64	Retrieves the current proxy settings
GET_RESPONSE_ERROR_CHECK Procedure on page 252-67	Checks if the response error check is set or not
GET_TRANSFER_TIMEOUT Procedure on page 252-68	Retrieves the current network transfer timeout value
SET_TRANSFER_TIMEOUT Procedure on page 252-94	Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header
SET_COOKIE_SUPPORT Procedures on page 252-83	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session
SET_DETAILED_EXCP_SUPPORT Procedure on page 252-85	Sets the `UTL_HTTP` package to raise a detailed exception
SET_FOLLOW_REDIRECT Procedures on page 252-86	Sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP responses to future requests in the `GET_RESPONSE` function
SET_PERSISTENT_CONN_SUPPORT Procedure on page 252-88	Sets whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session
SET_PROXY Procedure on page 252-92	Sets the proxy to be used for requests of HTTP or other protocols
SET_RESPONSE_ERROR_CHECK Procedure on page 252-93	Sets whether or not `GET_RESPONSE` raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges
SET_TRANSFER_TIMEOUT Procedure on page 252-94	Sets the timeout value for `UTL_HTTP` to read the HTTP response from the Web server or proxy server
SET_WALLET Procedure on page 252-95	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS

HTTP Requests Subprograms

Table 252–10 UTL_HTTP Subprograms—HTTP Requests

Subprogram	Description
BEGIN_REQUEST Function on page 252-38	Begins a new HTTP request.`UTL_HTTP` establishes the network connection to the target Web server or the proxy server and sends the HTTP request line.
SET_HEADER Procedure on page 252-87	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.
SET_AUTHENTICATION Procedure on page 252-78	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.
SET_AUTHENTICATION_FROM_WALLET Procedure on page 252-79	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.
SET_BODY_CHARSET Procedures on page 252-81	Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header
SET_COOKIE_SUPPORT Procedures on page 252-83	Enables or disables support for the HTTP cookies in the request
SET_FOLLOW_REDIRECT Procedures on page 252-86	Sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP response to this request in the GET_RESPONSE Function on page 252-65
SET_PERSISTENT_CONN_SUPPORT Procedure on page 252-88	Enables or disables support for the HTTP 1.1 persistent-connection in the request
SET_PROXY Procedure on page 252-92	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in `UTL_TCP`)
WRITE_RAW Procedure on page 252-97	Writes some binary data in the HTTP request body
WRITE_TEXT Procedure on page 252-98	Writes some text data in the HTTP request body

HTTP Request Contexts Subprograms

Table 252–11 UTL_HTTP Subprograms—HTTP Request Contexts

Subprogram	Description
CREATE_REQUEST_CONTEXT Function on page 252-44	Creates a request context in `UTL_HTTP` for a wallet and a cookie table
DESTROY_REQUEST_CONTEXT Procedure on page 252-46	Destroys a request context in `UTL_HTTP`

HTTP Responses Subprograms

Table 252–12 UTL_HTTP Subprograms—HTTP Responses

Subprogram	Description
END_RESPONSE Procedure on page 252-48	Ends the HTTP response. It completes the HTTP request and response.
GET_AUTHENTICATION Procedure on page 252-49	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header
GET_HEADER Procedure on page 252-58	Returns the n^{th} HTTP response header name and value returned in the response
GET_HEADER_BY_NAME Procedure on page 252-59	Returns the HTTP response header value returned in the response given the name of the header
GET_HEADER_COUNT Function on page 252-60	Returns the number of HTTP response headers returned in the response
GET_RESPONSE Function on page 252-65	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed.
READ_LINE Procedure on page 252-69	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer
READ_RAW Procedure on page 252-70	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer
READ_TEXT Procedure on page 252-71	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer
SET_BODY_CHARSET Procedures on page 252-81	Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header

HTTP Cookies Subprograms

Table 252–13 UTL_HTTP Subprograms—HTTP Cookies

Subprogram	Description
ADD_COOKIES Procedure on page 252-37	Add the cookies either to a request context or to the `UTL_HTTP` package's session state
CLEAR_COOKIES Procedure on page 252-40	Clears all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state
GET_COOKIE_COUNT Function on page 252-51	Returns the number of cookies maintained either in a request context or in the `UTL_HTTP` package's session states
GET_COOKIES Function on page 252-53	Returns all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state.

HTTP Persistent Connections Subprograms

Table 252–14 UTL_HTTP Subprograms—HTTP Persistent Connections

Subprogram	Description
CLOSE_PERSISTENT_CONN Procedure on page 252-41	Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session
CLOSE_PERSISTENT_CONNS Procedure on page 252-42	Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session
GET_PERSISTENT_CONN_COUNT Function on page 252-61	Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers
GET_PERSISTENT_CONNS Procedure on page 252-63	Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers

Error Conditions Subprograms

Table 252–15 UTL_HTTP Subprograms—Error Conditions

Subprogram	Description
GET_DETAILED_SQLCODE Function on page 252-55	Retrieves the detailed SQLCODE of the last exception raised
GET_DETAILED_SQLERRM Function on page 252-56	Retrieves the detailed SQLERRM of the last exception raised

Summary of UTL_HTTP Subprograms

Table 252–16 UTL_HTTP Package Subprograms

Subprogram	Description	Group
ADD_COOKIES Procedure on page 252-37	Add the cookies either to a request context or to the UTL_HTTP package's session state	HTTP Cookies Subprograms on page 252-30
BEGIN_REQUEST Function on page 252-38	Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line	HTTP Requests Subprograms on page 252-27
CLEAR_COOKIES Procedure on page 252-40	Clears all the cookies maintained either in a request context or in the UTL_HTTP package's session state	HTTP Cookies Subprograms on page 252-30
CLOSE_PERSISTENT_CONN Procedure on page 252-41	Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session	HTTP Persistent Connections Subprograms on page 252-31
CLOSE_PERSISTENT_CONNS Procedure on page 252-42	Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session	HTTP Persistent Connections Subprograms on page 252-31
CREATE_REQUEST_ CONTEXT Function on page 252-44	Creates a request context in UTL_HTTP for a wallet and a cookie table	HTTP Requests Subprograms on page 252-27
DESTROY_REQUEST_ CONTEXT Procedure on page 252-46	Destroys a request context in UTL_HTTP for a wallet and a cookie table	HTTP Requests Subprograms on page 252-27
END_REQUEST Procedure on page 252-47	Ends the HTTP request	HTTP Requests Subprograms on page 252-27
END_RESPONSE Procedure on page 252-48	Ends the HTTP response. It completes the HTTP request and response	HTTP Responses Subprograms on page 252-29
GET_AUTHENTICATION Procedure on page 252-49	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header	HTTP Responses Subprograms on page 252-29
GET_BODY_CHARSET Procedure on page 252-50	Retrieves the default character set of the body of all future HTTP requests	Session Settings Subprograms on page 252-26
GET_COOKIE_COUNT Function on page 252-51	Returns the number of cookies currently maintained by the UTL_HTTP package set by all Web servers	HTTP Cookies Subprograms on page 252-30
GET_COOKIE_SUPPORT Procedure on page 252-52	Retrieves the current cookie support settings	Session Settings Subprograms on page 252-26
GET_COOKIES Function on page 252-53	Returns all the cookies currently maintained by the UTL_HTTP package set by all Web servers	HTTP Cookies Subprograms on page 252-30

Table 252–16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
GET_DETAILED_EXCP_SUPPORT Procedure on page 252-54	Checks if the UTL_HTTP package will raise a detailed exception or not	Session Settings Subprograms on page 252-26
GET_DETAILED_SQLCODE Function on page 252-55	Retrieves the detailed SQLCODE of the last exception raised	Error Conditions Subprograms on page 252-32
GET_DETAILED_SQLERRM Function on page 252-56	Retrieves the detailed SQLERRM of the last exception raised	Error Conditions Subprograms on page 252-32
GET_FOLLOW_REDIRECT Procedure on page 252-57	Retrieves the follow-redirect setting in the current session	Session Settings Subprograms on page 252-26
GET_HEADER Procedure on page 252-58	Returns the n^{th} HTTP response header name and value returned in the response	HTTP Responses Subprograms on page 252-29
GET_HEADER_BY_NAME Procedure on page 252-59	Returns the HTTP response header value returned in the response given the name of the header	HTTP Responses Subprograms on page 252-29
GET_HEADER_COUNT Function on page 252-60	Returns the number of HTTP response headers returned in the response	HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29
GET_PERSISTENT_CONN_COUNT Function on page 252-61	Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers	HTTP Persistent Connections Subprograms on page 252-31
GET_HEADER_COUNT Function on page 252-60	Sees whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session	Session Settings Subprograms on page 252-26
GET_PERSISTENT_CONN_SUPPORT Procedure on page 252-62	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session (see Session Settings Subprograms on page 252-26)	HTTP Persistent Connections Subprograms on page 252-31
GET_PERSISTENT_CONNS Procedure on page 252-63	Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers	HTTP Persistent Connections Subprograms on page 252-31
GET_PROXY Procedure on page 252-64	Retrieves the current proxy settings	Session Settings Subprograms on page 252-26
GET_RESPONSE Function on page 252-65	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed	HTTP Responses Subprograms on page 252-29
GET_RESPONSE_ERROR_CHECK Procedure on page 252-67	Checks if the response error check is set or no	Session Settings Subprograms on page 252-26

Table 252–16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
GET_TRANSFER_TIMEOUT Procedure on page 252-68	Retrieves the current network transfer timeout value	Session Settings Subprograms on page 252-26
READ_LINE Procedure on page 252-69	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer	HTTP Responses Subprograms on page 252-29
READ_RAW Procedure on page 252-70	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer	HTTP Responses Subprograms on page 252-29
READ_TEXT Procedure on page 252-71	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer	HTTP Responses Subprograms on page 252-29
REQUEST Function on page 252-73	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.	Simple HTTP Fetches in a Single Call Subprograms on page 252-25
REQUEST_PIECES Function on page 252-75	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL	Simple HTTP Fetches in a Single Call Subprograms on page 252-25
SET_AUTHENTICATION Procedure on page 252-78	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.	HTTP Requests Subprograms on page 252-27
SET_AUTHENTICATION_ FROM_WALLET Procedure on page 252-79	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.	HTTP Requests Subprograms on page 252-27
SET_BODY_CHARSET Procedures on page 252-81	Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header	Session Settings Subprograms on page 252-26
SET_BODY_CHARSET Procedures on page 252-81	Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header	HTTP Requests Subprograms on page 252-27
SET_BODY_CHARSET Procedures on page 252-81	Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header	HTTP Responses Subprograms and Session Settings Subprograms on page 252-26
SET_COOKIE_SUPPORT Procedures on page 252-83	Enables or disables support for the HTTP cookies in the request	HTTP Requests Subprograms on page 252-27
SET_DETAILED_EXCP_ SUPPORT Procedure on page 252-85	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session	Session Settings Subprograms on page 252-26
SET_DETAILED_EXCP_ SUPPORT Procedure on page 252-85	Sets the `UTL_HTTP` package to raise a detailed exception	Session Settings Subprograms on page 252-26

Table 252–16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
SET_FOLLOW_REDIRECT Procedures on page 252-86	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the GET_RESPONSE function	HTTP Requests Subprograms on page 252-27
SET_HEADER Procedure on page 252-87	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the GET_RESPONSE function	Session Settings Subprograms on page 252-26
SET_HEADER Procedure on page 252-87	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.	HTTP Requests Subprograms on page 252-27
SET_PERSISTENT_CONN_SUPPORT Procedure on page 252-88	Enables or disables support for the HTTP 1.1 persistent-connection in the request	HTTP Requests Subprograms on page 252-27
SET_PROXY Procedure on page 252-92	Sets the proxy to be used for requests of HTTP or other protocols	Session Settings on page 252-16 and Session Settings Subprograms on page 252-26
SET_RESPONSE_ERROR_CHECK Procedure on page 252-93	Sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges	Session Settings Subprograms on page 252-26
SET_TRANSFER_TIMEOUT Procedure on page 252-94	Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server	Session Settings on page 252-16 and Session Settings Subprograms on page 252-26
SET_WALLET Procedure on page 252-95	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS	Session Settings Subprograms on page 252-26
WRITE_LINE Procedure on page 252-96	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP	HTTP Requests Subprograms on page 252-27
WRITE_RAW Procedure on page 252-97	Writes some binary data in the HTTP request body	HTTP Requests Subprograms on page 252-27
WRITE_TEXT Procedure on page 252-98	Writes some text data in the HTTP request body	HTTP Requests Subprograms on page 252-27

ADD_COOKIES Procedure

This procedure adds the cookies either to a request context or to the UTL_HTTP package's session state.

> **See Also:** HTTP Cookies on page 252-16 and HTTP Cookies Subprograms on page 252-30

Syntax

```
UTL_HTTP.ADD_COOKIES (
   cookies          IN  cookie_table,
   request_context  IN  request_context_key DEFAULT NULL);
```

Parameters

Table 252–17 ADD_COOKIES Procedure Parameters

Parameter	Description
cookies	The cookies to be added
request_context	Request context to add the cookies. If NULL, the cookies will be added to the UTL_HTTP package's session state instead.

Usage Notes

The cookies that the package currently maintains are not cleared before new cookies are added.

BEGIN_REQUEST Function

This functions begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

See Also: HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27

Syntax

```
UTL_HTTP.BEGIN_REQUEST (
   url               IN  VARCHAR2,
   method            IN  VARCHAR2 DEFAULT 'GET',
   http_version      IN  VARCHAR2 DEFAULT NULL,
   request_context   IN  request_context_key DEFAULT NULL)
RETURN req;
```

Parameters

Table 252–18 BEGIN_REQUEST Function Parameters

Parameter	Description
url	The URL of the HTTP request
method	The method performed on the resource identified by the URL
http_version	The HTTP protocol version that sends the request. The format of the protocol version is HTTP/major-version.minor-version, where major-version and minor-version are positive numbers. If this parameter is set to NULL, UTL_HTTP uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is NULL.
request_context	Request context that holds the private wallet and the cookie table to use in this HTTP request. If this parameter is NULL, the wallet and cookie table shared in the current database session will be used instead.

Usage Notes

- The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should escape those characters with the UTL_URL package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See Chapter 266, "UTL_URL" for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.
- BEGIN_REQUEST can send a URL whose length is up to 32767 bytes. However, different Web servers impose different limits on the length of the URL they can accept. This limit is often about 4000 bytes. If this limit is exceeded, the outcome will depend on the Web server. For example, a Web server might simply drop the HTTP connection without returning a response of any kind. If this happens, a subsequent invocation of the GET_RESPONSE Function will raise the PROTOCOL_

ERROR exception.

A URL will be long when its QUERY_STRING (that is, the information that follows the question mark (?)) is long. In general, it is better to send this parameterization in the body of the request using the POST method.

```
req := UTL_HTTP.BEGIN_REQUEST (url=>the_url, method=>'POST');
UTL_HTTP.SET_HEADER (r      =>  req,
                     name   =>  'Content-Type',
                     value  =>  'application/x-www-form-urlencoded');
UTL_HTTP.SET_HEADER (r      =>   req,
                     name   =>   'Content-Length',
                     value  =>'  <length of data posted in bytes>');
UTL_HTTP.WRITE_TEXT (r      =>   req,
                     data   =>   'p1 = value1&p2=value2...');
resp := UTL_HTTP.GET_RESPONSE
                     (r     =>   req);
...
```

The programmer must determine whether a particular Web server may, or may not, accept data provided in this way.

- An Oracle wallet must be set before accessing Web servers over HTTPS. See the SET_WALLET Procedure procedure on how to set up an Oracle wallet. To use SSL client authentication, the client certificate should be stored in the wallet and the caller must have the use-client-certificates privilege on the wallet. See "Managing Fine-grained Access to External Network Services" in the *Oracle Database Security Guide* to grant the privilege.
- To connect to the remote Web server directly, or indirectly through a HTTP proxy, the UTL_HTTP must have the connect ACL privilege to the remote Web server host or the proxy host respectively.

CLEAR_COOKIES Procedure

This procedure clears all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state.

> **See Also:** HTTP Cookies on page 252-16 and HTTP Cookies Subprograms on page 252-30

Syntax

```
UTL_HTTP.CLEAR_COOKIES (
   request_context  IN  request_context_key DEFAULT NULL);
```

Parameters

Table 252–19 CLEAR_COOKIES Procedure Parameters

Parameter	Description
`request_context`	Request context to clear the cookies. If `NULL`, the cookies maintained in the `UTL_HTTP` package's session state will be cleared instead.

CLOSE_PERSISTENT_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the `UTL_HTTP` package in the current database session.

> **See Also:** HTTP Persistent Connections on page 252-16 and HTTP Persistent Connections Subprograms on page 252-31

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONN (
   conn  IN connection);
```

Parameters

Table 252–20 CLOSE_PERSISTENT_CONN Procedure Parameters

Parameter	Description
conn	The HTTP persistent connection to close

CLOSE_PERSISTENT_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters NULL. If a particular parameter is set to NULL when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to foobar:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');
```

And the following call to the procedure closes all persistent connections through the foobar at TCP/IP port 80:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',
                                proxy_port => 80);
```

And the following call to the procedure closes all persistent connections:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS;
```

See Also: HTTP Persistent Connections on page 252-16 and HTTP Persistent Connections Subprograms on page 252-31

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS (
   host        IN VARCHAR2 DEFAULT NULL,
   port        IN PLS_INTEGER DEFAULT NULL,
   proxy_host  IN VARCHAR2 DEFAULT NULL,
   proxy_port  IN PLS_INTEGER DEFAULT NULL,
   ssl         IN BOOLEAN DEFAULT NULL);
```

Parameters

Table 252–21 CLOSE_PERSISTENT_CONNS Procedure Parameters

Parameter	Description
host	The host for which persistent connections are to be closed
port	The port number for which persistent connections are to be closed
proxy_host	The proxy host for which persistent connections are to be closed
proxy_port	The proxy port for which persistent connections are to be closed
ssl	Close persistent SSL connection

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL

of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a NULL value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a NULL value in a parameter to match only a NULL value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the CLOSE_PERSISTENT_CONN procedure that closes a specific persistent connection.

CREATE_REQUEST_CONTEXT Function

This function creates a request context. A request context is a context that holds a wallet and a cookie for private use in making a HTTP request. This allows the HTTP request to use a wallet and a cookie table that will not be shared with other applications making HTTP requests in the same database session.

> **See Also:** Request Context on page 252-17 and HTTP Request Contexts Subprograms on page 252-28

Syntax

```
UTL_HTTP.CREATE_REQUEST_CONTEXT (
 wallet_path          IN VARCHAR2 DEFAULT NULL,
 wallet_password      IN VARCHAR2 DEFAULT NULL,
 enable_cookies       IN BOOLEAN  DEFAULT TRUE,
 max_cookies          IN PLS_INTEGER DEFAULT 300,
 max_cookies_per_site IN PLS_INTEGER DEFAULT 20)
RETURN request_context_key;
```

Parameters

Table 252–22 CREATE_REQUEST_CONTEXT Function Parameters

Parameter	Description
`wallet_path`	Directory path that contains the Oracle wallet. The format is `file:`*`directory-path`*
`wallet_password`	The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to `NULL`. See the *Oracle Database Enterprise User Security Administrator's Guide* for detailed information about wallets.
`enable_cookies`	Sets whether HTTP requests using this request context should support HTTP cookies or not: `TRUE` to enable the support, `FALSE` to disable it.
`max_cookies`	Sets the maximum total number of cookies that will be maintained in this request context
`max_cookies_per_site`	Sets the maximum number of cookies per each Web site that will be maintained in this request context

Return Values

The request context created.

Examples

```
DECLARE
  request_context  UTL_HTTP.REQUEST_CONTEXT_KEY;
  req              utl_http.req;
BEGIN
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
       wallet_path          => 'file:/oracle/wallets/test_wallets',
       wallet_password      => NULL,
       enable_cookies       => TRUE,
       max_cookies          => 300,
       max_cookies_per_site => 20);
  req := UTL_HTTP.BEGIN_REQUEST(
```

```
        url                  => 'http://www.example.com/',
        request_context      => request_context);
END;
```

DESTROY_REQUEST_CONTEXT Procedure

This procedure destroys a request context in UTL_HTTP. A request context cannot be destroyed when it is in use by a HTTP request or response.

See Also: Request Context on page 252-17 and HTTP Request Contexts Subprograms on page 252-28

Syntax

```
UTL_HTTP.DESTROY_REQUEST_CONTEXT (
   request_context    request_context_key);
```

Parameters

Table 252–23 DESTROY_REQUEST_CONTEXT Procedure Parameters

Parameter	Description
request_context	Request context to destroy

Examples

```
DECLARE
  request_context  UTL_HTTP.REQUEST_CONTEXT_KEY;
BEGIN
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(…);
  …
  UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);
END;
```

END_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

> **See Also:** HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27

Syntax

```
UTL_HTTP.END_REQUEST (
   r  IN OUT NOCOPY req);
```

Parameters

Table 252–24 END_REQUEST Procedure Parameters

Parameter	Description
r	The HTTP request

END_RESPONSE Procedure

This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

> **See Also:** HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

```
UTL_HTTP.END_RESPONSE (
   r  IN OUT NOCOPY resp);
```

Parameters

Table 252–25 END_RESPONSE Procedure Parameters

Parameter	Description
r	The HTTP response

GET_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

See Also: HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

```
UTL_HTTP.GET_AUTHENTICATION(
   r          IN OUT NOCOPY resp,
   scheme     OUT VARCHAR2,
   realm      OUT VARCHAR2,
   for_proxy  IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 252–26 GET_AUTHENTICATION Procedure Parameters

Parameter	Description
r	The HTTP response
scheme	The scheme for the required HTTP authentication
realm	The realm for the required HTTP authentication
for_proxy	Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is FALSE

Usage Notes

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling GET_AUTHENTICATION. The Web client makes the second request and supplies the required authentication information with SET_AUTHORIZATION. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the required authentication information in the first request, thus saving an extra request.

GET_BODY_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

> **See Also:** Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.GET_BODY_CHARSET (
   charset  OUT NOCOPY VARCHAR2);
```

Parameters

Table 252–27 GET_BODY_CHARSET Procedure Parameters

Parameter	Description
`charset`	The default character set of the body of all future HTTP requests

GET_COOKIE_COUNT Function

This function returns the number of cookies maintained either in a request context or in the UTL_HTTP package's session state.

> **See Also:** HTTP Cookies on page 252-16 and HTTP Cookies Subprograms on page 252-30

Syntax

```
UTL_HTTP.GET_COOKIE_COUNT (
   request_context  IN  request_context_key DEFAULT NULL)
 RETURN PLS_INTEGER;
```

Parameters

Table 252–28 GET_COOKIE_COUNT Function Parameters

Parameter	Description
request_context	Request context to return the cookie count for. If NULL, the cookie count maintained in the UTL_HTTP package's session state will be returned instead.

GET_COOKIE_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

> **See Also:** Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.GET_COOKIE_SUPPORT (
   enable                OUT BOOLEAN,
   max_cookies           OUT PLS_INTEGER,
   max_cookies_per_site  OUT PLS_INTEGER);
```

Parameters

Table 252–29 GET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
`enable`	Indicates whether future HTTP requests should support HTTP cookies (`TRUE`) or not (`FALSE`)
`max_cookies`	Indicates the maximum total number of cookies maintained in the current session
`max_cookies_per_site`	Indicates the maximum number of cookies maintained in the current session for each Web site

GET_COOKIES Function

This function returns all the cookies maintained either in a request context or in the UTL_HTTP package's session state.

> **See Also:** HTTP Cookies on page 252-16 and HTTP Cookies Subprograms on page 252-30

Syntax

```
UTL_HTTP.GET_COOKIES (
   cookies          IN  OUT NOCOPY cookie_table,
   request_context  IN             request_context_key DEFAULT NULL);
```

Parameters

Table 252–30 GET_COOKIES Function Parameters

Parameter	Description
cookies	The cookies returned
request_context	Request context to return the cookies for. If NULL, the cookies maintained in the UTL_HTTP package's session state will be returned instead.

GET_DETAILED_EXCP_SUPPORT Procedure

This procedure checks if the UTL_HTTP package will raise a detailed exception or not.

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.GET_DETAILED_EXCP_SUPPORT (
   enable  OUT BOOLEAN);
```

Parameters

Table 252–31 GET_DETAILED_EXCP_SUPPORT Procedure Parameters

Parameter	Description
enable	TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE

GET_DETAILED_SQLCODE Function

This function retrieves the detailed SQLCODE of the last exception raised.

> **See Also:** Error Conditions on page 252-16 and Error Conditions Subprograms on page 252-32

Syntax

```
UTL_HTTP.GET_DETAILED_SQLCODE
RETURN PLS_INTEGER;
```

GET_DETAILED_SQLERRM Function

This function retrieves the detailed `SQLERRM` of the last exception raised.

See Also: Error Conditions on page 252-16 and Error Conditions Subprograms on page 252-32

Syntax

```
UTL_HTTP.GET_DETAILED_SQLERRM
RETURN VARCHAR2;
```

GET_FOLLOW_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.GET_FOLLOW_REDIRECT (
   max_redirects  OUT PLS_INTEGER);
```

Parameters

Table 252–32 GET_FOLLOW_REDIRECT Procedure Parameters

Parameter	Description
max_redirects	The maximum number of redirections for all future HTTP requests

GET_HEADER Procedure

This procedure returns the n^{th} HTTP response header name and value returned in the response.

> **See Also:** HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

```
UTL_HTTP.GET_HEADER (
   r      IN OUT NOCOPY resp,
   n      IN PLS_INTEGER,
   name   OUT NOCOPY VARCHAR2,
   value  OUT NOCOPY VARCHAR2);
```

Parameters

Table 252–33 GET_HEADER Procedure Parameters

Parameter	Description
r	The HTTP response
n	The n^{th} header to return
name	The name of the HTTP response header
value	The value of the HTTP response header

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

GET_HEADER_BY_NAME Procedure

This procedure returns the HTTP response header value returned in the response given the name of the header.

> **See Also:** HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(
   r      IN OUT NOCOPY resp,
   name   IN VARCHAR2,
   value  OUT NOCOPY VARCHAR2,
   n      IN PLS_INTEGER DEFAULT 1);
```

Parameters

Table 252–34 GET_HEADER_BY_NAME Procedure Parameters

Parameter	Description
r	The HTTP response
name	The name of the HTTP response header for which the value is to return
value	The value of the HTTP response header
n	The n^{th} occurrence of an HTTP response header by the specified name to return. The default is 1.

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

GET_HEADER_COUNT Function

This function returns the number of HTTP response headers returned in the response.

> **See Also:** HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

```
UTL_HTTP.GET_HEADER_COUNT (
   r  IN OUT NOCOPY resp)
RETURN PLS_INTEGER;
```

Parameters

Table 252–35 GET_HEADER_COUNT Function Parameters

Parameter	Description
r	The HTTP response

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

GET_PERSISTENT_CONN_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers.

> **See Also:** HTTP Persistent Connections on page 252-16 and HTTP Persistent Connections Subprograms on page 252-31

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_COUNT
RETURN PLS_INTEGER;
```

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

GET_PERSISTENT_CONN_SUPPORT Procedure

This procedure checks:

- If the persistent connection support is enabled
- Gets the maximum number of persistent connections in the current session

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (
   enable     OUT BOOLEAN,
   max_conns  OUT PLS_INTEGER);
```

Parameters

Table 252–36 GET_PERSISTENT_CONN_SUPPORT Procedure Parameters

Parameter	Description
`enable`	`TRUE` if persistent connection support is enabled; otherwise `FALSE`
`max_conns`	the maximum number of persistent connections maintained in the current session

GET_PERSISTENT_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers.

See Also: HTTP Persistent Connections on page 252-16 and HTTP Persistent Connections Subprograms on page 252-31

Syntax

```
UTL_HTTP.get_persistent_conns (
   connections  IN OUT NOCOPY connection_table);
```

Parameters

Table 252–37 GET_PERSISTENT_CONNS Procedure Parameters

Parameter	Description
connections	The network connections kept persistent

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

GET_PROXY Procedure

This procedure retrieves the current proxy settings.

> **See Also:** Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.GET_PROXY (
   proxy             OUT NOCOPY VARCHAR2,
   no_proxy_domains  OUT NOCOPY VARCHAR2);
```

Parameters

Table 252–38 GET_PROXY Procedure Parameters

Parameter	Description
`proxy`	The proxy (host and an optional port number) currently used by the `UTL_HTTP` package
`no_proxy_domains`	The list of hosts and domains for which no proxy is used for all requests

GET_RESPONSE Function

This function reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

> **See Also:** HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

```
UTL_HTTP.GET_RESPONSE (
   r                      IN OUT NOCOPY req,
   return_info_response   IN BOOLEAN DEFAULT FALSE)
RETURN resp;
```

Parameters

Table 252–39 GET_RESPONSE Function Parameters

Parameter	Description
r	The HTTP response
return_info_response	Return 100 informational response or not. ■ TRUE means get_response should return 100 informational response when it is received from the HTTP server. The request will not be ended if a 100 response is returned. ■ FALSE means the API should ignore any 100 informational response received from the HTTP server and should return the following non-100 response instead. The default is FALSE.

Exceptions

- When detailed-exception is disabled:

  ORA-29273 REQUEST_FAILED - the request fails to execute. Use the GET_DETAILED_EXCP_SUPPORT Procedure and the GET_DETAILED_SQLERRM Function to get the detailed error message.

- When detailed-exception is enabled:

  ORA-29261 BAD_ARGUMENT - some arguments passed are not valid

- When response error check is enabled:

  ORA-29268 HTTP_CLIENT_ERROR - the response code is in 400 range

  ORA-29269 HTTP_SERVER_ERROR - the response code is in 500 range

Usage Notes

- The request will be ended when this functions returns regardless of whether an exception is raised or not. There is no need to invoke the END_REQUEST Procedure.
- If URL redirection occurs, the URL and method fields in the req record will be updated to the last redirected URL and the method used to access the URL.

Examples

In certain situations (initiated by the HTTP client or not), the HTTP server may return a 1xx informational response. The user who does not expect such a response may indicate to GET_RESPONSE to ignore the response and proceed to receive the regular response. In the case when the user expects such a response, the user can indicate to GET_RESPONSE to return the response.

For example, when a user is issuing a HTTP POST request with a large request body, the user may want to check with the HTTP server to ensure that the server will accept the request before sending the data. To do so, the user will send the additional EXPECT: 100-CONTINUE request header, and check for 100 CONTINUE response from the server before proceeding to send the request body. Then, the user will get the regular HTTP response.

The following code example illustrates this:

```
DECLARE
 data  VARCHAR2(1024) := '...';
 req   utl_http.req;
 resp  utl_http.resp;
BEGIN

 req := utl_http.begin_request('http://www.acme.com/receiver', 'POST');
 utl_http.set_header(req, 'Content-Length', length(data));
 -- Ask HTTP server to return "100 Continue" response
 utl_http.set_header(req, 'Expect', '100-continue');
 resp := utl_http.get_response(req, TRUE);

 -- Check for and dispose "100 Continue" response
 IF (resp.status_code <> 100) THEN
   utl_http.end_response(resp);
   raise_application_error(20000, 'Request rejected');
 END IF;
 utl_http.end_response(resp);

 -- Now, send the request body
 utl_http.write_text(req, data);

 -- Get the regular response
 resp := utl_http.get_response(req);
 utl_http.read_text(resp, data);

 utl_http.end_response(resp);

END;
```

GET_RESPONSE_ERROR_CHECK Procedure

This procedure checks if the response error check is set or not.

> **See Also:** Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.GET_RESPONSE_ERROR_CHECK (
   enable  OUT BOOLEAN);
```

Parameters

Table 252–40 GET_RESPONSE_ERROR_CHECK Procedure Parameters

Parameter	Description
enable	TRUE if the response error check is set; otherwise FALSE

GET_TRANSFER_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.GET_TRANSFER_TIMEOUT (
   timeout  OUT PLS_INTEGER);
```

Parameters

Table 252–41 GET_TRANSFER_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The network transfer timeout value in seconds

READ_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer. The end of line is as defined in the function `read_line` of UTL_TCP. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

See Also: HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

```
UTL_HTTP.READ_LINE(
   r            IN OUT NOCOPY resp,
   data         OUT NOCOPY  VARCHAR2 CHARACTER SET ANY_CS,
   remove_crlf  IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 252–42 READ_LINE Procedure Parameters

Parameter	Description
`r`	The HTTP response
`data`	The HTTP response body in text form
`remove_crlf`	Removes the newline characters if set to `TRUE`

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_line` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_line` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

READ_RAW Procedure

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer. The `end_of_body` exception will be raised if the end of the HTTP response body is reached.

> **See Also:** HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

```
UTL_HTTP.READ_RAW(
   r     IN OUT NOCOPY resp,
   data  OUT NOCOPY RAW,
   len   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 252–43 READ_RAW Procedure Parameters

Parameter	Description
`r`	The HTTP response
`data`	The HTTP response body in binary form
`len`	The number of bytes of data to read. If `len` is `NULL`, this procedure will read as much input as possible to fill the buffer allocated in `data`. The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the `transfer_timeout` amount of time has elapsed. The default is `NULL`

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_raw` waits for each data packet to be ready to read until timeout occurs. If it occurs, `read_raw` stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

READ_TEXT Procedure

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

> **See Also:** HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

```
UTL_HTTP.READ_TEXT(
   r     IN OUT NOCOPY resp,
   data  OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
   len   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 252–44 READ_TEXT Procedure Parameters

Parameter	Description
`r`	The HTTP response
`data`	The HTTP response body in text form
`len`	The maximum number of characters of data to read. If `len` is NULL, this procedure will read as much input as possible to fill the buffer allocated in `data`. The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the `transfer_timeout` amount of time has elapsed. The default is NULL.

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_text` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_text` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "`ORA-01482: unsupported character set`" exception is raised if you try to read the response body

as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL. This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

> **See Also:** Simple HTTP Fetches on page 252-15 and Simple HTTP Fetches in a Single Call Subprograms on page 252-25

Syntax

```
UTL_HTTP.REQUEST (
   url              IN VARCHAR2,
   proxy            IN VARCHAR2 DEFAULT NULL,
   wallet_path      IN VARCHAR2 DEFAULT NULL,
   wallet_password  IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

Parameters

Table 252–45 REQUEST Function Parameters

Parameter	Description
`url`	Uniform resource locator
`proxy`	(Optional) Specifies a proxy server to use when making the HTTP request. See `SET_PROXY` for the full format of the proxy setting.
`wallet_path`	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of `wallet_path` on a PC is, for example, file:`c:\WINNT\Profiles\`*`username`*`\WALLETS`, and in Unix is, for example, `file:/home/`*`username`*`/wallets` When the `UTL_HTTP` package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See `SET_WALLET` for a description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.
`wallet_password`	(Optional) Specifies the password required to open the wallet

Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.

Exceptions

```
INIT_FAILED
REQUEST_FAILED
```

Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function `SET_WALLET` on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

Examples

```
SQL> SELECT UTL_HTTP.REQUEST('http://www.my-company.com/') FROM DUAL;
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')
<html>
<head><title>My Company Home Page</title>
<!--changed Jan. 16, 19
1 row selected.
```

If you are behind a firewall, include the `proxy` parameter. For example, from within the Oracle firewall, where there might be a proxy server named `www-proxy.my-company.com`:

```
SQLPLUS> SELECT
UTL_HTTP.REQUEST('http://www.my-company.com', 'www-proxy.us.my-company.com') FROM
DUAL;
```

REQUEST_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL. You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

See Also: Simple HTTP Fetches on page 252-15 and Simple HTTP Fetches in a Single Call Subprograms on page 252-25

Syntax

```
TYPE html_pieces IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

UTL_HTTP.REQUEST_PIECES (
   url             IN VARCHAR2,
   max_pieces      IN NATURAL DEFAULT 32767,
   proxy           IN VARCHAR2 DEFAULT NULL,
   wallet_path     IN VARCHAR2 DEFAULT NULL,
   wallet_password IN VARCHAR2 DEFAULT NULL)
RETURN html_pieces;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES (request_pieces, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 252–46 REQUEST_PIECES Function Parameters

Parameter	Description
url	Uniform resource locator
max_pieces	(Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that REQUEST_PIECES should return. If provided, then that argument should be a positive integer.
proxy	(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.
wallet_path	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles*username*\WALLETS, and in Unix is, for example, file:/home/*username*/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See SET_WALLET for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.
wallet_password	(Optional) Specifies the password required to open the wallet

Return Values

REQUEST_PIECES returns a PL/SQL table of type UTL_HTTP.HTML_PIECES. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL

table returned by REQUEST_PIECES are successive pieces of the data obtained from the HTTP request to that URL.

Exceptions

INIT_FAILED
REQUEST_FAILED

Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the "pieces") returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous "piece" is totally full.

Please see the documentation of the function SET_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

Examples

```
SET SERVEROUTPUT ON

DECLARE
   x   UTL_HTTP.HTML_PIECES;
   len PLS_INTEGER;
BEGIN
   x := UTL_HTTP.REQUEST_PIECES('http://www.oracle.com/', 100);
   DBMS_OUTPUT.PUT_LINE(x.count || ' pieces were retrieved.');
   DBMS_OUTPUT.PUT_LINE('with total length ');
   IF x.count < 1 THEN
      DBMS_OUTPUT.PUT_LINE('0');
  ELSE
   len := 0;
   FOR i in 1..x.count LOOP
      len := len + length(x(i));
```

```
   END LOOP;
   DBMS_OUTPUT.PUT_LINE(len);
  END IF;
END;
/
-- Output
Statement processed.
4 pieces were retrieved.
with total length
7687
```

SET_AUTHENTICATION Procedure

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

> **See Also:** HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27

Syntax

```
UTL_HTTP.SET_AUTHENTICATION(
   r         IN OUT NOCOPY req,
   username  IN VARCHAR2,
   password  IN VARCHAR2,
   scheme    IN VARCHAR2 DEFAULT 'Basic',
   for_proxy IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 252–47 SET_AUTHENTICATION Procedure Parameters

Parameter	Description
`r`	HTTP request
`username`	Username for the HTTP authentication
`password`	Password for the HTTP authentication
`scheme`	HTTP authentication scheme. Either `Basic` for the HTTP basic or `AWS` for Amazon S3 authentication scheme. Default is basic.
`for_proxy`	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is `FALSE`.

Usage Notes

The supported authentication schemes are HTTP basic and Amazon S3 authentication.

SET_AUTHENTICATION_FROM_WALLET Procedure

This procedure sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.

> **See Also:** External Password Store on on page 252-17, and HTTP Requests Subprograms on page 252-27

Syntax

```
UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(
   r         IN OUT NOCOPY req,
   alias     IN VARCHAR2,
   scheme    IN VARCHAR2 DEFAULT 'Basic',
   for_proxy IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 252–48 SET_AUTHENTICATION_FROM_WALLET Procedure Parameters

Parameter	Description
r	The HTTP request
alias	Alias to identify and retrieve the username and password credential stored in the Oracle wallet
scheme	HTTP authentication scheme. Either Basic for the HTTP basic or AWS for Amazon S3 authentication scheme. Default is basic.
for_proxy	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is FALSE.

Usage Notes

- To use the password credentials in a wallet, the UTL_HTTP user must have the use-passwords privilege on the wallet.
- The supported authentication schemes are HTTP basic and Amazon S3 authentication schemes.

Examples

Creating a wallet and entering username and password in the wallet

```
> mkstore -wrl /oracle/wallets/test_wallet -create
Enter password: ******
Enter password again: ******
> mkstore -wrl /oracle/wallets/test_wallet -createCredential hr-access jsmith
Your secret/Password is missing in the command line
Enter your secret/Password: ****
Re-enter your secret/Password: ****
Enter wallet password: ******
```

Granting the use-passwords privilege on the wallet to a user by the database administrator

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
```

```
    acl         => 'wallet-acl.xml',
    description => 'Wallet ACL',
    principal   => 'SCOTT',
    is_grant    => TRUE,
    privilege   => 'use-passwords');
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_acl(
      acl          => 'wallet-acl.xml',
      wallet_path  => 'file: /oracle/wallets/test_wallet');
END;
```

Using username and password from the wallet

```
DECLARE
  req  UTL_HTTP.req;
BEGIN
  UTL_HTTP.SET_WALLET(path => 'file:/oracle/wallets/test_wallet');
  req := UTL_HTTP.BEGIN_REQUEST(…);
  UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(req, 'hr-access');
  …
END;
```

SET_BODY_CHARSET Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

See Also:

- HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29
- Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header. Following the HTTP protocol standard specification, if the media type of a request or a response is `text`, but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to `ISO-8859-1`. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is ISO-8859-1 in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other `SET_BODY_CHARSET` procedure that operates on a request:

```
UTL_HTTP.SET_BODY_CHARSET (
   charset   IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header. According to the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "`ISO-8859-1`". Use this procedure to change the default body character set a request inherits from the session default setting:

```
UTL_HTTP.SET_BODY_CHARSET(
   r         IN OUT NOCOPY req,
   charset   IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header. For each the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a response inherits from the request:

```
UTL_HTTP.SET_BODY_CHARSET(
   r         IN OUT NOCOPY resp,
   charset   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 252–49 SET_BODY_CHARSET Procedure Parameters

Parameter	Description
`r`	The HTTP response.
`charset`	The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If `charset` is `NULL`, the database character set is assumed.

SET_COOKIE_SUPPORT Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

This procedure

See Also:

- HTTP Requests on page 252-16 andHTTP Requests Subprograms on page 252-27
- Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```
UTL_HTTP.SET_COOKIE_SUPPORT(
   r       IN OUT NOCOPY REQ,
   enable  IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```
UTL_HTTP.SET_COOKIE_SUPPORT (
   enable       IN BOOLEAN,
   max_cookies  IN PLS_INTEGER DEFAULT 300,
   max_cookies_per_site  IN PLS_INTEGER DEFAULT 20);
```

Parameters

Table 252–50 SET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
r	The HTTP request
enable	Set enable to TRUE to enable HTTP cookie support; FALSE to disable
max_cookies	Sets the maximum total number of cookies maintained in the current session
max_cookies_per_site	Sets the maximum number of cookies maintained in the current session for each Web site

Usage Notes

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the Set-Cookie HTTP headers can still be retrieved from the response.

Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other `SET_COOKIE_SUPPORT` procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See "Examples" on page 252-20 for how to use `GET_COOKIES` and `ADD_COOKIES` to retrieve, save, and restore cookies.

SET_DETAILED_EXCP_SUPPORT Procedure

This procedure sets the UTL_HTTP package to raise a detailed exception. By default, UTL_HTTP raises the request_failed exception when an HTTP request fails. Use GET_DETAILED_SQLCODE and GET_DETAILED_SQLEERM for more detailed information about the error.

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.SET_DETAILED_EXCP_SUPPORT (
   enable  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 252–51 SET_DETAILED_EXCP_SUPPORT Procedure Parameters

Parameter	Description
enable	Asks UTL_HTTP to raise a detailed exception directly if set to TRUE; otherwise FALSE

SET_FOLLOW_REDIRECT Procedures

This procedure sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the GET_RESPONSE function.

See Also:

- HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27
- Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

Use this procedure to set the maximum number of redirections:

```
UTL_HTTP.SET_FOLLOW_REDIRECT (
   max_redirects  IN PLS_INTEGER DEFAULT 3);
```

Use this procedure to change the maximum number of redirections a request inherits from the session default setting:

```
UTL_HTTP.SET_FOLLOW_REDIRECT(
   r              IN OUT NOCOPY req,
   max_redirects  IN PLS_INTEGER DEFAULT 3);
```

Parameters

Table 252–52 SET_FOLLOW_REDIRECT Procedure Parameters

Parameter	Description
r	The HTTP request
max_redirects	The maximum number of redirects. Set to zero to disable redirects.

Usage Notes

If max_redirects is set to a positive number, the GET_RESPONSE Function will automatically follow the redirected URL for the HTTP response status code 301, 302, and 307 for the HTTP HEAD and GET methods, and 303 for all HTTP methods, and retry the HTTP request (the request method will be changed to HTTP GET for the status code 303) at the new location. It follows the redirection until the final, non-redirect location is reached, or an error occurs, or the maximum number of redirections has been reached (to prevent an infinite loop). The URL and method fields in the REQ record will be updated to the last redirected URL and the method used to access the URL. Set the maximum number of redirects to zero to disable automatic redirection.

While it is set not to follow redirect automatically in the current session, it is possible to specify individual HTTP requests to follow redirect instructions the function FOLLOW_REDIRECT and vice versa.

The default maximum number of redirections in a database user session is 3. The default value affects only future requests and has no effect on existing requests.

The SET_FOLLOW_REDIRECT procedure must be called before GET_RESPONSE for any redirection to take effect.

SET_HEADER Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

See Also: HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27

Syntax

```
UTL_HTTP.SET_HEADER (
   r      IN OUT NOCOPY req,
   name   IN VARCHAR2,
   value  IN VARCHAR2);
```

Parameters

Table 252–53 SET_HEADER Procedure Parameters

Parameter	Description
r	The HTTP request
name	The name of the HTTP request header
value	The value of the HTTP request header

Usage Notes

Multiple HTTP headers with the same name are allowed in the HTTP protocol standard. Therefore, setting a header does not replace a prior header with the same name.

If the request is made using HTTP 1.1, UTL_HTTP sets the Host header automatically for you.

When you set the Content-Type header with this procedure, UTL_HTTP looks for the character set information in the header value. If the character set information is present, it is set as the character set of the request body. It can be overridden later by using the SET_BODY_CHARSET procedure.

When you set the Transfer-Encoding header with the value chunked, UTL_HTTP automatically encodes the request body written by the WRITE_TEXT, WRITE_LINE and WRITE_RAW procedures. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format.

SET_PERSISTENT_CONN_SUPPORT Procedure

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

> **See Also:** HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27

Syntax

Sets whether future HTTP requests should support the HTTP 1.1 persistent connection or not, and the maximum numbers of persistent connections to be maintained in the current database user session.

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
   enable      IN BOOLEAN DEFAULT FALSE,
   max_conns   IN PLS_INTEGER DEFAULT 0);
```

Enables or disables support for the HTTP 1.1 persistent-connection in the request.

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
   r           IN OUT NOCOPY req,
   enable      IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 252–54 SET_PERSISTENT_CONN_SUPPORT Procedure Parameters

Parameter	Description
`enable`	`TRUE` to keep the network connection persistent. `FALSE` otherwise.
maximum_conns	Maximum number of connections
`r`	The HTTP request

Usage Notes

If the persistent-connection support is enabled for an HTTP request, the package will keep the network connections to a Web server or the proxy server open in the package after the request is completed properly for a subsequent request to the same server to reuse for each HTTP 1.1 protocol specification. With the persistent connection support, subsequent HTTP requests may be completed faster because the network connection latency is avoided. If the persistent-connection support is disabled for a request, the package will always send the HTTP header "Connection: close" automatically in the HTTP request and close the network connection when the request is completed. This setting has no effect on HTTP requests that follows HTTP 1.0 protocol, for which the network connections will always be closed after the requests are completed.

When a request is being made, the package attempts to reuse an existing persistent connection to the target Web server (or proxy server) if one is available. If none is available, a new network connection will be initiated. The persistent-connection support setting for a request affects only whether the network connection should be closed after a request completes.

Use this procedure to change the persistent-connection support setting a request inherits from the session default setting.

Users should note that while the use of persistent connections in UTL_HTTP may reduce the time it takes to fetch multiple Web pages from the same server, it consumes precious system resources (network connections) in the database server. Also, excessive use of persistent connections may reduce the scalability of the database server when too many network connections are kept open in the database server. Network connections should be kept open only if they will be used immediately by subsequent requests and should be closed immediately when they are no longer needed. Set the default persistent connection support as disabled in the session, and enable persistent connection in individual HTTP requests as shown in "Examples" on page 252-89.

The default value of the maximum number of persistent connections in a database session is zero. To truly enable persistent connections, you must also set the maximum number of persistent connections to a positive value or no connections will be kept persistent.

Note that if you want to use persistent connections, you must call the overload that takes the maximum_conns parameter prior to calling the BEGIN_REQUEST Function, otherwise persistent connections will not be enabled for the current request even if the other form of SET_PERSISTENT_CONN_SUPPORT is called.

Examples

Using SET_PERSISTENT_CONN_SUPPORT in http requests at the session level, showing the active persistent connection after each request

```
DECLARE
  pieces utl_http.html_pieces;
  conns  utl_http.connection_table;
BEGIN

  -- Turns on persistent connection support for the request_pieces call.
  utl_http.set_persistent_conn_support(true, 1);

  FOR i IN 1..10 LOOP

    pieces := utl_http.request_pieces('http://www.example.com/');

    -- Shows the active persistent connection
    utl_http.get_persistent_conns(conns);
    FOR j IN 1..conns.count LOOP
       dbms_output.put_line('Persistent connection '||j||':
'||conns(j).host||':'||conns(j).port);
    END LOOP;

  END LOOP;

  -- Turns off persistent connection support. Set active max persistent connection
to 0 to close all active connections.
  utl_http.set_persistent_conn_support(false, 0);

END;
/
```

Using SET_PERSISTENT_CONN_SUPPORT in HTTP requets showing how to use persistent connection individually in each request to fetch multiple URLs at the same host

```
DECLARE
-- Table to store the URLs
TYPE vc2_table IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
paths VC2_TABLE;

PROCEDURE fetch_pages(paths IN vc2_table) AS
  req  UTL_HTTP.REQ;
  resp UTL_HTTP.RESP;
  data VARCHAR2(1024);

BEGIN

  -- Set the proxy server
  UTL_HTTP.SET_PROXY('www-proxy.example.com:80', '');

  FOR i IN 1..paths.count LOOP

    req := UTL_HTTP.BEGIN_REQUEST(paths(i));

    -- Use persistent connections except for the last request
    IF (i < paths.count) THEN
      -- Use a persistent connection for the current request
      UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(req, TRUE);
    END IF;

    resp := UTL_HTTP.GET_RESPONSE(req);

    -- Display the results of the response
    DBMS_OUTPUT.PUT_LINE('-');
    DBMS_OUTPUT.PUT_LINE('URL: ' || paths(i));
    DBMS_OUTPUT.PUT_LINE('HTTP Response Status Code:   ' || resp.status_code);
    DBMS_OUTPUT.PUT_LINE('HTTP Response Reason Phrase: ' || resp.reason_phrase);
    DBMS_OUTPUT.PUT_LINE('HTTP Response Version:       ' || resp.http_version);

    BEGIN
      LOOP
        UTL_HTTP.READ_TEXT(resp, data);
        -- do something with the data
      END LOOP;
    EXCEPTION
      WHEN UTL_HTTP.END_OF_BODY THEN
        NULL;
    END;
    UTL_HTTP.END_RESPONSE(resp);
  END LOOP;
END;

BEGIN
-- Set a maximum of 1 persistent connection, but start with persistent connections
-- off
   UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(FALSE, 1);

   -- Create a list of URLs
   paths(1) := 'http://www.example.com/technetwork/index.html';
   paths(2) := 'http://www.example.com/us/products/index.html';

   fetch_pages(paths);
```

```
 END;
/
```

SET_PROXY Procedure

This procedure sets the proxy to be used for requests of the HTTP or other protocols, excluding those for hosts that belong to the domain specified in `no_proxy_domains.no_proxy_domains` is a comma-, semi-colon-, or space-separated list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server.

> **See Also:** Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.SET_PROXY (
   proxy             IN VARCHAR2,
   no_proxy_domains  IN VARCHAR2);
```

Parameters

Table 252–55 SET_PROXY Procedure Parameters

Parameter	Description
`proxy`	The proxy (host and an optional port number) to be used by the `UTL_HTTP` package
`no_proxy_domains`	The list of hosts and domains for which no proxy should be used for all requests

Usage Notes

The proxy may include an optional TCP/IP port number at which the proxy server listens. The syntax is `[http://]host[:port][/]`, for example, `www-proxy.my-company.com:80`. If the port is not specified for the proxy, port 80 is assumed.

Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at the port of the particular domain or host, for example, `corp.my-company.com, eng.my-company.com:80`. When `no_proxy_domains` is `NULL` and the proxy is set, all requests go through the proxy. When the proxy is not set, `UTL_HTTP` sends requests to the target Web servers directly.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

If proxy settings are set when the database server instance is started, the proxy settings in the environment variables `http_proxy` and `no_proxy` are assumed. Proxy settings set by this procedure override the initial settings.

SET_RESPONSE_ERROR_CHECK Procedure

This procedure sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges. For example, when the requested URL is not found in the destination Web server, a 404 (document not found) response status code is returned.

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.SET_RESPONSE_ERROR_CHECK (
   enable  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 252–56 SET_RESPONSE_ERROR_CHECK Procedure Parameters

Parameter	Description
enable	TRUE to check for response errors; otherwise FALSE

Usage Notes

If the status code indicates an error—a 4xx or 5xx code—and this procedure is enabled, GET_RESPONSE will raise the HTTP_CLIENT_ERROR or HTTP_SERVER_ERROR exception. If SET_RESPONSE_ERROR_CHECK is set to FALSE, GET_RESPONSE will not raise an exception when the status code indicates an error.

Response error check is turned off by default.

The GET_RESPONSE function can raise other exceptions when SET_RESPONSE_ERROR_CHECK is set to FALSE.

SET_TRANSFER_TIMEOUT Procedure

This procedure sets the default time out value for all future HTTP requests that the UTL_HTTP package should attempt while reading the HTTP response from the Web server or proxy server. This time out value may be used to avoid the PL/SQL programs from being blocked by busy Web servers or heavy network traffic while retrieving Web pages from the Web servers.

> **See Also:** Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.SET_TRANSFER_TIMEOUT (
   timeout  IN PLS_INTEGER DEFAULT 60);
```

Parameters

Table 252–57 SET_TRANSFER_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The network transfer timeout value in seconds.

Usage Notes

The default value of the time out is 60 seconds.

SET_WALLET Procedure

This procedure sets the Oracle wallet used for all HTTP requests over Secured Socket Layer (SSL), namely HTTPS. When the UTL_HTTP package communicates with an HTTP server over SSL, the HTTP server presents its digital certificate, which is signed by a certificate authority, to the UTL_HTTP package for identification purpose. The Oracle wallet contains the list of certificate authorities that are trusted by the user of the UTL_HTTP package. An Oracle wallet is required to make an HTTPS request.

See Also:

- Session Settings on page 252-16 and Session Settings Subprograms on page 252-26
- "Managing Fine-Grained Access in PL/SQL Network Utility Packages" in the *Oracle Database Security Guide*

Syntax

```
UTL_HTTP.SET_WALLET (
   path      IN VARCHAR2,
   password  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 252–58 SET_WALLET Procedure Parameters

Parameter	Description
path	The directory path that contains the Oracle wallet. The format is file:*directory-path*. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles*username*\WALLETS, and in Unix is, for example, file:/home/*username*/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.
password	The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to NULL. See "Using Wallets with Automatic Login Enabled" in the *Oracle Database Advanced Security Guide* for information about using Oracle Wallet Manager and the ORAPKI utility to create an auto-login wallet

Usage Notes

To set up an Oracle wallet, use the Oracle Wallet Manager to create a wallet. In order for the HTTPS request to succeed, the certificate authority that signs the certificate of the remote HTTPS Web server must be a trust point set in the wallet.

When a wallet is created, it is populated with a set of well-known certificate authorities as trust points. If the certificate authority that signs the certificate of the remote HTTPS Web server is not among the trust points, or the certificate authority has new root certificates, you should obtain the root certificate of that certificate authority and install it as a trust point in the wallet using Oracle Wallet Manager

See Also: *Oracle Database Advanced Security Guide* for more information on Wallet Manager

WRITE_LINE Procedure

This procedure writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP). As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

> **See Also:** HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27

Syntax

```
UTL_HTTP.WRITE_LINE(
   r     IN OUT NOCOPY req,
   data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 252–59 WRITE_LINE Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text line to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. The UTL_HTTP package performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding: chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the SET_HEADER procedure for details.

If you send the Content-Length header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the Content-Length header, and the results using the WRITE_RAW procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where UTL_HTTP handles the length of the chunks transparently.

WRITE_RAW Procedure

This procedure writes some binary data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed.

See Also: HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27

Syntax

```
UTL_HTTP.WRITE_RAW(
   r     IN OUT NOCOPY REQ,
   data  IN            RAW);
```

Parameters

Table 252–60 WRITE_RAW Procedure Parameters

Parameter	Description
r	The HTTP request
data	The binary data to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding:chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

WRITE_TEXT Procedure

This procedure writes some text data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

> **See Also:** HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27

Syntax

```
UTL_HTTP.WRITE_TEXT(
   r     IN OUT NOCOPY REQ,
   data  IN            VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 252–61 WRITE_TEXT Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text data to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

253

UTL_I18N

`UTL_I18N` is a set of services that provides additional globalization functionality for applications written in PL/SQL.

> **See Also:** *Oracle Database Globalization Support Guide*

The chapter contains the following topics:

Using UTL_I18N

This section contains topics which relate to using the `UTL_I18N` package.

Overview

The UTL_I18N PL/SQL package consists of the following categories of services:

- String conversion functions for various datatypes.
- Functions that convert a text string to character references and vice versa.
- Functions that map between Oracle, Java, and ISO languages and territories.
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and e-mail safe character sets.
- A function that returns the Oracle character set name from an Oracle language name.
- A function that returns the maximum number of bytes for a character of an Oracle character set.
- A function that performs script transliteration.
- Functions that return the ISO currency code, local time zones, and local languages supported for a given territory.
- Functions that return the most appropriate linguistic sort, a listing of all the applicable linguistic sorts, and the local territories supported for a given language.
- Functions that map between the Oracle full and short language names.
- A function that returns the language translation of a given language and territory name.
- A function that returns a listing of the most commonly used time zones.

Security Model

The functions of the `UTL_I18N` package neither read database contents nor modify them. The functions operate on their arguments only and/or they retrieve static internationalization information from NLS Data files. The execution privilege for the package is granted to `PUBLIC` by default

Constants

The UTL_I18N package uses the constants shown in Table 253–1.

Table 253–1 UTL_I18N Constants

Constant	Type	Value	Description
GENERIC_CONTEXT	PLS_INTEGER	0	Returns the default character set for general cases.
MAIL_GENERIC	PLS_INTEGER	0	Map from an Oracle character set name to an email safe character set name on a non-Windows platform.
ORACLE_TO_IANA	PLS_INTEGER	0	Map from an Oracle character set name to an IANA character set name.
SHIFT_IN	PLS_INTEGER	0	Used with shift_status. Must be set the first time it is called in piecewise conversion.
IANA_TO_ORACLE	PLS_INTEGER	1	Map from an IANA character set name to an Oracle character set name.
MAIL_CONTEXT	PLS_INTEGER	1	The mapping is between an Oracle character set name and an email safe character set name.
MAIL_WINDOWS	PLS_INTEGER	1	Map from an Oracle character set name to an email safe character set name on a Windows platform.
SHIFT_OUT	PLS_INTEGER	1	
FWKATAKANA_HIRAGANA	VARCHAR2(30)	'fwkatakana_hiragana'	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
FWKATAKANA_HWKATAKANA	VARCHAR2(30)	'fwkatakana_hwkatakana'	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
HIRAGANA_FWKATAKANA	VARCHAR2(30)	'hiragana_fwkatakana'	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.
HIRAGANA_HWKATAKANA	VARCHAR2(30)	'hiragana_hwkatakana'	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.
HWKATAKANA_FWKATAKANA	VARCHAR2(30)	'hwkatakana_fwkatakana'	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
HWKATAKANA_HIRAGANA	VARCHAR2(30)	'hwkatakana_hiragana'	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
KANA_FWKATAKANA	VARCHAR2(30)	'kana_fwkatakana'	Converts any type of Kana character to a fullwidth Katakana character.
KANA_HIRAGANA	VARCHAR2(30)	'kana_hiragana'	Converts any type of Kana character to a fullwidth Hiragana character.

Table 253–1 (Cont.) UTL_I18N Constants

Constant	Type	Value	Description
KANA_HWKATAKANA	VARCHAR2(30)	'kana_ hwkatakana'	Converts any type of Kana character to a halfwidth Katakana character.

Summary of UTL_I18N Subprograms

Table 253–2 UTL_I18N Package Subprograms

Procedure	Description
ESCAPE_REFERENCE Function on page 253-9	Converts a given text string to its character reference counterparts, for characters that fall outside the document character set.
GET_COMMON_TIME_ZONES Function on page 253-10	Returns the list of common time zone IDs that are independent of the locales.
GET_DEFAULT_CHARSET Function on page 253-11	Returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.
GET_DEFAULT_ISO_CURRENCY Function on page 253-12	Returns the default ISO 4217 currency code for the specified territory.
GET_DEFAULT_LINGUISTIC_SORT Function on page 253-13	Returns the default linguistic sort name for the specified language.
GET_LOCAL_LANGUAGES Function on page 253-14	Returns the local language names for the specified territory.
GET_LOCAL_LINGUISTIC_SORTS Function on page 253-15	Returns the local linguistic sort names for the specified language.
GET_LOCAL_TERRITORIES Function on page 253-16	Returns the local territory names for the specified language.
GET_LOCAL_TIME_ZONES Function on page 253-17	Returns the local time zone IDs for the specified territory.
GET_MAX_CHARACTER_SIZE Function on page 253-19	Returns the maximum character size of a given character set.
GET_TRANSLATION Function on page 253-20	Returns the translation of the language and territory name in the specified translation language.
MAP_CHARSET Function on page 253-21	▪ Maps an Oracle character set name to an IANA character set name. ▪ Maps an IANA character set name to an Oracle character set name. ▪ Maps an Oracle character set name to an e-mail safe character set name.
MAP_FROM_SHORT_LANGUAGE Function on page 253-23	Maps an Oracle short language name to an Oracle language name.
MAP_LANGUAGE_FROM_ISO Function on page 253-24	Returns an Oracle language name from an ISO locale name.
MAP_LOCALE_TO_ISO Function on page 253-25	Returns an ISO locale name from the Oracle language and territory name.
MAP_TERRITORY_FROM_ISO Function on page 253-26	Returns an Oracle territory name from an ISO locale name.
MAP_TO_SHORT_LANGUAGE Function on page 253-27	Maps an Oracle language name to an Oracle short language name.
RAW_TO_CHAR Functions on page 253-28	Converts `RAW` data that is not encoded in the database character set into a `VARCHAR2` string
RAW_TO_NCHAR Functions on page 253-30	Converts `RAW` data that is not encoded in the national character set into an `NVARCHAR2` string

Table 253–2 (Cont.) UTL_I18N Package Subprograms

Procedure	Description
STRING_TO_RAW Function on page 253-32	Converts a VARCHAR2 or NVARCHAR2 string to another character set. The result is returned as a RAW datatype.
TRANSLITERATE Function on page 253-33	Transliterates between Japanese hiragana and katakana.
UNESCAPE_REFERENCE Function on page 253-35	Converts an input string that contains character references to a text string.

ESCAPE_REFERENCE Function

This function converts a text string to its character reference counterparts for characters that fall outside the character set used by the current document. Character references are mainly used in HTML and XML documents to represent characters independently of the encoding of the document.Character references may appear in two forms, numeric character references and character entity references. Numeric character references specify the Unicode code point value of a character, while character entity references use symbolic names to refer to the same character. For example, `&#xe5;` is the numeric character reference for the small letter "a" with a ring above, whereas `&aring;` is the character entity reference for the same character. Character entity references are also used to escape special characters, as an example, `<` represents the < (less than) sign. This is to avoid possible confusion with the beginning of a tag in Markup languages.

Syntax

```
UTL_I18N.ESCAPE_REFERENCE(
    str            IN VARCHAR2 CHARACTER SET ANY_CS,
    page_cs_name   IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 253–3 ESCAPE_REFERENCE Function Parameters

Parameter	Description
`str`	Specifies the input string
`page_cs_name`	Specifies the character set of the document. If `page_cs_name` is `NULL`, then the database character set is used for `CHAR` data and the national character set is used for `NCHAR` data.

Usage Notes

If the user specifies an invalid character set or a `NULL` string, then the function returns a `NULL` string.

Examples

```
UTL_I18N.ESCAPE_REFERENCE('hello < '||chr(229),'us7ascii')
```

This returns `'hello < &#xe5;'`.

GET_COMMON_TIME_ZONES Function

This function returns a listing of the most commonly used time zones. This list contains a subset of the time zones that are supported in the database.

Syntax

```
UTL_I18N.GET_COMMON_TIME_ZONES
 RETURN STRING_ARRAY;
```

Examples

Returns the list of the most commonly used time zones.

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
BEGIN
   retval := UTL_I18N.GET_COMMON_TIME_ZONES;
END;
/
```

GET_DEFAULT_CHARSET Function

This function returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.

> **See Also:** "MAP_CHARSET Function" on page 253-21 for an explanation of an e-mail safe character set

Syntax

```
UTL_I18N.GET_DEFAULT_CHARSET(
   language  IN VARCHAR2,
   context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
   iswindows IN BOOLEAN DEFAULT FALSE)
 RETURN VARCHAR2;
```

Parameters

Table 253–4 GET_DEFAULT_CHARSET Function Parameters

Parameter	Description
language	Specifies a valid Oracle language
context	GENERIC_CONTEXT | MAIL_CONTEXT
	GENERIC_CONTEXT: Returns the default character set for general cases
	MAIL_CONTEXT: Returns the default e-mail safe character set name
iswindows	If context is set as MAIL_CONTEXT, then iswindows should be set to TRUE if the platform is Windows and FALSE if the platform is not Windows. The default is FALSE.
	iswindows has no effect if context is set as GENERIC_CONTEXT.

Usage Notes

If the user specifies an invalid language name or an invalid flag, then the function returns a NULL string.

Examples

GENERIC_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.GENERIC_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

MAIL_CONTEXT, iswindows=TRUE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, TRUE)
```

This returns 'WE8MSWIN1252'.

MAIL_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

GET_DEFAULT_ISO_CURRENCY Function

This function returns the default ISO 4217 currency code for the specified territory.

Syntax

```
UTL_I18N.GET_DEFAULT_ISO_CURRENCY (
   territory    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 253–5 GET_DEFAULT_ISO_CURRENCY Function Parameters

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Displays the default ISO currency code for China.

```
DECLARE
   retval VARCHAR2(50);
BEGIN
   retval := UTL_I18N.GET_DEFAULT_ISO_CURRENCY('CHINA');
   DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

GET_DEFAULT_LINGUISTIC_SORT Function

This function returns the most commonly used Oracle linguistic sort for the specified language.

Syntax

```
UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
   language  IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 253–6 GET_DEFAULT_LINGUISTIC_SORT Function Parameters

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Displays the name of the most appropriate linguistic sort name for the language used in the current SQL session.

```
DECLARE
   retval VARCHAR2(50);
BEGIN
  SELECT value INTO retval FROM nls_session_parameters
   WHERE parameter = 'NLS_LANGUAGE';
   retval := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT(retval);
   DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

GET_LOCAL_LANGUAGES Function

This function returns the local language names for the specified territory.

Syntax

```
UTL_I18N.GET_LOCAL_LANGUAGES (
   territory    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

Table 253–7 GET_LOCAL_LANGUAGES Function Parameters

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Returns the list of local languages used in Belgium.

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
   cnt    INTEGER;
BEGIN
   retval   :=  UTL_I18N.GET_LOCAL_LANGUAGES('BELGIUM');
   DBMS_OUTPUT.PUT('Count = ');
   DBMS_OUTPUT.PUT_LINE(retval.LAST);
   cnt := retval.FIRST;
   WHILE cnt IS NOT NULL LOOP
      DBMS_OUTPUT.PUT_LINE(retval(cnt));
      cnt := retval.NEXT(cnt);
   END LOOP;
END;
/
...
Count = 2
DUTCH
FRENCH
```

GET_LOCAL_LINGUISTIC_SORTS Function

This function returns a list of the Oracle linguistic sort names that are appropriate for the specified language. A BINARY sort is included for all languages.

Syntax

```
UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS (
   language  IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

Table 253–8 GET_LOCAL_LINGUISTIC_SORTS Function Parameters

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Displays the local linguistic sort names for JAPANESE.

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
   cnt INTEGER;
BEGIN
  retval := UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS('Japanese');
  DBMS_OUTPUT.PUT('Count = ');
  DBMS_OUTPUT.PUT_LINE(retval.COUNT);
  cnt := retval.FIRST;
   WHILE cnt IS NOT NULL LOOP
      DBMS_OUTPUT.PUT_LINE(retval(cnt));
      cnt := retval.NEXT(cnt);
    END LOOP;
END;
/

...
Count = 2
JAPANESE_M
BINARY
```

GET_LOCAL_TERRITORIES Function

This function returns the local territory names for the specified language.

Syntax

```
UTL_I18N.GET_LOCAL_TERRITORIES (
   language  IN VARCHAR2 CHARACTER SET ANY_CS)
 RETURN STRING_ARRAY;
```

Parameters

Table 253–9 GET_LOCAL_TERRITORIES Function Parameters

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the list of Oracle territories that use German as one of their local languages.

```
DECLARE
   retval  UTL_I18N.STRING_ARRAY;
   cnt     INTEGER;
BEGIN
   retval  := UTL_I18N.GET_LCOAL_TERRITORIIES('GERMAN');
   DBMS_OUTPUT.PUT('Count = ');
   DBMS_OUTPUT.PUT_LINE(retval.LAST);
  cnt := retval.FIRST;
   WHILE cnt IS NOT NULL LOOP
      DBMS_OUTPUT.PUT_LINE(retval(cnt));
      cnt := retval.NEXT(cnt));
   END LOOP;
END;
/
...
Count = 4
GERMANY
AUSTRIA
LUXEMBOURG
SWITZERLAND
```

GET_LOCAL_TIME_ZONES Function

This function returns the local time zone IDs for the specified territory.

Syntax

```
UTL_I18N.GET_LOCAL_TIME_ZONES (
   territory      IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN STRING_ARRAY;
```

Parameters

Table 253–10 GET_LOCAL_TIME_ZONES Function Parameters

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Creates a function that returns the list of time zones locally used in the territory AZERBAIJAN followed by the general common time zones. This is useful for when the user's territory is known and the application still allows the user to choose other time zones as a user's preference.

```
CREATE OR REPLACE FUNCTION get_time_zones
(territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN utl_i18n.string_array
IS
  retval  utl_i18n.string_array;
  retval2 utl_i18n.string_array;
  stpos   INTEGER;
BEGIN
  retval  := utl_i18n.get_local_time_zones(
    territory);
  retval2 := utl_i18n.get_common_time_zones;
  stpos := retval.LAST + 1;
  retval(stpos) := '-----'; -- a separator
  FOR i IN retval2.FIRST..retval2.LAST LOOP
    stpos := stpos + 1;
    retval(stpos) := retval2(i);
  END LOOP;
  RETURN retval;
END;
/
```

Returns the list of local time zones for AZERBAIJAN followed by the common time zones with a separator string of five dashes (-----).

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
   cnt INTEGER;
BEGIN
   DBMS_OUTPUT.ENABLE(100000);
   retval UTL_I18N.GET_TIME_ZONES('AZERBAIJAN');
```

```
   cnt := retval.FIRST;
  WHILE cnt IS NOT NULL LOOP
    DBMS_OUTPUT.PUT_LINE(retval(cnt));
    cnt := retval.NEXT(cnt);
  END LOOP;
END;
/

Asia/Baku

...
```

GET_MAX_CHARACTER_SIZE Function

This function returns the maximum character size of a given character set.

Syntax

```
UTL_I18N.GET_MAX_CHARACTER_SIZE(
    charset_name       IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

Table 253–11 GET_MAX_CHARACTER_SIZE Function Parameters

Parameter	Description
charset_name	Specifies a valid character set name. It is case-insensitive.

Usage Notes

For shift-sensitive character sets, the returned maximum character size will include the possible extra shift characters.

Examples

```
UTL_I18N.GET_MAX_CHARACTER_SIZE('AL32UTF8');
```

This returns 4.

GET_TRANSLATION Function

This function returns the translation of the language and territory name in the specified translation language.

Syntax

```
UTL_I18N.GET_TRANSLATION (
   parameter        IN VARCHAR2 CHARACTER SET ANY_CS,
   trans_language   IN VARCHAR2 'AMERICAN',
   flag             IN PLS_INTEGER DEFAULT LANGUAGE_TRANS)
RETURN VARCHAR2 CHARACTER SET parameter%CHARSET;
```

Parameters

Table 253–12 GET_TRANSLATION Function Parameters

Parameter	Description
`parameter`	Specifies a valid language name, territory name, or a combined string in the form of *`language_territory`*. It is case-insensitive.
`trans_language`	Specifies a translation language name. For example, `ITALIAN` is for the Italian language. The default is `AMERICAN`, which indicates American English.
`flag`	Specifies the translation type: ■ `LANGUAGE_TRANS`: The function returns the language translation. ■ `TERRITORY_TRANS`: The function returns the territory translation. ■ `LANGUAGE_TERRITORY_TRANS`: The function returns the language and territory translation. The default translation type is `LANGUAGE_TRANS`.

Usage Notes

If `VARCHAR2` is used as a parameter type, the returned translation text can be corrupted due to the conversion to the database character set. Using `NVARCHAR2` as the parameter type will preserve the translation text because Unicode can encode all translated languages.

If the specified translation language is not available or an invalid name is provided, the default "American English" translations are returned. For example, Oracle does not provide `GUJARATI` translations, so the returned translation would be in American English.

Examples

The following returns the names of all the Oracle-supported languages in Italian.

```
DECLARE
   CURSOR c1 IS
     SELECT value FROM V$NLS_VALID_VALUES
     WHERE parameter = 'LANGUAGE'
  ORDER BY value;
  retval NVARCHAR2(100);
BEGIN
   FOR item IN c1 LOOP
     retval := UTL_I18N.GET_TRANSLATION (TO_NCHAR(item.value), 'italian');
   END LOOP;
END;
```

MAP_CHARSET Function

This function maps the following:

- An Oracle character set name to an IANA character set name.
- An IANA character set name to an Oracle character set name.
- An Oracle character set to an e-mail safe character set name.

Syntax

```
UTL_I18N.MAP_CHARSET(
   charset   IN VARCHAR2,
   context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
   flag      IN PLS_INTEGER DEFAULT ORACLE_TO_IANA)
RETURN VARCHAR2;
```

Parameters

Table 253–13 MAP_CHARSET Function Parameters

Parameter	Description
charset	Specifies the character set name to be mapped. The mapping is case-insensitive.
context	GENERIC_CONTEXT | MAIL_CONTEXT GENERIC_CONTEXT: The mapping is between an Oracle character set name and an IANA character set name. This is the default value. MAIL_CONTEXT: The mapping is between an Oracle character set name and an email safe character set name.
flag	■ ORACLE_TO_IANA | IANA_TO_ORACLE if GENERIC_CONTEXT is set ORACLE_TO_IANA: Map from an Oracle character set name to an IANA character set name. This is the default. IANA_TO_ORACLE: Map from an IANA character set name to an Oracle character set name. ■ MAIL_GENERIC | MAIL_WINDOWS if MAIL_CONTEXT is set MAIL_GENERIC: Map from an Oracle character set name to an email safe character set name on a non-Windows platform. MAIL_WINDOWS: Map from an Oracle character set name to an email safe character set name on a Windows platform.

Usage Notes

An e-mail safe character set is an Oracle character set that is commonly used by applications when they submit e-mail messages. The character set is usually used to convert contents in the database character set to e-mail safe contents. To specify the character set name in the mail header, you should use the corresponding IANA character set name obtained by calling the MAP_CHARSET function with the ORACLE_TO_IANA option, providing the e-mail safe character set name as input.

For example, no e-mail client recognizes message contents in the WE8DEC character set, whose corresponding IANA name is DEC-MCS. If WE8DEC is passed to the MAP_CHARSET function with the MAIL_CONTEXT option, then the function returns WE8ISO8859P1. Its corresponding IANA name, ISO-8859-1, is recognized by most e-mail clients.

The steps in this example are as follows:

1. Call the MAP_CHARSET function with the MAIL_CONTEXT | MAIL_GENERIC option with the database character set name, WE8DEC. The result is WE8ISO8859P1.
2. Convert the contents stored in the database to WE8ISO8859P1.
3. Call the MAP_CHARSET function with the ORACLE_TO_IANA | GENERIC_CONTEXT option with the e-mail safe character set, WE8ISO8859P1. The result is ISO-8859-1.
4. Specify ISO-8859-1 in the mail header when the e-mail message is submitted.

The function returns a character set name if a match is found. If no match is found or if the flag is invalid, then it returns NULL.

Note: Many Oracle character sets can map to one e-mail safe character set. There is no function that maps an e-mail safe character set to an Oracle character set name.

Examples

Generic Context

```
UTL_I18N.MAP_CHARSET('iso-8859-1',UTL_I18N.GENERIC_CONTEXT,UTL_I18N.IANA_TO_
ORACLE)
```

This returns 'WE8ISO8859P1'.

Context

```
UTL_I18N.MAP_CHARSET('WE8DEC', utl_i18n.mail_context,  utl_i18n.mail_generic)
```

This returns 'WE8ISO8859P1'.

See Also: *Oracle Database Globalization Support Guide* for a list of valid Oracle character sets

MAP_FROM_SHORT_LANGUAGE Function

This function maps an Oracle short language name to an Oracle language name.

Syntax

```
UTL_I18N.MAP_FROM_SHORT_LANGUAGE (
   language           IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 253–14 MAP_FROM_SHORT_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid short language name. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the default linguistic sort name for the customer with the ID of 9000. Note that the table customers is from the oe user in the Common Schema. Because the customer's language preference is stored using a short language name, you need to convert to a full language name by calling the GET_DEFAULT_LINGUISTIC_SORT procedure.

```
DECLARE
   short_n VARCHAR2(10);
   ling_n VARCHAR2(50);
BEGIN
   SELECT nls_language INTO short
   FROM customers WHERE customer_id = 9000;
   ling_n := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
   UTL_I18N.MAP_FROM_SHORT_LANGUAGE(short_n));
   DBMS_OUTPUT.PUT_LINE(ling_n);
END;
/
```

MAP_LANGUAGE_FROM_ISO Function

This function returns an Oracle language name from an ISO locale name.

Syntax

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO(
  isolocale IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 253–15 MAP_LANGUAGE_FROM_ISO Function Parameters

Parameter	Description
isolocale	Specifies the ISO locale. The mapping is case-insensitive.

Usage Notes

If the user specifies an invalid locale string, then the function returns a NULL string.

If the user specifies a locale string that includes only the language (for example, en_ instead of en_US), then the function returns the default language name for the specified language (for example, American).

Examples

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO('en_US')
```

This returns 'American'.

> **See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle languages

MAP_LOCALE_TO_ISO Function

This function returns an ISO locale name from an Oracle language name and an Oracle territory name. A valid string must include at least one of the following: a valid Oracle language name or a valid Oracle territory name.

Syntax

```
UTL_I18N.MAP_LOCALE_TO_ISO (
   ora_language   IN VARCHAR2,
   ora_territory  IN VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 253–16 MAP_LOCALE_TO_ISO Function Parameters

Parameter	Description
`ora_language`	Specifies an Oracle language name. It is case-insensitive.
ora_territory	Specifies an Oracle territory name. It is case-insensitive.

Usage Notes

If the user specifies an invalid string, then the function returns a `NULL` string.

Examples

```
UTL_I18N.MAP_LOCALE_TO_ISO('American','America')
```

This returns `'en_US'`.

> **See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle languages and territories

MAP_TERRITORY_FROM_ISO Function

This function returns an Oracle territory name from an ISO locale.

Syntax

```
UTL_I18N.MAP_TERRITORY_FROM_ISO (
  isolocale IN VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 253–17 MAP_TERRITORY_FROM_ISO Function Parameters

Parameter	Description
isolocale	Specifies the ISO locale. The mapping is case-insensitive.

Usage Notes

If the user specifies an invalid locale string, then the function returns a NULL string.

If the user specifies a locale string that includes only the territory (for example, _fr instead of fr_fr), then the function returns the default territory name for the specified territory (for example, France).

Examples

```
UTL_I18N.MAP_TERRITORY_FROM_ISO('en_US')
```

This returns 'America'.

> **See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle territories

MAP_TO_SHORT_LANGUAGE Function

This function maps an Oracle language name to an Oracle short language name.

Syntax

```
UTL_I18N.MAP_TO_SHORT_LANGUAGE (
   language    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 253–18 MAP_TO_SHORT_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid full language name. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the short language name for the language.

```
DECLARE  retval VARCHAR2(100);BEGIN  retval := UTL_I18N.MAP_TO_SHORT_
LANGUAGE('american');  DBMS_OUTPUT.PUT_LINE(retval);END;/US
```

RAW_TO_CHAR Functions

This function converts RAW data from a valid Oracle character set to a VARCHAR2 string in the database character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_CHAR(
   data          IN RAW,
   src_charset   IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_CHAR (
   data            IN RAW,
   src_charset     IN VARCHAR2 DEFAULT NULL,
   scanned_length  OUT PLS_INTEGER,
   shift_status    IN OUT PLS_INTEGER)
RETURN VARCHAR2;
```

Parameters

Table 253–19 RAW_TO_CHAR Function Parameters

Parameter	Description
data	Specifies the RAW data to be converted to a VARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned
shift_status	Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion. **Note:** ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'), 'utf8')
```

This returns the following string in the database character set:

```
'abcde'||chr(170)
```

Piecewise Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'),'utf8',shf,slen)
```

This expression returns the following string in the database character set:

```
'abcde'||chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to `8`.

The following example converts data from the Internet piece by piece to the database character set.

```
rvalue RAW(1050);
  nvalue VARCHAR2(1024);
  conversion_state  PLS_INTEGER = 0;
  converted_len   PLS_INTEGER;
  rtemp  RAW(10) = '';
  conn   utl_tcp.connection;
  tlen PLS_INTEGER;

  ...
  conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                    remote_port => 2000);
  LOOP
      tlen := utl_tcp.read_raw(conn, rvalue, 1024);
      rvalue := utl_raw.concat(rtemp, rvalue);
      nvalue := utl_i18n.raw_to_char(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
      if (converted_len < utl_raw.length(rvalue) )
      then
        rtemp := utl_raw.substr(rvalue, converted_len+1);
      else
        rtemp := '';
      end if;
      /* do anything you want with nvalue */
      /* e.g htp.prn(nvalue); */
    END LOOP;
    utl_tcp.close_connection(conn);
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      utl_tcp.close_connection(conn);
END;
```

RAW_TO_NCHAR Functions

This function converts RAW data from a valid Oracle character set to an NVARCHAR2 string in the national character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_NCHAR (
   data         IN RAW,
   src_charset  IN VARCHAR2 DEFAULT NULL)
 RETURN NVARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_NCHAR (
   data            IN RAW,
   src_charset      IN VARCHAR2 DEFAULT NULL,
   scanned_length   OUT PLS_INTEGER,
   shift_status     IN OUT PLS_INTEGER)
 RETURN NVARCHAR2;
```

Parameters

Table 253–20 RAW_TO_NCHAR Function Parameters

Parameter	Description
data	Specifies the RAW data to be converted to an NVARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned
shift_status	Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion. **Note:** ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8')
```

This returns the following string in the national character set:

```
'abcde'||chr(170)
```

Piecewise Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8', shf, slen)
```

This expression returns the following string in the national character set:

```
'abcde'||chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to `8`.

The following example converts data from the Internet piece by piece to the national character set.

```
rvalue RAW(1050);
  nvalue NVARCHAR2(1024);
  converstion_state  PLS_INTEGER = 0;
  converted_len   PLS_INTEGER;
  rtemp  RAW(10) = '';
  conn   utl_tcp.connection;
  tlen PLS_INTEGER;

  ...
  conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                    remote_port => 2000);
  LOOP
      tlen := utl_tcp.read_raw(conn, rvalue, 1024);
      rvalue := utl_raw.concat(rtemp, rvalue);
      nvalue := utl_i18n.raw_to_nchar(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
      if (converted_len < utl_raw.length(rvalue) )
      then
        rtemp := utl_raw.substr(rvalue, converted_len+1);
      else
        rtemp := '';
      end if;
      /* do anything you want with nvalue */
      /* e.g htp.prn(nvalue); */
    END LOOP;
    utl_tcp.close_connection(conn);
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      utl_tcp.close_connection(conn);
  END;
```

STRING_TO_RAW Function

This function converts a VARCHAR2 or NVARCHAR2 string to another valid Oracle character set and returns the result as RAW data.

Syntax

```
UTL_I18N.STRING_TO_RAW(
   data          IN VARCHAR2 CHARACTER SET ANY_CS,
   dst_charset   IN VARCHAR2 DEFAULT NULL)
RETURN RAW;
```

Parameters

Table 253–21 STRING_TO_RAW Function Parameters

Parameter	Description
data	Specifies the VARCHAR2 or NVARCHAR2 string to convert.
dst_charset	Specifies the destination character set. If dst_charset is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.

Usage Notes

If the user specifies an invalid character set, a NULL string, or a string whose length is 0, then the function returns a NULL string.

Examples

```
DECLARE
    r raw(50);
    s varchar2(20);
  BEGIN
    s:='abcdef'||chr(170);
    r:=utl_i18n.string_to_raw(s,'utf8');
    dbms_output.put_line(rawtohex(r));
  end;
/
```

This returns a hex value of '616263646566C2AA'.

TRANSLITERATE Function

This function performs script transliteration. In this release, the TRANSLITERATE function only supports Japanese Kana conversion.

Syntax

```
UTL_I18N.TRANSLITERATE (
  data IN VARCHAR2 CHARACTER SET ANY_CS,
  name IN VARCHAR2)
RETURN VARCHAR2 CHARACTER SET data%CHARSET;
```

Parameters

Table 253–22 TRANSLITERATE Function Parameters

Parameter	Description
data	Specifies the data to be converted. Either CHAR or NCHAR datatype can be specified.
name	Specifies the transliteration name string. For a list of valid names, see Table 253–23.

Constants

These options specify Japanese Kana conversions.

Table 253–23 TRANSLITERATE Function Constants

Constant Name	Value	Description
KANA_FWKATAKANA	'kana_fwkatakana'	Converts any type of Kana character to a fullwidth Katakana character.
KANA_HWKATAKANA	'kana_hwkatakana'	Converts any type of Kana character to a halfwidth Katakana character.
KANA_HIRAGANA	'kana_hiragana'	Converts any type of Kana character to a fullwidth Hiragana character.
FWKATAKANA_ HWKATAKANA	'fwkatakana_ hwkatakana'	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
FWKATAKANA_ HIRAGANA	'fwkatakana_ hiragana'	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
HWKATAKANA_ FWKATAKANA	'hwkatakana_ fwkatakana'	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
HWKATAKANA_ HIRAGANA	'hwkatakana_ hiragana'	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
HIRAGANA_ FWKATAKANA	'hiragana_ fwkatakana'	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.
HIRAGANA_ HWKATAKANA	'hiragana_ hwkatakana'	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.

Usage Notes

The function returns the converted string.

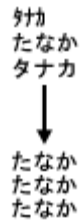
Examples

Given a table `japanese_emp`, containing an `NVARCHAR2` column `ename`, the following statement can be used to normalize all the kana names in `ename` to hiragana:

```
UPDATE japanese_emp
   SET ename = UTL_I18N.TRANSLITERATE (ename, 'kana_hiragana');
```

Figure shows how this output might look.

Figure 253–1 Loading Locale-Specific Data to the Database



The following statement normalizes one kana name to hiragana:

```
DECLARE
   Name  japanese_emp.ename%TYPE;
   Eno   CONSTANT  NUMBER(4) := 1;
BEGIN
   SELECT ename INTO name FROM japanese_emp WHERE enumber = eno;
   name := UTL_I18N.TRANSLITERATE(name, UTL_I18N.KANA_HIRAGANA);
   UPDATE japanese_emp SET ename = name WHERE enumber = eno;
EXCEPTION
   WHEN  UTL_I18N.UNSUPPORTED_TRANSLITERATION THEN
   DBMS_OUTPUT.PUT_LINE('transliteration not supported');
END;
/
```

UNESCAPE_REFERENCE Function

This function returns a string from an input string that contains character references. It decodes each character reference to the corresponding character value.

> **See Also:** "ESCAPE_REFERENCE Function" on page 253-9 for more information about escape sequences

Syntax

```
UTL_I18N.UNESCAPE_REFERENCE (
   str IN VARCHAR2 CHARACTER SET ANY_CS)
 RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 253–24 UNESCAPE_REFERENCE Function Parameters

Parameter	Description
str	Specifies the input string

Usage Notes

If the user specifies a NULL string or a string whose length is 0, then the function returns a NULL string. If the function fails, then it returns the original string.

Examples

```
UTL_I18N.UNESCAPE_REFERENCE('hello &lt; &#xe5;')
```

This returns 'hello <'||chr(229).

254

UTL_INADDR

The `UTL_INADDR` package provides a PL/SQL procedures to support internet addressing. It provides an API to retrieve host names and IP addresses of local and remote hosts.

This chapter contains the following topics:

Using UTL_INADDR

Security Model

This package is an invoker's rights package, which means that the invoking user must be granted the `connect` privilege in the access control list assigned to the remote network host to which he or she wishes to connect.

Note: For more information about managing fine-grained access, see *Oracle Database Security Guide*.

Exceptions

Table 254–1 Exception - Internet Address Package

Number	Exception	Description
ORA-24247	NETWORK_ACCESS_DENIED	Access to network is denied.
ORA-29257	UNKNOWN_HOST	The host is unknown.

Examples

Retrieve the local host name and IP address.

```
SET serveroutput on
BEGIN
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_NAME);  -- get local host name
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_ADDRESS);  -- get local IP addr
END;
/
```

Summary of UTL_INADDR Subprograms

Table 254–2 UTL_INADDR Package Subprograms

Subprogram	Description
GET_HOST_ADDRESS Function on page 254-7	Retrieves the IP address of the local or remote host given its name
GET_HOST_NAME Function on page 254-8	Retrieves the name of the local or remote host given its IP address

GET_HOST_ADDRESS Function

This function retrieves the IP address of the specified host.

Syntax

```
UTL_INADDR.GET_HOST_ADDRESS (
   host  IN VARCHAR2 DEFAULT NULL)
RETURN host_address VARCHAR2;
```

Parameters

Table 254–3 GET_HOST_ADDRESS Function Parameters

Parameter	Description
host	The name of the host to retrieve the IP address.

Return Values

Table 254–4 GET_HOST_ADDRESS Function Return Values

Parameter	Description
host_address	The IP address of the specified host, or that of the local host if host is NULL.

Exceptions

UNKNOWN_HOST: The specified IP address is unknown

Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the resolve privilege on LOCALHOST.

GET_HOST_NAME Function

This function retrieves the name of the local or remote host given its IP address.

Syntax

```
UTL_INADDR.GET_HOST_NAME (
   ip  IN VARCHAR2 DEFAULT NULL)
RETURN host_name VARCHAR2;
```

Parameters

Table 254–5 GET_HOST_NAME Function Parameters

Parameter	Description
ip	The IP address of the host used to determine its host name. If ip is not NULL, the official name of the host with its domain name is returned. If this is NULL, the name of the local host is returned and the name does not contain the domain to which the local host belongs.

Return Values

Table 254–6 GET_HOST_NAME Function Return Values

Parameter	Description
host_name	The name of the local or remote host of the specified IP address.

Exceptions

UNKNOWN_HOST: The specified IP address is unknown

Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the resolve privilege granted through DBMS_NETWORK_ACL_ADMIN on LOCALHOST.

255

UTL_IDENT

The `UTL_IDENT` package specifies which Database or client PL/SQL is running.

This chapter contains the following topics:

- Using UTL_IDENT
  - Overview
  - Security Model
  - Constants

Using UTL_IDENT

This section contains topics which relate to using the `UTL_IDENT` package.

Overview

The UTL_IDENT package is intended for use for conditional compilation of PL/SQL packages that are supported by Oracle, TimesTen Database, and clients such as Oracle Forms.

Security Model

The UTL_IDENT package runs as the package owner SYS. The public synonym UTL_IDENT, and EXECUTE permission on this package is granted to PUBLIC.

Constants

The UTL_IDENT package uses the constants shown in Table 255–1, " UTL_IDENT Constants".

Table 255–1 UTL_IDENT Constants

Constant	Type	Value	Description
IS_ORACLE_SERVER	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Server or not
IS_ORACLE_CLIENT	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Client or not
IS_TIMESTEN	BOOLEAN	TRUE/FALSE	Stipulates if TimesTen or not
IS_ORACLE_FORMS	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Forms or not

256

UTL_LMS

`UTL_LMS` retrieves and formats error messages in different languages.

See Also: *Oracle Database Globalization Support Guide*

This chapter contains the following topics:

Using UTL_LMS

This section contains topics which relate to using the `UTL_LMS` package.

Security Model

This package must be created as the user SYS.

Summary of UTL_LMS Subprograms

Table 256–1 UTL_LMS Package Subprograms

Function	Description
FORMAT_MESSAGE Function on page 256-5	Formats a retrieved error message
GET_MESSAGE Function on page 256-6	Retrieves an error message based on error number, product, facility, language, and message specified

FORMAT_MESSAGE Function

This function formats a message retrieved by the GET_MESSAGE function and returns the formatted message. If the function fails, then it returns a NULL result.

The following table shows special characters that can be used in the format string.

Special Character	Description
'%s'	Substitute the next string argument
'%d'	Substitute the next integer argument
'%%'	Represents the special character %

Syntax

```
UTL_LMS.FORMAT_MESSAGE (
   format IN VARCHAR2 CHARACTER SET ANY_CS,
   args   IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
 RETURN VARCHAR2 CHARACTER SET format%CHARSET;
```

Parameters

Table 256–2 FORMAT_MESSAGE Procedure Parameters

Parameter	Description
format	Specifies the string to format
args	Specifies the list of arguments

Examples

```
DECLARE
   s varchar2(200);
   i  pls_integer;
BEGIN
   i:= utl_lms.get_message(26052, 'rdbms', 'ora', 'french', s);
   dbms_output.put_line('before format, message is: '||s);
   dbms_output.put_line('formatted message is: '||utl_lms.format_message(s, 9,
'my_column_name');
END;
/
```

The following is an unformatted message:

```
Type %d non pris en charge pour l'expression SQL sur la colonne %s.
```

The following is the formatted message:

```
Type 9 non pris en charge pour l'expression SQL sur la colonne my_column_name.
```

GET_MESSAGE Function

This function retrieves an Oracle error message. The user can define user-specific error messages with the `lmsgen` utility.

It returns `0` when it is successful. It returns `-1` when it fails.

> **See Also:** *Oracle Database Globalization Support Guide* for more information about the `lmsgen` utility

Syntax

```
UTL_LMS.GET_MESSAGE (
   errnum    IN PLS_INTEGER,
   product   IN VARCHAR2,
   facility  IN VARCHAR2,
   language  IN VARCHAR2,
   message   OUT NOCOPY VARCHAR2CHARCTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

Table 256–3 GET_MESSAGE Function Parameters

Parameter	Description
`errnum`	Specifies the error number. Example: `'972'` (for `ORA-00972`)
`product`	Specifies the product to which the error message applies Example: '`rdbms`'
`facility`	Specifies the error message prefix Example: `'ora'`
`language`	Specifies the language of the message. The parameter is case-insensitive. The default is `NULL`, which causes `GET_MESSAGE` to use the value of the `NLS_LANGUAGE` session parameter.
`message`	Specifies the output buffer for the retrieved message

Usage Notes

If the `language` parameter is set to `NULL`, then the value of the `NLS_LANGUAGE` session parameter is used as the default.

Examples

```
DECLARE
  s varchar2(200);
  i pls_integer;
BEGIN
   i:=utl_lms.get_message(601, 'rdbms', 'oci', 'french', s);
   dbms_output.put_line('OCI--00601 is: '||s);
END
/
```

The following output results:

```
OCI--00601 is: Echec du processus de nettoyage.
```

257

UTL_MAIL

The `UTL_MAIL` package is a utility for managing email which includes commonly used email features, such as attachments, CC, and BCC.

This chapter contains the following topics:

Using UTL_MAIL

Security Model

UTL_MAIL is not installed by default because of the SMTP_OUT_SERVER configuration requirement and the security exposure this involves. In installing UTL_MAIL, you should take steps to prevent the port defined by SMTP_OUT_SERVER being swamped by data transmissions.

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note: For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide

---

Operational Notes

You must both install UTL_MAIL and define the SMTP_OUT_SERVER.

- To install UTL_MAIL:

```
sqlplus sys/<pwd>
SQL> @$ORACLE_HOME/rdbms/admin/utlmail.sql
SQL> @$ORACLE_HOME/rdbms/admin/prvtmail.plb
```

- You define the SMTP_OUT_SERVER parameter in the init.ora rdbms initialization file. However, if SMTP_OUT_SERVER is not defined, this invokes a default of DB_DOMAIN which is guaranteed to be defined to perform appropriately.

Rules and Limits

Use `UTL_MAIL` only within the context of the ASCII (American Standard Code for Information Interchange) and EBCDIC (Extended Binary-Coded Decimal Interchange Code) codes.

Summary of UTL_MAIL Subprograms

Table 257–1 UTL_MAIL Package Subprograms

Subprogram	Description
SEND Procedure on page 257-7	Packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients
SEND_ATTACH_RAW Procedure on page 257-8	Represents the `SEND` Procedure overloaded for `RAW` attachments
SEND_ATTACH_VARCHAR2 Procedure on page 257-9	Represents the `SEND` Procedure overloaded for `VARCHAR2` attachments

SEND Procedure

This procedure packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients. It hides the SMTP API and exposes a one-line email facility for ease of use.

Syntax

```
UTL_MAIL.SEND (
   sender      IN    VARCHAR2 CHARACTER SET ANY_CS,
   recipients  IN    VARCHAR2 CHARACTER SET ANY_CS,
   cc          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   bcc         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   subject     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   message     IN    VARCHAR2 CHARACTER SET ANY_CS,
   mime_type   IN    VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',
   priority    IN    PLS_INTEGER DEFAULT 3,
   replyto     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 257–2 SEND Procedure Parameters

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL
subject	String to be included as email subject string, default is NULL
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
replyto	Defines to whom the reply email is to be sent

SEND_ATTACH_RAW Procedure

This procedure is the SEND Procedure overloaded for RAW attachments.

Syntax

```
UTL_MAIL.SEND_ATTACH_RAW (
   sender           IN    VARCHAR2 CHARACTER SET ANY_CS,
   recipients       IN    VARCHAR2 CHARACTER SET ANY_CS,
   cc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   bcc              IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   subject          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   message          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   mime_type        IN    VARCHAR2 DEFAULT CHARACTER SET ANY_CS
                              DEFAULT 'text/plain; charset=us-ascii',
   priority         IN    PLS_INTEGER DEFAULT 3,
   attachment       IN    RAW,
   att_inline       IN    BOOLEAN DEFAULT TRUE,
   att_mime_type    IN    VARCHAR2 CHARACTER SET ANY_CS
                                       DEFAULT 'text/plain; charset=us-ascii',
   att_filename     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   replyto          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 257–3 SEND_ATTACH_RAW Procedure Parameters

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL
subject	String to be included as email subject string, default is NULL
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
attachment	RAW attachment
att_inline	Specifies whether the attachment is viewable inline with the message body, default is TRUE
att_mime_type	Mime type of the attachment, default is 'application/octet'
att_filename	String specifying a filename containing the attachment, default is NULL
replyto	Defines to whom the reply email is to be sent

SEND_ATTACH_VARCHAR2 Procedure

This procedure is the SEND Procedure overloaded for VARCHAR2 attachments.

Syntax

```
UTL_MAIL.SEND_ATTACH_VARCHAR2 (
   sender            IN    VARCHAR2 CHARACTER SET ANY_CS,
   recipients        IN    VARCHAR2 CHARACTER SET ANY_CS,
   cc                IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   bcc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   subject           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   message           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   mime_type         IN    VARCHAR2 CHARACTER SET ANY_CS
                                    DEFAULT 'text/plain; charset=us-ascii',
   priority          IN    PLS_INTEGER DEFAULT 3,
   attachment        IN    VARCHAR2 CHARACTER SET ANY_CS, ,
   att_inline        IN    BOOLEAN DEFAULT TRUE,
   att_mime_type     IN    VARCHAR2 CHARACTER SET ANY_CS
                                    DEFAULT 'text/plain; charset=us-ascii,
   att_filename      IN    VARCHAR2CHARACTER SET ANY_CS DEFAULT NULL,
   replyto           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 257–4 SEND_ATTACH_VARCHAR2 Procedure Parameters

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL
subject	String to be included as email subject string, default is NULL
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
attachment	Text attachment
att_inline	Specifies whether the attachment is inline, default TRUE
att_mime_type	Mime type of the attachment, default is 'text/plain; charset=us-ascii'
att_filename	String specifying a filename containing the attachment, default is NULL
replyto	Defines to whom the reply email is to be sent

258

UTL_MATCH

The `UTL_MATCH` package facilitates matching two records. This is typically used to match names, such as two First Names or two Last Names.

This chapter contains the following topics:

Using UTL_MATCH

Overview

"Edit Distance" also known as "Levenshtein Distance "(named after the Russian scientist Vladimir Levenshtein, who devised the algorithm in 1965), is a measure of Similarity between two strings, s1 and s2. The distance is the number of insertions, deletions or substitutions required to transform s1 to s2.

```
The Edit Distance between strings "shackleford" and "shackelford" = 2
```

The "Jaro-Winkler algorithm" is another way of calculating Edit distance between two strings. This method, developed at the U.S. Census, is a String Comparator measure that gives values of partial agreement between two strings. The string comparator accounts for length of strings and partially accounts for typical human errors made in alphanumeric strings.

Table 258–1 shows similarity values returned by Jaro-Winkler and Edit Distance

Table 258–1 Comparison between normalized values returned by Jaro-Winkler and Edit Distance algorithms

String 1	String 2	Jaro Winkler	Edit Distance
Dunningham	Cunnigham	89	80
Abroms	Abrams	92	83
Lampley	Campley	90	86
Marhta	Martha	96	67
Jonathon	Jonathan	95	88
Jeraldine	Geraldine	92	89

Security Model

The UTL_MATCH package runs with definer's rights. UTL_MATCH must be created under SYS. Operations provided by this package are performed with SYS privileges.

Summary of UTL_MATCH Subprograms

Table 258–2 DBMS_ALERT Package Subprograms

Subprogram	Description
EDIT_DISTANCE Function on page 258-6	Calculates the number of changes required to transform string-1 into string-2
EDIT_DISTANCE_ SIMILARITY Function on page 258-7	Calculates the number of changes required to transform string-1 into string-2, returning a value between 0 (no match) and 100 (perfect match)
JARO_WINKLER Function on page 258-8	Calculates the measure of agreement between string-1 and string-2
JARO_WINKLER_ SIMILARITY Function on page 258-9	Calculates the measure of agreement between string-1 and string-2, returning a value between 0 (no match) and 100 (perfect match)

EDIT_DISTANCE Function

This function calculates the number of insertions, deletions or substitutions required to transform string-1 into string-2.

Syntax

```
UTL_MATCH.EDIT_DISTANCE (
   s1  IN  VARCHAR2,
   s2  IN  VARCHAR2)
 RETURN PLS_INTEGER;
```

Parameters

Table 258–3 EDIT_DISTANCE Function Parameters

Parameter	Description
s1	The string to be transformed
s2	The string into which s1 is to be transformed

Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE('shackleford', 'shackelford') FROM DUAL;
-------------
returns 2
```

EDIT_DISTANCE_SIMILARITY Function

This function calculates the number of insertions, deletions or substations required to transform string-1 into string-2, and returns the Normalized value of the Edit Distance between two Strings. The value is typically between 0 (no match) and 100 (perfect match).

Syntax

```
UTL_MATCH.EDIT_DISTANCE_SIMILARITY (
   s1  IN  VARCHAR2,
   s2  IN  VARCHAR2)
 RETURN PLS_INTEGER;
```

Parameters

Table 258–4 EDIT_DISTANCE_SIMILARITY Function Parameters

Parameter	Description
s1	The string to be transformed
s2	The string into which s1 is to be transformed

Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE_SIMILARITY('shackleford', 'shackelford') FROM DUAL;
--------------
returns 82
```

JARO_WINKLER Function

This function calculates the measure of agreement between two strings.

Syntax

```
UTL_MATCH.JARO_WINKLER (
   s1  IN  VARCHAR2,
   s2  IN  VARCHAR2)
 RETURN BINARY_DOUBLE;
```

Parameters

Table 258–5 JARO_WINKLER Function Parameters

Parameter	Description
s1	Input
s2	input

Examples

```
SELECT UTL_MATCH.JARO_WINKLER('shackleford', 'shackelford') FROM DUAL;
--------------
returns 9.818E-001
```

JARO_WINKLER_SIMILARITY Function

This function calculates the measure of agreement between two strings, and returns a score between 0 (no match) and 100 (perfect match).

Syntax

```
UTL_MATCH.JARO_WINKLER (
   s1  IN  VARCHAR2,
   s2  IN  VARCHAR2)
 RETURN PLS_INTEGER;
```

Parameters

Table 258–6 JARO_WINKLER Function Parameters

Parameter	Description
s1	Input
s2	input

Examples

```
SELECT UTL_MATCH.JARO_WINKLER_SIMILARITY('shackleford', 'shackelford') FROM DUAL;
--------------
returns 98
```

259

UTL_NLA

The UTL_NLA package exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs.

This chapter contains the following topics:

Using UTL_NLA

This section contains topics which relate to using the `UTL_NLA` package.

Overview

The UTL_NLA package exposes a subset of the BLAS (Basic Linear Algebra Subprograms) and LAPACK (Linear Algebra PACKage) (Version 3.0) operations on vectors and matrices represented as VARRAYs.

Standards

For more information on the BLAS and LAPACK standards see

http://www.netlib.org/blas/
http://www.netlib.org/lapack/

Required Expertise

Users of this package are expected to have a sound grasp of linear algebra in general and of the BLAS and LAPACK libraries in particular.

Implementation

The mapping between BLAS and LAPACK procedures and their corresponding PL/SQL calls is one-to-one.

- All BLAS functions have the BLAS_ prefix (for example, the BLAS_ASUM Functions). The subroutines and functions in BLAS are mapped to PL/SQL procedures and functions, respectively.
- All LAPACK functions have the LAPACK_ prefix (for example, the LAPACK_GBSV Procedures). The subroutines in LAPACK are mapped to PL/SQL procedures. Procedures that perform the same operation but differ only on the datatype of the arguments have the same overloaded names.

The mapping between BLAS and LAPACK procedure parameters and those of their corresponding PL/SQL subprograms is almost one-to-one.

- Also in the PL/SQL interface for LAPACK, all /work/ arguments have been removed. The UTL_NLA package manages the allocation and de-allocation of all work areas required by the libraries.
- A new optional parameter, pack, has been added to the end of each LAPACK procedure that specifies if the matrix has been linearized in the row-major or column-major (default) format.

Rules and Limits

Vectors and matrices are stored in `VARRAY`s with a maximum size of one million entries. Given this restriction, `UTL_NLA` vectors can be up to one million entries but matrices need to be of size RxC <= 1,000,000.

Security Model

The UTL_NLA package is owned by user SYS and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

Subprogram Groups

- BLAS Level 1 (Vector-Vector Operations) Subprograms
- BLAS Level 2 (Matrix-Vector Operations) Subprograms
- BLAS Level 3 (Matrix-Matrix Operations) Subprograms
- LAPACK Driver Routines (Linear Equations) Subprograms
- LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

BLAS Level 1 (Vector-Vector Operations) Subprograms

Table 259–1 BLAS Level 1 (Vector-Vector Operations) Subprograms

Subprogram	Description
BLAS_ASUM Functions on page 259-18	Computes the sum of the absolute values of the vector components
BLAS_AXPY Procedures on page 259-19	Copies `alpha*X + Y` into vector `Y`
BLAS_COPY Procedures on page 259-20	Copies the contents of vector `X` to vector `Y`
BLAS_DOT Functions on page 259-21	Returns the dot (scalar) product of two vectors `X` and `Y`
BLAS_IAMAX Functions on page 259-30	Computes the index of the first element of a vector that has the largest absolute value
BLAS_NRM2 Functions on page 259-31	Computes the vector 2-norm (Euclidean norm)
BLAS_ROT Procedures on page 259-32	Returns the plane rotation of points
BLAS_ROTG Procedures on page 259-33	Returns the Givens rotation of points
BLAS_SCAL Procedures on page 259-34	Scales a vector by a constant
BLAS_SWAP Procedures on page 259-43	Swaps the contents of two vectors each of size n

BLAS Level 2 (Matrix-Vector Operations) Subprograms

Table 259–2 BLAS Level 2 (Matrix-Vector Operations) Subprograms

Subprogram	Description
BLAS_GBMV Procedures on page 259-22	Performs the matrix-vector operation `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` band matrix, with `kl` sub-diagonals and `ku` super-diagonals
BLAS_GEMV Procedures on page 259-26	Performs the matrix-vector operations `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` matrix
BLAS_GER Procedures on page 259-28	Performs a rank 1 operation `A := alpha*x*y' + A` where `alpha` is a scalar, `x` is an `m` element vector, `y` is an n element vector and `A` is an `m` by `n` matrix
BLAS_SBMV Procedures on page 259-41	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are n element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals
BLAS_SPMV Procedures on page 259-35	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix, supplied in packed form
BLAS_SPR Procedures on page 259-37	Performs a symmetric rank 1 operation `A := alpha*x*x' + A` where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix, supplied in packed form
BLAS_SPR2 Procedures on page 259-39	Performs a symmetric rank 2 operation `A := alpha*x*y' + alpha*y*x' +A` where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix, supplied in packed form
BLAS_SBMV Procedures on page 259-41	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are n element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals
BLAS_SYMV Procedures on page 259-46	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix
BLAS_SYR Procedures on page 259-48	Performs a symmetric rank 1 operation `A := alpha*x*x' + A` where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix
BLAS_SYR2 Procedures on page 259-50	Performs a symmetric rank 2 operation `A := alpha*x*y' + alpha*y*x' + A` where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix
BLAS_TBMV Procedures on page 259-57	Performs a matrix-vector operation `x := A*x` or `A'*x = b` where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular band matrix, with `(k + 1)` diagonals
BLAS_TBSV Procedures on page 259-59	Solves one of the systems of equation `A*x = b` or `A'*x = b` where `b` and `x` are `n` element vectors and `A` is an `n` by n unit, or non-unit, upper or lower triangular band matrix, with `(k + 1)` diagonals
BLAS_TPMV Procedures on page 259-61	Performs a matrix-vector operation `x := A*x` or `x := A'*x` where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular matrix, supplied in packed form

Table 259–2 (Cont.) BLAS Level 2 (Matrix-Vector Operations) Subprograms

Subprogram	Description
BLAS_TPSV Procedures on page 259-63	Solves one of the systems of equation `A*x = b` or `A'*x = b` where `b` and `x` are `n` element vectors and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular matrix, supplied in packed form
BLAS_TRMV Procedures on page 259-67	Performs a matrix-vector operation `x := A*x` or `x := A'*x` where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular matrix
BLAS_TRSV Procedures on page 259-71	Solves one of the systems of equation `A*x = b` or `A'*x = b` where `b` and `x` are `n` element vectors and `A` is an n by `n` unit, or non-unit, upper or lower triangular matrix

BLAS Level 3 (Matrix-Matrix Operations) Subprograms

Table 259–3 BLAS Level 3 (Matrix-Matrix Operations) Subprograms

Subprogram	Description
BLAS_GEMM Procedures on page 259-26	Performs one of the matrix-vector operations `C := alpha*op(A)*op(B) + beta*C` where `op(X) is one of op(X) = X or op(X) = X'` where `alpha` and `beta` are scalars, and `A`, `B` and `C` are matrices, with `op(A)` an `m` by `k` matrix, `op(B)` a `k` by `n` matrix and `C` an `m` by `n` matrix
BLAS_SYMM Procedures on page 259-44	Performs one of the matrix-vector operations `C := alpha*A*B + beta*C` or `C := alpha*B*A + beta*C` where `alpha` and `beta` are scalars, `A` is a symmetric matrix, and `B` and `C` are `m` by `n` matrices
BLAS_SYR2K Procedures on page 259-52	Performs one of the symmetric rank2 k operations `C := alpha*A*B' + alpha*B*A' + beta*C` or `C := alpha*A'*B + alpha*B'*A + beta*C` where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` and `B` are `n` by `k` matrices in the first case and `k` by `n` matrices in the second case
BLAS_SYRK Procedures on page 259-55	Performs one of the symmetric rank `k` operations `C := alpha*A*A' + beta*C` or `C := alpha*A'*A + beta*C` where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` is an `n` by `k` matrix in the first case and a `k` by `n` matrix in the second case
BLAS_TRMM Procedures on page 259-65	Performs one of the matrix-vector operations `B := alpha*op(A)*B` or `B := alpha*B*op(A)` where `alpha` is a scalar, `B` is an `m` by `n` matrix, `A` is a unit, or non-unit, upper or lower triangular matrix and `op(A)` is one of two alternatives
BLAS_TRSM Procedures on page 259-69	Performs one of the matrix-vector operations `op(A)*X = alpha*B` or `X*op(A) = alpha*B` where `alpha` is a scalar, `X` and `B` are `m` by `n` matrices, `A` is a unit, or non-unit, upper or lower triangular matrix, `op(A)` is one of two alternatives. The matrix `X` is overwritten on `B`

LAPACK Driver Routines (Linear Equations) Subprograms

Table 259–4 LAPACK Driver Routines (Linear Equations) Subprograms

Subprogram	Description
LAPACK_GBSV Procedures on page 259-73	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` matrix and `x` and `b` are `n` by `nrhs` matrices. The `LU` decomposition with partial pivoting and row interchanges is used to factor `A`.
LAPACK_GESV Procedures on page 259-82	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` matrix and `x` and `b` are `n` by `nrhs` matrices. The `LU` decomposition with partial pivoting and row interchanges is used to factor `A`.
LAPACK_GTSV Procedures on page 259-90	This procedure solves the equation `a * x = b` where `a` is an `n` by `n` tridiagonal matrix, by Gaussian elimination with partial pivoting.
LAPACK_PBSV Procedures on page 259-92	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite band matrix and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.
LAPACK_POSV Procedures on page 259-94	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite matrix and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.
LAPACK_PPSV Procedures on page 259-96	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite matrix stored in packed format and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.
LAPACK_PTSV Procedures on page 259-98	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite tridiagonal matrix, and `x` and `b` are `n` by `nrhs` matrices.
LAPACK_SPSV Procedures on page 259-108	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric matrix stored in packed format, and `x` and `b` are `n` by `nrhs` matrices. The diagonal pivoting method is used to factor `A`.
LAPACK_SYSV Procedures on page 259-118	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric matrix, and `x` and `b` are `n` by `nrhs` matrices. The diagonal pivoting method is used to factor `A`.

LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

Table 259–5 LAPACK Driver Routines (LLS and Eigenvalue Problems)

Subprogram	Description
LAPACK_GEES Procedures on page 259-75	Computes for an `n` by `n` real nonsymmetric matrix `A`, the eigenvalues, the real Schur form `T`, and, optionally, the matrix of Schur vectors `Z`. This gives the Schur factorization `A = Z*T*(Z**T)`.
LAPACK_GEEV Procedures on page 259-87	Computes for an `n` by `n` real nonsymmetric matrix `A`, the eigenvalues and, optionally, the left and/or right eigenvectors.
LAPACK_GELS Procedures on page 259-77	Solves overdetermined or underdetermined real linear systems involving an `m` by `n` matrix `A`, or its transpose, using a `QR` or `LQ` factorization of `A`. It is assumed that `A` has full rank.
LAPACK_GESDD Procedures on page 259-79	Computes the singular value decomposition (SVD) of a real `m` by `n` matrix `A`, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_GESVD Procedures on page 259-84	Computes the singular value decomposition (SVD) of a real `m` by `n` matrix `A`, optionally computing the left and/or right singular vectors. The SVD is written `A = U * SIGMA * transpose(V)`.
LAPACK_SBEV Procedures on page 259-100	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix `A`
LAPACK_SBEVD Procedures on page 259-102	Ccomputes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_SPEV Procedures on page 259-104	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A` in packed storage
LAPACK_SPEVD Procedures on page 259-106	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A` in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_STEV Procedures on page 259-110	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix `A`
LAPACK_STEVD Procedures on page 259-112	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_SYEV Procedures on page 259-114	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A`
LAPACK_SYEVD Procedures on page 259-116	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

Summary of UTL_NLA Subprograms

Table 259–6 UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_ASUM Functions on page 259-18	Computes the sum of the absolute values of the vector components	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_AXPY Procedures on page 259-19	Copies `alpha*X + Y` into vector `Y`	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_COPY Procedures on page 259-20	Copies the contents of vector `X` to vector `Y`	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_DOT Functions on page 259-21	Returns the dot (scalar) product of two vectors `X` and `Y`	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_GBMV Procedures on page 259-22	Performs the matrix-vector operation `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` band matrix, with `kl` sub-diagonals and `ku` super-diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_GEMM Procedures on page 259-26	Performs one of the matrix-vector operations where `alpha` and `beta` are scalars, and `A`, `B` and `C` are matrices, with `op(A)` an `m` by `k` matrix, `op(B)` a `k` by `n` matrix and `C` an `m` by `n` matrix	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_GEMV Procedures on page 259-26	Performs the matrix-vector operations `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_GER Procedures on page 259-28	Performs a rank 1 operation `A := alpha*x*y' + A` where `alpha` is a scalar, `x` is an `m` element vector, `y` is an n element vector and `A` is an `m` by `n` matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_IAMAX Functions on page 259-30	Computes the index of the first element of a vector that has the largest absolute value	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_NRM2 Functions on page 259-31	Computes the vector 2-norm (Euclidean norm)	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_ROT Procedures on page 259-32	Returns the plane rotation of points	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_ROTG Procedures on page 259-33	Returns the Givens rotation of points	BLAS Level 1 (Vector-Vector Operations) Subprograms

Table 259–6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_SBMV Procedures on page 259-41	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are n element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SCAL Procedures on page 259-34	Scales a vector by a constant	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_SPMV Procedures on page 259-35	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SPR Procedures on page 259-37	Performs a symmetric rank 1 operation `A := alpha*x*x' + A` where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SPR2 Procedures on page 259-39	Performs a symmetric rank 2 operation where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SWAP Procedures on page 259-43	Swaps the contents of two vectors each of size n	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_SYMM Procedures on page 259-44	Performs one of the matrix-vector operations where `alpha` and `beta` are scalars, `A` is a symmetric matrix, and `B` and `C` are `m` by `n` matrices	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_SYMV Procedures on page 259-46	Performs a matrix-vector operation where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR Procedures on page 259-48	Performs a symmetric rank 1 operation where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR2 Procedures on page 259-50	Performs a symmetric rank 2 operation where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR2K Procedures on page 259-52	Performs one of the symmetric rank2 k operations where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` and `B` are `n` by `k` matrices in the first case and `k` by `n` matrices in the second case	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_SYRK Procedures on page 259-55	Performs one of the symmetric rank `k` operations where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` is an `n` by `k` matrix in the first case and a `k` by `n` matrix in the second case	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_TBMV Procedures on page 259-57	Performs a matrix-vector operation where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular band matrix, with `(k + 1)` diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms

Table 259–6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_TBSV Procedures on page 259-59	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with (k + 1) diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TPMV Procedures on page 259-61	Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TPSV Procedures on page 259-63	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRMM Procedures on page 259-65	Performs one of the matrix-vector operations wherealpha is a scalar, B is an m by n matrix, A is a unit, or non-unit, upper or lower triangular matrix and op(A) is one of two alternatives	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRMV Procedures on page 259-67	Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRSM Procedures on page 259-69	Performs one of the matrix-vector operations op(A)*X = alpha*B or X*op(A) = alpha*B where alpha is a scalar, X and B are m by n matrices, A is a unit, or non-unit, upper or lower triangular matrix, op(A) is one of two alternatives. The matrix X is overwritten on B	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_TRSV Procedures on page 259-71	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
LAPACK_GBSV Procedures on page 259-73	This procedure computes the solution to a real system of linear equations a * x = b where a is an n by n matrix and x and b are n by nrhs matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_GEES Procedures on page 259-75	Computes for an n by n real nonsymmetric matrix A, the eigenvalues, the real Schur form T, and, optionally, the matrix of Schur vectors Z. This gives the Schur factorization A = Z*T*(Z**T).	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GEEV Procedures on page 259-87	Computes for an n by n real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GELS Procedures on page 259-77	Solves overdetermined or underdetermined real linear systems involving an m by n matrix A, or its transpose, using a QR or LQ factorization of A. It is assumed that A has full rank.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_ GESDD Procedures on page 259-79	Computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

Table 259–6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
LAPACK_GESV Procedures on page 259-82	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` matrix and `x` and `b` are `n` by `nrhs` matrices. The `LU` decomposition with partial pivoting and row interchanges is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_ GESVD Procedures on page 259-84	Computes the singular value decomposition (SVD) of a real `m` by `n` matrix `A`, optionally computing the left and/or right singular vectors. The SVD is written `A = U * SIGMA * transpose(V)`.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GTSV Procedures on page 259-90	This procedure solves the equation `a * x = b` where `a` is an `n` by `n` tridiagonal matrix, by Gaussian elimination with partial pivoting.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_PBSV Procedures on page 259-92	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite band matrix and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_POSV Procedures on page 259-94	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite matrix and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_PPSV Procedures on page 259-96	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite matrix stored in packed format and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_PTSV Procedures on page 259-98	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite tridiagonal matrix, and `x` and `b` are `n` by `nrhs` matrices.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_SBEV Procedures on page 259-100	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix `A`	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_ SBEVD Procedures on page 259-102	Ccomputes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_SPEV Procedures on page 259-104	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A` in packed storage	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_ SPEVD Procedures on page 259-106	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A` in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

Table 259–6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
LAPACK_SPSV Procedures on page 259-108	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric matrix stored in packed format, and `x` and `b` are `n` by `nrhs` matrices. The diagonal pivoting method is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_STEV Procedures on page 259-110	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix `A`	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_ STEVD Procedures on page 259-112	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_ SYEVD Procedures on page 259-116	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_SYSV Procedures on page 259-118	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric matrix, and `x` and `b` are `n` by `nrhs` matrices. The diagonal pivoting method is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms

BLAS_ASUM Functions

This procedure computes the sum of the absolute values of the vector components.

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 259-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ASUM (
   n      IN       POSITIVEN,
   x      IN       UTL_NLA_ARRAY_DBL,
   incx   IN       POSITIVEN)
 RETURN BINARY_DOUBLE;

UTL_NLA.BLAS_ASUM (
   n      IN       POSITIVEN,
   alpha  IN       SCALAR_DOUBLE,
   x      IN       UTL_NLA_ARRAY_FLT)
 RETURN BINARY_FLOAT
```

Parameters

Table 259–7 BLAS_ASUM Function Parameters

Parameter	Description
`n`	Specifies the number of elements of the vectors `x` and `y`. `n` must be at least zero.
`x`	`UTL_NLA_ARRAY_FLT/DBL` of dimension at least `( 1 + ( n - 1 )*abs( incx ) )`
`incx`	Specifies the increment for the elements of `x`. `incx` must not be zero.

BLAS_AXPY Procedures

This procedure copies `alpha*X + Y` into vector `Y`.

> **See Also:** BLAS Level 1 (Vector-Vector Operations) Subprograms on page 259-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_AXPY (
   n      IN       POSITIVEN,
   alpha  IN       SCALAR_DOUBLE,
   x      IN       UTL_NLA_ARRAY_DBL,
   incx   IN       POSITIVEN,
   y      IN OUT   UTL_NLA_ARRAY_DBL,
   incy   IN       POSITIVEN);

UTL_NLA.BLAS_AXPY (
   n      IN       POSITIVEN,
   alpha  IN       SCALAR_DOUBLE,
   x      IN       UTL_NLA_ARRAY_FLT,
   incx   IN       POSITIVEN,
   y      IN OUT   UTL_NLA_ARRAY_FLT,
   incy   IN       POSITIVEN);
```

Parameters

Table 259–8 BLAS_AXPY Procedure Parameters

Parameter	Description
`n`	Specifies the number of elements of the vectors `x` and `y`. `n` must be at least zero.
`alpha`	Specifies the scalar alpha.
`x`	`UTL_NLA_ARRAY_FLT/DBL` of `dimension` at least `( 1 + ( n - 1 )*abs( incx ) )`
`incx`	Specifies the increment for the elements of `x`. `incx` must not be zero.
`y`	`UTL_NLA_ARRAY_FLT/DBL` of `DIMENSION` at least `( 1 + ( n - 1 )*abs( incy) )`
`incy`	Specifies the increment for the elements of `y`. `incy` must not be zero.

BLAS_COPY Procedures

This procedure copies the contents of vector X to vector Y.

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 259-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_COPY (
   n     IN     POSITIVEN,
   x     IN     UTL_NLA_ARRAY_DBL,
   incx  IN     POSITIVEN,
   y     IN OUT UTL_NLA_ARRAY_DBL,
   incy  IN     POSITIVEN);

UTL_NLA.BLAS_COPY (
   n     IN     POSITIVEN,
   x     IN     UTL_NLA_ARRAY_FLT,
   incx  IN     POSITIVEN,
   y     IN OUT UTL_NLA_ARRAY_FLT,
   incy  IN     POSITIVEN);
```

Parameters

Table 259–9 BLAS_COPY Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.

BLAS_DOT Functions

This function returns the dot (scalar) product of two vectors X and Y.

> **See Also:** BLAS Level 1 (Vector-Vector Operations) Subprograms on page 259-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_DOT (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_DBL,
   incx  IN   POSITIVEN,
   y     IN   UTL_NLA_ARRAY_DBL,
   incy  IN   POSITIVEN)
  RETURN BINARY_DOUBLE;

UTL_NLA.BLAS_DOT (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_FLT,
   incx  IN   POSITIVEN,
   y     IN   UTL_NLA_ARRAY_FLT,
   incy  IN   POSITIVEN)
  RETURN BINARY_FLOAT;
```

Parameters

Table 259–10 BLAS_DOT Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.

BLAS_GBMV Procedures

This procedure performs one of the matrix-vector operations

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*A'*x + beta*y
```

where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` band matrix, with `kl` sub-diagonals and `ku` super-diagonals.

> **See Also:** BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 259-8 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_GEMV (
   trans  IN      flag,
   m      IN      POSITIVEN,   n      IN      POSITIVEN,
   kl     IN      NATURALN,
   ku     IN      NATURALN,
   alpha  IN      SCALAR_DOUBLE,
   a      IN      UTL_NLA_ARRAY_DBL,
   lda    IN      POSITIVEN,
   x      IN      UTL_NLA_ARRAY_DBL,
   incx   IN      POSITIVEN,
   beta   IN      SCALAR_DOUBLE,
   y      IN OUT  UTL_NLA_ARRAY_DBL,
   incy   IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');

UTL_NLA.BLAS_GEMV (
   trans  IN      flag,
   m      IN      POSITIVEN,
   n      IN      POSITIVEN,
   kl     IN      NATURALN,
   ku     IN      NATURALN,
   alpha  IN      SCALAR_FLOAT,
   a      IN      UTL_NLA_ARRAY_FLT,
   lda    IN      POSITIVEN,
   x      IN      UTL_NLA_ARRAY_FLT,
   incx   IN      POSITIVEN,
   beta   IN      SCALAR_FLOAT,
   y      IN OUT  UTL_NLA_ARRAY_FLT,
   incy   IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 259–11 BLAS_GBMV Procedure Parameters

Parameter	Description
`trans`	Specifies the operation to be performed: ■ `trans` = 'N' or 'n' `y := alpha*A*x + beta*y` ■ `trans` = 'T' or 't' `y := alpha*A'*x + beta*y` ■ `trans` = 'C' or 'c' `y := alpha*A'*x + beta*y`

Table 259–11 (Cont.) BLAS_GBMV Procedure Parameters

Parameter	Description
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
kl	Specifies the number of sub-diagonals of the matrix A. kl must satisfy 0. le. kl.
ku	Specifies the number of super-diagonals of the matrix A. ku must satisfy 0 .le. ku.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry, the leading (kl + ku + 1) by n part of the array A must contain the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (ku+1) of the array, the first super-diagonal starting at position 2 in row ku, the first sub-diagonal starting at position 1 in row (ku+2), and so on. Elements in the array A that do not correspond to elements in the band matrix (such as the top left ku by ku triangle) are not referenced.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (kl+ku+1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx)) when trans = ''N' or 'n' and at least (1 + (m - 1)*abs(incx)) otherwise. Before entry, the incremented array X must contain the vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (m - 1)*abs(incy)) when trans = 'N' or 'n' and at least (1+(n-1)*abs(incy)) otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_GEMM Procedures

This procedure performs one of the matrix-matrix operations

```
C := alpha*op( A )*op( B ) + beta*C
```

where `op(X)` is one of

```
op(X) = X
```

or

```
op(X) = X'
```

where `alpha` and `beta` are scalars, and `A`, `B` and `C` are matrices, with `op(A)` an `m` by `k` matrix, `op(B)` a `k` by `n` matrix and `C` an `m` by `n` matrix.

> **See Also:** BLAS Level 3 (Matrix-Matrix Operations) Subprograms on page 259-10 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_GEMM (

   c      IN OUT  UTL_NLA_ARRAY_FLT,
   ldc    IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 259–12 BLAS_GEMM Procedure Parameters

Parameter	Description
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: ■ transa = 'N' or 'n' : op(A) = 'A' ■ transa = 'T' or 't' : op(A) = 'A' ■ transa = 'C' or 'c' : op(A) = 'A'
transb	Specifies the form of op(B) to be used in the matrix multiplication as follows: ■ transb = 'N' or 'n' : op(B) = B ■ transb = 'T' or 't' : op(B) = B' ■ transb = 'C' or 'c': op(B) = B'
m	Specifies the number of rows of the matrix op(A) and of the matrix C. m must be at least zero.
n	Specifies the number of columns of the matrix op(B) and of the matrix C. n must be at least zero.
k	Specifies the rows of the matrix op(A) and the number of columns of the matrix op(B). k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is k when transa = 'N' or 'n', and is m otherwise. Before entry with transa = 'N' or 'n', the leading m by k part of the array A must contain the matrix A, otherwise the leading k by m part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When transa = 'N' or 'n', lda must be at least max (1,k).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, kb) where kb is n when transb = ''N' or 'n', and is k otherwise. Before entry with transb = 'N' or 'n', the leading k by n part of the array b must contain the matrix B, otherwise the leading n by k part of the arrayb must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. When transb = 'N' or 'n', ldb must be at least max (1, n).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc, n). Before entry, the leading m by n part of the array C must contain the matrix C, except when beta is zero, in which case C need not be set on entry. On exit, the arrayC is overwritten by the m by n matrix (alpha*op(A)*op(B) + beta*C).
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max(1, m).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_GEMV Procedures

This procedure performs one of the matrix-vector operations

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*A'*x + beta*y
```

where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` matrix.

incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (m - 1)*abs(incy)) when trans = 'N' or 'n' and at least (1 + (n - 1)*abs(incy)) otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_GER Procedures

This procedure performs the rank 1 operation

```
A := alpha*x*y' + A
```

where alpha is a scalar, x is an m element vector, y is an n element vector and A is an m by n matrix.

See Also: BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 259-8 for other subprograms in this group

Parameters

Table 259–14 BLAS_GER Procedure Parameters

Parameter	Description
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (m - 1)*abs(incx)) Before entry, the incremented array X must contain the m element vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.

Table 259–14 (Cont.) BLAS_GER Procedure Parameters

Parameter	Description
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incy)) Before entry, the incremented array Y must contain the m element vector y.
incy	Specifies the increment for the elements of y. incx must not be zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients. On exit, a is overwritten by the updated matrix.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1, m)
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_IAMAX Functions

This function computes the index of first element of a vector that has the largest absolute value.

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 259-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_IAMAX (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_DBL,
   incx  IN   POSITIVEN,
  RETURN POSITIVEN;

UTL_NLA.BLAS_IAMAX (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_FLT,
   incx  IN   POSITIVEN,
  RETURN POSITIVEN;
```

Parameters

Table 259–15 BLAS_IAMAX Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

BLAS_NRM2 Functions

This function computes the vector 2-norm (Euclidean norm).

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 259-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_NRM2 (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_DBL,
   incx  IN   POSITIVEN)
  RETURN BINARY_DOUBLE;

UTL_NLA.BLAS_NRM2 (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_FLT,
   incx  IN   POSITIVEN)
  RETURN BINARY_FLOAT;
```

Parameters

Table 259–16 BLAS_NRM2 Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

BLAS_ROT Procedures

This procedure returns the plane rotation of points.

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 259-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ROT (
   n      IN      POSITIVEN,
   x      IN OUT  UTL_NLA_ARRAY_DBL,
   incx   IN      POSITIVEN,
   y      IN OUT  UTL_NLA_ARRAY_DBL,
   incy   IN      POSITIVEN,
   c      IN      SCALAR_DOUBLE,
   s      IN      SCALAR_DOUBLE);

UTL_NLA.BLAS_ROT (
   n      IN      POSITIVEN,
   x      IN OUT  UTL_NLA_ARRAY_FLT,
   incx   IN      POSITIVEN,
   y      IN OUT  UTL_NLA_ARRAY_FLT,
   incy   IN      POSITIVEN,
   c      IN      SCALAR_DOUBLE,
   s      IN      SCALAR_DOUBLE);
```

Parameters

Table 259–17 BLAS_ROT Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)* abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1+(n-1)*abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.
c	SCALAR_FLOAT/DOUBLE.Specifies the scalar C.
s	SCALAR_FLOAT/DOUBLE.Specifies the scalar S.

BLAS_ROTG Procedures

This procedure returns the Givens rotation of points.

> **See Also:** BLAS Level 1 (Vector-Vector Operations) Subprograms on page 259-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ROTG (
   a   IN OUT   SCALAR_DOUBLE,
   b   IN OUT   SCALAR_DOUBLE,
   c   IN OUT   SCALAR_DOUBLE,
   s   IN OUT   SCALAR_DOUBLE);

UTL_NLA.BLAS_ROTG (
   a   IN OUT   SCALAR_FLOAT,
   b   IN OUT   SCALAR_FLOAT,
   c   IN OUT   SCALAR_FLOAT,
   s   IN OUT   SCALAR_FLOAT);
```

Parameters

Table 259–18 BLAS_ROTG Procedure Parameters

Parameter	Description
a	SCALAR_FLOAT/DOUBLE. Specifies the scalar A.
b	SCALAR_FLOAT/DOUBLE. Specifies the scalar B.
c	SCALAR_FLOAT/DOUBLE. Specifies the scalar C.
s	SCALAR_FLOAT/DOUBLE. Specifies the scalar S.

BLAS_SCAL Procedures

This procedure scales a vector by a constant.

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 259-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SCAL (
   n      IN  POSITIVEN,
   alpha  IN  SCALAR_DOUBLE,
   x      IN  OUT UTL_NLA_ARRAY_DBL,
   incx   IN  POSITIVEN);

UTL_NLA.BLAS_SCAL (
   n      IN  POSITIVEN,
   alpha  IN  SCALAR_FLOAT,
   x      IN  OUT UTL_NLA_ARRAY_FLT,
   incx   IN  POSITIVEN);
```

Parameters

Table 259–19 BLAS_SCAL Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

BLAS_SPMV Procedures

This procedure performs the matrix-vector operation

```
y := alpha*A*x + beta*y
```

where alpha and beta are scalars, x and y are n element vectors and A is an n by n symmetric matrix, supplied in packed form.

> **See Also:** BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 259-8 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SPMV (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_DOUBLE,
   ap     IN      UTL_NLA_ARRAY_DBL,
   x      IN      UTL_NLA_ARRAY_DBL,
   incx   IN      POSITIVEN,
   beta   IN      SCALAR_DOUBLE,
   y      IN OUT  UTL_NLA_ARRAY_DBL,
   incy   IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');

UTL_NLA.BLAS_SPMV (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_FLOAT,
   ap      IN     UTL_NLA_ARRAY_FLT,
   x      IN      UTL_NLA_ARRAY_FLT,
   incx   IN      POSITIVEN,
   beta   IN      SCALAR_FLOAT,
   y      IN OUT  UTL_NLA_ARRAY_FLT,
   incy   IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 259–20 BLAS_SPMV Procedure Parameters

Parameter	Description
uplo	Specifies the upper or lower triangular part of the matrix A is supplied in the packed array AP: ▪ uplo = 'U' or 'u'. The upper triangular part of A is supplied in AP. ▪ uplo = 'L' or 'l'. The lower triangular part of A is supplied in AP.
n	Specifies the order of the matrix A. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.

Table 259–20 (Cont.) BLAS_SPMV Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n+1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains, ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then Y need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at leasT (1+(n-1)*abs(incy)) Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SPR Procedures

This procedure performs the rank 1 operation

```
A := alpha*x*x' + A
```

where alpha is a real scalar, x is an n element vector, and A is an n by n symmetric matrix, supplied in packed form.

See Also: BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 259-8 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SPR (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_DBL,
   x      IN OUT  UTL_NLA_ARRAY_DBL,
   incx   IN      POSITIVEN,
   ap     IN OUT  UTL_NLA_ARRAY_DBL,
   pack   IN      flag DEFAULT 'C');

UTL_NLA.BLAS_SPR (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_FLT,
   x      IN OUT  UTL_NLA_ARRAY_FLT,
   incx   IN      POSITIVEN,
   ap     IN OUT  UTL_NLA_ARRAY_FLT,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 259–21 BLAS_SPR Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array ap: ■ uplo = 'U' or 'u': The upper triangular part of A is supplied in ap. ■ uplo = 'L' or 'l' : The lower triangular part of A is supplied in ap.
n	Specifies the order of the matrix A. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the m element vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.

Table 259–21 (Cont.) BLAS_SPR Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n +1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. On exit, the array ap is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on. On exit, the array ap is overwritten by the lower triangular part of the updated matrix
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SPR2 Procedures

This procedure performs the rank 2 operation

```
A := alpha*x*y' + alpha*y*x' +A
```

where alpha is a scalar, x and y are n element vectors, and A is an n by n symmetric matrix, supplied in packed form.

See Also: BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 259-8 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SPR2 (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_DBL,

   lda    IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 259–22 BLAS_SPR2 Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array ap : ■ uplo = 'U' or 'u' : The upper triangular part of A is supplied in ap. ■ uplo = 'L' or 'l' : The lower triangular part of A is supplied in ap.
n	Specifies the order of the matrix A. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the m element vector x.

Table 259–22 (Cont.) BLAS_SPR2 Procedure Parameters

Parameter	Description
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incy)) Before entry, the incremented array X must contain the m element vector y.
incy	Specifies the increment for the elements of y. incy must not be zero.
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n+1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. On exit, the array ap is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on. On exit, the array ap is overwritten by the lower triangular part of the updated matrix
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k + 1).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SBMV Procedures

This procedure performs the matrix-vector operation

```
y := alpha*A*x + beta*y
```

where alpha and beta are scalars, x and y are n element vectors and A is an n by n symmetric band matrix, with k super-diagonals.

> **See Also:** BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 259-8 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SBMV (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   k      IN      NATURALN,

   a      IN      UTL_NLA_ARRAY_FLT,
   lda    IN      POSITIVEN,
   x      IN      UTL_NLA_ARRAY_FLT,
   incx   IN      POSITIVEN,
   beta   IN      SCALAR_FLOAT,
   y      IN OUT  UTL_NLA_ARRAY_FLT,
   incy   IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 259–23 BLAS_SBMV Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the band matrix A is being supplied: ■ uplo = 'U' or 'u'. The upper triangular part of A is supplied. ■ uplo = 'L' or 'l'. The lower triangular part of A is supplied.
n	Specifies the order of the matrix A. n must be at least zero.
k	Specifies the number of super-diagonals of the matrix A. k must satisfy 0 .le. k.

Table 259–23 (Cont.) BLAS_SBMV Procedure Parameters

Parameter	Description
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in rowk, and so on. The top left k by k triangle of the array A is not referenced. Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced. Unchanged on exit
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k + 1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incy)) Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SWAP Procedures

This procedure swaps the contents of two vectors each of size n.

Syntax

```
UTL_NLA.BLAS_SWAP (
   n     IN     POSITIVEN,
   x     IN OUT UTL_NLA_ARRAY_DBL,
   incx  IN     POSITIVEN,
   y     IN OUT UTL_NLA_ARRAY_DBL,
   incy  IN     POSITIVEN);

UTL_NLA.BLAS_SWAP (
   n     IN     POSITIVEN,
   x     IN OUT UTL_NLA_ARRAY_FLT,
   incx  IN     POSITIVEN,
   y     IN OUT UTL_NLA_ARRAY_FLT,
   incy  IN     POSITIVEN);
```

Parameters

Table 259–24 BLAS_SWAP Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1+(n-1)*abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.

BLAS_SYMM Procedures

This procedure performs one of the matrix-matrix operations

```
C := alpha*A*B + beta*C
```

or

```
C := alpha*B*A + beta*C
```

where `alpha` and `beta` are scalars, `A` is a symmetric matrix, and `B` and `C` are `m` by `n` matrices.

> **See Also:** BLAS Level 3 (Matrix-Matrix Operations) Subprograms on page 259-10 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SYMM (
   side   IN      flag,
   uplo   IN      flag,
   m      IN      POSITIVEN,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_DOUBLE,
   a      IN      UTL_NLA_ARRAY_DBL,
   lda    IN      POSITIVEN,
   b      IN      UTL_NLA_ARRAY_DBL,
   ldb    IN      POSITIVEN,
   beta   IN      SCALAR_DOUBLE,
   c      IN OUT  UTL_NLA_ARRAY_DBL,
   ldc    IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');

UTL_NLA.BLAS_SYMM (
   side   IN      flag,
   uplo   IN      flag,
   m      IN      POSITIVEN,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_FLOAT,
   a      IN      UTL_NLA_ARRAY_FLT,
   lda    IN      POSITIVEN,
   b      IN      UTL_NLA_ARRAY_FLT,
   ldb    IN      POSITIVEN,
   beta   IN      SCALAR_FLOAT,
   c      IN OUT  UTL_NLA_ARRAY_FLT,
   ldc    IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 259–25 BLAS_SYMM Procedure Parameters

Parameter	Description
`side`	Specifies whether the symmetric matrix `A` appears on the left or right in the operation: ■ `side = 'L'` or `'l'` : `C := alpha*A*B + beta*C` ■ `side = 'R'` or `'r'` : `C := alpha*B*A + beta*C`

Table 259–25 (Cont.) BLAS_SYMM Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: ■ uplo = 'U' or 'u' : Only the upper triangular part of the symmetric matrix is to be referenced. ■ uplo = 'L' or 'l' : Only the lower triangular part of the symmetric matrix is to be referenced.
m	Specifies the number of rows of the matrix C. m must be at least zero.
n	Specifies the number of columns of the matrix C. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where ka is m when side = 'L' or 'l', and is n otherwise. Before entry with side = 'L' or 'l', the leading m by m part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading m by m upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading m by m lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced. Before entry with side = 'R' or 'r', the n by n part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1,m), otherwise lda must be at least max(1,n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb,n). Before entry, the leading m by n part of the array B must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1,m).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc,n). Before entry, the leading m by n part of the array C must contain the matrix C, except when beta is zero, in which case C need not be set on entry. On exit, the array C is overwritten by the m by n updated matrix.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max (1,m).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SYMV Procedures

This procedure performs the matrix-vector operation

```
y := alpha*A*x + beta*y
```

where alpha and beta are scalars, x and y are n element vectors and A is an n by n symmetric matrix.

Parameters

Table 259–26 BLAS_SYMV Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: ■ uplo = 'U'or 'u'. Only the upper triangular part ofA is to be referenced. ■ uplo = 'L' or 'l'. Only the lower triangular part of A is to be referenced.
n	Specifies the order of the matrix A. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.

Table 259–26 (Cont.) BLAS_SYMV Procedure Parameters

Parameter	Description
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1,n).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incy)) Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SYR Procedures

This procedure performs the rank 1 operation

```
A := alpha*x*x' + A
```

where alpha is a real scalar, x is an n element vector, and A is an n by n symmetric matrix.

Parameters

Table 259–28 BLAS_SYR2 Procedure Parameters

Parameter	Description
`uplo`	Specifies whether the upper or lower triangular part of the array `A` is to be referenced: ▪ `uplo = 'U'` or `'u'` : Only the upper triangular part of `A` is to be referenced. ▪ `uplo = 'L'` or `'l'` : Only the lower triangular part of `A` is to be referenced.
`n`	Specifies the order of the matrix `A`. `n` must be at least zero.
`alpha`	Specifies the scalar alpha.
`x`	`UTL_NLA_ARRAY_FLT/DBL` of dimension at least `( 1 + ( n - 1 )*abs( incx ) )` Before entry, the incremented array `X` must contain the m element vector `x`.

Table 259–28 (Cont.) BLAS_SYR2 Procedure Parameters

Parameter	Description
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incy)) Before entry, the incremented array Y must contain the m element vector y.
incy	Specifies the increment for the elements of y. incy must not be zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n) With uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced. On exit, the upper triangular part of the array A is overwritten by the upper triangular part of the updated matrix. With uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced. On exit, the lower triangular part of the array A is overwritten by the lower triangular part of the updated matrix.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1, n)
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SYR2K Procedures

This procedure performs one of the symmetric rank2 k operations

```
C := alpha*A*B' + alpha*B*A' + beta*C
```

or

```
C := alpha*A'*B + alpha*B'*A + beta*C
```

where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` and `B` are `n` by `k` matrices in the first case and `k` by `n` matrices in the second case.

> **See Also:** BLAS Level 3 (Matrix-Matrix Operations) Subprograms on page 259-10 for other subprograms in this group

Syntax

```

Parameters

Table 259–29 BLAS_SYR2K Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the array C is to be referenced: ■ uplo = 'U' or 'u' : Only the upper triangular part of C is to be referenced. ■ uplo = 'L' or 'l' : Only the lower triangular part of C is to be referenced.
trans	Specifies the operations to be performed: ■ trans = 'N' or 'n'C : C := alpha*A*B' + alpha*B*A' + beta*C ■ trans = 'T' or 't'C : C := alpha*A'*B + alpha*B'*A + beta*C ■ trans = 'C' or 'c'C : C := alpha*A'*B + alpha*B'*A + beta*C
n	Specifies the order of matrix C. n must be at least zero.
k	On entry with trans = 'N' or 'n', k specifies the number of columns of the matrices A and B. On entry with trans = 'T' or 't' or trans = 'C' or 'c', k specifies the number of rows of the matrices A and B. k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where kb is k when trans = 'N' or 'n', and is n otherwise. Before entry with trans = 'N' or 'n', the leading n byk part of the array A must contain the matrix A, otherwise the leading k by n part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When trans = 'N' or 'n', lda must be at leastmax(1,n), otherwise lda must be at least max(1,k).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,kb) where kb is k when trans = 'N' or 'n', and is n otherwise. Before entry with trans = 'N' or 'n', the leading n byk part of the array B must contain the matrix B, otherwise the leading k by n part of the array B must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. When trans = 'N' or 'n', ldb must be at least max (1,n), otherwise ldb must be at least max (1,k).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.

Table 259–29 (Cont.) BLAS_SYR2K Procedure Parameters

Parameter	Description
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc,n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array C must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of C is not referenced. On exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array C must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of C is not referenced. On exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max(1,n).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SYRK Procedures

This procedure performs one of the symmetric rank k operations

```
C := alpha*A*A' + beta*C
```

or

```
C := alpha*A'*A + beta*C
```

where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and`A` is an `n` by `k` matrix in the first case and a `k` by`n` matrix in the second case.

Parameters

Table 259–30 BLAS_SYRK Procedure Parameters

Parameter	Description
`uplo`	Specifies whether the upper or lower triangular part of the array `C` is to be referenced: ▪ `uplo` = `'U'` or `'u'` : Only the upper triangular part of `C` is to be referenced. ▪ `uplo` = `'L'` or `'l'` : Only the lower triangular part of `C` is to be referenced.

Table 259–30 (Cont.) BLAS_SYRK Procedure Parameters

Parameter	Description
trans	Specifies the operations to be performed: ■ trans = 'N' or 'n' : C := alpha*A*A' + beta*C ■ trans = 'T' or 't' : C := alpha*A'*A + beta*C ■ trans ='C' or 'c' : C := alpha*A'*A + beta*C
n	Specifies the order of matrix C. n must be at least zero.
k	On entry with trans = 'N' or 'n', k specifies the number of columns of the matrix A. On entry with trans = 'T' or 't' or trans = 'C' or 'c', k specifies the number of rows of the matrix A. k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where ka is k when trans = 'N' or 'n', and is n otherwise. Before entry with trans = 'N' or 'n', the leading n byk part of the array A must contain the matrix A, otherwise the leading k by n part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When trans = 'N' or 'n', lda must be at least max(1,n), otherwiselda must be at least max(1,k).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc,n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array C must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of C is not referenced. On exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array C must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of C is not referenced. On exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max(1,n).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_TBMV Procedures

This procedure performs the matrix-vector operations

```
x := A*x
```

or

```
x := A'*x
```

where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with (k+1) diagonals.

> **See Also:** BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 259-8 for other subprograms in this group

Syntax

```

   incx   IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 259–31 BLAS_TBMV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = 'U' or 'u'. A is an upper triangular matrix. ■ uplo = 'L' or 'l'. A is a lower triangular matrix.
trans	Specifies the operation to be performed: ■ trans = 'N' or 'n'x := A*x ■ trans = 'T' or 't'x := A'*x ■ trans = 'C' or 'c'x := A'*x

Table 259–31 (Cont.) BLAS_TBMV Procedure Parameters

Parameter	Description
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
k	Specifies whether or not A is unit triangular: ■ with uplo = 'U' or 'u', K specifies the number of super-diagonals of the matrix A. ■ with uplo = 'L' or 'l', K specifies the number of sub-diagonals of the matrix A. K must satisfy 0 .le. k.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced. Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced. Note that when diag = ''U' or 'u', the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k+1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)). Before entry, the incremented array X must contain the n element vector x. On exit, X is overwritten with the transformed vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_TBSV Procedures

This procedure solves one of the systems of equations

```
A*x = b
```

or

```
A'*x = b
```

where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with (k+1) diagonals.

Parameters

Table 259–32 BLAS_TBSV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = ''U' or 'u'. A is an upper triangular matrix. ■ uplo = 'L' or 'l'. A is a lower triangular matrix.
trans	Specifies the equations to be solved: ■ trans = 'N' or 'n : 'A*x = b ■ trans = 'T' or 't': A'*x = b ■ trans = 'C' or 'c': A'*x = b

Table 259–32 (Cont.) BLAS_TBSV Procedure Parameters

Parameter	Description
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u' : A is assumed to be unit triangular. ■ diag = 'N' or 'n' : A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
k	Specifies whether or not A is unit triangular: ■ with uplo = 'U' or 'u', K specifies the number of super-diagonals of the matrix A. ■ with uplo = 'L' or 'l', K specifies the number of sub-diagonals of the matrix A. K must satisfy 0 .le. k.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced. Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced. Note that when diag = 'U' or 'u', the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.
lda	On entry, lda specifies the first dimension of A as declared in the calling (sub) program. lda must be at least (k+1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) *abs(incx)) Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

BLAS_TPMV Procedures

This procedure performs the matrix-vector operations

```
x := A*x
```

or

```
x := A'*x
```

where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

> **See Also:** BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 259-8 for other subprograms in this group

Syntax

```

```

Parameters

Table 259–33 BLAS_TPMV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = 'U' or 'u'. A is an upper triangular matrix. ■ uplo = 'L' or 'l'. A is a lower triangular matrix.
trans	Specifies the operation to e performed: ■ trans = 'N' or 'n'x := A*x ■ trans = 'T' or 't'x := A'*x ■ trans = 'C' or 'c'x := A'*x
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.

Table 259–33 (Cont.) BLAS_TPMV Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced. Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced. Note that when diag = 'U' or 'u', the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)). Before entry, the incremented array X must contain the n element vector x. On exit, X is overwritten with the transformed vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_TPSV Procedures

This procedure solves one of the systems of equations

```
A*x = b
```

or

```
A'*x = b
```

where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

> **See Also:** BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 259-8 for other subprograms in this group

Parameters

Table 259–34 BLAS_TPSV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = 'U' or 'u' : A is an upper triangular matrix. ■ uplo = 'L' or 'l' : A is a lower triangular matrix.
trans	Specifies the operation to be performed: ■ trans = 'N' or 'n' : A*x = b ■ trans = 'T' or 't' : A'*x = b ■ trans = 'C' or 'c' : A'*x = b
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u' : A is assumed to be unit triangular. ■ diag = 'N' or 'n' : 'A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.

Table 259–34 (Cont.) BLAS_TPSV Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n+1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced, but are assumed to be unity.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) *abs(incx)) Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

BLAS_TRMM Procedures

This procedure performs one of the matrix-matrix operations

```
B := alpha*op( A )*B
```

or

```
B := alpha*B*op( A )
```

where `alpha` is a scalar, `B` is an `m` by `n` matrix, `A` is a unit, or non-unit, upper or lower triangular matrix and `op(A)` is one of

```
op( A ) = A
```

or

```
op( A ) = A'
```

```

Parameters

Table 259–35 BLAS_TRMM Procedure Parameters

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: ■ side = 'L' or 'l' : B := alpha*op(A)*B ■ side = 'R' or 'r' : B := alpha*B*op(A)
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: ■ uplo = 'U' or 'u' : A is an upper triangular matrix. ■ uplo = 'L' or 'l' : A is a lower triangular matrix.
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: ■ transa = 'N' or 'n' : op(A) = A ■ transa = 'T' or 't' : op(A) = A' ■ transa = 'C' or 'c' : op(A) = A'
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
m	Specifies the number of rows of the B. m must be at least zero.
n	Specifies the number of columns of B. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. When alpha is zero then A is not referenced and B need not be set before entry.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,k) where k is m when side = 'L' or 'l', and is n when side = ''R' or 'r'. Before entry with uplo = 'U' or 'u' , the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading k byk lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = ''U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1,m), otherwise lda must be at least max(1,n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb,n). Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the transformed matrix.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1,m).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_TRMV Procedures

This procedure performs the matrix-vector operations

```
x := A*x
```

or

```
x := A'*x
```

where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix.

Parameters

Table 259–36 BLAS_TRMV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = 'U' or 'u'. A is an upper triangular matrix. ■ uplo = 'L' or 'l'. A is a lower triangular matrix.
trans	Specifies the operation to be performed: ■ trans = 'N' or 'n'x := A*x ■ trans= 'T' or 't'x := A'*x ■ trans = 'C' or 'c'x := A'*x

Table 259–36 (Cont.) BLAS_TRMV Procedure Parameters

Parameter	Description
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1,n).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least(1+(n-1)*as(incx)). Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_TRSM Procedures

This procedure performs one of the matrix-matrix operations

```
op( A )*X = alpha*B
```

or

```
X*op( A ) = alpha*B
```

where `alpha` is a scalar, `X` and `B` are `m` by `n` matrices, `A` is a unit, or non-unit, upper or lower triangular matrix and `op(A)` is one of

```
op( A ) = A
```

or

```
op( A ) = A'
```

The matrix `X` is overwritten on `B`.

Parameters

Table 259–37 BLAS_TRSM Procedure Parameters

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: ■ side = 'L' or 'l' : op(A)*X = alpha*B ■ side = 'R' or 'r' : X*op(A) = alpha*B
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: ■ uplo = 'U' or 'u' : A is an upper triangular matrix. ■ uplo = 'L' or 'l' : A is a lower triangular matrix.
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: ■ transa = 'N' or 'n' : op(A) = A ■ transa = 'T' or 't' : op(A) = A' ■ transa = 'C' or 'c' : op(A) = A'
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
m	Specifies the number of rows of the B. m must be at least zero.
n	Specifies the number of columns of B. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. When alpha is zero then A is not referenced and B need not be set before entry.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, k) where k is m when side = 'L' or 'l', and is n when side = 'R' or 'r'. Before entry with uplo = 'U' or 'u', the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading k by k lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1, m), otherwise lda must be at least max (1, n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb, n). Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the solution matrix X.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1, m).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_TRSV Procedures

This procedure solves one of the systems of equations

```
A*x = b
```

or

```
A'*x = b
```

where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix.

Parameters

Table 259–38 BLAS_TRSV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = 'U' or 'u'. A is an upper triangular matrix. ■ uplo = 'L' or 'l'. A is a lower triangular matrix.
trans	Specifies the operation to be performed: ■ trans = 'N' or 'n'A*x = b ■ trans = 'T' or 't'A'*x = b ■ trans = 'C' or 'c'A'*x = b

Table 259–38 (Cont.) BLAS_TRSV Procedure Parameters

Parameter	Description
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of A as declared in the calling (sub) program. lda must be at least max(1, n).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) * abs (incx)) Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

LAPACK_GBSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where a is a band matrix of order n with kl sub diagonals and ku superdiagonals, and x and b are n by nrhs matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor A as

```
a = L * U
```

where L is a product of permutation and unit lower triangular matrices with kl sub diagonals, and U is upper triangular with kl+ku superdiagonals. The factored form of a is then used to solve the system of equations

```
a * x = b
```

> **See Also:** LAPACK Driver Routines (Linear Equations) Subprograms on page 259-11 for other subprograms in this group

Syntax

```
UTL_NLA.LAPACK_GBSV (

```

Parameters

Table 259–39 LAPACK_GBSV Procedure Parameters

Parameter	Description
n	The number of linear equations, equivalent to the order of the matrixa .n >= 0
kl	The number of sub diagonals within the band of a. kl >= 0.

Table 259–39 (Cont.) LAPACK_GBSV Procedure Parameters

Parameter	Description
ku	The number of superdiagonals within the band of a . ku >= 0.
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
ab	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldab, n). On entry, the matrix a in band storage, in rows kl+1 to 2*kl+ku+1; rows 1 to kl of the array need not be set. The j-th column of A is stored in the j-th column of the array ab: ab(kl+ku+1+i-j,j) = a(i,j) for max(1,j-ku)<=i<=min(n,j+kl) On exit, details of the factorization: U is stored as an upper triangular band matrix with kl+ku superdiagonals in rows 1 to KL+KU+1, and the multipliers used during the factorization are stored in rows: kl+ku+2 to 2*kl+ku+1
ldab	The leading dimension of the array ab. ldab >= 2*kl+ku+1
ipiv	INTEGER array, DIMENSION (n). The pivot indices that define the permutation matrix P; row iof the matrix was interchanged with row ipiv(i).
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, U(i,i) is exactly zero. The factorization has been completed, but the factor U is exactly singular, and the solution has not been computed
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GEES Procedures

This procedure computes for an n by n real nonsymmetric matrix A, the eigenvalues, the real Schur form T, and, optionally, the matrix of Schur vectors Z. This gives the Schur factorization A = Z*T*(Z**T).

A matrix is in real Schur form if it is upper quasi-triangular with 1 by 1 and 2 by 2 blocks. 2 by 2 blocks will be standardized in the form

```
[ a b ]

[ c a ]
```

where b*c < 0. The eigenvalues of such a block are a +- sqrt(bc).

```

Parameters

Table 259–40 LAPACK_GEES Procedure Parameters

Parameter	Description
jobz	■ 'N': Schur vectors are not computed. ■ 'V': Schur vectors are computed.
n	The order of the matrix a. N >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). ■ On entry, the n by n matrix A. ■ On exit, A has been overwritten by its real Schur form T.
lda	The leading dimension of the array a. lda >= max(1,n).

Table 259–40 (Cont.) LAPACK_GEES Procedure Parameters

Parameter	Description
wr	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). wr and wi contain the real and imaginary parts respectively of the computed eigenvalues in the same order that they appear on the diagonal of the output Schur form T. Complex conjugate pairs of eigenvalues will appear consecutively with the eigenvalue having the positive imaginary part first.
wi	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldz, n). wr and wi contain the real and imaginary parts respectively of the computed eigenvalues in the same order that they appear on the diagonal of the output Schur form T. Complex conjugate pairs of eigenvalues will appear consecutively with the eigenvalue having the positive imaginary part first.
vs	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). ■ If jobvs = 'V', vs contains the orthogonal matrix Z of Schur vectors. ■ If jobvs = 'N', vs is not referenced.
ldvs	The leading dimension of the array vs. VS. ldvs >= 1. If jobvs = 'V', ldvs >= N
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, and i is <= N: the QR algorithm failed to compute all the eigenvalues. Elements 1:ILO-1 and i+1:N of wr and wi contain those eigenvalues which have converged. If jobvs = 'V', vs contains the matrix which reduces A to its partially converged Schur form.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GELS Procedures

This procedure solves overdetermined or underdetermined real linear systems involving an `m` by `n` matrix `A`, or its transpose, using a `QR` or `LQ` factorization of `A`. It is assumed that `A` has full rank.

The following options are provided:

1. If `TRANS = 'N'` and `m >= n`: find the least squares solution of an overdetermined system, that is, solve the least squares problem.

   ```
   minimize || B - A*X ||
   ```

2. If `TRANS = 'N'` and `m < n`: find the minimum norm solution of an underdetermined system `A * X = B`.
3. If `TRANS = 'T'` and `m >= n`: find the minimum norm solution of an undetermined system `A**T * X = B`.
4. If `TRANS = 'T'` and `m < n`: find the least squares solution of an overdetermined system, that is, solve the least squares problem `minimize || B - A**T * X ||`.

pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GESDD Procedures

This procedures computes the singular value decomposition (SVD) of a real `m` by `n` matrix `A`, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.

The SVD is written

```
A = U * SIGMA * transpose(V)
```

where SIGMA is an `m` by `n` matrix which is zero except for its `min(m,n)` diagonal elements, `U` is an`m` by `m` orthogonal matrix, and `V` is an`n` by `n` orthogonal matrix. The diagonal elements of SIGMA are the singular values of `A`, they are real and non-negative, and are returned in descending order. The first `min(m,n)` columns of `U` and `V` are the left and right singular vectors of `A`.

Note that the routine returns `V**T`, not `V`.

Parameters

Table 259–42 LAPACK_GESDD Procedure Parameters

Parameter	Description
jobz	Specifies options for computing all or part of the matrix U: ■ 'A': All m columns of u and all n rows of V**T are returned in arrays u and vt. ■ 'S': The first min(m,n) columns of u and the first min(m,n) rows of V**T are returned in the arrays u and vt. ■ 'O': The first min(m,n) columns of u (the left singular vectors) are overwritten on the array a. jobu and jobvt cannot both be 'O ■ 'N': No columns of u (no left singular vectors) are computed.
m	The order of the matrix a. m >= 0.
n	The order of the matrix a. n >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the n by n matrix A. On exit: ■ If jobz = 'O', a is overwritten with the first min(m,n) columns of u (the left singular vectors, stored columnwise). ■ If m >= n, a is overwritten with the first m rows of V**T (the right singular vectors, stored rowwise). ■ If jobz .ne. 'O', the contents of a are destroyed.
lda	The leading dimension of the array a. lda >= max(1,m).
s	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (min(m,n)). The singular values of a, sorted so that S(i) >= S(i+1).
u	UTL_NLA_ARRAY_FLT/DBL. ucol = m if jobz = 'A' or jobz = 'O' and m < n; ucol = min(m,n) if jobz = 'S'. ■ If jobz = 'A' or jobz = 'O' and m < n, u contains the m by m orthogonal matrix u. ■ If jobz = 'S', u contains the first min(m,n) columns of u (the left singular vectors, stored columnwise). ■ If jobz = 'O' and m >= n, or jobz = 'n', u is not referenced.
ldu	The leading dimension of the array U. ldu >= 1. If jobz = 'S' or 'A',or jobz = 'O' and m < n, ldu >= m.
vt	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldvt, n). ■ If jobz = 'A' or jobz = 'O' and m >= n, vt contains the n by n orthogonal matrix V**T. ■ If jobz = 'S', vt contains the first min(m,n) rows of V**T (the right singular vectors, stored rowwise). ■ If jobz = 'O' and m < n, or jobz = 'N', vt is not referenced.
ldvt	The leading dimension of the array vt. ldvt >= 1. ■ If jobz = 'A', or jobz = 'O' and m >= n, ldvt >= n. ■ If jobz = 'S', ldvt >= min(m,n).

Table 259–42 (Cont.) LAPACK_GESDD Procedure Parameters

Parameter	Description
`info`	■ `= 0` : successful exit ■ `< 0` : If `info = -i`, the `i`-th argument had an illegal value ■ `> 0` : SBDSDC did not converge, updating process failed.
`pack`	(Optional) Flags the packing of the matrices: ■ `'C'`: column-major (default) ■ `'R'`: row-major

LAPACK_GESV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where a is an n by n matrix and x and b are n by nrhs matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor A as

```
a = P * L * U
```

where P is a permutation matrix, L is unit lower triangular, and U is upper triangular. The factored form of a is then used to solve the system of equations

```
a * x = b
```

Parameters

Table 259–43 LAPACK_GESV Procedure Parameters

Parameter	Description
n	The number of linear equations, equivalent to the order of the matrix a. n >= 0
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the n by n coefficient matrix a. On exit, the factors L and U from the factorization a = P*L*U; the unit diagonal elements of L are not stored.

Table 259–43 (Cont.) LAPACK_GESV Procedure Parameters

Parameter	Description
lda	The leading dimension of the array a. lda >= max(1,n)
ipiv	INTEGER array, DIMENSION (n). The pivot indices that define the permutation matrix P; row iof the matrix was interchanged with row ipiv(i).
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, U(i,i) is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution could not be computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GESVD Procedures

This procedures computes the singular value decomposition (SVD) of a real `m` by `n` matrix `A`, optionally computing the left and/or right singular vectors. The SVD is written

```
A = U * SIGMA * transpose(V)
```

where SIGMA is an `m` by `n` matrix which is zero except for its `min(m,n)` diagonal elements, `U` is an`m` by `m` orthogonal matrix, and `V` is an`n` by `n` orthogonal matrix. The diagonal elements of SIGMA are the singular values of `A`, they are real and non-negative, and are returned in descending order. The first `min(m,n)` columns of `U` and `V` are the left and right singular vectors of `A`.

Note that the routine returns `V**T`, not `V`.

Parameters

Table 259–44 LAPACK_GESVD Procedure Parameters

Parameter	Description
jobu	Specifies options for computing all or part of the matrix U: ■ 'A': All m columns of U are returned in array U. ■ 'S': The first min(m,n) columns of U (the left singular vectors) are returned in the array U. ■ 'O': The first min(m,n) columns of U (the left singular vectors) are overwritten on the array a. jobu and jobvt cannot both be 'O' ■ 'N': No columns of U (no left singular vectors) are computed.
jobvt	Specifies options for computing all or part of the matrix V**T: ■ 'A': All n rows of V**T are returned in the array vt. ■ 'S': The first min(m,n) rows of V**T (the right singular vectors) are returned in the array vt. ■ 'O': The first min(m,n) rows of V**T (the right singular vectors) are overwritten on the array a. jobvt and jobu cannot both be 'O'. ■ 'N': No rows of V**T (no right singular vectors) are computed.
m	The order of the matrix a. M >= 0.
n	The order of the matrix a. N >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the n by n matrix A. On exit: ■ If jobu = 'O', A is overwritten with the first min(m,n) columns of U (the left singular vectors, stored columnwise); ■ If jobvt = 'O', A is overwritten with the first min(m,n) rows of V**T (the right singular vectors, stored rowwise); ■ If jobu.ne.'O' and jobvt.ne.'O', the contents of A are destroyed.
lda	The leading dimension of the array a. lda >= max(1,n).
s	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (min(m,n)). The singular values of A, sorted so that S(i) >= S(i+1).
u	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldu,ucol).(ldu,m)if jobu = 'A' or (ldu,min(m,n)) if jobu = 'S'. ■ If jobu = 'A', U contains the m by m orthogonal matrix U. ■ If jobu = 'S', U contains the first min(m,n) columns of U (the left singular vectors, stored columnwise). ■ If jobu = 'N' or 'O', U is not referenced.
ldu	The leading dimension of the array U. ldu >= 1. If jobu = 'S' or 'a', ldu >= m.

Table 259–44 (Cont.) LAPACK_GESVD Procedure Parameters

Parameter	Description
vt	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldvt, n). ■ If jobvt = 'A', vt contains the n by n orthogonal matrix V**T. ■ If jobvt = 'S', vt contains the first min(m,n) rows of V**T (the right singular vectors, stored rowwise). ■ If jobvt = 'N' or 'O', vt is not referenced.
ldvt	The leading dimension of the array vt. ldvt >= 1. ■ If jobvt = 'A', ldvt >= n. ■ If jobvt = 'S', ldvt >= min(m,n).
info	■ = 0 : successful exit ■ < 0 : If info = -i, the i-th argument had an illegal value ■ > 0 : If SBDSQR did not converge, info specifies how many superdiagonals of an intermediate bidiagonal form B did not converge to zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GEEV Procedures

This procedures computes for an `n` by `n` real nonsymmetric matrix `A`, the eigenvalues and, optionally, the left and/or right eigenvectors.

- The right eigenvector `v(j)` of `A` satisfies `A * v(j) = lambda(j) * v(j)` where `lambda(j)` is its eigenvalue.
- The left eigenvector `u(j)` of `A` satisfies `u(j)**H * A = lambda(j) * u(j)**H` where `u(j)**H` denotes the conjugate transpose of `u(j)`.

The computed eigenvectors are normalized to have Euclidean norm equal to `1` and largest component real.

`jobvl`	■ `'N'`: Left eigenvectors of `A` are not computed. ■ `'V'`: Left eigenvectors of `A` are computed.

Table 259–45 (Cont.) LAPACK_GEEV Procedure Parameters

Parameter	Description
jobvr	■ 'N': Right eigenvectors of A are not computed. ■ 'V': Right eigenvectors of A are computed.
n	The order of the matrix a. N >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). ■ On entry, the n by n matrix A. ■ On exit, A has been overwritten.
lda	The leading dimension of the array a. lda >= max(1,n).
wr	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). wr and wi contain the real and imaginary parts respectively of the computed eigenvalues. Complex conjugate pairs of eigenvalues will appear consecutively with the eigenvalue having the positive imaginary part first.
wi	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldz, n). wr and wi contain the real and imaginary parts respectively of the computed eigenvalues. Complex conjugate pairs of eigenvalues will appear consecutively with the eigenvalue having the positive imaginary part first.
vl	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). ■ If jobvl = 'V', the left eigenvectors u(j) are stored one after another in the columns of vl, in the same order as their eigenvalues. ■ If jobvs = 'N', vl is not referenced. ■ If the j-th eigenvalue is real, then u(j) = VL(:,j), the j-th column of vl. ■ If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then u(j) = VL(:,j) + i*VL(:,j+1) and u(j+1) = VL(:,j) - i*VL(:,j+1).
ldv1	The leading dimension of the array vl. ldvl >= 1. If jobvl = 'v', ldvl >= n.
vr	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldvr, n). ■ If jobvr = 'V', the right eigenvectors v(j) are stored one after another in the columns of vr, in the same order as their eigenvalues.. ■ If jobvr = 'N', vr is not referenced. ■ If the j-th eigenvalue is real, then v(j) = VR(:,j), the j-th column of vr. ■ If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then v(j) = VR(:,j) + i*VR(:,j+1) and v(j+1) = VR(:,j) - i*VR(:,j+1).
ldvr	The leading dimension of the array vr. vr.ldvr >= 1. If jobvr = 'V', ldvr >= N
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, and i is <= N: the QR algorithm failed to compute all the eigenvalues, and no eigenvectors have been computed. Elements i+1:N of wr and wi contain eigenvalues which have converged..

Table 259–45 (Cont.) LAPACK_GEEV Procedure Parameters

Parameter	Description
`pack`	(Optional) Flags the packing of the matrices: ■ `'C'`: column-major (default) ■ `'R'`: row-major

LAPACK_GTSV Procedures

This procedure solves the equation

```
a * x = b
```

where a is an n by n tridiagonal matrix, by Gaussian elimination with partial pivoting.

Note that the equation a'*x = b may be solved by interchanging the order of the arguments du and dl.

> **See Also:** LAPACK Driver Routines (Linear Equations) Subprograms on page 259-11 for other subprograms in this group

Syntax

Parameters

Table 259–46 LAPACK_GTSV Procedure Parameters

Parameter	Description
n	The order of the matrix a .n >= 0
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
dl	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1). On entry, dl must contain the (n-1) sub-diagonal elements of a. On exit, dl is overwritten by the (n-2) elements of the second super-diagonal of the upper triangular matrix U from the LU factorization of a, in dl(1), ..., dl(n-2).
d	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). On entry, d must contain the diagonal elements of a. On exit, d is overwritten by the n diagonal elements of U.

Table 259–46 (Cont.) LAPACK_GTSV Procedure Parameters

Parameter	Description
du	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1). On entry, du must contain the (n-1)super-diagonal elements of a. On exit, du is overwritten by the (n-1) elements of the first super-diagonal of U.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (LDB, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0, the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max (1, n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, U(i,i) is exactly zero, and the solution has not been computed. The factorization has not been completed unless i = n.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_PBSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where `a` is an n by n symmetric positive definite band matrix and `x` and `b` are `n` by `nrhs` matrices.

The Cholesky decomposition is used to factor `A` as

`A = U**T*U` if `UPLO ='U'`

or

`A = L * L**T` if `UPLO = 'L'`

where `U` is an upper triangular matrix and `L` is a lower triangular matrix. The factored form of `A` is then used to solve the system of equations `A * X = B`.

> **See Also:** LAPACK Driver Routines (Linear Equations) Subprograms on page 259-11 for other subprograms in this group

Syntax

```

```

Parameters

Table 259–47 LAPACK_PBSV Procedure Parameters

Parameter	Description
`uplo`	▪ `uplo = 'U'`. Upper triangular of `A` is stored. ▪ `uplo = 'L'`. Lower triangular of `A` is stored.
`n`	The number of linear equations, that is, the order of the matrix `a .n >= 0`

Table 259–47 (Cont.) LAPACK_PBSV Procedure Parameters

Parameter	Description
kd	The number of superdiagonals of the matrix A if uplo = 'U', or the number of subdiagonals if UPLO = 'L'. KD >= 0.
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
ab	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldab, n). On entry, the upper or lower triangle of the symmetric band matrix a, stored in the first kd+1 rows of the array. The j-th column of a is stored in the j-th column of the array ab is as follows: ■ if uplo = 'U',AB(KD+1+i-j,j) = A(i,j) for max(1,j-KD)<=i<=j; ■ if uplo = 'L',AB(1+i-j,j) = A(i,j) for j<=i<=min(N,j+KD) .See below for further details.On exit, if info = 0, the triangular factor U or L from the Cholesky factorization A = U**T*U or A = L*L**T of the bandmatrix A, in the same storage format as a.
ldab	The leading dimension of the array ab. ldb >= kd+1
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, the leading minor of order i of a is not positive definite, so the factorization could not be completed, and the solution has not been computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_POSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where a is an n by n symmetric positive definite matrix and x and b are n by nrhs matrices.

The Cholesky decomposition is used to factor A as

```
A = U**T* U if uplo = 'U'
```

or

```
A = L * L**T if UPLO = 'L'
```

where U is an upper triangular matrix and L is a lower triangular matrix. The factored form of A is then used to solve the system of equations `A * X = B`.

   pack      IN      flag DEFAULT 'C');
```

Parameters

Table 259–48 LAPACK_POSV Procedure Parameters

Parameter	Description
uplo	■ uplo = 'U'. Upper triangular of A is stored. ■ uplo = 'L'. Lower triangular of A is stored.
n	The number of linear equations, that is, the order of the matrix a .n >= 0
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.

Table 259–48 (Cont.) LAPACK_POSV Procedure Parameters

Parameter	Description
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). If uplo = 'U', the leading NRHS n by n upper triangular part of a contains the upper NRHS triangular part of the matrix A, and the strictly lower NRHS triangular part of A is not referenced. If uplo = ''L', then rhs leading n by n lower triangular part of a contains the lower nrhs triangular part of the matrix a, and the strictly upper nrhs triangular part of a is not referenced. On exit, if info = 0, the factor U or L from the Cholesky factorization A = U**T*U or A = L*L**T.
lda	The leading dimension of the array a. lda >= max (1, n)
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, the leading minor of order i of a is not positive definite, so the factorization could not be completed, and the solution has not been computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_PPSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where `a` is an n by n symmetric positive definite matrix stored in packed format and `x` and `b` are `n` by `nrhs` matrices.

The Cholesky decomposition is used to factor `A` as

`A = U**T* U` if `UPLO = 'U'`

or

`A = L * L**T` if `UPLO = 'L'`

where **U** is an upper triangular matrix and `L` is a lower triangular matrix. The factored form of `A` is then used to solve the system of equations `A * X = B`.

Parameters

Table 259–49 LAPACK_PPSV Procedure Parameters

Parameter	Description
`uplo`	▪ `uplo = 'U'` . Upper triangular of `A` is stored. ▪ `uplo = 'L'`. Lower triangular of `A` is stored.
`n`	The number of linear equations, that is, the order of the matrix `a` .`n >= 0`
`nrhs`	The number of right-hand sides, which is the number of columns of the matrix `b`. `nrhs >= 0`.

Table 259–49 (Cont.) LAPACK_PPSV Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n*(n+1)/2). On entry, the upper or lower triangle of the symmetric matrix a, packed columnwise in a linear array. The j-th column of a is stored in the array ap as follows: If uplo = 'U', AP(i + (j-1)*j/2) = A(i,j) for 1<=i<=j; If uplo = 'L', AP(i + (j-1)*(2n-j)/2) = A(i,j) for j<=i<=n; On exit, if info = 0, the factor U or 'L' from the Cholesky factorization A = U**T*U or A = L*L**T in the same storage format as A.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, the leading minor of order i of a is not positive definite, so the factorization could not be completed, and the solution has not been computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_PTSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where a is an n by n symmetric positive definite tridiagonal matrix, and x and b are n by nrhs matrices.

a is factored as A = L*D*L**T, and the factored form of a is then used to solve the system of equations.

Parameters

Table 259–51 LAPACK_SBEV Procedure Parameters

Parameter	Description
`jobz`	▪ `'N'`: Compute eigenvalues only. ▪ `'V'`: Compute eigenvalues and eigenvectors.
`uplo`	▪ `'U'`: Upper triangle of A is stored. ▪ `'L'`: Lower triangle of A is stored.
`n`	The order of the matrix `a`. `N >= 0`.
`kd`	The number of superdiagonals of the matrix `A` if `uplo = 'U'`, or the number of subdiagonals if `uplo = 'L'`. `kd >= 0`.

Table 259–51 (Cont.) LAPACK_SBEV Procedure Parameters

Parameter	Description
ab	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldab, n). On entry, the upper or lower triangle of the symmetric band matrix A stored in the first kd+1 rows of the array. The j-th column of A is stored in the j-th column of the array ab: ■ If uplo = 'U', ab(kd+1+i-j,j) = a(i,j) for max(1,j-kd)<=i<=j. ■ If uplo = 'L', AB(1+i-j,j) = A(i,j) for j<=i<=min(n,j+kd). On exit, ab is overwritten by values generated during the reduction to tridiagonal form: ■ If uplo = 'U', the diagonal and first superdiagonal of the tridiagonal matrix T are returned in rows kd and kd+1 of ab. ■ If uplo = 'L', the diagonal and first subdiagonal of T are returned in the first two rows of ab.
ldab	The leading dimension of the array ab. ldab >= kd + 1.
w	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). If info = 0, the eigenvalues in ascending order.
z	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). ■ If jobz = 'V', then if info = 0, z contains the orthonormal eigenvectors of the matrix A, with the i-th column of z holding the eigenvector associated with w(i). ■ If jobz = 'N', then z is not referenced.
ldz	The leading dimension of the array z. ldz >= 1, and if jobz = 'v', ldz >= max(1,n).
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, the algorithm failed to converge; i off-diagonal elements of an intermediate tridiagonal form did not converge to zero
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_SBEVD Procedures

This procedure computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

Table 259–52 (Cont.) LAPACK_SBEVD Procedure Parameters

Parameter	Description
ab	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldab, n). On entry, the upper or lower triangle of the symmetric band matrix A stored in the first kd+1 rows of the array. The j-th column of A is stored in the j-th column of the array ab: ■ If uplo = 'U', ab(kd+1+i-j,j) = a(i,j) for max(1,j-kd)<=i<=j. ■ If uplo = 'L', AB(1+i-j,j) = A(i,j) for j<=i<=min(n,j+kd). On exit, ab is overwritten by values generated during the reduction to tridiagonal form: ■ If uplo = 'U', the diagonal and first superdiagonal of the tridiagonal matrix T are returned in rows kd and kd+1 of ab. ■ If uplo = 'L', the diagonal and first subdiagonal of T are returned in the first two rows of ab.
ldab	The leading dimension of the array ab. ldab >= kd + 1.
w	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldz,n). If info = 0, the eigenvalues in ascending order.
z	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). ■ If jobz = 'V', then if info = 0, z contains the orthonormal eigenvectors of the matrix A, with the i-th column of z holding the eigenvector associated with w(i). ■ If jobz = 'N', then z is not referenced.
ldz	The leading dimension of the array z. ldz >= 1, and if jobz = 'v', ldz >= max(1,n).
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, the algorithm failed to converge; i off-diagonal elements of an intermediate tridiagonal form did not converge to zero
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_SPEV Procedures

This procedure computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A` in packed storage.

Parameters

Table 259–53 LAPACK_SPEV Procedure Parameters

Parameter	Description
`jobz`	▪ `'N'`: Compute eigenvalues only. ▪ `'V'`: Compute eigenvalues and eigenvectors.
`uplo`	▪ `'U'`: Upper triangle of `A` is stored. ▪ `'L'`: Lower triangle of A is stored.
`n`	The order of the matrix `a`. `N >= 0`.

Table 259–53 (Cont.) LAPACK_SPEV Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n*(n+1)/2). On entry, the upper or lower triangle of the symmetric matrix a packed columnwise in a linear array. The j-th column of a is stored in the array ap: ■ If uplo = 'U', ap(i + (j-1)*j/2) = a(i,j) for 1<=i<=j. ■ If uplo = 'L', ap(i + (j-1)*(2*n-j)/2) = a(i,j) for j<=i<=n. On exit, ap is overwritten by values generated during the reduction to tridiagonal form: ■ If uplo = 'U', the diagonal and first superdiagonal of the tridiagonal matrix T overwrite the corresponding elements of A. ■ If uplo = 'L', the diagonal and first subdiagonal of T overwrite the corresponding elements of A.
w	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). If info = 0, the eigenvalues in ascending order.
z	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldz,n). ■ If jobz = 'V', then if info = 0, z contains the orthonormal eigenvectors of the matrix A, with the i-th column of z holding the eigenvector associated with w(i). ■ If jobz = 'N', then z is not referenced.
ldz	The leading dimension of the array z. ldz >= 1, and if jobz = 'v', ldz >= max(1,n).
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, the algorithm failed to converge; i off-diagonal elements of an intermediate tridiagonal form did not converge to zero
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_SPEVD Procedures

This procedure computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A` in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm. The divide and conquer algorithm makes very mild assumptions about floating point arithmetic.

Parameters

Table 259–54 LAPACK_SPEVD Procedure Parameters

Parameter	Description
`jobz`	■ `'N'`: Compute eigenvalues only. ■ `'V'`: Compute eigenvalues and eigenvectors.
`uplo`	■ `'U'`: Upper triangle of A is stored. ■ `'L'`: Lower triangle of A is stored.
`n`	The order of the matrix `a. N >= 0`.

Table 259–54 (Cont.) LAPACK_SPEVD Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n*(n+1)/2). On entry, the upper or lower triangle of the symmetric matrix a packed columnwise in a linear array. The j-th column of a is stored in the array ap: ■ If uplo = 'U', ap(i + (j-1)*j/2) = a(i,j) for 1<=i<=j. ■ If uplo = 'L', ap(i + (j-1)*(2*n-j)/2) = a(i,j) for j<=i<=n. On exit, ap is overwritten by values generated during the reduction to tridiagonal form: ■ If uplo = 'U', the diagonal and first superdiagonal of the tridiagonal matrix T overwrite the corresponding elements of A. ■ If uplo = 'L', the diagonal and first subdiagonal of T overwrite the corresponding elements of A.
w	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). If info = 0, the eigenvalues in ascending order.
z	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldz,n). ■ If jobz = 'V', then if info = 0, z contains the orthonormal eigenvectors of the matrix A, with the i-th column of z holding the eigenvector associated with w(i). ■ If jobz = 'N', then z is not referenced.
ldz	The leading dimension of the array z. ldz >= 1, and if jobz = 'v', ldz >= max(1,n).
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, the algorithm failed to converge; i off-diagonal elements of an intermediate tridiagonal form did not converge to zero
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_SPSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where `a` is an n by n symmetric matrix stored in packed format, and `x` and `b` are n by nrhs matrices.

The diagonal pivoting method is used to factor `A` as

`A = U * D * U**T`, if `UPLO = 'U'`

or

`A = L * D * L**T`, if `UPLO = 'L'`

where `U` (or `L`) is a product of permutation and unit upper (lower) triangular matrices, and `D` is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of `A` is then used to solve the system of equations `A * X = B`.

```

Parameters

Table 259–55 LAPACK_SPSV Procedure Parameters

Parameter	Description
`uplo`	■ `uplo = 'U'`. Upper triangular of `A` is stored. ■ `uplo = 'L'` . Lower triangular of `A` is stored.
`n`	The number of linear equations, which is the order of the matrix `a`. `N >= 0`.
`nrhs`	The number of right-hand sides, which is the number of columns of the matrix `b`. `nrhs >= 0`.

Table 259–55 (Cont.) LAPACK_SPSV Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n*(n+1)/2). On entry, the upper or lower triangle of the symmetric matrix A, packed columnwise in a linear array. The j-th column of A is stored in the array ap as follows: ■ uplo = 'U': AP(i + (j-1)*j/2) = A(i,j) for 1<=i<=j ■ uplo = 'L' : AP(i + (j-1)*(2n-j)/2) = A(i,j) for j<=i<=n See below for further details. On exit, the block diagonal matrix D and the multipliers used to obtain the factor U or L from the factorization A = U*D*U**T or A = L*D*L**T as computed by SSPTRF, stored as a packed triangular matrix in the same storage format as A.
ipiv	INTEGER array, DIMENSION (n). Details of the interchanges and the block structure of d, as determined by SSPTRF. ■ If ipiv(k) > 0, then rows and columns k and ipiv(k) were interchanged, and d(k,k) is a 1 by1 diagonal block. ■ If uplo = 'U' and ipiv(k) = ipiv(k-1) < 0, then rows and columns k-1 and -ipiv(k) were interchanged and d(k-1:k,k-1:k) is a 2 by 2 diagonal block. ■ If uplo = 'L' and ipiv(k) = ipiv(k+1) < 0, then rows and columns k+1 and -ipiv(k) were interchanged and d(k:k+1,k:k+1) is a 2 by 2 diagonal block.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, d(i,i) is exactly zero. The factorization has been completed, but the block diagonal matrix d is exactly singular, so the solution could not be computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_STEV Procedures

LAPACK_SYSV Procedures

This procedure computes the solution to a real system of linear equations

`a * x = b`

where `a` is an n by n symmetric matrix, and `x` and `b` are n by nrhs matrices.

The diagonal pivoting method is used to factor `A` as

`A = U * D * U**T`, if `UPLO = 'U'`

or

`A = L * D * L**T`, if `UPLO = 'L'`

where `U` (or `L`) is a product of permutation and unit upper (lower) triangular matrices, and `D` is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of `A` is then used to solve the system of equations `A * X = B`.

   lda    IN       POSITIVEN,
   ipiv   IN OUT   UTL_NLA_ARRAY_INT,
   b      IN OUT   UTL_NLA_ARRAY_FLT,
   ldb    IN       POSITIVEN,
   info   OUT      INTEGER,
   pack   IN       flag DEFAULT 'C');
```

Parameters

Table 259–60 LAPACK_SYSV Procedure Parameters

Parameter	Description
`uplo`	▪ `uplo = 'U'`. Upper triangular of `A` is stored. ▪ `uplo = 'L'` . Lower triangular of `A` is stored.
`n`	The number of linear equations, which is the order of the matrix `a`. `N >= 0`.

Table 259–60 (Cont.) LAPACK_SYSV Procedure Parameters

Parameter	Description
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1). On entry, the symmetric matrix a. If UPLO = 'U', the leading n by n upper triangular part of a contains the upper triangular part of the matrix a, and the strictly lower triangular part of a is not referenced. If uplo = 'L', the leading n by n lower triangular part of a contains the lower triangular part of the matrix a, and the strictly upper triangular part of a is not referenced. On exit, if info = 0, the block diagonal matrix d and the multipliers used to obtain the factor U or L from the factorization A = U*D*U**T or A = L*D*L**T as computed by SSYTRF.
lda	The leading dimension of the array a. lda >= max(1,n)
ipiv	INTEGER array, DIMENSION (ldb, nrhs). Details of the interchanges and the block structure of d, as determined by SSYTRF. ■ If ipiv(k) > 0, then rows and columns k and ipiv(k) were interchanged, and d(k,k) is a 1 by1 diagonal block. ■ If uplo = 'U' and ipiv(k) = ipiv(k-1) < 0, then rows and columns k-1 and -ipiv(k) were interchanged and d(k-1:k,k-1:k) is a 2 by 2 diagonal block. ■ If uplo = 'L' and ipiv(k) = ipiv(k+1) < 0, then rows and columns k+1 and -ipiv(k) were interchanged and d(k:k+1,k:k+1) is a 2 by 2 diagonal block.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, d(i,i) is exactly zero. The factorization has been completed, but the block diagonal matrix d is exactly singular, so the solution could not be computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

260

UTL_RAW

The `UTL_RAW` package provides SQL functions for manipulating `RAW` datatypes.

This chapter contains the following topics:

Using UTL_RAW

Overview

This package is necessary because normal SQL functions do not operate on RAWs, and PL/SQL does not allow overloading between a RAW and a CHAR datatype. UTL_RAW also includes subprograms that convert various COBOL number formats to, and from, RAWs.

UTL_RAW is not specific to the database environment, and it may actually be used in other environments. For this reason, the prefix UTL has been given to the package, instead of DBMS.

Operational Notes

UTL_RAW allows a RAW "record" to be composed of many elements. By using the RAW datatype, character set conversion will not be performed, keeping the RAW in its original format when being transferred through remote procedure calls.

With the RAW functions, you can manipulate binary data that was previously limited to the hextoraw and rawtohex functions.

Note: Notes on datatypes:

- The PLS_INTEGER and BINARY_INTEGER datatypes are identical. This document uses BINARY_INTEGER to indicate datatypes in reference information (such as for table types, record types, subprogram parameters, or subprogram return values), but may use either in discussion and examples.
- The INTEGER and NUMBER(38) datatypes are also identical. This document uses INTEGER throughout.

Summary of UTL_RAW Subprograms

Table 260–1 UTL_RAW Package Subprograms

Subprogram	Description
BIT_AND Function on page 260-7	Performs bitwise logical "and" of the values in RAW r1 with RAW r2 and returns the "anded" result RAW
BIT_COMPLEMENT Function on page 260-8	Performs bitwise logical "complement" of the values in RAW r and returns the "complement'ed" result RAW
BIT_OR Function on page 260-9	Performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the "or'd" result RAW
BIT_XOR Function on page 260-10	Performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the "xor'd" result RAW
CAST_FROM_BINARY_DOUBLE Function on page 260-11	Returns the RAW binary representation of a BINARY_DOUBLE value
CAST_FROM_BINARY_FLOAT Function on page 260-13	Returns the RAW binary representation of a BINARY_FLOAT value
CAST_FROM_BINARY_INTEGER Function on page 260-14	Returns the RAW binary representation of a BINARY_INTEGER value
CAST_FROM_NUMBER Function on page 260-15	Returns the RAW binary representation of a NUMBER value
CAST_TO_BINARY_DOUBLE Function on page 260-16	Casts the RAW binary representation of a BINARY_DOUBLE into a BINARY_DOUBLE
CAST_TO_BINARY_FLOAT Function on page 260-18	Casts the RAW binary representation of a BINARY_FLOAT into a BINARY_FLOAT
CAST_TO_BINARY_INTEGER Function on page 260-20	Casts the RAW binary representation of a BINARY_INTEGER into a BINARY_INTEGER
CAST_TO_NUMBER Function on page 260-21	Casts the RAW binary representation of a NUMBER into a NUMBER
CAST_TO_NVARCHAR2 Function on page 260-22	Converts a RAW value into a VARCHAR2 value
CAST_TO_RAW Function on page 260-23	Converts a VARCHAR2 value into a RAW value
CAST_TO_VARCHAR2 Function on page 260-24	Converts a RAW value into a VARCHAR2 value
COMPARE Function on page 260-25	Compares RAW r1 against RAW r2
CONCAT Function on page 260-26	Concatenates up to 12 RAWs into a single RAW
CONVERT Function on page 260-27	Converts RAW r from character set from_charset to character set to_charset and returns the resulting RAW
COPIES Function on page 260-29	Returns n copies of r concatenated together
LENGTH Function on page 260-30	Returns the length in bytes of a RAW r

Table 260–1 (Cont.) UTL_RAW Package Subprograms

Subprogram	Description
OVERLAY Function on page 260-31	Overlays the specified portion of target `RAW` with overlay `RAW`, starting from byte position `pos` of target and proceeding for `len` bytes
REVERSE Function on page 260-33	Reverses a byte sequence in `RAW r` from end to end
SUBSTR Function on page 260-34	Returns `len` bytes, starting at `pos` from `RAW r`
TRANSLATE Function on page 260-36	Translates the bytes in the input `RAW r` according to the bytes in the translation `RAWs from_set` and `to_set`
TRANSLITERATE Function on page 260-38	Converts the bytes in the input `RAW r` according to the bytes in the transliteration `RAWs from_set` and `to_set`
XRANGE Function on page 260-40	Returns a `RAW` containing all valid 1-byte encodings in succession, beginning with the value `start_byte` and ending with the value `end_byte`

BIT_AND Function

This function performs bitwise logical "and" of the values in RAW r1 with RAW r2 and returns the "anded" result RAW.

Syntax

```
UTL_RAW.BIT_AND (
   r1 IN RAW,
   r2 IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_and, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–2 BIT_AND Function Parameters

Parameter	Description
r1	RAW to "and" with r2
r2	RAW to "and" with r1

Return Values

Table 260–3 BIT_AND Function Return Values

Return	Description
RAW	Containing the "and" of r1 and r2
NULL	Either r1 or r2 input parameter was NULL

Usage Notes

If r1 and r2 differ in length, the and operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

BIT_COMPLEMENT Function

This function performs bitwise logical "complement" of the values in `RAW r` and returns the complement'ed result `RAW`. The result length equals the input `RAW r` length.

Syntax

```
UTL_RAW.BIT_COMPLEMENT (
   r IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_complement, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–4 BIT_COMPLEMENT Function Parameters

Parameter	Description
`r`	`RAW` to perform "complement" operation

Return Values

Table 260–5 BIT_COMPLEMENT Function Return Values

Return	Description
`RAW`	The "complement" of `r1`
`NULL`	If `r` input parameter was `NULL`

BIT_OR Function

This function performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the or'd result RAW.

Syntax

```
UTL_RAW.BIT_OR (
   r1 IN RAW,
   r2 IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_or, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–6 BIT_OR Function Parameters

Parameters	Description
r1	RAW to "or" with r2
r2	RAW to "or" with r1

Return Values

Table 260–7 BIT_OR Function Return Values

Return	Description
RAW	Containing the "or" of r1 and r2
NULL	Either r1 or r2 input parameter was NULL

Usage Notes

If r1 and r2 differ in length, then the "or" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

BIT_XOR Function

This function performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the xor'd result RAW.

Syntax

```
UTL_RAW.BIT_XOR (
   r1 IN RAW,
   r2 IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_xor, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–8 BIT_XOR Function Parameters

Parameter	Description
r1	RAW to "xor" with r2
r2	RAW to "xor" with r1

Return Values

Table 260–9 BIT_XOR Function Return Values

Return	Description
RAW	Containing the "xor" of r1 and r2
NULL	If either r1 or r2 input parameter was NULL

Usage Notes

If r1 and r2 differ in length, then the "xor" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

CAST_FROM_BINARY_DOUBLE Function

This function returns the RAW binary representation of a BINARY_DOUBLE value.

Syntax

```
UTL_RAW.CAST_FROM_BINARY_DOUBLE(
   n          IN BINARY_DOUBLE,
   endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–10 CAST_FROM_BINARY_DOUBLE Function Parameters

Parameter	Description
n	BINARY_DOUBLE value
endianess	A BINARY_INTEGER value indicating the endianess. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine.

Return Values

The binary representation of the BINARY_DOUBLE value, or NULL if the input is NULL.

Usage Notes

- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit  8
byte 7: bit  7 ~ bit  0
```

- The parameter endianess describes how the bytes of BINARY_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY_DOUBLE.

	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
big_endian	db0	db1	db2	db3	db4	db5	db6	db7
little_endian	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the `BINARY_DOUBLE` argument are copied straight across into the `RAW` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

CAST_FROM_BINARY_FLOAT Function

This function returns the RAW binary representation of a BINARY_FLOAT value.

Syntax

```
UTL_RAW.CAST_FROM_BINARY_FLOAT(
   n          IN BINARY_FLOAT,
   endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–11 CAST_FROM_BINARY_FLOAT Function Parameters

Parameter	Description
n	BINARY_FLOAT value
endianess	A BINARY_INTEGER value indicating the endianess. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine.

Return Values

The binary representation (RAW) of the BINARY_FLOAT value, or NULL if the input is NULL.

Usage Notes

- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24
byte 1: bit 23 ~ bit 16
byte 2: bit 15 ~ bit  8
byte 3: bit 7 ~  bit  0
```

- The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

	rb0	rb1	rb2	rb3
big_endian	fb0	fb1	fb2	fb3
little_endian	fb3	fb2	fb1	fb0

- In case of machine-endian, the 4 bytes of the BINARY_FLOAT argument are copied straight across into the RAW return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

CAST_FROM_BINARY_INTEGER Function

This function returns the RAW binary representation of a BINARY_INTEGER value.

Syntax

```
UTL_RAW.CAST_FROM_BINARY_INTEGER (
   n          IN BINARY_INTEGER
   endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–12 CAST_FROM_BINARY_INTEGER Function Parameters

Parameter	Description
n	BINARY_INTEGER value.
endianess	A BINARY_INTEGER value indicating the endianess. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine.

Return Values

The binary representation of the BINARY_INTEGER value.

CAST_FROM_NUMBER Function

This function returns the RAW binary representation of a NUMBER value.

Syntax

```
UTL_RAW.CAST_FROM_NUMBER (
   n  IN NUMBER)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–13 CAST_FROM_NUMBER Function Parameters

Parameter	Description
n	NUMBER value

Return Values

The binary representation of the NUMBER value.

CAST_TO_BINARY_DOUBLE Function

This function casts the RAW binary representation of a BINARY_DOUBLE into a BINARY_DOUBLE.

Syntax

```
UTL_RAW.CAST_TO_BINARY_DOUBLE (
   r          IN RAW
   endianess  IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

Pragmas

```
pragma restrict_references(cast_to_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–14 CAST_TO_BINARY_DOUBLE Function Parameters

Parameter	Description
r	Binary representation of a BINARY_DOUBLE
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The BINARY_DOUBLE value.

Usage Notes

- If the RAW argument is more than 8 bytes, only the first 8 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_DOUBLE_NAN is returned.
- If the RAW argument is less than 8 bytes, a VALUE_ERROR exception is raised.
- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit  8
byte 7: bit  7 ~ bit  0
```

- The parameter endianess describes how the bytes of BINARY_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY_DOUBLE.

	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
big_endian	db0	db1	db2	db3	db4	db5	db6	db7
little_endian	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the `RAW` argument are copied straight across into the `BINARY_DOUBLE` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

CAST_TO_BINARY_FLOAT Function

This function casts the RAW binary representation of a BINARY_FLOAT into a BINARY_FLOAT.

Syntax

```
UTL_RAW.CAST_TO_BINARY_FLOAT (
   r          IN RAW
   endianess  IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_FLOAT;
```

Pragmas

```
pragma restrict_references(cast_to_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–15 CAST_TO_BINARY_FLOAT Function Parameters

Parameter	Description
r	Binary representation of a BINARY_FLOAT
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The BINARY_FLOAT value.

Usage Notes

- If the RAW argument is more than 4 bytes, only the first 4 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_FLOAT_NAN is returned.
- If the RAW argument is less than 4 bytes, a VALUE_ERROR exception is raised.
- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24
byte 1: bit 23 ~ bit 16
byte 2: bit 15 ~ bit  8
byte 3: bit 7 ~  bit  0
```

- The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

	rb0	rb1	rb2	rb3
big_endian	fbo	fb1	fb2	fb3
little_endian	fb3	fb2	fb1	fb0

- In case of machine-endian, the 4 bytes of the RAW argument are copied straight across into the BINARY_FLOAT return value. The effect is the same if the user has

passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

CAST_TO_BINARY_INTEGER Function

This function casts the RAW binary representation of a BINARY_INTEGER into a BINARY_INTEGER.

Syntax

```
UTL_RAW.CAST_TO_BINARY_INTEGER (
   r          IN RAW
   endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references(cast_to_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–16 CAST_TO_BINARY_INTEGER Function Parameters

Parameter	Description
r	Binary representation of a BINARY_INTEGER
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The BINARY_INTEGER value

CAST_TO_NUMBER Function

This function casts the RAW binary representation of a NUMBER into a NUMBER.

Syntax

```
UTL_RAW.CAST_TO_NUMBER (
   r  IN RAW)
 RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(cast_to_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–17 CAST_TO_NUMBER function Parameters

Parameter	Description
r	Binary representation of a NUMBER

Return Values

The NUMBER value.

CAST_TO_NVARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into an NVARCHAR2 value with that number of data bytes.

> **Note:** When casting to a NVARCHAR2, the current Globalization Support character set is used for the characters within that NVARCHAR2 value.

Syntax

```
UTL_RAW.CAST_TO_NVARCHAR2 (
   r IN RAW)
RETURN NVARCHAR2;
```

Pragmas

```
pragma restrict_references(cast_to_NVARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–18 CAST_TO_NVARCHAR2 Function Parameters

Parameter	Description
r	RAW (without leading length field) to be changed to a NVARCHAR2)

Return Values

Table 260–19 CAST_TO_NVARCHAR2 Function Return Values

Return	Description
NVARCHAR2	Containing having the same data as the input RAW
NULL	If r input parameter was NULL

CAST_TO_RAW Function

This function converts a VARCHAR2 value represented using some number of data bytes into a RAW value with that number of data bytes. The data itself is not modified in any way, but its datatype is recast to a RAW datatype.

Syntax

```
UTL_RAW.CAST_TO_RAW (
   c  IN VARCHAR2)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_to_raw, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–20 CAST_TO_RAW Function Parameters

Parameter	Description
c	VARCHAR2 to be changed to a RAW

Return Values

Table 260–21 CAST_TO_RAW Function Return Values

Return	Description
RAW	Containing the same data as the input VARCHAR2 and equal byte length as the input VARCHAR2 and without a leading length field
NULL	If c input parameter was NULL

CAST_TO_VARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into a VARCHAR2 value with that number of data bytes.

> **Note:** When casting to a VARCHAR2, the current Globalization Support character set is used for the characters within that VARCHAR2.

Syntax

```
UTL_RAW.CAST_TO_VARCHAR2 (
   r IN RAW)
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(cast_to_VARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–22 CAST_TO_VARCHAR2 Function Parameters

Parameter	Description
r	RAW (without leading length field) to be changed to a VARCHAR2

Return Values

Table 260–23 CAST_TO_VARCHAR2 Function Return Values

Return	Description
VARCHAR2	Containing having the same data as the input RAW
NULL	If r input parameter was NULL

COMPARE Function

This function compares two RAW values. If they differ in length, then the shorter is extended on the right according to the optional pad parameter.

Syntax

```
UTL_RAW.COMPARE (
   r1  IN RAW,
   r2  IN RAW,
   pad IN RAW DEFAULT NULL)
  RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(compare, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–24 COMPARE Function Parameters

Parameter	Description
r1	1st RAW to be compared, may be NULL or 0 length
r2	2nd RAW to be compared, may be NULL or 0 length
pad	This is an optional parameter. Byte to extend whichever of r1 or r2 is shorter. The default: x'00'

Return Values

Table 260–25 COMPARE Function Return Values

Return	Description
NUMBER	Equals 0 if RAW byte strings are both NULL or identical; or, Equals position (numbered from 1) of the first mismatched byte

CONCAT Function

This function concatenates up to 12 RAWs into a single RAW. If the concatenated size exceeds 32K, then an error is returned

Syntax

```
UTL_RAW.CONCAT (
   r1  IN RAW DEFAULT NULL,
   r2  IN RAW DEFAULT NULL,
   r3  IN RAW DEFAULT NULL,
   r4  IN RAW DEFAULT NULL,
   r5  IN RAW DEFAULT NULL,
   r6  IN RAW DEFAULT NULL,
   r7  IN RAW DEFAULT NULL,
   r8  IN RAW DEFAULT NULL,
   r9  IN RAW DEFAULT NULL,
   r10 IN RAW DEFAULT NULL,
   r11 IN RAW DEFAULT NULL,
   r12 IN RAW DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(concat, WNDS, RNDS, WNPS, RNPS);
```

Parameters

r1....r12 are the RAW items to concatenate.

Return Values

Table 260–26 CONCAT Function Return Values

Return	Description
RAW	Containing the items concatenated

Exceptions

There is an error if the sum of the lengths of the inputs exceeds the maximum allowable length for a RAW, which is 32767 bytes.

CONVERT Function

This function converts RAW r from character set from_charset to character set to_charset and returns the resulting RAW.

Both from_charset and to_charset must be supported character sets defined to the Oracle server.

Syntax

```
UTL_RAW.CONVERT (
   r            IN RAW,
   to_charset   IN VARCHAR2,
   from_charset IN VARCHAR2)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(convert, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–27 CONVERT Function Parameters

Parameter	Description
r	RAW byte-string to be converted
to_charset	Name of the character set to which r is converted
from_charset	Name of the character set in which r is supplied

Return Values

Table 260–28 CONVERT Function Return Values

Return	Description
RAW	Byte string r converted according to the specified character sets.

Exceptions

Table 260–29 CONVERT Function Exceptions

Error	Description
ORA-06502	PL/SQL: numeric or value error
ORA-12703	This character set conversion is not supported
ORA-12705	Cannot access NLS data files or invalid environment specified

Usage Notes

- The NLS_LANG parameter form *language_territory.character set* is also accepted for to_charset and from_charset. However, this form is deprecated and should be avoided. Note that *language* and *territory* are ignored by this subprogram.
- The converted value is silently truncated if it exceeds the maximum length of a RAW value, which is 32767 bytes. Do not convert values longer than floor(32767/4) = 8191 bytes if you want to avoid this truncation for all possible combinations of to_

`charset` and `from_charset`. You can use the maximum character width of the target character set `to_charset`, if known, to expand the limit to a less pessimistic value. For example, if the target character set is ZHS16GBK, the maximum safe source string length is floor(32767/2) = 16383 bytes. For single-byte target character sets, no truncation is ever necessary.

COPIES Function

This function returns n copies of r concatenated together.

Syntax

```
UTL_RAW.COPIES (
   r IN RAW,
   n IN NUMBER)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(copies, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–30 COPIES Function Parameters

Parameters	Description
r	RAW to be copied
n	Number of times to copy the RAW (must be positive)

Return Values

This returns the RAW copied n times.

Exceptions

Table 260–31 COPIES Function Exceptions

Error	Description
VALUE_ERROR	Either: - r is missing, NULL or 0 length - n < 1 - Length of result exceeds maximum length of a RAW

LENGTH Function

This function returns the length in bytes of a `RAW` `r`.

Syntax

```
UTL_RAW.LENGTH (
   r  IN RAW)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(length, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–32 LENGTH Function Parameters

Parameter	Description
`r`	`RAW` byte stream to be measured

Return Values

Table 260–33 LENGTH Function Return Values

Return	Description
`NUMBER`	Current length of the `RAW`

OVERLAY Function

This function overlays the specified portion of target RAW with overlay_str RAW, starting from byte position pos of target and proceeding for len bytes.

Syntax

```
UTL_RAW.OVERLAY (
   overlay_str IN RAW,
   target      IN RAW,
   pos         IN BINARY_INTEGER DEFAULT 1,
   len         IN BINARY_INTEGER DEFAULT NULL,
   pad         IN RAW            DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(overlay, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–34 OVERLAY Function Parameters

Parameters	Description
overlay_str	Byte-string used to overlay target
target	Byte-string which is to be overlaid
pos	Position in target (numbered from 1) to start overlay
len	The number of target bytes to overlay
pad	Pad byte used when overlay len exceeds overlay_str length or pos exceeds target length

Defaults and Optional Parameters

Table 260–35 OVERLAY Function Optional Parameters

Optional Parameter	Description
pos	1
len	To the length of overlay_str
pad	x'00'

Return Values

Table 260–36 OVERLAY Function Return Values

Return	Description
RAW	The target byte_string overlaid as specified.

Usage Notes

If overlay_str has less than len bytes, then it is extended to len bytes using the pad byte. If overlay_str exceeds len bytes, then the extra bytes in overlay_str are

ignored. If len bytes beginning at position pos of target exceeds the length of target, then target is extended to contain the entire length of overlay_str.

If len is specified, it must be greater than or equal to 0. If pos is specified, it must be greater than or equal to 1. If pos exceeds the length of target, then target is padded with pad bytes to position pos, and target is further extended with overlay_str bytes.

Exceptions

Table 260–37 OVERLAY Function Exceptions

Error	Description
VALUE_ERROR	Either: - Overlay_str is NULL or has 0 length - Target is missing or undefined - Length of target exceeds maximum length of a RAW - len < 0 - pos < 1

REVERSE Function

This function reverses a byte sequence in RAW r from end to end. For example, x'0102F3' would be reversed to x'F30201', and 'xyz' would be reversed to 'zyx'.The result length is the same as the input RAW length.

Syntax

```
UTL_RAW.REVERSE (
   r IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(reverse, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–38 REVERSE Function Parameters

Parameter	Description
r	RAW to reverse

Return Values

Table 260–39 REVERSE Function Return Values

Return	Description
RAW	Containing the "reverse" of r

Exceptions

Table 260–40 REVERSE Function Exceptions

Error	Description
VALUE_ERROR	R is NULL or has 0 length

SUBSTR Function

This function returns len bytes, starting at pos from RAW r.

Syntax

```
UTL_RAW.SUBSTR (
   r   IN RAW,
   pos IN BINARY_INTEGER,
   len IN BINARY_INTEGER DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(substr, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–41 SUBSTR Function Parameters

Parameter	Description
r	RAW byte-string from which a portion is extracted
pos	Byte position in r at which to begin extraction
len	Number of bytes from pos to extract from r (optional)

Defaults and Optional Parameters

Table 260–42 SUBSTR Function Optional Parameter

Optional Parameter	Description
len	Position pos through to the end of r

Return Values

Table 260–43 SUBSTR Function Return Values

Return	Description
portion of r	Beginning at pos for len bytes long
NULL	r input parameter was NULL

Usage Notes

- If pos is positive, then SUBSTR counts from the beginning of r to find the first byte. If pos is negative, then SUBSTR counts backward from the end of the r. The value pos cannot be 0.
- If len is omitted, then SUBSTR returns all bytes to the end of r. The value len cannot be less than 1.

Exceptions

Table 260–44 SUBSTR Function Exceptions

Error	Description
VALUE_ERROR	VALUE_ERROR is returned if: ■ pos = 0 or > length of r ■ len < 1 or > length of r - (pos-1)

TRANSLATE Function

This function translates the bytes in the input RAW r according to the bytes in the translation RAWs from_set and to_set. If a byte in r has a matching byte in from_set, then it is replaced by the byte in the corresponding position in to_set, or deleted.

Bytes in r, but undefined in from_set, are copied to the result. Only the first (leftmost) occurrence of a byte in from_set is used. Subsequent duplicates are not scanned and are ignored.

Syntax

```
UTL_RAW.TRANSLATE (
   r        IN RAW,
   from_set IN RAW,
   to_set   IN RAW)
  RETURN RAW;
```

> **Note:** Be aware that *to_set* and *from_set* are reversed in the calling sequence compared to TRANSLITERATE.

Pragmas

```
pragma restrict_references(translate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–45 TRANSLATE Function Parameters

Parameter	Description
r	RAW source byte-string to be translated
from_set	RAW byte-codes to be translated, if present in r
to_set	RAW byte-codes to which corresponding from_str bytes are translated

Return Values

Table 260–46 TRANSLATE Function Return Values

Return	Description
RAW	Translated byte-string

Usage Notes

- If to_set is shorter than from_set, the extra from_set bytes have no corresponding translation bytes. Bytes from the input RAW that match any such from_set bytes are not translated or included in the result. They are effectively translated to NULL.
- If to_set is longer than from_set, the extra to_set bytes are ignored.
- If a byte value is repeated in from_set, the repeated occurrence is ignored.

Note: Differences from the TRANSLITERATE Function:

- The `from_set` parameter comes before the `to_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are not translated or included in the result.
- The resulting `RAW` value may be shorter than the input `RAW` value.

Note that `TRANSLATE` and `TRANSLITERATE` only differ in functionality when `to_set` has fewer bytes than `from_set`.

Exceptions

Table 260–47 TRANSLATE Function Exceptions

Error	Description
`VALUE_ERROR`	Either: - `r` is `NULL` or has 0 length - `from_set` is `NULL` or has 0 length - `to_set` is `NULL` or has 0 length

TRANSLITERATE Function

This function converts the bytes in the input RAW r according to the bytes in the transliteration RAWs from_set and to_set. Successive bytes in r are looked up in the from_set, and, if not found, copied unaltered to the result RAW. If found, then they are replaced in the result RAW by either corresponding bytes in the to_set, or the pad byte when no correspondence exists.

Bytes in r, but undefined in from_set, are copied to the result. Only the first (leftmost) occurrence of a byte in from_set is used. Subsequent duplicates are not scanned and are ignored. The result RAW is always the same length as r.

Syntax

```
UTL_RAW.TRANSLITERATE (
   r        IN RAW,
   to_set   IN RAW DEFAULT NULL,
   from_set IN RAW DEFAULT NULL,
   pad      IN RAW DEFAULT NULL)
  RETURN RAW;
```

Note: Be aware that *to_set* and *from_set* are reversed in the calling sequence compared to TRANSLATE.

Pragmas

```
pragma restrict_references(transliterate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–48 TRANSLITERATE Function Parameters

Parameter	Description
r	RAW input byte-string to be converted
to_set	RAW byte-codes to which corresponding from_set bytes are converted (any length)
from_set	RAW byte-codes to be converted, if presenting r (any length)
pad	1 byte used when to-set is shorter than the from_set

Defaults and Optional Parameters

Table 260–49 TRANSLITERATE Function Optional Parameters

Optional Parameter	Description
to_set	To the NULL string and effectively extended with pad to the length of from_set as necessary
from_set	x'00' through x'fff'
pad	x'00'

Return Values

Table 260–50 TRANSLITERATE Function Return Values

Return	Description
RAW	Converted byte-string.

Usage Notes

- If to_set is shorter than from_set, the extra from_set bytes have no corresponding conversion bytes. Bytes from the input RAW that match any such from_set bytes are converted in the result to the pad byte instead.
- If to_set is longer than from_set, the extra to_set bytes are ignored.
- If a byte value is repeated in from_set, the repeated occurrence is ignored.

Note: Differences from the TRANSLATE Function:

- The to_set parameter comes before the from_set parameter in the calling sequence.
- Bytes from r that appear in from_set but have no corresponding values in to_set are replaced by pad in the result.
- The resulting RAW value always has the same length as the input RAW value.

Note that TRANSLATE and TRANSLITERATE only differ in functionality when to_set has fewer bytes than from_set.

Exceptions

Table 260–51 TRANSLITERATE Function Exceptions

Error	Description
VALUE_ERROR	R is NULL or has 0 length

XRANGE Function

This function returns a RAW `value` containing the succession of one-byte encodings beginning and ending with the specified byte-codes. The specified byte-codes must be single-byte `RAW` values. If the `start_byte` value is greater than the `end_byte` value, then the succession of resulting bytes begins with `start_byte`, wraps through `x'FF'` back to `x'00'`, then ends at `end_byte`.

Syntax

```
UTL_RAW.XRANGE (
   start_byte IN RAW DEFAULT NULL,
   end_byte   IN RAW DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(xrange, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 260–52 XRANGE Function Parameters

Parameters	Description
`start_byte`	Beginning byte-code value of resulting sequence. The default is `x'00'`.
`end_byte`	Ending byte-code value of resulting sequence. The default is `x'FF'`.

Return Values

Table 260–53 XRANGE Function Return Values

Return	Description
`RAW`	Containing succession of 1-byte hexadecimal encodings

261

UTL_RECOMP

The UTL_RECOMP package recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallel.

This chapter contains the following topics:

Using UTL_RECOMP

Overview

This script is particularly useful after a major-version upgrade that typically invalidates all PL/SQL and Java objects. Although invalid objects are recompiled automatically on use, it is useful to run this script prior to operation because this will either eliminate or minimize subsequent latencies due to on-demand automatic recompilation at runtime.

Parallel recompilation can exploit multiple CPUs to reduce the time taken to recompile invalid objects. The degree of parallelism is specified by the first argument to RECOMP_PARALLEL Procedure.

In general, a parallelism setting of one thread for each available CPU provides a good initial setting. However, please note that the process of recompiling an invalid object writes a significant amount of data to system tables and is fairly I/O intensive. A slow disk system may be a significant bottleneck and limit speedups available from a higher degree of parallelism.

Operational Notes

- This package uses the job queue for parallel recompilation.
- This package must be run using `SQL*PLUS`.
- You must be connected `AS SYSDBA` to run this script.
- This package expects the following packages to have been created with VALID status:
  - `STANDARD` (`standard.sql`)
  - `DBMS_STANDARD` (`dbmsstdx.sql`)
  - `DBMS_JOB` (`dbmsjob.sql`)
  - `DBMS_RANDOM (dbmsrand.sql)`
- There should be no other DDL on the database while running entries in this package. Not following this recommendation may lead to deadlocks.

Examples

Recompile all objects sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL();
```

Recompile objects in schema SCOTT sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL('SCOTT');
```

Recompile all objects using 4 parallel threads:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(4);
```

Recompile objects in schema JOE using the number of threads specified in the parameter JOB_QUEUE_PROCESSES:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(NULL, 'JOE');
```

Summary of UTL_RECOMP Subprograms

Table 261–1 UTL_RECOMP Package Subprograms

Subprogram	Description
RECOMP_PARALLEL Procedure on page 261-7	Recompiles invalid objects in a given schema, or all invalid objects in the database, in parallel
RECOMP_SERIAL Procedure on page 261-8	Recompiles invalid objects in a given schema or all invalid objects in the database

RECOMP_PARALLEL Procedure

This procedure uses the information exposed in the DBA_Dependencies view to recompile invalid objects in the database, or in a given schema, in parallel.

Syntax

```
UTL_RECOMP.RECOMP_PARALLEL(
   threads  IN   PLS_INTEGER DEFAULT NULL,
   schema   IN   VARCHAR2    DEFAULT NULL,
   flags    IN   PLS_INTEGER DEFAULT 0);
```

Parameters

Table 261–2 RECOMP_PARALLEL Procedure Parameters

Parameter	Description
threads	The number of recompile threads to run in parallel. If NULL, use the value of 'job_queue_processes'.
schema	The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.
flags	Flag values are intended for internal testing and diagnosability only.

Usage Notes

The parallel recompile exploits multiple CPUs to reduce the time taken to recompile invalid objects. However, please note that recompilation writes significant amounts of data to system tables, so the disk system may be a bottleneck and prevent significant speedups.

RECOMP_SERIAL Procedure

This procedure recompiles invalid objects in a given schema or all invalid objects in the database.

Syntax

```
UTL_RECOMP.RECOMP_SERIAL(
   schema    IN   VARCHAR2    DEFAULT NULL,
   flags     IN   PLS_INTEGER DEFAULT 0);
```

Parameters

Table 261–3 RECOMP_SERIAL Procedure Parameters

Parameter	Description
`schema`	The schema in which to recompile invalid objects. If `NULL`, all invalid objects in the database are recompiled.
`flags`	Flag values are intended for internal testing and diagnosability only.

262

UTL_REF

The UTL_REF package provides PL/SQL procedures to support reference-based operations. Unlike SQL, UTL_REF procedures enable you to write generic type methods without knowing the object table name.

This chapter contains the following topics:

Using UTL_REF

Overview

Oracle supports user-defined composite type or object type. Any instance of an object type is called an object. An object type can be used as the type of a column or as the type of a table.

In an object table, each row of the table stores an object. You can uniquely identify an object in an object table with an object identifier.

A reference is a persistent pointer to an object, and each reference can contain an object identifier. The reference can be an attribute of an object type, or it can be stored in a column of a table. Given a reference, an object can be retrieved.

Security Model

The procedural option is needed to use this package. This package must be created under SYS (CONNECT /AS SYSDBA). Operations provided by this package are performed under the current calling user, not under the package owner SYS.

You can use the UTL_REF package from stored PL/SQL procedures/packages on the server, as well as from client/side PL/SQL code.

When invoked from PL/SQL procedures/packages on the server, UTL_REF verifies that the invoker has the appropriate privileges to access the object pointed to by the REF.

> **Note:** This is in contrast to PL/SQL packages/procedures on the server which operate with definer's privileges, where the package owner must have the appropriate privileges to perform the desired operations.

Thus, if UTL_REF is defined under user SYS, and user A invokes UTL_REF.SELECT to select an object from a reference, then user A (the invoker) requires the privileges to check.

When invoked from client-side PL/SQL code, UTL_REF operates with the privileges of the client session under which the PL/SQL execution is being done.

Types

An object type is a composite datatype defined by the user or supplied as a library type. You can create the object type `employee_type` using the following syntax:

```
CREATE TYPE employee_type AS OBJECT (
   name    VARCHAR2(20),
   id      NUMBER,

member function GET_ID
    (name VARCHAR2)
   RETURN MEMBER);
```

The object type `employee_type` is a user-defined type that contains two attributes, `name` and `id`, and a member function, `GET_ID`().

You can create an object table using the following SQL syntax:

```
CREATE TABLE employee_table OF employee_type;
```

Exceptions

Exceptions can be returned during execution of UTL_REF functions for various reasons. For example, the following scenarios would result in exceptions:

- The object selected does not exist. This could be because either:
  1. The object has been deleted, or the given reference is dangling (invalid).
  2. The object table was dropped or does not exist.
- The object cannot be modified or locked in a serializable transaction. The object was modified by another transaction after the serializable transaction started.
- You do not have the privilege to select or modify the object. The caller of the UTL_REF subprogram must have the proper privilege on the object that is being selected or modified.

Table 262–1 UTL_REF Exceptions

Exceptions	Description
errnum == 942	Insufficient privileges.
errnum == 1031	Insufficient privileges.
errnum == 8177	Unable to serialize, if in a serializable transaction.
errnum == 60	Deadlock detected.
errnum == 1403	No data found (if the REF is NULL, and so on.).

The UTL_REF package does not define any named exceptions. You may define exception handling blocks to catch specific exceptions and to handle them appropriately.

Summary of UTL_REF Subprograms

Table 262–2 UTL_REF Package Subprograms

Subprogram	Description
DELETE_OBJECT Procedure on page 262-8	Deletes an object given a reference
LOCK_OBJECT Procedure on page 262-10	Locks an object given a reference
SELECT_OBJECT Procedure on page 262-11	Selects an object given a reference
UPDATE_OBJECT Procedure on page 262-12	Updates an object given a reference

DELETE_OBJECT Procedure

This procedure deletes an object given a reference. The semantic of this subprogram is similar to the following SQL statement:

```
DELETE FROM object_table
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.DELETE_OBJECT (
   reference IN REF "<typename>");
```

Parameters

Table 262–3 DELETE_OBJECT Procedure Parameters

Parameter	Description
reference	Reference of the object to delete.

Exceptions

May be raised.

Examples

The following example illustrates usage of the UTL_REF package to implement this scenario: if an employee of a company changes their address, their manager should be notified.

... declarations of Address_t and others...

```
CREATE OR REPLACE TYPE Person_t (
   name    VARCHAR2(64),
   gender  CHAR(1),
   address Address_t,
   MEMBER PROCEDURE setAddress(addr IN Address_t)
);

CREATE OR REPLACE TYPE BODY Person_t (
   MEMBER PROCEDURE setAddress(addr IN Address_t) IS
   BEGIN
      address := addr;
   END;
);

CREATE OR REPLACE TYPE Employee_t (
```

Under Person_t: Simulate implementation of inheritance using a REF to Person_t and delegation of setAddress to it.

```
   thePerson  REF Person_t,
   empno      NUMBER(5),
   deptREF    Department_t,
   mgrREF     Employee_t,
   reminders  StringArray_t,
```

```
   MEMBER PROCEDURE setAddress(addr IN Address_t),
   MEMBER procedure addReminder(reminder VARCHAR2);
);

CREATE TYPE BODY Employee_t (
   MEMBER PROCEDURE setAddress(addr IN Address_t) IS
      myMgr Employee_t;
      meAsPerson Person_t;
   BEGIN
```

Update the address by delegating the responsibility to `thePerson`. Lock the Person object from the reference, and also select it:

```
      UTL_REF.LOCK_OBJECT(thePerson, meAsPerson);
      meAsPerson.setAddress(addr);
```

Delegate to `thePerson`:

```
        UTL_REF.UPDATE_OBJECT(thePerson, meAsPerson);
        if mgr is NOT NULL THEN
```

Give the manager a reminder:

```
         UTL_REF.LOCK_OBJECT(mgr);
         UTL_REF.SELECT_OBJECT(mgr, myMgr);
         myMgr.addReminder
         ('Update address in the employee directory for' ||
         thePerson.name || ', new address: ' || addr.asString);
         UTL_REF.UPDATE_OBJECT(mgr, myMgr);
      END IF;
   EXCEPTION
      WHEN OTHERS THEN
      errnum := SQLCODE;
      errmsg := SUBSTR(SQLERRM, 1, 200);
```

LOCK_OBJECT Procedure

This procedure locks an object given a reference. In addition, this procedure lets the program select the locked object. The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
  INTO object
  FROM object_table t
  WHERE REF(t) = reference
  FOR UPDATE;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides. It is not necessary to lock an object before updating/deleting it.

Syntax

```
UTL_REF.LOCK_OBJECT (
   reference IN REF "<typename>");

UTL_REF.LOCK_OBJECT (
   reference IN REF "<typename>",
   object    IN OUT "<typename>");
```

Parameters

Table 262–4 LOCK_OBJECT Procedure Parameters

Parameter	Description
`reference`	Reference of the object to lock.
`object`	The PL/SQL variable that stores the locked object. This variable should be of the same object type as the locked object.

Exceptions

May be raised.

SELECT_OBJECT Procedure

This procedure selects an object given its reference. The selected object is retrieved from the database and its value is put into the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
INTO object
FROM object_table t
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.SELECT_OBJECT (
   reference IN REF "<typename>",
   object    IN OUT "<typename>");
```

Parameters

Table 262–5 SELECT_OBJECT Procedure Parameters

Parameter	Description
`reference`	Reference to the object to select or retrieve.
`object`	The PL/SQL variable that stores the selected object; this variable should be of the same object type as the referenced object.

Exceptions

May be raised.

UPDATE_OBJECT Procedure

This procedure updates an object given a reference. The referenced object is updated with the value contained in the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```
UPDATE object_table t
SET VALUE(t) = object
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.UPDATE_OBJECT (
   reference IN REF "<typename>",
   object    IN     "<typename>");
```

Parameters

Table 262–6 UPDATE_OBJECT Procedure Parameters

Parameter	Description
`reference`	Reference of the object to update.
`object`	The PL/SQL variable that contains the new value of the object. This variable should be of the same object type as the object to update.

Exceptions

May be raised.

263

UTL_SMTP

The `UTL_SMTP` package is designed for sending electronic mails (e-mails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.

> **See Also:** *Oracle Database Development Guide*

This chapter contains the following topics:

Using UTL_SMTP

Overview

The UTL_SMTP protocol consists of a set of commands for an e-mail client to dispatch e-mails to an SMTP server. The UTL_SMTP package provides interfaces to the SMTP commands. For many of the commands, the package provides both a procedural and a functional interface. The functional form returns the reply from the server for processing by the client. The procedural form checks the reply and raises an exception if the reply indicates a transient (400-range reply code) or permanent error (500-range reply code). Otherwise, it discards the reply.

Note that the original SMTP protocol communicates using 7-bit ASCII. Using UTL_SMTP, all text data (in other words, those in VARCHAR2) are converted to US7ASCII before it is sent to the server. Some implementations of SMTP servers that support SMTP extension 8BITMIME [RFC1652] support full 8-bit communication between client and server. The body of the DATA command can be transferred in full 8 bits, but the rest of the SMTP command and response must be in 7 bits. When the target SMTP server supports 8BITMIME extension, users of multibyte databases may convert their non-US7ASCII, multibyte VARCHAR2 data to RAW and use the WRITE_RAW_DATA subprogram to send multibyte data using 8-bit MIME encoding.

UTL_SMTP provides for SMTP communication as specified in RFC821, but does not provide an API to format the content of the message according to RFC 822 (for example, setting the subject of an electronic mail). You must format the message appropriately. In addition, UTL_SMTP does not have the functionality to implement an SMTP server for an e-mail clients to send e-mails using SMTP.

Security Model

This package is an invoker's rights package. The invoking user must have the `connect` privilege granted in the access control list assigned to the remote network host to which the user must connect.

Note: For more information, see Managing Fine-Grained Access in PL/SQL Packages and Types in *Oracle Database Security Guide*

Constants

The UTL_SMTP package uses the constants shown in Table 263–1, " UTL_SMTP Constants".

Table 263–1 UTL_SMTP Constants

Name	Type	Value	Description
ALL_SCHEMES	VARCHAR2(256)	'CRAM-MD5 PLAIN LOGIN'	List of all authentication schemes UTL_SMTP supports, in order of their relative security strength. The subset of the schemes in ALL_SCHEMES (namely, PLAIN and LOGIN) in which cleartext passwords are sent over SMTP must be used only in SMTP connections that are secured by Secure Socket Layer / Transport Layer Security (SSL/TLS).
NON_CLEARTEXT_PASSWORD_SCHEMES	VARCHAR2(256)	'CRAM-MD5'	List of authentication schemes that UTL_SMTP supports and in which no cleartext passwords are sent over SMTP. They can be used in SMTP connections that are not secured by SSL/TLS. Note that these schemes may still be weak when used in an insecure SMTP connection.

Types

CONNECTION Record Type

This is a PL/SQL record type used to represent an SMTP connection.

Syntax

```
TYPE connection IS RECORD (
    host              VARCHAR2(255),
    port              PLS_INTEGER,
    tx_timeout        PLS_INTEGER,
    private_tcp_con   utl_tcp.connection,
    private_state     PLS_INTEGER);
```

Fields

Table 263–2 CONNECTION Record Type Fields

Field	Description
`host`	Name of the remote host when connection is established. `NULL` when no connection is established.
`port`	Port number of the remote SMTP server connected. `NULL` when no connection is established.
`tx_timeout`	Time in seconds that the `UTL_SMTP` package waits before timing out in a read or write operation in this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. `0` indicates not to wait at all. `NULL` indicates to wait forever.
`private_tcp_con`	Private, for implementation use only. You should not modify this field.
`private_state`	Private, for implementation use only. You should not modify this field.

Usage Notes

The read-only fields in a connection record are used to return information about the SMTP connection after the connection is successfully made with the `OPEN_CONNECTION Functions`. Changing the values of these fields has no effect on the connection. The fields `private_tcp_con` and `private_state` for implementation use only. You should not modify these fields.

REPLY, REPLIES Record Types

These are PL/SQL record types used to represent an SMTP reply line. Each SMTP reply line consists of a reply code followed by a text message. While a single reply line is expected for most SMTP commands, some SMTP commands expect multiple reply lines. For those situations, a PL/SQL table of reply records is used to represent multiple reply lines.

Syntax

```
TYPE reply IS RECORD (
  code    PLS_INTEGER,
  text    VARCHAR2(508));

TYPE replies IS TABLE OF reply INDEX BY BINARY_INTEGER;
```

Fields

Table 263–3 REPLY, REPLIES Record Type Fields

Field	Description
`code`	3-digit reply code
`text`	Text message of the reply

Reply Codes

The following is a list of the SMTP reply codes.

Table 263–4 SMTP Reply Codes

Reply Code	Meaning
211	System status, or system help reply
214	Help message [Information on how to use the receiver or the meaning of a particular non-standard command; this reply is useful only to the human user]
220	<domain> Service ready
221	<domain> Service closing transmission channel
250	Requested mail action okay, completed
251	User not local; forwards to <forward-path>
252	OK, pending messages for node <node> started. Cannot VRFY user (for example, info is not local), but takes message for this user and attempts delivery.
253	OK, <messages> pending messages for node <node> started
354	Start mail input; end with <CRLF.CRLF>
355	Octet-offset is the transaction offset
421	<domain> Service not available, closing transmission channel (This can be a reply to any command if the service knows it must shut down.)
450	Requested mail action not taken: mailbox unavailable [for example, mailbox busy]
451	Requested action terminated: local error in processing
452	Requested action not taken: insufficient system storage
453	You have no mail.
454	TLS not available due to temporary reason. Encryption required for requested authentication mechanism.
458	Unable to queue messages for node <node>
459	Node <node> not allowed: reason
500	Syntax error, command unrecognized (This may include errors such as command line too long.)
501	Syntax error in parameters or arguments
502	Command not implemented
503	Bad sequence of commands
504	Command parameter not implemented
521	<Machine> does not accept mail.
530	Must issue a STARTTLS command first. Encryption required for requested authentication mechanism.
534	Authentication mechanism is too weak.
538	Encryption required for requested authentication mechanism.
550	Requested action not taken: mailbox unavailable [for, mailbox not found, no access]

Table 263–4 (Cont.) SMTP Reply Codes

Reply Code	Meaning
551	User not local; please try <forward-path>
552	Requested mail action terminated: exceeded storage allocation
553	Requested action not taken: mailbox name not allowed [for example, mailbox syntax incorrect]
554	Transaction failed

Operational Notes

SMTP connection is initiated by a call to OPEN_CONNECTION Functions which returns a SMTP connection. After a connection is established, the following calls are required to send a mail:

HELO Function and Procedure - identify the domain of the sender

MAIL Function and Procedure- start a mail, specify the sender

RCPT Function - specify the recipient

OPEN_DATA Function and Procedure- start the mail body

WRITE_RAW_DATA Procedure - write the mail body (multiple calls allowed)

CLOSE_DATA Function and Procedure - close the mail body and send the mail

The SMTP connection is closed by calling QUIT Function and Procedure.

Exceptions

The table lists the exceptions that can be raised by the interface of the UTL_SMTP package. The network error is transferred to a reply code of 421- service not available.

Table 263–5 UTL_SMTP Exceptions

INVALID_OPERATION	Raised when an invalid operation is made. In other words, calling API other than the WRITE_DATA Procedure, the WRITE_RAW_DATA Procedure or the CLOSE_DATA Function and Procedure after the OPEN_DATA Function and Procedure is called, or calling WRITE_DATA, WRITE_RAW_DATA or CLOSE_DATA without first calling OPEN_DATA.
TRANSIENT_ERROR	Raised when receiving a reply code in 400 range
PERMANENT_ERROR	Raised when receiving a reply code in 500 range

Rules and Limits

No limitation or range-checking is imposed by the API. However, you must be aware of the following size limitations on various elements of SMTP. Sending data that exceed these limits may result in errors returned by the server.

Table 263–6 SMTP Size Limitation

Element	Size Limitation
`user`	Maximum total length of a user name is 64 characters
`domain`	Maximum total length of a domain name or number is 64 characters
`path`	Maximum total length of a reverse-path or forward-path is 256 characters (including the punctuation and element separators)
`command line`	Maximum total length of a command line including the command word and the `<CRLF>` is 512 characters
`reply line`	Maximum total length of a reply line including the reply code and the `<CRLF>` is 512 characters
`text line`	Maximum total length of a text line including the `<CRLF>` is 1000 characters (but not counting the leading dot duplicated for transparency)
`recipients buffer`	Maximum total number of recipients that must be buffered is 100 recipients

Examples

The following example illustrates how UTL_SMTP is used by an application to send e-mail. The application connects to an SMTP server at port 25 and sends a simple text message.

```
DECLARE
  c UTL_SMTP.CONNECTION;

  PROCEDURE send_header(name IN VARCHAR2, header IN VARCHAR2) AS
  BEGIN
    UTL_SMTP.WRITE_DATA(c, name || ': ' || header || UTL_TCP.CRLF);
  END;

BEGIN
  c := UTL_SMTP.OPEN_CONNECTION('smtp-server.acme.com');
  UTL_SMTP.HELO(c, 'foo.com');
  UTL_SMTP.MAIL(c, 'sender@foo.com');
  UTL_SMTP.RCPT(c, 'recipient@foo.com');
  UTL_SMTP.OPEN_DATA(c);
  send_header('From',    '"Sender" <sender@foo.com>');
  send_header('To',      '"Recipient" <recipient@foo.com>');
  send_header('Subject', 'Hello');
  UTL_SMTP.WRITE_DATA(c, UTL_TCP.CRLF || 'Hello, world!');
  UTL_SMTP.CLOSE_DATA(c);
  UTL_SMTP.QUIT(c);
EXCEPTION
  WHEN utl_smtp.transient_error OR utl_smtp.permanent_error THEN
    BEGIN
      UTL_SMTP.QUIT(c);
    EXCEPTION
      WHEN UTL_SMTP.TRANSIENT_ERROR OR UTL_SMTP.PERMANENT_ERROR THEN
        NULL; -- When the SMTP server is down or unavailable, we don't have
              -- a connection to the server. The QUIT call raises an
              -- exception that we can ignore.
    END;
    raise_application_error(-20000,
      'Failed to send mail due to the following error: ' || sqlerrm);
END;
```

Summary of UTL_SMTP Subprograms

Table 263–7 UTL_SMTP Package Subprograms

Subprogram	Description
AUTH Function and Procedure on page 263-15	Sends the AUTH command to authenticate to the SMTP server
CLOSE_CONNECTION Procedure on page 263-17	Closes the SMTP connection, causing the current SMTP operation to terminate
CLOSE_DATA Function and Procedure on page 263-18	Closes the data session
COMMAND Function and Procedure on page 263-19	Performs a generic SMTP command
COMMAND_REPLIES Function on page 263-20	Performs a generic SMTP command and retrieves multiple reply lines
DATA Function and Procedure on page 263-21	Sends the e-mail body
EHLO Function and Procedure on page 263-22	Performs the initial handshake with SMTP server using the EHLO command
HELO Function and Procedure on page 263-23	Performs the initial handshake with SMTP server using the HELO command
HELP Function on page 263-24	Sends HELP command
MAIL Function and Procedure on page 263-25	Initiates an e-mail transaction with the server, the destination is a mailbox
NOOP Function and Procedure on page 263-26	NULL command
OPEN_CONNECTION Functions on page 263-27	Opens a connection to an SMTP server
OPEN_DATA Function and Procedure on page 263-29	Sends the DATA command
QUIT Function and Procedure on page 263-30	Terminates an SMTP session and disconnects from the server
RCPT Function on page 263-31	Specifies the recipient of an e-mail message
RSET Function and Procedure on page 263-32	Terminates the current e-mail transaction
STARTTLS Function and Procedure on page 263-33	Sends STARTTLS command to secure the SMTP connection using SSL/TLS
VRFY Function on page 263-34	Verifies the validity of a destination e-mail address
WRITE_DATA Procedure on page 263-35	Writes a portion of the e-mail message
WRITE_RAW_DATA Procedure on page 263-36	Writes a portion of the e-mail message with RAW data

AUTH Function and Procedure

This subprogram sends the AUTH command to authenticate to the SMTP server. The UTL_SMTP package goes through the user's choices of authentication schemes, skips any that is not supported by the SMTP server and uses the first supported. To determine the schemes the SMTP server supports from its EHLO reply, the user must call the EHLO Function and Procedure. Otherwise, UTL_SMTP uses the first scheme in the list.

Syntax

```
UTL_SMTP.AUTH (
   c          IN OUT NOCOPY connection,
   username   IN            VARCHAR2,
   password   IN            VARCHAR2,
   schemes    IN            VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES)
 RETURN reply;

UTL_SMTP.AUTH (
   c          IN OUT NOCOPY connection,
   username   IN            VARCHAR2,
   password   IN            VARCHAR2,
   schemes    IN            VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES);
```

Parameters

Table 263–8 AUTH Function and Procedure Parameters

Parameter	Description
c	SMTP connection
username	Username
password	Password
schemes	Space-separated list of authentication schemes UTL_SMTP is allowed to use in the preferred order. See the ALL_SCHEMES and NON_CLEARTEXT_PASSWORD_SCHEMES constants for suggestions.

Return Values

Table 263–9 AUTH Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

- Currently only PLAIN, LOGIN and CRAM-MD5 authentication schemes are supported by UTL_SMTP.
- Since the SMTP server may change the authentication schemes it supports after the SMTP connection is secured by SSL/TLS after the STARTTLS command (for example, adding PLAIN and LOGIN), the caller must call the EHLO Function and Procedure again for UTL_SMTP to update the list after the STARTTLS Function and Procedure is called.

Examples

```
DECLARE
  c utl_smtp.connection;
BEGIN
  c := utl_smtp.open_connection(
      host => 'smtp.example.com',
      port => 25,
      wallet_path => 'file:/oracle/wallets/smtp_wallet',
      wallet_password => 'password',
      secure_connection_before_smtp => FALSE);
  UTL_SMTP.STARTTLS(c);
  UTL_SMTP.AUTH(
      c => c,
      username => 'scott',
      password => 'password'
      schemes  => utl_smtp.all_schemes);
END;
```

CLOSE_CONNECTION Procedure

This procedure closes the SMTP connection, causing the current SMTP operation to terminate. Use this procedure only to cancel an e-mail in the middle of the data session. To end the SMTP connection properly, use the QUIT Function and Procedure.

Syntax

```
UTL_SMTP.CLOSE_CONNECTION (
   c     IN OUT NOCOPY connection);
```

Parameters

Table 263–10 CLOSE_CONNECTION Procedure Parameters

Parameter	Description
c	SMTP connection

CLOSE_DATA Function and Procedure

This subprogram ends the e-mail message by sending the sequence <CR><LF>.<CR><LF> (a single period at the beginning of a line).

Syntax

```
UTL_SMTP.CLOSE_DATA (
   c     IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.CLOSE_DATA (
   c     IN OUT NOCOPY connection);
```

Parameters

Table 263–11 CLOSE_DATA Function and Procedure Parameters

Parameter	Description
c	SMTP connection

Return Values

Table 263–12 CLOSE_DATA Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.

CLOSE_DATA must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA.

COMMAND Function and Procedure

This subprogram performs a generic SMTP command.

Syntax

```
UTL_SMTP.COMMAND (
   c     IN OUT NOCOPY    connection,
   cmd   IN               VARCHAR2,
   arg   IN               VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.COMMAND (
   c     IN OUT NOCOPY    connection,
   cmd   IN               VARCHAR2,
   arg   IN               VARCHAR2 DEFAULT NULL);
```

Parameters

Table 263–13 COMMAND Function and Procedure Parameters

Parameter	Description
c	SMTP connection
cmd	SMTP command to send to the server
arg	Optional argument to the SMTP argument. A space is inserted between cmd and arg.

Return Values

Table 263–14 COMMAND Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

This function is used to invoke generic SMTP commands. Use COMMAND if only a single reply line is expected. Use COMMAND_REPLIES if multiple reply lines are expected.

For COMMAND, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

COMMAND_REPLIES Function

This function performs a generic SMTP command and retrieves multiple reply lines.

Syntax

```
UTL_SMTP.COMMAND_REPLIES (
   c     IN OUT NOCOPY    connection,
   cmd   IN               VARCHAR2,
   arg   IN               VARCHAR2 DEFAULT NULL)
RETURN replies;
```

Parameters

Table 263–15 COMMAND_REPLIES Function Parameters

Parameter	Description
c	SMTP connection
cmd	SMTP command to send to the server
arg	Optional argument to the SMTP argument. A space is inserted between cmd and arg.

Return Values

Table 263–16 COMMAND_REPLIES Function Return Values

Return Value	Description
replies	Reply of the command (see REPLY, REPLIES Record Types)

Usage Notes

This function is used to invoke generic SMTP commands. Use COMMAND if only a single reply line is expected. Use COMMAND_REPLIES if multiple reply lines are expected.

For COMMAND, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

DATA Function and Procedure

This subprogram specifies the body of an e-mail message.

Syntax

```
UTL_SMTP.DATA (
   c     IN OUT NOCOPY connection
   body  IN  VARCHAR2 CHARACTER SET ANY_CS)
RETURN reply;

UTL_SMTP.DATA (
   c     IN OUT NOCOPY connection
   body  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 263–17 DATA Function and Procedure Parameters

Parameter	Description
c	SMTP Connection
body	Text of the message to be sent, including headers, in [RFC822] format

Return Values

Table 263–18 DATA Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine terminates the message with a <CR><LF>.<CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of <CR><LF>.<CR><LF> (single period) in body to <CR><LF>..<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

The DATA subprogram must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL and RCPT have been called. The connection to the SMTP server must be open, and a mail transaction must be active when this routine is called.

The expected response from the server is a message beginning with status code 250. The 354 response received from the initial DATA command is not returned to the caller.

EHLO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the EHLO command.

Syntax

```
UTL_SMTP.EHLO (
   c       IN OUT NOCOPY connection,
   domain  IN)
RETURN replies;

UTL_SMTP.EHLO (
   c       IN OUT NOCOPY connection,
   domain  IN);
```

Parameters

Table 263–19 EHLO Function and Procedure Parameters

Parameter	Description
c	SMTP connection
domain	Domain name of the local (sending) host. Used for identification purposes.

Return Values

Table 263–20 EHLO Function and Procedure Return Values

Return Value	Description
replies	Reply of the command (see REPLY, REPLIES Record Types).

Usage Notes

The EHLO interface is identical to HELO except that it allows the server to return more descriptive information about its configuration. [RFC1869] specifies the format of the information returned, which the PL/SQL application can retrieve using the functional form of this call. For compatibility with HELO, each line of text returned by the server begins with status code 250.

Related Functions

HELO Function and Procedure

HELO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the `HELO` command.

Syntax

```
UTL_SMTP.HELO (
   c       IN OUT NOCOPY   connection,
   domain  IN              VARCHAR2)
RETURN reply;

UTL_SMTP.HELO (
   c       IN OUT NOCOPY   connection,
   domain  IN              VARCHAR2);
```

Parameters

Table 263–21 HELO Function and Procedure Parameters

Parameter	Description
`c`	SMTP connection
`domain`	Domain name of the local (sending) host. Used for identification purposes.

Return Values

Table 263–22 HELO Function and Procedure Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

RFC 821 specifies that the client must identify itself to the server after connecting. This routine performs that identification. The connection must have been opened through a call to OPEN_CONNECTION Functions before calling this routine.

The expected response from the server is a message beginning with status code 250.

Related Functions

EHLO Function and Procedure

HELP Function

This function sends the `HELP` command.

Syntax

```
UTL_SMTP.HELP (
   c         IN OUT NOCOPY   connection,
   command   IN              VARCHAR2 DEFAULT NULL)
RETURN replies;
```

Parameters

Table 263–23 HELP Function Parameters

Parameter	Description
`c`	SMTP connection
`command`	Command to get the help message

Return Values

Table 263–24 HELP Function Return Values

Return Value	Description
`replies`	Reply of the command (see REPLY, REPLIES Record Types)

MAIL Function and Procedure

This subprogram initiate a mail transaction with the server. The destination is a mailbox.

Syntax

```
UTL_SMTP.MAIL (
   c           IN OUT NOCOPY   connection,
   sender      IN              VARCHAR2,
   parameters  IN              VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.MAIL (
   c           IN OUT NOCOPY   connection,
   sender      IN              VARCHAR2,
   parameters  IN              VARCHAR2 DEFAULT NULL);
```

Parameters

Table 263–25 MAIL Function and Procedure Parameters

Parameter	Description
c	SMTP connection
sender	E-mail address of the user sending the message.
parameters	Additional parameters to mail command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX ....)".

Return Values

Table 263–26 MAIL Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

This command does not send the message; it simply begins its preparation. It must be followed by calls to RCPT and DATA to complete the transaction. The connection to the SMTP server must be open and a HELO or EHLO command must have already been sent.

The expected response from the server is a message beginning with status code 250.

NOOP Function and Procedure

This subprogram issues the NULL command.

Syntax

```
UTL_SMTP.NOOP (
   c  IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.NOOP (
   c  IN OUT NOCOPY connection);
```

Parameter

Table 263–27 NOOP Function and Procedure Parameters

Parameter	Description
c	SMTP connection

Return Values

Table 263–28 NOOP Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

- This command has no effect except to elicit a successful reply from the server. It can be issued at any time after the connection to the server has been established with OPEN_CONNECTION. The NOOP command can be used to verify that the server is still connected and is listening properly.
- This command replies with a single line beginning with status code 250.

OPEN_CONNECTION Functions

These functions open a connection to an SMTP server.

Syntax

```
UTL_SMTP.OPEN_CONNECTION (
   host                            IN  VARCHAR2,
   port                            IN  PLS_INTEGER DEFAULT 25,
   c                               OUT connection,
   tx_timeout                      IN  PLS_INTEGER DEFAULT NULL,
   wallet_path                     IN  VARCHAR2 DEFAULT NULL,
   wallet_password                 IN  VARCHAR2 DEFAULT NULL,
   secure_connection_before_smtp   IN  BOOLEAN DEFAULT FALSE)
 RETURN reply;

UTL_SMTP.OPEN_CONNECTION (
   host                           IN  VARCHAR2,
   port                           IN  PLS_INTEGER DEFAULT 25,
   tx_timeout                     IN  PLS_INTEGER DEFAULT NULL,
   wallet_path                    IN  VARCHAR2 DEFAULT NULL,
   wallet_password                IN  VARCHAR2 DEFAULT NULL,
   secure_connection_before_smtp  IN  BOOLEAN DEFAULT FALSE)
RETURN connection;
```

Parameters

Table 263–29 OPEN_CONNECTION Functions Parameters

Parameter	Description
host	Name of the SMTP server host
port	Port number on which SMTP server is listening (usually 25)
c	SMTP connection
tx_timeout	Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation for this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.
wallet_path	Directory path that contains the Oracle wallet for SSL/TLS. The format is file: <directory-path>
wallet_password	Password to open the wallet. When the wallet is auto-login enabled, the password can be set to NULL.
secure_connection_ before_smtp	If TRUE, a secure connection with SSL/TLS is made before SMTP communication. If FALSE, no connection is made.

Return Values

Table 263–30 OPEN_CONNECTION Functions Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

- The expected response from the server is a message beginning with status code 220.
- The version of `OPEN_CONNECTION` that returns `UTL_SMTP.CONNECTION` record checks the reply code returned by an SMTP server when the connection is first established. It raises an exception when the reply indicates an error. Otherwise, it discards the reply. If you want to examine the reply, invoke the version of `OPEN_CONNECTION` that returns `REPLY`.
- `tx_timeout` is intended to govern both the read operations and the write operations. However, an implementation restriction prevents `tx_timeout` from governing write operations in the current release.

Examples

```
DECLARE
  c utl_smtp.connection;
BEGIN
  c := UTL_SMTP.OPEN_CONNECTION(
   host => 'smtp.example.com',
   port => 465,
   wallet_path => 'file:/oracle/wallets/smtp_wallet',
   wallet_password => 'password',
   secure_connection_before_smtp => TRUE);
END;
```

OPEN_DATA Function and Procedure

This subprogram sends the DATA command after which you can use WRITE_DATA and WRITE_RAW_DATA to write a portion of the e-mail message.

Syntax

```
UTL_SMTP.OPEN_DATA (
   c     IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.OPEN_DATA (
   c     IN OUT NOCOPY connection);
```

Parameters

Table 263–31 OPEN_DATA Function and Procedure Parameters

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in RFC822 format.

Return Values

Table 263–32 OPEN_DATA Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

- The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.
- OPEN_DATA must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

QUIT Function and Procedure

This subprogram terminates an SMTP session and disconnects from the server.

Syntax

```
UTL_SMTP.QUIT (
   c  IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.QUIT (
   c  IN OUT NOCOPY connection);
```

Parameter

Table 263–33 QUIT Function and Procedure Parameters

Parameter	Description
c	SMTP connection

Return Values

Table 263–34 QUIT Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

The QUIT command informs the SMTP server of the client's intent to terminate the session. It then closes the connection established by OPEN_CONNECTION which must have been called before executing this command. If a mail transaction is in progress when QUIT is issued, it is canceled in the same manner as RSET.

The function form of this command returns a single line beginning with the status code 221 on successful termination. In all cases, the connection to the SMTP server is closed. The fields REMOTE_HOST and REMOTE_PORT of c are reset.

Related Functions

RSET Function and Procedure

RCPT Function

This subprogram specifies the recipient of an e-mail message.

Syntax

```
UTL_SMTP.RCPT (
   c           IN OUT NOCOPY     connection,
   recipient   IN                VARCHAR2,
   parameters  IN                VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.RCPT (
   c           IN OUT NOCOPY     connection,
   recipient   IN                VARCHAR2,
   parameters  IN                VARCHAR2 DEFAULT NULL);
```

Table 263–35 RCPT Function and Procedure Parameters

Parameter	Description
c	SMTP connection
recipient	E-mail address of the user to which the message is being sent
parameters	Additional parameters to RCPT command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX ....)".

Return Values

Table 263–36 RCPT Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

To send a message to multiple recipients, call this routine multiple times. Each invocation schedules delivery to a single e-mail address. The message transaction must have been begun by a prior call to MAIL, and the connection to the mail server must have been opened and initialized by prior calls to OPEN_CONNECTION and HELO or EHLO respectively.

The expected response from the server is a message beginning with status code 250 or 251.

RSET Function and Procedure

This subprogram terminates the current mail transaction.

Syntax

```
UTL_SMTP.RSET (
   c  IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.RSET (
   c  IN OUT NOCOPY connection);
```

Parameters

Table 263–37 RSET Function and Procedure Parameters

Parameter	Description
c	SMTP connection

Return Values

Table 263–38 RSET Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

- This command allows the client to cancel an e-mail message it was in the process of composing. No mail is sent. The client can call RSET at any time after the connection to the SMTP server has been opened by means of OPEN_CONNECTION until DATA or OPEN_DATA is called. Once the e-mail data has been sent, it is too late to prevent the e-mail from being sent.
- The server responds to RSET with a message beginning with status code 250.

Related Functions

QUIT Function and Procedure

STARTTLS Function and Procedure

This subprogram sends the STARTTLS command to secure the SMTP connection using SSL/TLS. SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the OPEN_CONNECTION Functions.

Syntax

```
UTL_SMTP.STARTTLS (
   c  IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.STARTTLS (
   c  IN OUT NOCOPY connection);
```

Parameters

Table 263–39 STARTTLS Function and Procedure Parameters

Parameter	Description
c	SMTP connection

Return Values

Table 263–40 STARTTLS Function and Procedure Return Values

Return Value	Description
reply	SMTP reply

Usage Notes

The STARTTLS command must only be issued on an unencrypted connection and when the SMTP server indicates the support of the command in the reply of the EHLO command. The wallet to be used for encryption must have been specified when the initial SMTP connection was opened by the OPEN_CONNECTION function.

Examples

```
DECLARE
  c utl_smtp.connection;
BEGIN
  c := utl_smtp.open_connection(
     host => 'smtp.example.com',
     port => 25,
     wallet_path => 'file:/oracle/wallets/smtp_wallet',
     wallet_password => 'password',
     secure_connection_before_smtp => FALSE);
  utl_smtp.starttls(c);
END
```

VRFY Function

This function verifies the validity of a destination e-mail address.

Syntax

```
UTL_SMTP.VRFY (
   c          IN OUT NOCOPY connection
   recipient  IN VARCHAR2)
RETURN reply;
```

Parameters

Table 263–41 VRFY Function Parameters

Parameter	Description
`c`	SMTP connection
`recipient`	E-mail address to be verified

Return Values

Table 263–42 VRFY Function Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

The server attempts to resolve the destination address `recipient`. If successful, it returns the recipient's full name and fully qualified mailbox path. The connection to the server must have already been established by means of `OPEN_CONNECTION` and `HELO` or `EHLO` before making this request.

Successful verification returns one or more lines beginning with status code 250 or 251.

WRITE_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to WRITE_DATA appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_DATA (
   c     IN OUT NOCOPY connection,
   data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 263–43 WRITE_DATA Procedure Parameters

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in [RFC822] format

Usage Notes

- The calls to the OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be made in the correct order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.
- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine terminates the message with a <CR><LF>.<CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of <CR><LF>.<CR><LF> (single period) in the body to <CR><LF>..<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.
- The OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be called only after OPEN_CONNECTION Functions, HELO Function and Procedure, or EHLO Function and Procedure, MAIL Function and Procedure, and RCPT Function have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the WRITE_DATA Procedure because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA Function and Procedure.
- Text (VARCHAR2) data sent using WRITE_DATA is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a '?' character. If 8BITMIME extension is negotiated with the SMTP server using the EHLO subprogram, multibyte VARCHAR2 data can be sent by first converting the text to RAW using the UTL_RAW package, and then sending the RAW data using WRITE_RAW_DATA.

WRITE_RAW_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to WRITE_RAW_DATA appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_RAW_DATA (
   c     IN OUT NOCOPY connection
   data  IN RAW);
```

Parameters

Table 263–44 WRITE_RAW_DATA Procedure Parameters

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in [RFC822] format

Usage Notes

- The calls to the OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be made in the correct order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.
- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine terminates the message with a <CR><LF>.<CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of <CR><LF>.<CR><LF> (single period) in the body to <CR><LF>..<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.
- The OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be called only after OPEN_CONNECTION Functions, HELO Function and Procedure, or EHLO Function and Procedure, MAIL Function and Procedure, and RCPT Function have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the WRITE_DATA Procedure because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA Function and Procedure.

UTL_SPADV

The UTL_SPADV package, one of a set of Oracle Streams packages, provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment. This package uses the Oracle Streams Performance Advisor to gather statistics.

This chapter contains the following topic:

- Using UTL_SPADV
  - Overview
  - Security Model
  - Operational Notes
- Summary of UTL_SPADV Subprograms

See Also: *Oracle Streams Concepts and Administration* for more information about this package and the Oracle Streams Performance Advisor

Using UTL_SPADV

Overview

This package enables you to collect and analyze statistics about the performance or Oracle Streams components. You can either collect statistics on demand or you can create a monitoring job that continually monitors Oracle Streams performance.

When this package is used on an Oracle Database 11*g* Release 2 (11.2) database, it can monitor Oracle Database 10*g* Release 2 (10.2) and later databases. It cannot monitor databases before release 10.2.

See Also: *Oracle Streams Concepts and Administration*

Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

Operational Notes

To use this package, you must connect to an Oracle database as an Oracle Streams administrator and run the `utlspadv.sql` script in the `rdbms/admin` directory in `ORACLE_HOME`.

The `utlspadv.sql` script creates the following tables:

- STREAMS$_PA_COMPONENT Table
- STREAMS$_PA_COMPONENT_LINK Table
- STREAMS$_PA_COMPONENT_PROP Table
- STREAMS$_PA_COMPONENT_STAT Table
- STREAMS$_PA_CONTROL Table
- STREAMS$_PA_DATABASE Table
- STREAMS$_PA_DATABASE_PROP Table
- STREAMS$_PA_MONITORING Table
- STREAMS$_PA_PATH_BOTTLENECK Table
- STREAMS$_PA_PATH_STAT Table
- STREAMS$_PA_SHOW_COMP_STAT Table
- STREAMS$_PA_SHOW_PATH_STAT Table

The Oracle Streams Performance Advisor populates these tables when it is run.

See Also: *Oracle Streams Concepts and Administration*

STREAMS$_PA_COMPONENT Table

The `STREAMS$_PA_COMPONENT` table displays information about the Oracle Streams components at each database.

Table 264–1 STREAMS$_PA_COMPONENT Table

Column	Datatype	NULL	Description
`COMPONENT_ID`	`NUMBER`	`NOT NULL`	Identification number assigned to the component by the Oracle Streams Performance Advisor
`COMPONENT_NAME`	`VARCHAR2(194)`		Name of the component
`COMPONENT_DB`	`VARCHAR2(128)`		Name of the database that contains the component

Table 264–1 (Cont.) STREAMS$_PA_COMPONENT Table

Column	Datatype	NULL	Description
COMPONENT_TYPE	VARCHAR2(20)		Type of the component The following types are possible: ■ CAPTURE for a capture process ■ PROPAGATION SENDER for a propagation sender ■ PROPAGATION RECEIVER for a propagation receiver ■ APPLY for an apply process ■ QUEUE for a queue
COMPONENT_CHANGED_TIME	DATE		Time when the component was last changed

STREAMS$_PA_COMPONENT_LINK Table

The STREAMS$_PA_COMPONENT_LINK table displays information about how information flows between Oracle Streams components.

Table 264–2 STREAMS$_PA_COMPONENT_LINK Table

Column	Datatype	NULL	Description
PATH_ID	NUMBER	NOT NULL	Identification number assigned to the path by the Oracle Streams Performance Advisor
PATH_KEY	VARCHAR2(4000)		Unique key assigned to the path by the Oracle Streams Performance Advisor
SOURCE_COMPONENT_ID	NUMBER	NOT NULL	Source component ID for the path The path starts with this component.
DESTINATION_COMPONENT_ID	NUMBER	NOT NULL	Destination component ID for the path The path ends with this component.
POSITION	NUMBER		Position of the component in the path

STREAMS$_PA_COMPONENT_PROP Table

The STREAMS$_PA_COMPONENT_PROP table displays information about capture processes and apply processes necessary for analysis by the Streams Performance Advisor.

Table 264–3 STREAMS$_PA_COMPONENT_PROP Table

Column	Datatype	NULL	Description
COMPONENT_ID	NUMBER	NOT NULL	Identification number assigned to the component by the Oracle Streams Performance Advisor
PROP_NAME	VARCHAR2(30)		Property name For a capture process, the component properties include the following: ■ SOURCE_DATABASE - The source database for the changes captured by the capture process ■ PARALLELISM - The setting for the parallelism capture process parameter ■ OPTIMIZATION_MODE - Indicates whether the capture process uses combined capture and apply (greater than zero) or does not use combined capture and apply (0) For an apply process, the component properties include the following: ■ SOURCE_DATABASE - The source database for the messages applied by the apply process ■ PARALLELISM - The setting for the parallelism apply process parameter ■ APPLY_CAPTURED - Indicates whether the apply process applies captured messages (YES) persistent messages (NO) ■ MESSAGE_DELIVERY_MODE - Either buffered or persistent
PROP_VALUE	VARCHAR2(30)		Property value

STREAMS$_PA_COMPONENT_STAT Table

The STREAMS$_PA_COMPONENT_STAT table displays performance statistics and session statistics about each Oracle Streams component.

Table 264–4 STREAMS$_PA_COMPONENT_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run

Table 264–4 (Cont.) STREAMS$_PA_COMPONENT_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was run for the advisor run ID
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Streams Performance Advisor
STATISTIC_TIME	DATE		Time when the statistic was recorded
STATISTIC_NAME	VARCHAR2(64)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2(64)		Unit of measurement for the statistic
SUB_COMPONENT_TYPE	VARCHAR2(64)		Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: ■ LOGMINER READER for a builder server of a capture process ■ LOGMINER PREPARER for a preparer server of a capture process ■ LOGMINER BUILDER for a reader server of a capture process ■ CAPTURE SESSION for a capture process session The following apply process subcomponent types are possible: ■ PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database ■ APPLY READER for a reader server of an apply process ■ APPLY COORDINATOR for a coordinator process of an apply process ■ APPLY SERVER for a reader server of an apply process
SESSION_ID	NUMBER		Identification number of the session for the component. Query the V$SESSION view for information about the session.
SESSION_SERIAL#	NUMBER		Session serial number of the session for the component. Query the V$SESSION view for information about the session.

STREAMS$_PA_CONTROL Table

The STREAMS$_PA_CONTROL table displays the parameters set for the COLLECT_STATS procedure in this package. The parameters control the monitoring behavior.

Table 264–5 STREAMS$_PA_CONTROL Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run
PARAM_NAME	VARCHAR2(30)		The name of the parameter
PARAM_VALUE	VARCHAR2(4000)		The value set for the parameter
PARAM_UNIT	VARCHAR2(30)		The unit of the parameter

STREAMS$_PA_DATABASE Table

The STREAMS$_PA_DATABASE table displays information about each database that contains Oracle Streams components.

Table 264–6 STREAMS$_PA_DATABASE Table

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2(128)	NOT NULL	Global name of the database analyzed by the Oracle Streams Performance Advisor
LAST_QUERIED	DATE		The time when the Performance Advisor successfully collected information from a database in its last run
ERROR_NUMBER	NUMBER		The error number of the error encountered when the database was last queried
ERROR_MESSAGE	VARCHAR2(4000)		The error message of the error encountered when the database was last queried

STREAMS$_PA_DATABASE_PROP Table

The STREAMS$_PA_DATABASE_PROP table displays Oracle Streams database property information necessary for analysis by the Streams Performance Advisor.

Table 264–7 STREAMS$_PA_DATABASE_PROP Table

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2(128)	NOT NULL	Global name of the database analyzed by the Oracle Streams Performance Advisor

Table 264–7 (Cont.) STREAMS$_PA_DATABASE_PROP Table

Column	Datatype	NULL	Description
PROP_NAME	VARCHAR2(30)		Property name The database properties include the following: ■ VERSION ■ COMPATIBILITY ■ MANAGEMENT_PACK_ACCESS ■ DB_UNIQUE_NAME
PROP_VALUE	VARCHAR2(30)		Property value

STREAMS$_PA_MONITORING Table

The STREAMS$_PA_MONITORING table displays information about each monitoring job running in a database.

Table 264–8 STREAMS$_PA_MONITORING Table

Column	Datatype	NULL	Description
JOB_NAME	VARCHAR2(30)	NOT NULL	Name of the monitoring job
CLIENT_NAME	VARCHAR2(30)		Name of the client that submitted the job **See Also:** "Full Monitoring Job Names" on page 264-27
QUERY_USER_NAME	VARCHAR2(30)		User granted privileges to view the monitoring results
SHOW_STATS_TABLE	VARCHAR2(30)		Name of the table used by the SHOW_STATS procedure to display statistics
STARTED_TIME	TIMESTAMP		Time the monitoring job started
STOPPED_TIME	TIMESTAMP		Time the monitoring job last stopped
ALTERED_TIME	TIMESTAMP		Time the monitoring job was last altered
STATE	VARCHAR2(30)		State of the monitoring job, either ENABLED or STOPPED

STREAMS$_PA_PATH_BOTTLENECK Table

The STREAMS$_PA_PATH_BOTTLENECK table displays information about Oracle Streams components that might be slowing down the flow of messages.

Table 264–9 STREAMS$_PA_PATH_BOTTLENECK Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run
ADVISOR_RUN_REASON	VARCHAR2(4000)		Reason for the bottleneck
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor

Table 264–9 (Cont.) STREAMS$_PA_PATH_BOTTLENECK Table

Column	Datatype	NULL	Description
PATH_KEY	VARCHAR2(4000)		Unique key assigned to the path by the Oracle Streams Performance Advisor
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Streams Performance Advisor
TOP_SESSION_ID	NUMBER		Session ID of the top component. Query the V$SESSION view for information about the session.
TOP_SESSION_SERIAL#	NUMBER		Session serial number of the top component. Query the V$SESSION view for information about the session.
ACTION_NAME	VARCHAR2(32)		Action name for the top session
BOTTLENECK_ IDENTIFIED	VARCHAR2(30)		Whether a bottleneck was identified

STREAMS$_PA_PATH_STAT Table

The STREAMS$_PA_PATH_STAT table displays performance statistics about each stream path.

Table 264–10 STREAMS$_PA_PATH_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was run for the advisor run ID
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor
PATH_KEY	VARCHAR2(4000)		Unique key assigned to the path by the Oracle Streams Performance Advisor
STATISTIC_TIME	DATE		Time when the statistic was recorded
STATISTIC_NAME	VARCHAR2(64)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2(64)		Unit of measurement for the statistic

STREAMS$_PA_SHOW_COMP_STAT Table

The STREAMS$_PA_SHOW_COMP_STAT table displays statistics for Oracle Streams components.

Table 264–11 STREAMS$_PA_SHOW_COMP_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run

Table 264–11 (Cont.) STREAMS$_PA_SHOW_COMP_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor
POSITION	NUMBER		Position of the component in the path
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Streams Performance Advisor
COMPONENT_NAME	VARCHAR2(194)		Name of the component
COMPONENT_TYPE	VARCHAR2(30)		Type of the component The following types are possible: ■ CAPTURE for a capture process ■ PROPAGATION SENDER for a propagation sender ■ PROPAGATION RECEIVER for a propagation receiver ■ APPLY for an apply process ■ QUEUE for a queue
SUB_COMPONENT_TYPE	VARCHAR2(30)		Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: ■ LOGMINER READER for a builder server of a capture process ■ LOGMINER PREPARER for a preparer server of a capture process ■ LOGMINER BUILDER for a reader server of a capture process ■ CAPTURE SESSION for a capture process session The following apply process subcomponent types are possible: ■ PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database ■ APPLY READER for a reader server of an apply process ■ APPLY COORDINATOR for a coordinator process of an apply process ■ APPLY SERVER for a reader server of an apply process

Table 264–11 (Cont.) STREAMS$_PA_SHOW_COMP_STAT Table

Column	Datatype	NULL	Description
SESSION_ID	NUMBER		Identification number of the session for the component. Query the V$SESSION view for information about the session.
SESSION_SERIAL#	NUMBER		Session serial number of the session for the component. Query the V$SESSION view for information about the session.
STATISTIC_ALIAS	VARCHAR2(30)		Name of the statistic
STATISTIC_NAME	VARCHAR2(128)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2(128)		Unit of measurement for the statistic

STREAMS$_PA_SHOW_PATH_STAT Table

The STREAMS$_PA_SHOW_PATH_STAT table displays statistics for the stream paths in an Oracle Streams configuration. A monitoring job uses this table as the default table for the statistics collected for stream paths.

Table 264–12 STREAMS$_PA_SHOW_PATH_STAT Table

Column	Datatype	NULL	Description
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run
SETTING	VARCHAR2(2000)		Setting for the Oracle Streams Performance Advisor Run
STATISTICS	VARCHAR2(4000)		Component-level statistics
SESSION_STATISTICS	VARCHAR2(4000)		Session-level statistics
OPTIMIZATION	NUMBER		Whether the path uses the combined capture and apply optimization 0 (zero) means that the path does not use the combined capture and apply optimization. 1 means that the path uses the combined capture and apply optimization.

Summary of UTL_SPADV Subprograms

Table 264–13 UTL_SPADV Package Subprograms

Subprogram	Description
ALTER_MONITORING Procedure on page 264-15	Alters the monitoring job submitted by the current user.
COLLECT_STATS Procedure on page 264-17	Uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.
IS_MONITORING Function on page 264-19	Checks whether a monitoring job is currently running.
SHOW_STATS Procedure on page 264-20	Generates output that includes the statistics gathered by the `COLLECT_STATS` procedure.
SHOW_STATS_HTML Procedure on page 264-20	Generates HTML output that includes the statistics gathered by the `COLLECT_STATS` procedure.
START_MONITORING Procedure on page 264-25	Starts a monitoring job.
STOP_MONITORING Procedure on page 264-28	Stops a monitoring job.

ALTER_MONITORING Procedure

This procedure alters the monitoring job submitted by the current user.

Syntax

```
UTL_SPADV.ALTER_MONITORING(
   interval                      IN NUMBER  DEFAULT NULL,
   top_event_threshold           IN NUMBER  DEFAULT NULL,
   bottleneck_idle_threshold     IN NUMBER  DEFAULT NULL,
   bottleneck_flowctrl_threshold IN NUMBER  DEFAULT NULL,
   retention_time                IN NUMBER  DEFAULT NULL);
```

Parameters

Table 264–14 ALTER_MONITORING Procedure Parameters

Parameter	Description
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. If NULL, then the current value is not changed.
top_event_threshold	A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected. If NULL, then the current value is not changed.
bottleneck_idle_threshold	A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis. If NULL, then the current value is not changed.
bottleneck_flowctrl_threshold	A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis. If NULL, then the current value is not changed.
retention_time	The number of hours to retain monitoring results. If NULL, then the current value is not changed.

Exceptions

Table 264–15 ALTER_MONITORING Procedure Exceptions

Exception	Description
ORA-20113	no active monitoring job found

COLLECT_STATS Procedure

This procedure uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

Note: This procedure commits.

See Also: *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

Syntax

```
UTL_SPADV.COLLECT_STATS(
   interval                      IN NUMBER  DEFAULT 60,
   num_runs                      IN NUMBER  DEFAULT 10,
   comp_stat_table             IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
   path_stat_table             IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
   top_event_threshold           IN NUMBER  DEFAULT 15,
   bottleneck_idle_threshold     IN NUMBER  DEFAULT 50,
   bottleneck_flowctrl_threshold IN NUMBER  DEFAULT 50);
```

Parameters

Table 264–16 COLLECT_STATS Procedure Parameters

Parameter	Description
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds.
num_runs	The number of times that the Oracle Streams Performance Advisor is run by the procedure.
comp_stat_table	The name of the table that stores the statistics collected for Oracle Streams components and subcomponents. Specify the table name as *[schema_name.]object_name*. If the schema is not specified, then the current user is the default. The procedure creates the specified table if it does not exist. Oracle recommends that you use the default table STREAMS$_ADVISOR_COMP_STAT. See "Usage Notes" on page 264-18 for more information about this parameter.
path_stat_table	The name of the table that stores the statistics collected for stream paths. Specify the table name as *[schema_name.]object_name*. If the schema is not specified, then the current user is the default. The procedure creates the specified table if it does not exist. Oracle recommends that you use the default table STREAMS$_ADVISOR_PATH_STAT. See "Usage Notes" on page 264-18 for more information about this parameter.

Table 264–16 (Cont.) COLLECT_STATS Procedure Parameters

Parameter	Description
top_event_threshold	A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.
bottleneck_idle_threshold	A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.
bottleneck_flowctrl_threshold	A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.

Usage Notes

The table specified in the path_stat_table parameter stores stream path statistics. This table also concatenates the component and subcomponent statistics stored in the table specified in the comp_stat_table parameter. The SHOW_STATS procedure in this package shows only the statistics stored in the table specified in the path_stat_table parameter.

IS_MONITORING Function

This function checks whether a monitoring job is currently running. This function either returns `TRUE` if a monitoring job is currently running or `FALSE` if a monitoring job is not currently running.

A monitoring job is submitted using the `START_MONITORING` procedure.

See Also: "START_MONITORING Procedure" on page 264-25

Syntax

```
UTL_SPADV.IS_MONITORING(
   job_name    IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
   client_name IN VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

Table 264–17 IS_MONITORING Function Parameters

Parameter	Description
`job_name`	The name of the job for which to check.
`client_name`	The name of the client that submitted the job.

SHOW_STATS Procedure

This procedure generates output that includes the statistics gathered by the COLLECT_STATS and START_MONITORING procedures.

The output is formatted so that it can be imported into a spreadsheet for analysis.

Note: This procedure does not commit.

See Also:

- "COLLECT_STATS Procedure" on page 264-17
- "START_MONITORING Procedure" on page 264-25
- *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

Syntax

```
UTL_SPADV.SHOW_STATS(
   path_stat_table IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
   path_id           IN NUMBER    DEFAULT NULL,
   bgn_run_id        IN NUMBER    DEFAULT -1,
   end_run_id        IN NUMBER    DEFAULT -10,
   show_path_id      IN BOOLEAN   DEFAULT TRUE,
   show_run_id       IN BOOLEAN   DEFAULT TRUE,
   show_run_time     IN BOOLEAN   DEFAULT TRUE,
   show_optimization IN BOOLEAN   DEFAULT TRUE,
   show_setting      IN BOOLEAN   DEFAULT FALSE,
   show_stat         IN BOOLEAN   DEFAULT TRUE,
   show_sess         IN BOOLEAN   DEFAULT FALSE,
   show_legend       IN BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 264–18 SHOW_STATS Procedure Parameters

Parameter	Description
path_stat_table	The name of the table that contains the stream path statistics. Specify the table name as *[schema_name.]object_name*. If the schema is not specified, then the current user is the default. When you gather statistics using the COLLECT_STATS procedure, this table is specified in the path_stat_table parameter in the COLLECT_STATS procedure. The default table is STREAMS$_ADVISOR_PATH_STAT. When you gather statistics using the START_MONITORING procedure, you can determine the name for this table by querying the SHOW_STATS_TABLE column in the STREAMS$_PA_MONITORING view. The default table for a monitoring job is STREAMS$_PA_SHOW_PATH_STAT.
path_id	A stream path ID. If non-NULL, then the procedure shows output for the specified stream path only. If NULL, then the procedure shows output for all active stream paths.

Table 264–18 (Cont.) SHOW_STATS Procedure Parameters

Parameter	Description
bgn_run_id	The first Oracle Streams Performance Advisor run ID to show in the range of runs. See "Usage Notes" on page 264-22 for more information about this parameter.
end_run_id	The last Oracle Streams Performance Advisor run ID to show in the range of runs. See "Usage Notes" on page 264-22 for more information about this parameter.
show_path_id	If TRUE, then the path ID for each stream path is included in the output. If FALSE, then the path ID for each stream path is not included in the output.
show_run_id	If TRUE, then the Oracle Streams Performance Advisor run ID is included in the output. If FALSE, then the Oracle Streams Performance Advisor run ID is not included in the output.
show_run_time	If TRUE, then the Oracle Streams Performance Advisor run time is included in the output. If FALSE, then the Oracle Streams Performance Advisor run time is not included in the output.
show_optimization	If TRUE, then path output includes information pertaining to the combined capture and apply optimization. If FALSE, then path output does not include information pertaining to the combined capture and apply optimization.
show_setting	If TRUE, then the settings for the threshold parameters are included in the output. The threshold parameters are the top_event_threshold, bottleneck_idle_threshold, and bottleneck_flowctrl_threshold parameters in the COLLECT_STATS procedure. If FALSE, then the settings for the threshold parameters are not included in the output.
show_stat	If TRUE, then the component-level and subcomponent-level statistics are included in the output. These components include capture processes, queues, propagation senders, propagation receivers, and apply processes. The subcomponents are the subcomponents for capture processes and apply processes. If FALSE, then the component-level and subcomponent-level statistics are not included in the output.
show_sess	If TRUE, then the session-level statistics are included in the output. Session-level statistics include IDLE, FLOW CONTROL, and EVENT statistics. If FALSE, then the session-level statistics are not included in the output.
show_legend	If TRUE, then the legend is included in the output. The legend describes the abbreviations used in the output. If FALSE, then the legend is not included in the output.

Usage Notes

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Streams Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if `bgn_run_id` is set to `1` and `end_run_id` is set to `10`, then the procedure shows statistics for the first ten Oracle Streams Performance Advisor runs.

However, if `bgn_run_id` is set to `-1` and `end_run_id` is set to `-10`, then the procedure shows statistics for the last ten Oracle Streams Performance Advisor runs.

> **See Also:** *Oracle Streams Concepts and Administration* for information about the combined capture and apply optimization

SHOW_STATS_HTML Procedure

This procedure generates HTML output that includes the statistics gathered by the COLLECT_STATS and START_MONITORING procedures.

Note: This procedure does not commit.

See Also:

- "COLLECT_STATS Procedure" on page 264-17
- "START_MONITORING Procedure" on page 264-25
- *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

Syntax

```
UTL_SPADV.SHOW_STATS_HTML(
   directory       IN VARCHAR2,
   reportname      IN VARCHAR2  DEFAULT 'SPADVREPORT.HTML',
   comp_stat_table IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
   path_id         IN NUMBER    DEFAULT NULL,
   bgn_run_id      IN NUMBER    DEFAULT -1,
   end_run_id      IN NUMBER    DEFAULT -10,
   detailed        IN BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 264–19 SHOW_STATS_HTML Procedure Parameters

Parameter	Description
directory	The directory object for the directory on the local computer system into which the generated HTML report is placed The specified directory object must be created using the SQL statement CREATE DIRECTORY, and the user who invokes the procedure must have READ and WRITE privilege on each one.
reportname	The name of the HTML report
comp_stat_table	The name of the table that stores the statistics collected for Oracle Streams components and subcomponents. Specify the table name as *[schema_name.]object_name*. If the schema is not specified, then the current user is the default. When you gather statistics using the COLLECT_STATS procedure, this table is specified in the comp_stat_table parameter in the COLLECT_STATS procedure. The default table is STREAMS$_ADVISOR_COMP_STAT. When you gather statistics using the START_MONITORING procedure, you can determine the name for this table by querying the SHOW_STATS_TABLE column in the STREAMS$_PA_MONITORING view. The default table for a monitoring job is STREAMS$_PA_SHOW_PATH_STAT. Oracle recommends that you start a monitoring job with the START_MONITORING procedure in this package and use the appropriate the STREAMS$_PA_SHOW_PATH_STAT table.

Table 264–19 (Cont.) SHOW_STATS_HTML Procedure Parameters

Parameter	Description
path_id	A stream path ID. If non-NULL, then the procedure shows output for the specified stream path only. If NULL, then the procedure shows output for all active stream paths.
bgn_run_id	The first Oracle Streams Performance Advisor run ID to show in the range of runs. See "Usage Notes" on page 264-24 for more information about this parameter.
end_run_id	The last Oracle Streams Performance Advisor run ID to show in the range of runs. See "Usage Notes" on page 264-24 for more information about this parameter.
detailed	If TRUE, then the procedure generates component-level statistics. If FALSE, then the procedure does not generate component-level statistics.

Usage Notes

Use the bgn_run_id and end_run_id together to specify the range of Oracle Streams Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if bgn_run_id is set to 1 and end_run_id is set to 10, then the procedure shows statistics for the first ten Oracle Streams Performance Advisor runs.

However, if bgn_run_id is set to -1 and end_run_id is set to -10, then the procedure shows statistics for the last ten Oracle Streams Performance Advisor runs.

START_MONITORING Procedure

This procedure starts a monitoring job.

This procedure runs the COLLECT_STATS procedure to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

Note: This procedure commits.

See Also:

- "COLLECT_STATS Procedure" on page 264-17
- *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

Syntax

```
UTL_SPADV.START_MONITORING(
   job_name                      IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
   client_name                   IN VARCHAR2  DEFAULT NULL,
   query_user_name               IN VARCHAR2  DEFAULT NULL,
   interval                      IN NUMBER    DEFAULT 60,
   top_event_threshold           IN NUMBER    DEFAULT 15,
   bottleneck_idle_threshold     IN NUMBER    DEFAULT 50,
   bottleneck_flowctrl_threshold IN NUMBER    DEFAULT 50,
   retention_time                IN NUMBER    DEFAULT 24);
```

Parameters

Table 264–20 START_MONITORING Procedure Parameters

Parameter	Description
job_name	The name of the monitoring job to create.
client_name	The name of the client.
query_user_name	The user who will query the result tables. This procedure grants privileges to the specified user to enable the user to query the result tables.
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. The specified interval is used for the interval parameter in the COLLECT_STATS procedure.
top_event_threshold	A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.

Table 264–20 (Cont.) START_MONITORING Procedure Parameters

Parameter	Description
bottleneck_idle_threshold	A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.
bottleneck_flowctrl_threshold	A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.
retention_time	The number of hours to retain monitoring results.

Exceptions

Table 264–21 START_MONITORING Procedure Exceptions

Exception	Description
ORA-20111	cannot start monitoring due to active EM monitoring job Stop the Oracle Enterprise Manager (EM) monitoring job, and run the START_MONITORING procedure again.
ORA-20112	cannot start monitoring due to active Streams monitoring job Stop the Streams monitoring job, and run the START_MONITORING procedure again.

Usage Notes

The following are usage notes for the START_MONITORING procedure:

- Requirements for the User Running the Procedure
- Full Monitoring Job Names
- Restrictions on Monitoring Jobs

Requirements for the User Running the Procedure

The user who runs the START_MONITORING procedure must meet the following requirements:

- The user must have access to a database link to each database that contains Oracle Streams components.
- The user must have been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure, and each database link must connect to a user at the remote database that has been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure.

Full Monitoring Job Names

When you submit a monitoring job, the client name and job name are concatenated to form the full monitoring job name. You specify the client name using the `client_name` parameter and the job name using the `job_name` parameter when you run the `START_MONITORING` procedure. The client name for a monitoring job submitted by Oracle Enterprise Manager is always `EM`.

The following table show examples of full monitoring job names:

Setting for client_name Parameter	Setting for job_name parameter	Full Monitoring Job Name
NULL	STREAMS$_MONITORING_JOB	STREAMS$_MONITORING_JOB
EM	STREAMS$_MONITORING_JOB	EMSTREAMS$_MONITORING_JOB
strm	STREAMS$_MONITORING_JOB	strmSTREAMS$_MONITORING_JOB
strm	mjob1	strmmjob1

Restrictions on Monitoring Jobs

The following restrictions apply to monitoring jobs:

- The limit for the length of the full monitoring job name is 30 bytes.
- Two monitoring jobs cannot have the same full monitoring job name, even if the monitoring jobs were submitted by different schemas. The name check is not case-sensitive. For example, `strmSTREAMS$_MONITORING_JOB` and `STRMSTREAMS$_MONITORING_JOB` are considered to be the same name.
- Oracle Enterprise Manager can have at most one monitoring job for each database.
- Each schema can have at most one monitoring job.

STOP_MONITORING Procedure

This procedure stops a monitoring job that was submitted by the current user.

Syntax

```
UTL_SPADV.STOP_MONITORING(
   purge IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 264–22 STOP_MONITORING Procedure Parameters

Parameter	Description
purge	If TRUE, then the procedure purges information about the monitoring job from the result tables. If FALSE, then the procedure retains information about the monitoring job in the result tables.

265

UTL_TCP

With the `UTL_TCP` package and its procedures and functions, PL/SQL applications can communicate with external TCP/IP-based servers using TCP/IP. Because many Internet application protocols are based on TCP/IP, this package is useful to PL/SQL applications that use Internet protocols and e-mail.

This chapter contains the following topics:

Using UTL_TCP

Overview

The UTL_TCP package provides TCP/IP client-side access functionality in PL/SQL.

Security Model

This package is an invoker's rights package and the invoking user needs the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note: For more information about managing fine-grained access, see *Oracle Database Security Guide*

Types

CONNECTION Type

This is a PL/SQL record type used to represent a TCP/IP connection.

Syntax

```
TYPE connection IS RECORD (
    remote_host    VARCHAR2(255),
    remote_port    PLS_INTEGER,
    local_host     VARCHAR2(255),
    local_port     PLS_INTEGER,
    charset        VARCHAR2(30),
    newline        VARCHAR2(2),
    tx_timeout     PLS_INTEGER,
    private_sd     PLS_INTEGER);
```

Fields

Table 265–1 Connection Record Type Fields

Field	Description
remote_host	Name of the remote host when connection is established. NULL when no connection is established.
remote_port	Port number of the remote host connected. NULL when no connection is established.
local_host	Name of the local host used to establish the connection. NULL when no connection is established.
local_port	Port number of the local host used to establish the connection. NULL when no connection is established.
charset	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network.
newline	Newline character sequence. This newline character sequence is appended to the text line sent by WRITE_LINE API.
tx_timeout	Time in seconds that the UTL_TCP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

Usage Notes

The fields in a connection record are used to return information about the connection, which is often made using OPEN_CONNECTION. Changing the values of those fields has

no effect on the connection. The fields `private_XXXX` are for implementation use only. You should not modify the values.

In the current release of the `UTL_TCP` package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields are not set in the connection record returned by the function.

Time out on write operations is not supported in the current release of the `UTL_TCP` package.

CRLF

The character sequence carriage-return line-feed. It is the newline sequence commonly used by many communication standards.

Syntax

```
CRLF CONSTANT VARCHAR2(2 CHAR);
```

Usage Notes

This package variable defines the newline character sequence commonly used in many Internet protocols. This is the default value of the newline character sequence for `WRITE_LINE`, specified when a connection is opened. While such protocols use `<CR><LF>` to denote a new line, some implementations may choose to use just line-feed to denote a new line. In such cases, users can specify a different newline character sequence when a connection is opened.

Exceptions

The exceptions raised by the TCP/IP package are listed in Table 265–2.

Table 265–2 TCP/IP Exceptions

Exception	Description
BUFFER_TOO_SMALL	Buffer is too small for input that requires look-ahead
END_OF_INPUT	Raised when no more data is available to read from the connection
NETWORK_ERROR	Generic network error
BAD_ARGUMENT	Bad argument passed in an API call (for example, a negative buffer size)
TRANSFER_TIMEOUT	No data is read and a read time out occurred
PARTIAL_MULTIBYTE_CHAR	No complete character is read and a partial multibyte character is found at the end of the input

Rules and Limits

The interface provided in the package only allows connections to be initiated by the PL/SQL program. It does not allow the PL/SQL program to accept connections initiated outside the program.

Examples

The following code example illustrates how the TCP/IP package can be used to retrieve a Web page over HTTP. It connects to a Web server listening at port 80 (standard port for HTTP) and requests the root document.

```
DECLARE
  c  utl_tcp.connection;  -- TCP/IP connection to the Web server
  ret_val pls_integer;
BEGIN
  c := utl_tcp.open_connection(remote_host => 'www.acme.com',
                               remote_port =>  80,
                               charset     => 'US7ASCII');  -- open connection
  ret_val := utl_tcp.write_line(c, 'GET / HTTP/1.0');    -- send HTTP request
  ret_val := utl_tcp.write_line(c);
  BEGIN
    LOOP
      dbms_output.put_line(utl_tcp.get_line(c, TRUE));  -- read result
    END LOOP;
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      NULL; -- end of input
  END;
  utl_tcp.close_connection(c);
END;
```

The following code example illustrates how the TCP/IP package can be used by an application to send e-mail (also known as email from PL/SQL). The application connects to an SMTP server at port 25 and sends a simple text message.

```
PROCEDURE send_mail (sender    IN VARCHAR2,
                     recipient IN VARCHAR2,
                   message   IN VARCHAR2) IS
    mailhost   VARCHAR2(30) := 'mailhost.mydomain.com';
    smtp_error  EXCEPTION;
    mail_conn   utl_tcp.connection;
    PROCEDURE smtp_command(command IN VARCHAR2,
                           ok      IN VARCHAR2 DEFAULT '250')
    IS
        response varchar2(3);
        len pls_integer;
    BEGIN
        len := utl_tcp.write_line(mail_conn, command);
        response := substr(utl_tcp.get_line(mail_conn), 1, 3);
        IF (response <> ok) THEN
            RAISE smtp_error;
        END IF;
    END;

BEGIN
    mail_conn := utl_tcp.open_connection(remote_host => mailhost,
                                         remote_port => 25,
                                         charset     => 'US7ASCII');
    smtp_command('HELO ' || mailhost);
    smtp_command('MAIL FROM: ' || sender);
    smtp_command('RCPT TO: ' || recipient);
    smtp_command('DATA', '354');
    smtp_command(message);
    smtp_command('QUIT', '221');
    utl_tcp.close_connection(mail_conn);
```

```
EXCEPTION
    WHEN OTHERS THEN
        -- Handle the error
END;
```

Summary of UTL_TCP Subprograms

Table 265–3 UTL_TCP Package Subprograms

Subprogram	Description
AVAILABLE Function on page 265-12	Determines the number of bytes available for reading from a TCP/IP connection
CLOSE_ALL_ CONNECTIONS Procedure on page 265-14	Closes all open TCP/IP connections
CLOSE_CONNECTION Procedure on page 265-15	Closes an open TCP/IP connection
FLUSH Procedure on page 265-16	Transmits immediately to the server all data in the output buffer, if a buffer is used
GET_LINE Function on page 265-17	Returns the line of data read
GET_LINE_NCHAR Function on page 265-18	Returns the line of data read in NCHAR form
GET_RAW Function on page 265-19	Return the data read instead of the amount of data read
GET_TEXT Function on page 265-20	Returns the text data read
GET_TEXT_NCHAR Function on page 265-21	Returns the text data read in NCHAR form
OPEN_CONNECTION Function on page 265-22	Opens a TCP/IP connection to a specified service
READ_LINE Function on page 265-24	Receives a text line from a service on an open connection
READ_RAW Function on page 265-26	Receives binary data from a service on an open connection
READ_TEXT Function on page 265-27	Receives text data from a service on an open connection
SECURE_CONNECTION Procedure on page 265-29	Secures a TCP/IP connection using SSL/TLS
WRITE_LINE Function on page 265-30	Transmits a text line to a service on an open connection
WRITE_RAW Function on page 265-31	Transmits a binary message to a service on an open connection
WRITE_TEXT Function on page 265-32	Transmits a text message to a service on an open connection

AVAILABLE Function

This function determines the number of bytes available for reading from a TCP/IP connection. It is the number of bytes that can be read immediately without blocking. Determines if data is ready to be read from the connection.

Syntax

```
UTL_TCP.AVAILABLE (
   c        IN OUT NOCOPY connection,
   timeout  IN PLS_INTEGER DEFAULT 0)
RETURN PLS_INTEGER;
```

Parameters

Table 265–4 AVAILABLE Function Parameters

Parameter	Description
c	TCP connection to determine the amount of data that is available to be read
timeout	Time in seconds to wait before giving up and reporting that no data is available. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

Return Values

The number of bytes available for reading without blocking

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. Users may use this API to determine if data is available to be read before calling the read API so that the program are not blocked because data is not ready to be read from the input.

The number of bytes available for reading returned by this function may be less than what is actually available. On some platforms, this function may only return 1, to indicate that some data is available. If you are concerned about the portability of your application, then assume that this function returns a positive value when data is available for reading, and 0 when no data is available. This function returns a positive value when all the data at a particular connection has been read and the next read result in the END_OF_INPUT exception.

The following example illustrates using this function in a portable manner:

```
DECLARE
   c   utl_tcp.connection
   data VARCHAR2(256);
   len  PLS_INTEGER;
BEGIN
   c := utl_tcp.open_connection(...);
   LOOP
      IF (utl_tcp.available(c) > 0) THEN
         len := utl_tcp.read_text(c, data, 256);
      ELSE
         ---do some other things
        . . . .
      END IF
```

```
   END LOOP;
END;
```

CLOSE_ALL_CONNECTIONS Procedure

This procedure closes all open TCP/IP connections.

Syntax

```
UTL_TCP.CLOSE_ALL_CONNECTIONS;
```

Usage Notes

This call is provided to close all connections before a PL/SQL program ends to avoid dangling connections.

CLOSE_CONNECTION Procedure

This procedure closes an open TCP/IP connection.

Syntax

```
UTL_TCP.CLOSE_CONNECTION (
   c IN OUT NOCOPY connection);
```

Parameters

Table 265–5 CLOSE_CONNECTION Procedure Parameters

Parameter	Description
c	TCP connection to close

Usage Notes

Connection must have been opened by a previous call to `OPEN_CONNECTION`. The fields `remote_host, remote_port, local_host, local_port` and `charset` of `c` are reset after the connection is closed.

An open connection must be closed explicitly. An open connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

FLUSH Procedure

This procedure transfers immediately to the server all data in the output buffer, if a buffer is used.

Syntax

```
UTL_TCP.FLUSH (
   c IN OUT NOCOPY connection);
```

Parameters

Table 265–6 FLUSH Procedure Parameters

Parameter	Description
c	TCP connection to which to send data

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

GET_LINE Function

This function returns the line of data read.

Syntax

```
UTL_TCP.GET_LINE (
   c           IN OUT NOCOPY connection,
   remove_crlf IN            BOOLEAN DEFAULT FALSE,
   peek        IN            BOOLEAN DEFAULT FALSE)
 RETURN VARCHAR2;
```

Parameters

Table 265–7 GET_LINE Function Parameters

Parameter	Description
c	TCP connection from which to receive data
remove_crlf	If TRUE, then one ore more trailing CRLF characters are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to OPEN_CONNECTION.
- See READ_LINE for the read time out, character set conversion, buffer size, and multibyte character issues.

GET_LINE_NCHAR Function

This function returns the line of data read in NCHAR form.

Syntax

```
UTL_TCP.GET_LINE_NCHAR (
   c           IN OUT NOCOPY connection,
   remove_crlf IN            BOOLEAN DEFAULT FALSE,
   peek        IN            BOOLEAN DEFAULT FALSE)
 RETURN NVARCHAR2;
```

Parameters

Table 265–8 GET_LINE_NCHAR Function Parameters

Parameter	Description
`c`	TCP connection from which to receive data
`remove_crlf`	If `TRUE`, then one ore more trailing CRLF characters are removed from the received message.
`peek`	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to `TRUE` and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to `OPEN_CONNECTION`.
- See `READ_LINE` for the read time out, character set conversion, buffer size, and multibyte character issues.

GET_RAW Function

This function returns the data read instead of the amount of data read.

Syntax

```
UTL_TCP.GET_RAW (
   c     IN OUT NOCOPY connection,
   len   IN            PLS_INTEGER DEFAULT 1,
   peek  IN            BOOLEAN     DEFAULT FALSE)
 RETURN RAW;
```

Parameters

Table 265–9 GET_RAW Function Parameters

Parameter	Description
c	TCP connection from which to receive data
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, then one ore more trailing CRLF characters are removed from the received message.

Return Values

The binary data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding READ_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

GET_TEXT Function

This function returns the text data read.

Syntax

```
UTL_TCP.GET_TEXT (
   c    IN OUT NOCOPY connection,
   len  IN            PLS_INTEGER DEFAULT 1,
   peek IN            BOOLEAN     DEFAULT FALSE)
 RETURN VARCHAR2;
```

Parameters

Table 265–10 GET_TEXT Function Parameters

Parameter	Description
c	TCP connection from which to receive data
len	Number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, then one ore more trailing CRLF characters are removed from the received message.

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

GET_TEXT_NCHAR Function

This function returns the text data read in NCHAR form.

Syntax

```
UTL_TCP.GET_TEXT_NCHAR (
   c    IN OUT NOCOPY connection,
   len  IN            PLS_INTEGER DEFAULT 1,
   peek IN            BOOLEAN     DEFAULT FALSE)
 RETURN NVARCHAR2;
```

Parameters

Table 265–11 GET_TEXT_NCHAR Function Parameters

Parameter	Description
c	TCP connection from which to receive data
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, then one ore more trailing CRLF characters are removed from the received message.

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

OPEN_CONNECTION Function

This function opens a TCP/IP connection to a specified service.

Syntax

```
UTL_TCP.OPEN_CONNECTION  (
   remote_host          IN VARCHAR2,
   remote_port          IN PLS_INTEGER,
   local_host           IN VARCHAR2 DEFAULT NULL,
   local_port           IN PLS_INTEGER DEFAULT NULL,
   in_buffer_size       IN PLS_INTEGER DEFAULT NULL,
   out_buffer_size      IN PLS_INTEGER DEFAULT NULL,
   charset              IN VARCHAR2 DEFAULT NULL,
   newline              IN VARCHAR2 DEFAULT CRLF,
   tx_timeout           IN PLS_INTEGER DEFAULT NULL,
   wallet_path          IN  VARCHAR2 DEFAULT NULL,
   wallet_password      IN  VARCHAR2 DEFAULT NULL,
  RETURN connection;
```

Parameters

Table 265–12 OPEN_CONNECTION Function Parameters

Parameter	Description
remote_host	Name of the host providing the service. When remote_host is NULL, it connects to the local host.
remote_port	Port number on which the service is listening for connections
local_host	Name of the host providing the service. NULL means does not care.
local_port	Port number on which the service is listening for connections. NULL means don't care.
in_buffer_size	The size of input buffer. The use of an input buffer can speed up execution performance in receiving data from the server. The appropriate size of the buffer depends on the flow of data between the client and the server, and the traffic/latency on the network. A zero value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the input buffer is 32767 bytes.
out_buffer_size	The size of output buffer. The use of an output buffer can speed up execution performance in sending data to the server. The appropriate size of buffer depends on the flow of data between the client and the server, and the network condition. A zero value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the output buffer is 32767 bytes.
charset	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network using READ_TEXT, READ_LINE, WRITE_TEXT and WRITE_LINE. Set this parameter to NULL when no conversion is needed.

Table 265–12 (Cont.) OPEN_CONNECTION Function Parameters

Parameter	Description
newline	Newline character sequence. This newline character sequence is appended to the text line sent by WRITE_LINE API.
tx_timeout	Time in seconds that the UTL_TCP package should wait before giving up in a read or write operations in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.
wallet_path	Directory path that contains the Oracle wallet for SSL/TLS. The format is file:*directory-path*
wallet_password	Password to open the wallet. When the wallet is auto-login enabled, the password may be set to NULL.

Return Values

A connection to the targeted TCP/IP service

Usage Notes

- Note that connections opened by this UTL_TCP package can remain open and be passed from one database call to another in a shared server configuration. However, the connection must be closed explicitly. The connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.
- In the current release of the UTL_TCP package, the parameters local_host and local_port are ignored when open_connection makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The local_host and local_port fields is not set in the connection record returned by the function.
- tx_timeout is intended to govern both the read operations and the write operations. However, an implementation restriction prevents tx_timeout from governing write operations in the current release.

Examples

```
DECLARE
  c UTL_TCP.CONNECTION;
BEGIN
  c := UTL_TCP.OPEN_CONNECTION(
   host            => 'www.example.com',
   port            => 443,
   wallet_path     => 'file:/oracle/wallets/smtp_wallet',
   wallet_password => '****');
  UTL_TCP.SECURE_CONNECTION (c => c);
END;
```

READ_LINE Function

This function receives a text line from a service on an open connection. A line is terminated by a line-feed, a carriage-return or a carriage-return followed by a line-feed.

Syntax

```
UTL_TCP.READ_LINE (
   c           IN OUT NOCOPY connection,
   data        IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
   peek        IN            BOOLEAN DEFAULT FALSE)
 RETURN PLS_INTEGER;
```

Parameters

Table 265–13 READ_LINE Function Parameters

Parameter	Description
c	TCP connection from which to receive data
data	Data received.
remove_crlf	If TRUE, then one ore more trailing CRLF characters are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the end-of-line have been reached, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the READ_RAW function. If a partial multibyte character is seen

in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

READ_RAW Function

This function receives binary data from a service on an open connection.

Syntax

```
UTL_TCP.READ_RAW (
   c     IN OUT NOCOPY connection,
   data  IN OUT NOCOPY RAW,
   len   IN            PLS_INTEGER DEFAULT 1,
   peek  IN            BOOLEAN     DEFAULT FALSE)
 RETURN PLS_INTEGER;
```

Parameters

Table 265–14 READ_RAW Function Parameters

Parameter	Description
`c`	TCP connection from which to receive data
`data (IN OUT COPY)`	Data received
`len`	Number of bytes of data to receive
`peek`	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to `TRUE` and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of bytes of data received

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of bytes have been read, or the end of input has been reached.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

READ_TEXT Function

This function receives text data from a service on an open connection.

Syntax

```
UTL_TCP.READ_TEXT (
   c    IN OUT NOCOPY connection,
   data IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
   len  IN            PLS_INTEGER DEFAULT 1,
   peek IN            BOOLEAN     DEFAULT FALSE)
RETURN PLS_INTEGER;
```

Parameters

Table 265–15 READ_TEXT Function Parameters

Parameter	Description
c	TCP connection from which to receive data
data	Data received
len	Number of characters of data to receive
peek	Normally, users want to read the data and remove it from the input queue, that is, consume it. In some situations, users may just want to look ahead at the data without removing it from the input queue so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and an input buffer must be set up when the connection is opened. The amount of data that you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the specified number of characters has been read, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

Unless explicitly overridden, the size of a VARCHAR2 buffer is specified in terms of bytes, while the parameter len refers to the maximum number of characters to be read. When the database character set is multibyte, where a single character may consist of more than 1 byte, you should ensure that the buffer can hold the maximum of characters. In general, the size of the VARCHAR2 buffer should equal the number of characters to be read, multiplied by the maximum number of bytes of a character of the database character set.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

SECURE_CONNECTION Procedure

This procedure secures a TCP/IP connection using SSL/TLS. SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the OPEN_CONNECTION Function.

Syntax

```
UTL_TCP.SECURE_CONNECTION (
   c    IN OUT NOCOPY connection);
```

Parameters

Table 265–16 SECURE_CONNECTION Procedure Parameters

Parameter	Description
c	TCP connection from which to receive data

WRITE_LINE Function

This function transmits a text line to a service on an open connection. The `newline` character sequence is appended to the message before it is transmitted.

Syntax

```
UTL_TCP.WRITE_LINE (
   c    IN OUT NOCOPY connection,
   data IN            VARCHAR2 DEFAULT NULL CHARACTER SET ANY_CS)
  RETURN PLS_INTEGER;
```

Parameters

Table 265–17 WRITE_LINE Function Parameters

Parameter	Description
`c`	TCP connection to which to send data
`data`	Buffer containing the data to be sent

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

WRITE_RAW Function

This function transmits a binary message to a service on an open connection. The function does not return until the specified number of bytes have been written.

Syntax

```
UTL_TCP.WRITE_RAW (
   c    IN OUT NOCOPY connection,
   data IN            RAW,
   len  IN            PLS_INTEGER DEFAULT NULL)
 RETURN PLS_INTEGER;
```

Parameters

Table 265–18 WRITE_RAW Function Parameters

Parameter	Description
`c`	TCP connection to which to send data
`data`	Buffer containing the data to be sent
`len`	The number of bytes of data to transmit. When `len` is `NULL`, the whole length of data is written.

Return Values

The number of bytes of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

WRITE_TEXT Function

This function transmits a text message to a service on an open connection.

Syntax

```
UTL_TCP.WRITE_TEXT (
   c    IN OUT NOCOPY connection,
   data IN            VARCHAR2 CHARACTER SET ANY_CS,
   len  IN            PLS_INTEGER DEFAULT NULL)
 RETURN num_chars PLS_INTEGER;
```

Parameters

Table 265–19 WRITE_TEXT Function Parameters

Parameter	Description
`c`	TCP connection to which to send data
`data`	Buffer containing the data to be sent
`len`	The number of characters of data to transmit. When `len` is `NULL`, the whole length of data is written. The actual amount of data written may be less because of network condition.

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

266

UTL_URL

The UTL_URL package has two functions: ESCAPE and UNESCAPE.

See Also: Chapter 252, "UTL_HTTP"

This chapter contains the following topics:

- Using UTL_URL
  - Overview
  - Exceptions
  - Examples
- Summary of UTL_URL Subprograms

Using UTL_URL

Overview

A Uniform Resource Locator (URL) is a string that identifies a Web resource, such as a page or a picture. Use a URL to access such resources by way of the HyperText Transfer Protocol (HTTP). For example, the URL for Oracle's Web site is:

```
http://www.oracle.com
```

Normally, a URL contains English alphabetic characters, digits, and punctuation symbols. These characters are known as the *unreserved characters*. Any other characters in URLs, including multibyte characters or binary octet codes, must be escaped to be accurately processed by Web browsers or Web servers. Some punctuation characters, such as dollar sign ($), question mark (?), colon (:), and equals sign (=), are reserved as delimiters in a URL. They are known as the *reserved characters*. To literally process these characters, instead of treating them as delimiters, they must be escaped.

The unreserved characters are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent ('), left parenthesis (( ), right parenthesis ( ))

The reserved characters are:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign ($), percentage sign (%), and comma (,)

The UTL_URL package has two functions that provide escape and unescape mechanisms for URL characters. Use the escape function to escape a URL before the URL is used fetch a Web page by way of the UTL_HTTP package. Use the unescape function to unescape an escaped URL before information is extracted from the URL.

For more information, refer to the Request For Comments (RFC) document RFC2396. Note that this URL escape and unescape mechanism is different from the x-www-form-urlencoded encoding mechanism described in the HTML specification:

```
http://www.w3.org/TR/html
```

Exceptions

Table 266–1 lists the exceptions that can be raised when the UTL_URL package API is invoked.

Table 266–1 UTL_URL Exceptions

Exception	Error Code	Reason
BAD_URL	29262	The URL contains badly formed escape code sequences
BAD_FIXED_ WIDTH_CHARSET	29274	Fixed-width multibyte character set is not allowed as a URL character set.

Examples

You can implement the `x-www-form-urlencoded` encoding using the `UTL_URL.ESCAPE` function as follows:

```
CREATE OR REPLACE FUNCTION form_url_encode (
   data    IN VARCHAR2,
   charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
  RETURN utl_url.escape(data, TRUE, charset); -- note use of TRUE
END;
```

For decoding data encoded with the `form-URL-encode scheme`, the following function implements the decording scheme:

```
CREATE OR REPLACE FUNCTION form_url_decode(
   data    IN VARCHAR2,
   charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
  RETURN utl_url.unescape(
     replace(data, '+', ' '),
     charset);
END;
```

Summary of UTL_URL Subprograms

Table 266–2 UTL_URL Package Subprograms

Subprogram	Description
ESCAPE Function on page 266-7	Returns a URL with illegal characters (and optionally reserved characters) escaped using the `%2-digit-hex-code` format
UNESCAPE Function on page 266-9	Unescapes the escape character sequences to their original forms in a URL. Convert the `%XX` escape character sequences to the original characters

ESCAPE Function

This function returns a URL with illegal characters (and optionally reserved characters) escaped using the `%2-digit-hex-code` format.

Syntax

```
UTL_URL.ESCAPE (
   url                   IN VARCHAR2 CHARACTER SET ANY_CS,
   escape_reserved_chars IN BOOLEAN  DEFAULT  FALSE,
   url_charset           IN VARCHAR2 DEFAULT  utl_http.body_charset)
 RETURN VARCHAR2;
```

Parameters

Table 266–3 ESCAPE Function Parameters

Parameter	Description
`url`	The original URL
`escape_reserved_chars`	Indicates whether the URL reserved characters should be escaped. If set to `TRUE`, both the reserved and illegal URL characters are escaped. Otherwise, only the illegal URL characters are escaped. The default value is `FALSE`.
`url_charset`	When escaping a character (single-byte or multibyte), determine the target character set that character should be converted to before the character is escaped in %hex-code format. If `url_charset` is `NULL`, the database charset is assumed and no character set conversion will occur. The default value is the current default body character set of the `UTL_HTTP` package, whose default value is `ISO-8859-1`. The character set can be named in Internet Assigned Numbers Authority (IANA) or in the Oracle naming convention.

Usage Notes

Use this function to escape URLs that contain illegal characters as defined in the URL specification RFC 2396. The legal characters in URLs are:

- `A` through `Z`, `a` through `z`, and `0` through `9`
- Hyphen (`-`), underscore (_), period (`.`), exclamation point (`!`), tilde (`~`), asterisk (`*`), accent (`'`), left parenthesis (`(`), right parenthesis (`)`)

The reserved characters consist of:

- Semi-colon (`;`) slash (`/`), question mark (`?`), colon (`:`), at sign (`@`), ampersand (`&`), equals sign (`=`), plus sign (`+`), dollar sign (`$`), and comma (`,`)

Many of the reserved characters are used as delimiters in the URL. You should escape characters beyond those listed here by using escape_url. Also, to use the reserved characters in the name-value pairs of the query string of a URL, those characters must be escaped separately. An escape_url cannot recognize the need to escape those characters because once inside a URL, those characters become indistinguishable from the actual delimiters. For example, to pass a name-value pair `$logon=scott/tiger` into the query string of a URL, escape the `$` and `/` separately as `%24logon=scott%2Ftiger` and use it in the URL.

Normally, you will escape the entire URL, which contains the reserved characters (delimiters) that should not be escaped. For example:

```
utl_url.escape('http://www.acme.com/a url with space.html')
```

Returns:

```
http://www.acme.com/a%20url%20with%20space.html
```

In other situations, you may want to send a query string with a value that contains reserved characters. In that case, escape only the value fully (with `escape_reserved_chars` set to `TRUE`) and then concatenate it with the rest of the URL. For example:

```
url := 'http://www.acme.com/search?check=' || utl_url.escape
('Is the use of the "$" sign okay?', TRUE);
```

This expression escapes the question mark (`?`), dollar sign (`$`), and space characters in `'Is the use of the "$" sign okay?'` but not the `?` after `search` in the URL that denotes the use of a query string.

The Web server that you intend to fetch Web pages from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be escaped are escaped in the target character set. For example, a user of an EBCDIC database who wants to access an ASCII Web server should escape the URL using `US7ASCII` so that a space is escaped as `%20` (hex code of a space in ASCII) instead of `%40` (hex code of a space in EBCDIC).

This function does not validate a URL for the proper URL format.

UNESCAPE Function

This function unescapes the escape character sequences to its original form in a URL, to convert the `%XX` escape character sequences to the original characters.

Syntax

```
UTL_URL.UNESCAPE (
   url            IN VARCHAR2 CHARACTER SET ANY_CS,
   url_charset    IN VARCHAR2 DEFAULT utl_http.body_charset)
                  RETURN VARCHAR2;
```

Parameters

Table 266–4 UNESCAPE Function Parameters

Parameter	Description
`url`	The URL to unescape
`url_charset`	After a character is unescaped, the character is assumed to be in the `source_charset` character set and it will be converted from the `source_charset` to the database character set before the URL is returned. If `source_charset` is `NULL`, the database charset is assumed and no character set conversion occurred. The default value is the current default body character set of the `UTL_HTTP` package, whose default value is "ISO-8859-1". The character set can be named in Internet Assigned Numbers Authority (IANA) or Oracle naming convention.

Usage Notes

The Web server that you receive the URL from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be unescaped are unescaped in the source character set. For example, a user of an EBCDIC database who receives a URL from an ASCII Web server should unescape the URL using `US7ASCII` so that `%20` is unescaped as a space (0x20 is the hex code of a space in ASCII) instead of a `?` (because 0x20 is not a valid character in EBCDIC).

This function does not validate a URL for the proper URL format.

267

WPG_DOCLOAD

The WPG_DOCLOAD package provides an interface to download files, BLOBs and BFILEs.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

Using WPG_DOCLOAD

Constants

NAME_COL_LEN

The `NAME` column in your document table must be the same as the value of `name_col_len`.

```
name_col_len CONSTANT pls_integer := 64;
```

MIMET_COL_LEN

The `MIME_TYPE` column in your document table must be the same as the value of `mimet_col_len`.

```
mimet_col_len CONSTANT pls_integer := 48;
```

MAX_DOCTABLE_NAME_LEN

The name length of your document table must be less than `max_doctable_name_len`.

```
max_doctable_name_len CONSTANT pls_integer := 256;
```

Summary of WPG_DOCLOAD Subprograms

Table 267–1 WPG_DOCLOAD Package Subprograms

Subprogram	Description
DOWNLOAD_FILE Procedures on page 267-5	Downloads files, `BLOBS` and `BFILES`

DOWNLOAD_FILE Procedures

There are three versions of this procedure:

- The first version downloads files and is invoked from within a document download procedure to signal the PL/SQL Gateway that `p_filename` is to be downloaded from the document table to the client's browser.
- The second version can be called from within any procedure to signal the PL/SQL Gateway that `p_blob` is to be downloaded to the client's browser.
- The third version can be called from within any procedure to signal the PL/SQL Gateway that `p_bfile` is to be downloaded to the client's browser.

Syntax

```
WPG_DOCLOAD.DOWNLOAD_FILE(
   p_filename      IN             VARCHAR2,
   p_bcaching      IN             BOOLEAN DEFAULT TRUE);

WPG_DOCLOAD.DOWNLOAD_FILE(
   p_blob          IN OUT NOCOPY  BLOB);

WPG_DOCLOAD.DOWNLOAD_FILE(
   p_bfile         IN OUT         BFILE);
```

Parameters

Table 267–2 DOWNLOAD_FILE Procedure Parameters

Parameter	Description
`p_filename`	The file to download from the document table.
`p_blob`	The `BLOB` to download.
`p_bfile`	The `BFILE` to download (see Usage Notes).
`p_bcaching`	Whether browser caching is enabled (see Usage Notes).

Usage Notes

- Normally, a document will be downloaded to the browser unless the browser sends an 'If-Modified-Since' header to the gateway indicating that it has the requested document in its cache. In that case, the gateway will determine if the browser's cached copy is up to date, and if it is, it will send an HTTP 304 status message to the browser indicating that the browser should display the cached copy. However, because a document URL and a document do not necessarily have a one-to-one relationship in the PL/SQL Web Gateway, in some cases it may be undesirable to have the cached copy of a document displayed. In those cases, the `p_bcaching` parameter should be set to FALSE to indicate to the gateway to ignore the 'If-Modified-Since' header, and download the document.
- `p_bfile` and `p_blob` are declared as `IN OUT` because the locator is initially opened to check for file accessibility and existence. The open operation can only be performed if the locator is writable and readable.

268

ANYDATA TYPE

An ANYDATA TYPE contains an instance of a given type, plus a description of the type. In this sense, an ANYDATA is self-describing. An ANYDATA can be persistently stored in the database.

This chapter contains the following topics:

Using ANYDATA TYPE

Restrictions

Persistent storage of `ANYDATA` instances whose type contains embedded LOBs other than `BFILE`s is not currently supported.

Operational Notes

Construction

There are 2 ways to construct an ANYDATA. The CONVERT* calls enable construction of the ANYDATA in its entirety with a single call. They serve as explicit CAST functions from any type in the Oracle ORDBMS to ANYDATA.

```
STATIC FUNCTION ConvertBDouble(dbl IN BINARY_DOUBLE) return ANYDATA,
STATIC FUNCTION ConvertBfile(b IN BFILE) RETURN ANYDATA,
STATIC FUNCTION ConvertBFloat(fl IN BINARY_FLOAT) return ANYDATA,
STATIC FUNCTION ConvertBlob(b IN BLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertChar(c IN CHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertClob(c IN CLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertCollection(col IN "collection_type") RETURN ANYDATA,
STATIC FUNCTION ConvertDate(dat IN DATE) RETURN ANYDATA,
STATIC FUNCTION ConvertIntervalDS(inv IN INTERVAL DAY TO SECOND) return ANYDATA,
STATIC FUNCTION ConvertIntervalYM(invIN INTERVAL YEAR TO MONTH) return ANYDATA,
STATIC FUNCTION ConvertNchar(nc IN NCHAR) return ANYDATA,
STATIC FUNCTION ConvertNClob(nc IN NCLOB) return ANYDATA,
STATIC FUNCTION ConvertNumber(num IN NUMBER) RETURN ANYDATA,
STATIC FUNCTION ConvertNVarchar2(nc IN NVARCHAR2) return ANYDATA,
STATIC FUNCTION ConvertObject(obj IN "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertRaw(r IN RAW) RETURN ANYDATA,
STATIC FUNCTION ConvertRef(rf IN REF "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertTimestamp(ts IN TIMESTAMP) return ANYDATA,
STATIC FUNCTION ConvertTimestampTZ(ts IN TIMESTAMP WITH TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertTimestampLTZ(ts IN TIMESTAMP WITH LOCAL TIMEZONE) return
ANYDATA,
STATIC FUNCTION ConvertURowid(rid IN UROWID) return ANYDATA,
STATIC FUNCTION ConvertVarchar(c IN VARCHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertVarchar2(c IN VARCHAR2) RETURN ANYDATA,
```

The second way to construct an ANYDATA is a piece by piece approach. The BEGINCREATE Static Procedure call begins the construction process and ENDCREATE Member Procedure call finishes the construction process. In between these two calls, the individual attributes of an object type or the elements of a collection can be set using SET* calls. For piece by piece access of the attributes of objects and elements of collections, the PIECEWISE Member Procedure should be invoked prior to GET* calls.

Note: The ANYDATA has to be constructed or accessed sequentially starting from its first attribute (or collection element). The BEGINCREATE call automatically begins the construction in a piece-wise mode. There is no need to call PIECEWISE immediately after BEGINCREATE. ENDCREATE should be called to finish the construction process (before which any access calls can be made).

Access

Access functions are available based on SQL. These functions do not throw exceptions on type-mismatch. Instead, they return NULL if the type of the ANYDATA does not correspond to the type of access. If you wish to use only ANYDATA functions of the appropriate types returned in a query, you should use a WHERE clause which uses GETTYPENAME and choose the type you are interested in (say "SYS.NUMBER"). Each of

these functions returns the value of a specified datatype inside a SYS.ANYDATA wrapper.

```
MEMBER FUNCTION AccessBDouble(self IN ANYDATA) return BINARY_DOUBLE
   DETERMINISTIC,
MEMBER FUNCTION AccessBfile(self IN ANYDATA) return BFILE,
MEMBER FUNCTION AccessBFloat(self IN ANYDATA) return BINARY_FLOAT
   DETERMINISTIC,
MEMBER FUNCTION AccessBlob(self IN ANYDATA) return BLOB,
MEMBER FUNCTION AccessChar(self IN ANYDATA) return CHAR,
MEMBER FUNCTION AccessClob(self IN ANYDATA) return CLOB,
MEMBER FUNCTION AccessDate(self IN ANYDATA) return DATE,
MEMBER FUNCTION AccessIntervalYM(self IN ANYDATA) return INTERVAL YEAR TO MONTH,
MEMBER FUNCTION AccessIntervalDS(self IN ANYDATA) return INTERVAL DAY TO SECOND,
MEMBER FUNCTION AccessNchar(self IN ANYDATA) return NCHAR,
MEMBER FUNCTION AccessNClob(self IN ANYDATA) return NCLOB
MEMBER FUNCTION AccessNumber(self IN ANYDATA) return NUMBER,
MEMBER FUNCTION AccessNVarchar2(self IN ANYDATA) return NVARCHAR2,
MEMBER FUNCTION AccessRaw(self IN ANYDATA) return RAW,
MEMBER FUNCTION AccessTimestamp(self IN ANYDATA) return TIMESTAMP,
MEMBER FUNCTION AccessTimestampLTZ(self IN ANYDATA) return TIMESTAMP WITH LOCAL
   TIMEZONE,
MEMBER FUNCTION AccessTimestampTZ(self IN ANYDATA) return TIMESTAMP WITH
   TIMEZONE,
MEMBER FUNCTION AccessURowid(self IN ANYDATA) return UROWID DETERMINISTIC
MEMBER FUNCTION AccessVarchar(self IN ANYDATA) return VARCHAR,
MEMBER FUNCTION AccessVarchar2(self IN ANYDATA) return VARCHAR2,
```

Summary of ANYDATA Subprograms

Table 268–1 ANYDATA Type Subprograms

Subprogram	Description
BEGINCREATE Static Procedure on page 268-7	Begins creation process on a new `ANYDATA`
ENDCREATE Member Procedure on page 268-8	Ends creation of an `ANYDATA`
GET* Member Functions on page 268-9	Gets the current data value (which should be of appropriate type)
GETTYPE Member Function on page 268-12	Gets the Type of the `ANYDATA`
GETTYPENAME Member Function on page 268-13	Get the fully qualified type name for the `ANYDATA`
PIECEWISE Member Procedure on page 268-14	Sets the `MODE` of access of the current data value to be an attribute at a time (if the data value is of `TYPECODE_OBJECT`)
SET* Member Procedures on page 268-15	Sets the current data value.

BEGINCREATE Static Procedure

This procedure begins the creation process on a new ANYDATA.

Syntax

```
STATIC PROCEDURE BeginCreate(
   dtype          IN OUT NOCOPY AnyType,
   adata          OUT NOCOPY ANYDATA);
```

Parameters

Table 268–2 BEGINCREATE Procedure Parameters

Parameter	Description
dtype	The type of the ANYDATA. (Should correspond to OCI_TYPECODE_OBJECT or a Collection typecode.)
adata	ANYDATA being constructed.

Exception

DBMS_TYPES.INVALID_PARAMETERS: dtype is invalid (not fully constructed, and similar deficits.)

Usage Notes

There is no need to call PIECEWISE immediately after this call. The construction process begins in a piece-wise manner automatically.

ENDCREATE Member Procedure

This procedure ends creation of an ANYDATA. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE EndCreate(
   self         IN OUT NOCOPY ANYDATA);
```

Parameters

Table 268–3 ENDCREATE Procedure Parameter

Parameter	Description
self	An ANYDATA.

GET* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE with which we are accessing (depending on whether we have invoked the PIECEWISE call).

If PIECEWISE has NOT been called, we are accessing the ANYDATA in its entirety and the type of the data value should match the type of the ANYDATA.

If PIECEWISE has been called, we are accessing the ANYDATA piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

```
MEMBER FUNCTION GetBDouble(
   self         IN ANYDATA,
   dbl          OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBfile(
   self         IN ANYDATA,
   b            OUT NOCOPY BFILE)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetBFloat(
   self         IN ANYDATA,
   fl           OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBlob(
   self         IN ANYDATA,
   b            OUT NOCOPY BLOB)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetChar(
   self         IN ANYDATA,
   c            OUT NOCOPY CHAR)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetClob(
   self         IN ANYDATA,
   c            OUT NOCOPY CLOB)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetCollection(
   self         IN ANYDATA,
   col          OUT NOCOPY "<collection_type>")
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetDate(
   self         IN ANYDATA,
   dat          OUT NOCOPY DATE)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetIntervalDS(
   self         IN ANYDATA,
   inv          OUT NOCOPY INTERVAL DAY TO SECOND)
 RETURN         PLS_INTEGER;
```

```
MEMBER FUNCTION GetIntervalYM(
   self         IN ANYDATA,
   inv          OUT NOCOPY INTERVAL YEAR TO MONTH)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetNchar(
   self         IN ANYDATA,
   nc           OUT NOCOPY NCHAR)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetNClob(
   self         IN ANYDATA,
   nc           OUT NOCOPY NCLOB)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetNumber(
   self         IN ANYDATA,
   num          OUT NOCOPY NUMBER)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetNVarchar2(
   self         IN ANYDATA,
   nc           OUT NOCOPY NVARCHAR2)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetObject(
   self         IN ANYDATA,
   obj          OUT NOCOPY "<object_type>")
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetRaw(
   self         IN ANYDATA,
   r            OUT NOCOPY RAW)
   RETURN       PLS_INTEGER;

MMEMBER FUNCTION GetRef(
   self         IN ANYDATA,
   rf           OUT NOCOPY REF "<object_type>")
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetTimestamp(
   self         IN ANYDATA,
   ts           OUT NOCOPY TIMESTAMP)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampTZ(
   self         IN ANYDATA,
   ts           OUT NOCOPY TIMESTAMP WITH TIME ZONE)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampLTZ(
   self         IN ANYDATA,
   ts           OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GetVarchar(
   self         IN ANYDATA,
   c            OUT NOCOPY VARCHAR)
   RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GetVarchar2(
   self         IN ANYDATA,
   c            OUT NOCOPY VARCHAR2)
   RETURN       PLS_INTEGER;
```

Parameters

Table 268–4 GET* Function Parameter

Parameter	Description
self	An ANYDATA.
num	The number to be obtained.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMS_TYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.

GETTYPE Member Function

This function gets the typecode of the ANYDATA.

Syntax

```
MEMBER FUNCTION GETTYPE(
   self          IN ANYDATA,
   typ           OUT NOCOPY AnyType)
   RETURN        PLS_INTEGER;
```

Parameters

Table 268–5 GETTYPE Function Parameter

Parameter	Description
self	An ANYDATA.
typ	The AnyType corresponding to the ANYDATA. May be NULL if it does not represent a user-defined type.

Return Values

The typecode corresponding to the type of the ANYDATA.

GETTYPENAME Member Function

This function gets the fully qualified type name for the ANYDATA.

If the ANYDATA is based on a built-in type, this function will return NUMBER and other relevant information.

If it is based on a user defined type, this function will return *schema_name.type_name*, for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

```
MEMBER FUNCTION GETTYPENAME(
   self         IN ANYDATA)
   RETURN       VARCHAR2;
```

Parameters

Table 268–6 GETTYPENAME Function Parameter

Parameter	Description
self	An ANYDATA.

Return Values

Type name of the ANYDATA.

PIECEWISE Member Procedure

This procedure sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).

It sets the MODE of access of the data value to be a collection element at a time (if the data value is of collection type). Once this call has been made, subsequent calls to SET* and GET* will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE(
   self         IN OUT NOCOPY ANYDATA);
```

Parameters

Table 268–7 PIECEWISE Procedure Parameters

Parameter	Description
self	The current data value.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS
- DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an OBJECT or COLLECTION type before this call can be made.

Piece-wise construction and access of nested attributes that are of object or collection types is not supported.

SET* Member Procedures

Sets the current data value.

This is a list of procedures that should be called depending on the type of the current data value. The type of the data value should be the type of the attribute at the current position during the piece-wise construction process.

Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
   self        IN OUT NOCOPY ANYDATA,
   dbl         IN BINARY_DOUBLE,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
   self        IN OUT NOCOPY ANYDATA,
   b           IN BFILE,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
   self        IN OUT NOCOPY ANYDATA,
   fl          IN            BINARY_FLOAT,
   last_elem   IN            boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
   self        IN OUT NOCOPY ANYDATA,
   b           IN BLOB,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
   self        IN OUT NOCOPY ANYDATA,
   c           IN CHAR,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
   self        IN OUT NOCOPY ANYDATA,
   c           IN CLOB,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
   self        IN OUT NOCOPY ANYDATA,
   col         IN "<collectyion_type>",
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
   self        IN OUT NOCOPY ANYDATA,
   dat         IN DATE,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
   self        IN OUT NOCOPY ANYDATA,
   inv         IN INTERVAL DAY TO SECOND,
   last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
   self        IN OUT NOCOPY ANYDATA,
   inv         IN INTERVAL YEAR TO MONTH,
   last_elem   IN boolean DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETNCHAR(
   self        IN OUT NOCOPY ANYDATA,
   nc          IN NCHAR,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
   self        IN OUT NOCOPY ANYDATA,
   nc          IN NClob,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
   self        IN OUT NOCOPY ANYDATA,
   num         IN NUMBER,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
   self        IN OUT NOCOPY ANYDATA,
   nc          IN NVarchar2,
   last_elem   IN boolean DEFAULT FALSE),

MEMBER PROCEDURE SETOBJECT(
   self        IN OUT NOCOPY ANYDATA,
   obj         IN "<object_type>",
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
   self        IN OUT NOCOPY ANYDATA,
   r           IN RAW,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
   self        IN OUT NOCOPY ANYDATA,
   rf          IN REF "<object_type>",
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
   self       IN OUT NOCOPY ANYDATA,
   ts         IN TIMESTAMP,
   last_elem  IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPTZ(self IN OUT NOCOPY ANYDATA,
   ts          IN TIMESTAMP WITH TIME ZONE,
   last_elem   IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPLTZ(
   self IN OUT NOCOPY ANYDATA,
   ts IN TIMESTAMP WITH LOCAL TIME ZONE,
   last_elem IN boolean DEFAULT FALSE),

MEMBER PROCEDURE SETVARCHAR(
   self        IN OUT NOCOPY ANYDATA,
   c           IN VARCHAR,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
   self        IN OUT NOCOPY ANYDATA,
   c           IN VARCHAR2,
   last_elem   IN boolean DEFAULT FALSE);
```

Parameters

Table 268–8 SET Procedure Parameters*

Parameter	Description
self	An ANYDATA.
num	The number, and associated information, that is to be set.
last_elem	Relevant only if ANYDATA represents a collection. Set to TRUE if it is the last element of the collection, FALSE otherwise.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
- DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

Usage Notes

When BEGINCREATE is called, construction has already begun in a piece-wise fashion. Subsequent calls to SET* will set the successive attribute values.

If the ANYDATA is a standalone collection, the SET* call will set the successive collection elements.

269

ANYDATASET TYPE

An ANYDATASET TYPE contains a description of a given type plus a set of data instances of that type. An ANYDATASET can be persistently stored in the database if desired, or it can be used as interface parameters to communicate self-descriptive sets of data, all of which belong to a certain type.

This chapter contains the following topics:

Construction

The ANYDATASET needs to be constructed value by value, sequentially.

For each data instance (of the type of the ANYDATASET), the ADDINSTANCE function must be invoked. This adds a new data instance to the ANYDATASET. Subsequently, SET* can be called to set each value in its entirety.

The MODE of construction/access can be changed to attribute/collection element wise by making calls to PIECEWISE.

- If the type of the ANYDATASET is TYPECODE_OBJECT, individual attributes will be set with subsequent SET* calls. Likewise on access.
- If the type of the current data value is a collection type individual collection elements will be set with subsequent SET* calls. Likewise on access. This call is very similar to ANYDATA.PIECEWISE call defined for the type ANYDATA.

Note that there is no support for piece-wise construction and access of nested (not top level) attributes that are of object types or collection types.

ENDCREATE should be called to finish the construction process (before which no access calls can be made).

Summary of ANYDATASET TYPE Subprograms

Table 269–1 ANYDATASET Type Subprograms

Subprogram	Description
ADDINSTANCE Member Procedure on page 269-4	Adds a new data instance to an ANYDATASET.
BEGINCREATE Static Procedure on page 269-5	Creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.
ENDCREATE Member Procedure on page 269-6	Ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.
GET* Member Functions on page 269-7	Gets the current data value (which should be of appropriate type).
GETCOUNT Member Function on page 269-10	Gets the number of data instances in an ANYDATASET.
GETINSTANCE Member Function on page 269-11	Gets the next instance in an ANYDATASET.
GETTYPE Member Function on page 269-12	Gets the ANYTYPE describing the type of the data instances in an ANYDATASET.
	current data value (which should be of appropriate type).
GETTYPENAME Member Function on page 269-13	Gets the AnyType describing the type of the data instances in an ANYDATASET.
PIECEWISE Member Procedure on page 269-14	Sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).
SET* Member Procedures on page 269-15	Sets the current data value.

ADDINSTANCE Member Procedure

This procedure adds a new data instance to an ANYDATASET.

Syntax

```
MEMBER PROCEDURE AddInstance(
   self          IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 269–2 ADDINSTANCE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

Exceptions

```
DBMS_TYPES.invalid_parameters: Invalid parameters.
DBMS_TYPES.incorrect_usage: On incorrect usage.
```

Usage Notes

The data instances have to be added sequentially. The previous data instance must be fully constructed (or set to NULL) before a new one can be added.

This call DOES NOT automatically set the mode of construction to be piece-wise. The user has to explicitly call PIECEWISE if a piece-wise construction of the instance is intended.

BEGINCREATE Static Procedure

This procedure creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.

Syntax

```
STATIC PROCEDURE BeginCreate(
   typecode     IN PLS_INTEGER,
   rtype        IN OUT NOCOPY AnyType,
   aset         OUT NOCOPY ANYDATASET);
```

Parameters

Table 269–3 BEGINCREATE Procedure Parameter

Parameter	Description
typecode	The typecode for the type of the ANYDATASET.
dtype	The type of the data values. This parameter is a must for user-defined types like TYPECODE_OBJECT, Collection typecodes, and similar others.
aset	The ANYDATASET being constructed.

Exceptions

DBMS_TYPES.invalid_parameters: dtype is invalid (not fully constructed, and like errors.)

ENDCREATE Member Procedure

This procedure ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE ENDCREATE(
   self              IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 269–4 ENDCREATE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

GET* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE with which you are accessing it (depending on how we have invoked the PIECEWISE call). If PIECEWISE has not been called, we are accessing the instance in its entirety and the type of the data value should match the type of the ANYDATASET.

If PIECEWISE has been called, we are accessing the instance piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

```
MEMBER FUNCTION GETBDOUBLE(
   self        IN ANYDATASET,
   dbl         OUT NOCOPY BINARY_DOUBLE)
   RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFLOAT(
   self        IN ANYDATASET,
   fl          OUT NOCOPY BINARY_FLOAT)
   RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFILE(
   self        IN ANYDATASET,
   b           OUT NOCOPY BFILE)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETBLOB(
   self        IN ANYDATASET,
   b           OUT NOCOPY BLOB)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCHAR(
   self        IN ANYDATASET,
   c           OUT NOCOPY CHAR)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCLOB(
   self        IN ANYDATASET,
   c           OUT NOCOPY CLOB)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCOLLECTION(
   self        IN ANYDATASET,
   col         OUT NOCOPY "<collection_type>")
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETDATE(
   self        IN ANYDATASET,
   dat         OUT NOCOPY DATE)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETINTERVALDS(
   self        IN ANYDATASET,
   inv         IN OUT NOCOPY INTERVAL DAY TO SECOND)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETINTERVALYM(
   self        IN ANYDATASET,
   inv IN OUT NOCOPY INTERVAL YEAR TO MONTH)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCHAR(
   self        IN ANYDATASET,
   nc          OUT NOCOPY NCHAR)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCLOB(
   self        IN ANYDATASET,
   nc          OUT NOCOPY NCLOB)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETNUMBER(
   self        IN ANYDATASET,
   num         OUT NOCOPY NUMBER)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETNVARCHAR2(
   self        IN ANYDATASET,
   nc          OUT NOCOPY NVARCHAR2)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETOBJECT(
   self        IN ANYDATASET,
   obj         OUT NOCOPY "<object_type>")
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETRAW(
   self        IN ANYDATASET,
   r           OUT NOCOPY RAW)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETREF(
   self        IN ANYDATASET,
   rf          OUT NOCOPY REF "<object_type>")
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP(
   self        IN ANYDATASET,
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPLTZ(
   self        IN ANYDATASET,
   ts          OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPTZ(
   self        IN ANYDATASET,
   ts          OUT NOCOPY TIMESTAMP WITH TIME ZONE)
 RETURN PLS_INTEGER,

MEMBER FUNCTION GETUROWID(
   self        IN ANYDATASET,
   rid         OUT NOCOPY UROWID)
 RETURN PLS_INTEGER
```

```
MEMBER FUNCTION GETVARCHAR(
   self        IN ANYDATASET,
   c           OUT NOCOPY VARCHAR)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETVARCHAR2(
   self        IN ANYDATASET,
   c           OUT NOCOPY VARCHAR2)
   RETURN      PLS_INTEGER;
```

Parameters

Table 269–5 GET* Function Parameters

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information., that is to be obtained.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMS_TYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.INVALID_PARAMETERs: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

GETCOUNT Member Function

This function gets the number of data instances in an ANYDATASET.

Syntax

```
MEMBER FUNCTION GetCount(
   self        IN ANYDATASET)
   RETURN      PLS_INTEGER;
```

Parameter

Table 269–6 GETCOUNT Function Parameter

Parameter	Description
self	The ANYDATASET being accessed.

Return Values

The number of data instances.

GETINSTANCE Member Function

This function gets the next instance in an ANYDATASET. Only sequential access to the instances in an ANYDATASET is allowed. After this function has been called, the GET* functions can be invoked on the ANYDATASET to access the current instance. If PIECEWISE is called before doing the GET* calls, the individual attributes (or collection elements) can be accessed.

It is an error to invoke this function before the ANYDATASET is fully created.

Syntax

```
MEMBER FUNCTION GETINSTANCE(
   self           IN OUT NOCOPY ANYDATASET)
   RETURN         PLS_INTEGER;
```

Parameters

Table 269–7 GETINSTANCE Function Parameter

Parameter	Description
self	The ANYDATASET being accessed.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

DBMS_TYPES.NO_DATA signifies the end of the ANYDATASET (all instances have been accessed).

Usage Notes

This function should be called even before accessing the first instance.

GETTYPE Member Function

Gets the AnyType describing the type of the data instances in an ANYDATASET.

Syntax

```
MEMBER FUNCTION GETTYPE(
   self           IN ANYDATASET,
   typ            OUT NOCOPY AnyType)
   RETURN         PLS_INTEGER;
```

Parameters

Table 269–8 GETTYPE Function Parameter

Parameter	Description
self	The ANYDATASET.
typ	The ANYTYPE corresponding to the AnyData. May be NULL if it does not represent a user-defined function.

Return Values

The typecode corresponding to the type of the ANYDATA.

GETTYPENAME Member Function

This procedure gets the fully qualified type name for the ANYDATASET.

If the ANYDATASET is based on a built-in, this function will return NUMBER and associated information.

If it is based on a user defined type, this function will return *schema_name.type_name*. for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

```
MEMBER FUNCTION GETTYPENAME(
   self           IN ANYDATASET)
   RETURN         VARCHAR2;
```

Parameter

Table 269–9 GETTYPENAME Function Parameter

Parameter	Description
self	The ANYDATASET being constructed.

Return Values

Type name of the ANYDATASET.

PIECEWISE Member Procedure

This procedure sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).

It sets the MODE of construction, access of the data value to be a collection element at a time (if the data value is of a collection TYPE). Once this call has been made, subsequent SET* and GET* calls will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE(
   self         IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 269–10 PIECEWISE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid parameters.

DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an object or collection type before this call can be made. There is no support for piece-wise construction or access of embedded object type attributes or nested collections.

SET* Member Procedures

This procedure sets the current data value.

The type of the current data value depends on the MODE with which we are constructing (depending on how we have invoked the PIECEWISE call). The type of the current data should be the type of the ANYDATASET if PIECEWISE has NOT been called. The type should be the type of the attribute at the current position if PIECEWISE has been called.

Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
   self              IN OUT NOCOPY ANYDATASET,
   dbl               IN BINARY_DOUBLE,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
   self              IN OUT NOCOPY ANYDATASET,
   fl                IN BINARY_FLOAT,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
   self              IN OUT NOCOPY ANYDATASET,
   b                 IN BFILE,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
   self              IN OUT NOCOPY ANYDATASET,
   b                 IN BLOB,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
   self              IN OUT NOCOPY ANYDATASET,
   c                 IN CHAR,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
   self              IN OUT NOCOPY ANYDATASET,
   c                 IN CLOB,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
   self              IN OUT NOCOPY ANYDATASET,
   col               IN "<collection_type>",
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
   self              IN OUT NOCOPY ANYDATASET,
   dat               IN DATE,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
   self              IN OUT NOCOPY ANYDATASET,
   inv               IN INTERVAL DAY TO SECOND,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
   self              IN OUT NOCOPY ANYDATASET,
```

```
   inv               IN INTERVAL YEAR TO MONTH,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
   self              IN OUT NOCOPY ANYDATASET,
   nc                IN NCHAR,
   last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
  self               IN OUT NOCOPY ANYDATASET,
  nc                 IN NClob,
  last_elem          IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
   self               IN OUT NOCOPY ANYDATASET,
   num                IN NUMBER,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
   self              IN OUT NOCOPY ANYDATASET,
   nc                IN NVarchar2,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
   self               IN OUT NOCOPY ANYDATASET,
   obj                IN "<object_type>",
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
   self               IN OUT NOCOPY ANYDATASET,
   r                  IN RAW,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
   self               IN OUT NOCOPY ANYDATASET,
   rf                 IN REF "<object_type>",
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
   self               IN OUT NOCOPY ANYDATASET,
   ts                 IN TIMESTAMP,
   last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPLTZ(
   self              IN OUT NOCOPY ANYDATASET,
   ts                IN TIMESTAMP WITH LOCAL TIME ZONE,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPTZ(
   self              IN OUT NOCOPY ANYDATASET,
   ts                IN TIMESTAMP WITH TIME ZONE,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETUROWID(
   self               IN OUT NOCOPY ANYDATASET,
   rid                IN UROWID,
   last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR(
   self               IN OUT NOCOPY ANYDATASET,
```

```
   c                IN VARCHAR,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
   self             IN OUT NOCOPY ANYDATASET,
   c                IN VARCHAR2,
   last_elem BOOLEAN DEFAULT FALSE);
```

Parameters

Table 269–11 SET* Procedure Parameters

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information, that is to be set.
last_elem	Relevant only if PIECEWISE has been already called (for a collection). Set to TRUE if it is the last element of the collection, FALSE otherwise.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid parameters (if it is not appropriate to add a number at this point in the creation process).
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
- DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

270

ANYTYPE TYPE

An `ANYTYPE TYPE` can contain a type description of any persistent SQL type, named or unnamed, including object types and collection types. It can also be used to construct new transient type descriptions.

New persistent types can only be created using the `CREATE TYPE` statement. Only new transient types can be constructed using the `ANYTYPE` interfaces.

This chapter discusses the following:

Summary of ANYTYPE Subprograms

Table 270–1 ANYTYPE Type Subprograms

Subprogram	Description
BEGINCREATE Static Procedure on page 270-3	Creates a new instance of `ANYTYPE` which can be used to create a transient type description.
SETINFO Member Procedure on page 270-4	Sets any additional information required for constructing a `COLLECTION` or builtin type.
ADDATTR Member Procedure on page 270-6	Adds an attribute to an `ANYTYPE` (of typecode `DBMS_TYPES.TYPECODE_OBJECT`).
ENDCREATE Member Procedure on page 270-7	Ends creation of a transient `ANYTYPE`. Other creation functions cannot be called after this call.
GETPERSISTENT Static Function on page 270-8	Returns an `ANYTYPE` corresponding to a persistent type created earlier using the `CREATE TYPE` SQL statement.
GETINFO Member Function on page 270-9	Gets the type information for the `ANYTYPE`.
GETATTRELEMINFO Member Function on page 270-10	Gets the type information for an attribute of the type (if it is of `TYPECODE_OBJECT`). Gets the type information for a collection's element type if the *self* parameter is of a collection type.

BEGINCREATE Static Procedure

This procedure creates a new instance of ANYTYPE which can be used to create a transient type description.

Syntax

```
STATIC PROCEDURE BEGINCREATE(
   typecode       IN          PLS_INTEGER,
   atype          OUT NOCOPY  ANYTYPE);
```

Parameters

Table 270–2 BEGINCREATE Procedure Parameters

Parameter	Description
typecode	Use a constant from DBMS_TYPES package. Typecodes for user-defined type: ■ DBMS_TYPES.TYPECODE_OBJECT ■ DBMS_TYPES.TYPECODE_VARRAY or ■ DBMS_TYPES.TYPECODE_TABLE Typecodes for builtin types: ■ DBMS_TYPES.TYPECODE_NUMBER, and similar types.
atype	ANYTYPE for a transient type

SETINFO Member Procedure

This procedure sets any additional information required for constructing a COLLECTION or builtin type.

Syntax

```
MEMBER PROCEDURE SETINFO(
   self          IN OUT NOCOPY ANYTYPE,
   prec          IN PLS_INTEGER,
   scale         IN PLS_INTEGER,
   len           IN PLS_INTEGER,
   csid          IN PLS_INTEGER,
   csfrm         IN PLS_INTEGER,
   atype         IN ANYTYPE DEFAULT NULL,
   elem_tc       IN PLS_INTEGER DEFAULT NULL,
   elem_count    IN PLS_INTEGER DEFAULT 0);
```

Parameters

Table 270–3 SETINFO Procedure Parameters

Parameter	Description
self	The transient ANYTYPE that is being constructed.
prec	Optional.Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
scale	Optional.Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.
csfrm	Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.
atype	Optional. Required if collection element typecode is a user-defined type such as TYPECODE_OBJECT, and similar others. It is also required for a built-in type that needs user-defined type information such as TYPECODE_REF. This parameter is not needed otherwise.

The Following Parameters Are Required For Collection Types

Table 270–4 SETINFO Procedure Parameters - Collection Types

Parameter	Description
elem_tc	Must be of the collection element's typecode (from DBMS_TYPES package).
elem_count	Pass 0 for elem_count if the self represents a nested table (TYPECODE_TABLE). Otherwise pass the collection count if *self* represents a VARRAY.

Exceptions

- DBMS_TYPES.INVALID_PARAMETER: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling ENDCREATE, and similar actions.)

Usage Notes

It is an error to call this function on an ANYTYPE that represents a persistent user defined type.

ADDATTR Member Procedure

This procedure adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPECODE_OBJECT).

Syntax

```
MEMBER PROCEDURE ADDATTR(
   self          IN OUT NOCOPY ANYTYPE,
   aname         IN VARCHAR2,
   typecode      IN PLS_INTEGER,
   prec          IN PLS_INTEGER,
   scale         IN PLS_INTEGER,
   len           IN PLS_INTEGER,
   csid          IN PLS_INTEGER,
   csfrm         IN PLS_INTEGER,
   attr_type     IN ANYTYPE DEFAULT NULL);
```

Parameters

Table 270–5 ADDATTR Procedure Parameters

Parameter	Description
self	The transient ANYTYPE that is being constructed. Must be of type DBMS_TYPES.TYPECODE_OBJECT.
aname	Optional. Attribute's name. Could be NULL.
typecode	Attribute's typecode. Can be built-in or user-defined typecode (from DBMS_TYPES package).
prec	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
scale	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Give length.
csid	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.
csfrm	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.
attr_type	Optional. ANYTYPE corresponding to a user-defined type. This parameter is required if the attribute is a user defined type.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling EndCreate, and similar actions.)

ENDCREATE Member Procedure

This procedure ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE ENDCREATE(
   self           IN OUT NOCOPY ANYTYPE);
```

Parameter

Table 270–6 ENDCREATE Procedure Parameter

Parameter	Description
self	The transient ANYTYPE that is being constructed.

GETPERSISTENT Static Function

This procedure returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

Syntax

```
STATIC FUNCTION GETPERSISTENT(
   schema_name      IN VARCHAR2,
   type_name        IN VARCHAR2,
   version          IN VARCHAR2 DEFAULT NULL)
   RETURN           ANYTYPE;
```

Parameters

Table 270–7 GETPERSISTENT Function Parameters

Parameter	Description
schema_name	Schema name of the type.
type_name	Type name.
version	Type version.

Return Values

An ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

GETINFO Member Function

This function gets the type information for the ANYTYPE.

Syntax

```
MEMBER FUNCTION GETINFO (
   self        IN ANYTYPE,
   prec        OUT PLS_INTEGER,
   scale       OUT PLS_INTEGER,
   len         OUT PLS_INTEGER,
   csid        OUT PLS_INTEGER,
   csfrm       OUT PLS_INTEGER,
   schema_name OUT VARCHAR2,
   type_name   OUT VARCHAR2,
   version     OUT varchar2,
   numelems    OUT PLS_INTEGER)
   RETURN      PLS_INTEGER;
```

Parameters

Table 270–8 GETINFO Function Parameters

Parameter	Description
self	The ANYTYPE.
prec	If typecode represents a number. Gives precision and scale. Ignored otherwise.
scale	If typecode represents a number. Gives precision and scale. Ignored otherwise.
len	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.
schema_name	Type's schema (if persistent).
type_name	Type's typename.
version	Type's version.
numelems	If *self* is a TYPECODE_VARRAY, this gives the VARRAY count. If self is of TYPECODE_OBJECT, this gives the number of attributes.

Return Values

The typecode of *self*.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly Constructed).

GETATTRELEMINFO Member Function

This function gets the type information for an attribute of the type (if it is of TYPECODE_OBJECT). Gets the type information for a collection's element type if the *self* parameter is of a collection type.

Syntax

```
MEMBER FUNCTION GETATTRELEMINFO (
   self           IN ANYTYPE,
   pos            IN PLS_INTEGER,
   prec           OUT PLS_INTEGER,
   scale          OUT PLS_INTEGER,
   len            OUT PLS_INTEGER,
   csid           OUT PLS_INTEGER,
   csfrm          OUT PLS_INTEGER,
   attr_elt_type  OUT ANYTYPE
   aname          OUT VARRCHAR2)
   RETURN         PLS_INTEGER;
```

Parameters

Table 270–9 GETATTRELEMINFO Function Parameters

Parameter	Description
self	The ANYTYPE.
pos	If self is of TYPECODE_OBJECT, this gives the attribute position (starting at 1). It is ignored otherwise.
prec	If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.
scale	If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.
len	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid, csfrm	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2. Gives character set ID, character set form.
attr_elt_type	If attribute/collection element typecode represents a user-defined type, this returns the ANYTYPE corresponding to it. User can subsequently describe the *attr_elt_type*.
aname	Attribute name (if it is an attribute of an object type, NULL otherwise).

Return Values

The typecode of the attribute or collection element.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly constructed).

271

Oracle Database Advanced Queuing (AQ) Types

This chapter describes the types used with Oracle Database Advanced Queuing (AQ) packages for PL/SQL, `DBMS_AQ`, and `DBMS_AQADM`.

> **See Also:** *Oracle Database Advanced Queuing User's Guide* for information about using Oracle Database Advanced Queuing.

This chapter contains the following topics:

Using Oracle Database Advanced Queuing Types

This section contains the following topic:

- Security Model

Security Model

PUBLIC is granted EXECUTE privilege on the types described in this chapter.

Summary of Types

- AQ$_AGENT Type
- AQ$_AGENT_LIST_T Type
- AQ$_DESCRIPTOR Type
- AQ$_NTFN_DESCRIPTOR Type
- AQ$_POST_INFO Type
- AQ$_POST_INFO_LIST Type
- AQ$_PURGE_OPTIONS_T Type
- AQ$_RECIPIENT_LIST_T Type
- AQ$_REG_INFO Type
- AQ$_REG_INFO_LIST Type
- AQ$_SUBSCRIBER_LIST_T Type
- DEQUEUE_OPTIONS_T Type
- ENQUEUE_OPTIONS_T Type
- SYS.MSG_PROP_T Type
- MESSAGE_PROPERTIES_T Type
- MESSAGE_PROPERTIES_ARRAY_T Type
- MSGID_ARRAY_T Type

AQ$_AGENT Type

This type identifies a producer or a consumer of a message.

Syntax

```
TYPE SYS.AQ$_AGENT IS OBJECT (
   name       VARCHAR2(30),
   address    VARCHAR2(1024),
   protocol   NUMBER  DEFAULT 0);
```

Attributes

Table 271–1 AQ$_AGENT Attributes

Attribute	Description
`name`	Name of a producer or consumer of a message. The name must follow object name guidelines in the *Oracle Database SQL Language Reference* with regard to reserved characters.
`address`	Protocol-specific address of the recipient. If the protocol is `0`, then the address is of the form [*schema*.]*queue*[@*dblink*]. For example, a queue named `emp_messages` in the `HR` queue at the site `dbs1.net` has the address: hr.emp_messages@dbs1.net
`protocol`	Protocol to interpret the address and propagate the message. Protocols 1-127 are reserved for internal use. If the protocol number is in the range 128 - 255, the address of the recipient is not interpreted by Oracle Database Advanced Queuing.

AQ$_AGENT_LIST_T Type

This type identifies the list of agents for which `DBMS_AQ.LISTEN` listens.

See Also: "AQ$_AGENT Type" on page 271-5

Syntax

```
TYPE SYS.AQ$_AGENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
   INDEX BY BINARY INTEGER;
```

AQ$_DESCRIPTOR Type

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

See Also: "MESSAGE_PROPERTIES_T Type" on page 271-26

Syntax

```
TYPE SYS.AQ$_DESCRIPTOR IS OBJECT (
   queue_name      VARCHAR2(61),
   consumer_name   VARCHAR2(30),
   msg_id          RAW(16),
   msg_prop        MSG_PROP_T,
   gen_desc        AQ$_NTFN_DESCRIPTOR,
   msgid_array     SYS.AQ$_NTFN_MSGID_ARRAY,
   ntfnsRecdInGrp  NUMBER);
```

Attributes

Table 271–2 AQ$_DESCRIPTOR Attributes

Attribute	Description
queue_name	Name of the queue in which the message was enqueued which resulted in the notification
consumer_name	Name of the consumer for the multiconsumer queue
msg_id	Identification number of the message
msg_prop	Message properties specified by the MSG_PROP_T type
gen_desc	Indicates the timeout specifications
msgid_array	Group notification message ID list
ntfnsRecdInGrp	Notifications received in group

AQ$_NTFN_DESCRIPTOR Type

This type is for storing a generic notification descriptor regarding PL/SQL notification flags.

Syntax

```
TYPE SYS.AQ$_NTFN_DESCRIPTOR IS OBJECT(   ntfn_flags   NUMBER)
```

Attributes

Table 271–3 AQ$_NTFN_DESCRIPTOR Attributes

Attribute	Description
`ntfn_flags`	Set to 1 if the notifications are already removed after a stipulated timeout. Set 2 to denote grouping. Default is 0.

AQ$_NTFN_MSGID_ARRAY Type

This type is for storing grouping notification data for AQ namespace, value 2^{30} which is the max varray size.

Syntax

```
TYPE SYS.AQ$_NTFN_MSGID_ARRAY   AS VARRAY(1073741824)OF RAW(16);
```

AQ$_POST_INFO Type

Specifies anonymous subscriptions to which you want to post messages.

Syntax

```
TYPE SYS.AQ$_POST_INFO IS OBJECT (
   name        VARCHAR2(128),
   namespace   NUMBER,
   payload     RAW(2000)  DEFAULT NULL);
```

Attributes

Table 271–4 AQ$_POST_INFO Attributes

Attribute	Description
`name`	Name of the anonymous subscription to which you want to post
`namespace`	To receive notifications from other applications through `DBMS_AQ.POST` or `OCISubscriptionPost()`, the namespace must be `DBMS_AQ.NAMESPACE_ANONYMOUS`
`payload`	The payload to be posted to the anonymous subscription

AQ$_POST_INFO_LIST Type

Identifies the list of anonymous subscriptions to which you want to post messages.

See Also: AQ$_POST_INFO Type on page 271-10

Syntax

```
TYPE SYS.AQ$_POST_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_POST_INFO;
```

AQ$_PURGE_OPTIONS_T Type

This type specifies the options available for purging a queue table.

See Also: PURGE_QUEUE_TABLE Procedure on page 25-48.

Syntax

```
TYPE AQ$_PURGE_OPTIONS_T is RECORD (
   block           BOOLEAN       DEFAULT FALSE
   delivery_mode   PLS_INTEGER   DEFAULT PERSISTENT);
```

Table 271–5 AQ$_PURGE_OPTIONS_T Type Attributes

Attribute	Description
`block`	`TRUE/FALSE`. ■ If `block` is `TRUE`, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueuers and dequeuers to block while the queue table is purged. The purge call always succeeds if `block` is `TRUE`. ■ The default for `block` is `FALSE`. This will not block enqueuers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.
`delivery_mode`	Kind of messages to purge, either `DBMS_AQ.BUFFERED` or `DBMS_AQ.PERSISTENT`

AQ$_RECIPIENT_LIST_T Type

Identifies the list of agents that receive the message. This type can be used only when the queue is enabled for multiple dequeues.

See Also: "AQ$_AGENT Type" on page 271-5

Syntax

```
TYPE SYS.AQ$_RECIPIENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
   INDEX BY BINARY_INTEGER;
```

AQ$_REG_INFO Type

This type identifies a producer or a consumer of a message.

Syntax

```
TYPE SYS.AQ$_REG_INFO IS OBJECT (
   name                              VARCHAR2(128),
   namespace                         NUMBER,
   callback                          VARCHAR2(4000),
   context                           RAW(2000)  DEFAULT NULL,
   qosflags                          NUMBER,
   timeout                           NUMBER
   ntfn_grouping_class               NUMBER,
   ntfn_grouping_value               NUMBER    DEFAULT 600,
   ntfn_grouping_type                NUMBER,
   ntfn_grouping_start_time          TIMESTAMP WITH TIME ZONE,
   ntfn_grouping_repeat_count   NUMBER);
```

Attributes

Table 271–6 AQ$_REG_INFO Type Attributes

Attribute	Description
`name`	Specifies the name of the subscription. The subscription name is of the form *`schema.queue`* if the registration is for a single consumer queue or *`schema.queue:consumer_name`* if the registration is for a multiconsumer queues.
`namespace`	Specifies the namespace of the subscription. To receive notification from Oracle Database Advanced Queuing queues, the namespace must be `DBMS_AQ.NAMESPACE_AQ`. To receive notifications from other applications through `DBMS_AQ.POST` or `OCISubscriptionPost()`, the namespace must be `DBMS_AQ.NAMESPACE_ANONYMOUS`.
`callback`	Specifies the action to be performed on message notification. For HTTP notifications, use `http://www.company.com:8080`. For e-mail notifications, use `mailto://xyz@company.com`. For raw message payload for the `PLSQLCALLBACK` procedure, use `plsql://`*`schema.procedure`*`?PR=0`. For user-defined type message payload converted to XML for the `PLSQLCALLBACK` procedure, use `plsql://`*`schema.procedure`*`?PR=1`
`context`	Specifies the context that is to be passed to the callback function
`qosflags`	Can be set to one or more of the following values to specify the notification quality of service: ■ `NTFN_QOS_RELIABLE`- This value specifies that reliable notification is required. Reliable notifications persist across instance and database restarts. ■ `NTFN_QOS_PAYLOAD` - This value specifies that payload delivery is required. It is supported only for client notification and only for `RAW` queues. ■ `NTFN_QOS_PURGE_ON_NTFN` - This value specifies that the registration is to be purged automatically when the first notification is delivered to this registration location.

Table 271–6 (Cont.) AQ$_REG_INFO Type Attributes

Attribute	Description
ntfn_grouping_class	Currently, only the following flag can be set to specify criterion for grouping. The default value will be 0. If ntfn_grouping_class is 0, all other notification grouping attributes must be 0. ■ NTFN_GROUPING_CLASS_TIME - Notifications grouped by time, that is, the user specifies a time value and a single notification gets published at the end of that time.
ntfn_grouping_value	Time-period of grouping notifications specified in seconds, meaning the time after which grouping notification would be sent periodically until ntfn_grouping_repeat_count is exhausted.
ntfn_grouping_type	■ NTFN_GROUPING_TYPE_SUMMARY - Summary of all notifications that occurred in the time interval. (Default) ■ NTFN_GROUPING_TYPE_LAST - Last notification that occurred in the interval.
ntfn_grouping_start_time	Notification grouping start time. Notification grouping can start from a user-specified time that should a valid timestamp with time zone. If ntfn_grouping_start_time is not specified when using grouping, the default is to current timestamp with time zone
ntfn_grouping_repeat_count	Grouping notifications will be sent as many times as specified by the notification grouping repeat count and after that revert to regular notifications. The ntfn_grouping_repeat_count, if not specified, will default to ■ NTFN_GROUPING_FOREVER - Keep sending grouping notifications forever.

Usage Notes

You can use the following notification mechanisms:

- OCI callback
- e-mail callback
- PL/SQL callback

Table 271–7 shows the actions performed for nonpersistent queues for different notification mechanisms when RAW presentation is specified. Table 271–8 shows the actions performed when XML presentation is specified.

Table 271–7 Actions Performed for Nonpersistent Queues When RAW Presentation Specified

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
RAW	OCI callback receives the RAW data in the payload.	Not supported	PL/SQL callback receives the RAW data in the payload.
Oracle object type	Not supported	Not supported	Not supported

Table 271–8 Actions Performed for Nonpersistent Queues When XML Presentation Specified

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
`RAW`	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.
`Oracle object type`	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.

AQ$_REG_INFO_LIST Type

Identifies the list of registrations to a queue.

See Also: "AQ$_REG_INFO Type" on page 271-14

Syntax

```
TYPE SYS.AQ$_REG_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_REG_INFO;
```

AQ$_SUBSCRIBER_LIST_T Type

Identifies the list of subscribers that subscribe to a queue.

See Also: "AQ$_AGENT Type" on page 271-5

Syntax

```
TYPE SYS.AQ$_SUBSCRIBER_LIST_T IS TABLE OF SYS.AQ$_AGENT
   INDEX BY BINARY_INTEGER;
```

DEQUEUE_OPTIONS_T Type

Specifies the options available for the dequeue operation.

Syntax

```
TYPE DEQUEUE_OPTIONS_T IS RECORD (
   consumer_name     VARCHAR2(30)    DEFAULT NULL,
   dequeue_mode      BINARY_INTEGER  DEFAULT REMOVE,
   navigation        BINARY_INTEGER  DEFAULT NEXT_MESSAGE,
   visibility        BINARY_INTEGER  DEFAULT ON_COMMIT,
   wait              BINARY_INTEGER  DEFAULT FOREVER,
   msgid             RAW(16)         DEFAULT NULL,
   correlation       VARCHAR2(128)   DEFAULT NULL,
   deq_condition     VARCHAR2(4000)  DEFAULT NULL,
   signature         aq$_sig_prop    DEFAULT NULL,
   transformation    VARCHAR2(61)    DEFAULT NULL,
   delivery_mode     PLS_INTEGER     DEFAULT PERSISTENT);
```

Attributes

Table 271–9 DEQUEUE_OPTIONS_T Attributes

Attribute	Description
consumer_name	Name of the consumer. Only those messages matching the consumer name are accessed. If a queue is not set up for multiple consumers, then this field should be set to NULL. For secure queues, consumer_name must be a valid AQ agent name, mapped to the database user performing the dequeue operation, through dbms_aqadm.enable_db_access procedure call.
dequeue_mode	Specifies the locking behavior associated with the dequeue. Possible settings are: BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement. LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement. REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties. REMOVE_NODATA: Mark the message as updated or deleted. The message can be retained in the queue table based on the retention properties.

Table 271–9 (Cont.) DEQUEUE_OPTIONS_T Attributes

Attribute	Description
navigation	Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Possible settings are: NEXT_MESSAGE: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then AQ retrieves the next available message that matches the search criteria and belongs to the message group. This setting is the default. NEXT_TRANSACTION: Skip the remainder of the current transaction group (if any) and retrieve the first message of the next transaction group. This setting can only be used if message grouping is enabled for the current queue. FIRST_MESSAGE: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue. FIRST_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will reset the position to the beginning of the queue and dequeue messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups. NEXT_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will dequeue the next set of messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups.
visibility	Specifies whether the new message is dequeued as part of the current transaction.The visibility parameter is ignored when using the BROWSE dequeue mode. Possible settings are: ON_COMMIT: The dequeue will be part of the current transaction. This setting is the default. IMMEDIATE: The dequeue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation.
wait	Specifies the wait time if there is currently no message available which matches the search criteria. Possible settings are: FOREVER: Wait forever. This setting is the default. NO_WAIT: Do not wait. number: Wait time in seconds.
msgid	Specifies the message identifier of the message to be dequeued.
correlation	Specifies the correlation identifier of the message to be dequeued. Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.

Table 271–9 (Cont.) DEQUEUE_OPTIONS_T Attributes

Attribute	Description
deq_condition	A conditional expression based on the message properties, the message data properties, and PL/SQL functions. A deq_condition is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the WHERE clause of a SQL query). Message properties include priority, corrid and other columns in the queue table To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The deq_condition parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.
signature	Currently not implemented
transformation	Specifies a transformation that will be applied after dequeuing the message. The source type of the transformation must match the type of the queue.
delivery_mode	The dequeuer specifies the delivery mode of the messages it wishes to dequeue in the dequeue options. It can be BUFFERED or PERSISTENT or PERSISTENT_OR_BUFFERED. The message properties of the dequeued message indicate the delivery mode of the dequeued message. Array dequeue is only supported for buffered messages with an array size of '1'.

ENQUEUE_OPTIONS_T Type

Specifies the options available for the enqueue operation.

Syntax

```
TYPE SYS.ENQUEUE_OPTIONS_T IS RECORD (
   visibility            BINARY_INTEGER  DEFAULT ON_COMMIT,
   relative_msgid        RAW(16)         DEFAULT NULL,
   sequence_deviation    BINARY_INTEGER  DEFAULT NULL,
   transformation        VARCHAR2(61)    DEFAULT NULL,
   delivery_mode         PLS_INTEGER     NOT NULL DEFAULT PERSISTENT);
```

Attributes

Table 271–10 ENQUEUE_OPTIONS_T Attributes

Attribute	Description
visibility	Specifies the transactional behavior of the enqueue request. Possible settings are: ON_COMMIT: The enqueue is part of the current transaction. The operation is complete when the transaction commits. This setting is the default. IMMEDIATE: The enqueue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation. This is the only value allowed when enqueuing to a non-persistent queue.
relative_msgid	Specifies the message identifier of the message which is referenced in the sequence deviation operation. This field is valid only if BEFORE is specified in sequence_deviation. This parameter is ignored if sequence deviation is not specified.
sequence_deviation	Specifies whether the message being enqueued should be dequeued before other messages already in the queue. Possible settings are: BEFORE: The message is enqueued ahead of the message specified by relative_msgid. TOP: The message is enqueued ahead of any other messages.
transformation	Specifies a transformation that will be applied before enqueuing the message. The return type of the transformation function must match the type of the queue.
delivery_mode	The enqueuer specifies the delivery mode of the messages it wishes to enqueue in the enqueue options. It can be BUFFERED or PERSISTENT. The message properties of the enqueued message indicate the delivery mode of the enqueued message. Array enqueue is only supported for buffered messages with an array size of '1'.

SYS.MSG_PROP_T Type

This type is used in PL/SQL notification, as one field in aq$_descriptor, to pass message properties of an AQ message to the PL/SQL notification client callback.

Syntax

```
CREATE or replace TYPE sys.msg_prop_t AS OBJECT (
   priority         NUMBER,
   delay            NUMBER,
   expiration       NUMBER,
   correlation      VARCHAR2(128),
   attempts         NUMBER,
   exception_queue  VARCHAR2(51),
   enqueue_time     DATE,
   state            NUMBER,
   sender_id        aq$_agent,
   original_msgid   RAW(16),
   delivery_mode    NUMBER);
```

Parameters

Table 271–11 SYS.MSG_PROP_T Type Attributes

Parameter	Description
priority	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
delay	Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by msgid overrides the delay specification. A message enqueued with delay set is in the WAITING state, and when the delay expires, the message goes to the READY state. DELAY processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: NO_DELAY: The message is available for immediate dequeuing number: The number of seconds to delay the message
expiration	Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: NEVER: The message does not expire number: The number of seconds message remains in READY state. If the message is not dequeued before it expires, then it is moved to the exception queue in the EXPIRED state.
correlation	Returns the identifier supplied by the producer of the message at enqueue time.

Table 271–11 (Cont.) SYS.MSG_PROP_T Type Attributes

Parameter	Description
attempts	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.
exception_queue	Specifies the name of the queue into which the message is moved if it cannot be processed successfully. Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases: ■ RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation. For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. ■ A message was not dequeued before the expiration time elapsed. ■ Message propagation to the specified destination queue failed with one of the following errors: * There were no recipients for the multiconsumer destination queue. * Recipients were specified for a single-consumer destination queue. * Destination queue was an exception queue * There was an error when applying transformation. The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.
enqueue_time	Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.
state	Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow: ■ DBMS_AQ.READY: The message is ready to be processed. ■ DBMS_AQ.WAITING: The message delay has not yet been reached. ■ DBMS_AQ.PROCESSED: The message has been processed and is retained. ■ DBMSAQ.EXPIRED: The message has been moved to the exception queue.

Table 271–11 (Cont.) SYS.MSG_PROP_T Type Attributes

Parameter	Description
sender_id	The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]
original_msgid	This parameter is used by Oracle Database Advanced Queuing for propagating messages.
delivery_mode	DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT.

MESSAGE_PROPERTIES_T Type

This type is defined inside the DBMS_AQ package, and describes the information that AQ uses to convey the state of individual messages. These are set at enqueue time, and their values are returned at dequeue time.

See Also: AQ$_RECIPIENT_LIST_T Type on page 271-13

Syntax

```
TYPE message_properties_t IS RECORD (
   priority               BINARY_INTEGER  NOT NULL DEFAULT 1,
   delay                  BINARY_INTEGER  NOT NULL DEFAULT NO_DELAY,
   expiration             BINARY_INTEGER  NOT NULL DEFAULT NEVER,
   correlation            VARCHAR2(128)   DEFAULT NULL,
   attempts               BINARY_INTEGER,
   recipient_list         AQ$_RECIPIENT_LIST_T,
   exception_queue        VARCHAR2(61)    DEFAULT NULL,
   enqueue_time           DATE,
   state                  BINARY_INTEGER,
   sender_id              SYS.AQ$_AGENT   DEFAULT NULL,
   original_msgid         RAW(16)         DEFAULT NULL,
   signature              aq$_sig_prop    DEFAULT NULL,
   transaction_group      VARCHAR2(30)    DEFAULT NULL,
   user_property          SYS.ANYDATA     DEFAULT NULL
   delivery_mode          PLS_INTEGER     NOT NULL DEFAULT DBMS_AQ.PERSISTENT);
```

Attributes

Table 271–12 MESSAGE_PROPERTIES_T Attributes

Attribute	Description
priority	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
delay	Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by msgid overrides the delay specification. A message enqueued with delay set is in the WAITING state, and when the delay expires, the message goes to the READY state. DELAY processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: NO_DELAY: The message is available for immediate dequeuing number: The number of seconds to delay the message

Table 271–12 (Cont.) MESSAGE_PROPERTIES_T Attributes

Attribute	Description
`expiration`	Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: `NEVER`: The message does not expire number: The number of seconds message remains in `READY` state. If the message is not dequeued before it expires, then it is moved to the exception queue in the `EXPIRED` state.
`correlation`	Returns the identifier supplied by the producer of the message at enqueue time.
`attempts`	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.
`recipient_list`	This parameter is only valid for queues that allow multiple consumers. The default recipients are the queue subscribers. This parameter is not returned to a consumer at dequeue time. For type definition, see the "AQ$_AGENT Type" on page 271-5.

Table 271–12 (Cont.) MESSAGE_PROPERTIES_T Attributes

Attribute	Description
exception_queue	Specifies the name of the queue into which the message is moved if it cannot be processed successfully. Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases: ■ RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation. For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. ■ A message was not dequeued before the expiration time elapsed. ■ Message propagation to the specified destination queue failed with one of the following errors: * There were no recipients for the multiconsumer destination queue. * Recipients were specified for a single-consumer destination queue. * Destination queue was an exception queue * There was an error when applying transformation. The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.
enqueue_time	Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.
state	Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow: ■ DBMS_AQ.READY: The message is ready to be processed. ■ DBMS_AQ.WAITING: The message delay has not yet been reached. ■ DBMS_AQ.PROCESSED: The message has been processed and is retained. ■ DBMSAQ.EXPIRED: The message has been moved to the exception queue.

Table 271–12 (Cont.) MESSAGE_PROPERTIES_T Attributes

Attribute	Description
sender_id	The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]
original_msgid	This parameter is used by Oracle Database Advanced Queuing for propagating messages.
signature	Currently not implemented
transaction_group	Specifies the transaction_group for the dequeued message. Messages belonging to the same transaction group will have the same value for this attribute. This attribute is only set by the DBMS_AQ.DEQUEUE_ARRAY. This attribute cannot be used to set the transaction group of a message through DBMS_AQ.ENQUEUE or DBMS_AQ.ENQUEUE_ARRAY calls.
user_property	This optional attribute is used to store additional information about the payload.
delivery_mode	The message publisher specifies the delivery mode in the message_properties. This can be DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT. Array enqueue is only supported for buffered messages with an array size of '1'.

MESSAGE_PROPERTIES_ARRAY_T Type

This type is used by `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message properties. Each element in the `payload_array` should have a corresponding element in the `MESSAGE_PROPERTIES_ARRAY_T VARRAY`.

See Also: "MESSAGE_PROPERTIES_T Type" on page 271-26

Syntax

```
TYPE MESSAGE_PROPERTIES_ARRAY_T IS VARRAY (2147483647)
   OF MESSAGE_PROPERTIES_T;
```

MSGID_ARRAY_T Type

The `msgid_array_t` type is used in `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message IDs that correspond to the enqueued or dequeued messages.

Syntax

```
TYPE MSGID_ARRAY_T IS TABLE OF RAW(16) INDEX BY BINARY_INTEGER
```

272

DBFS Content Interface Types

This chapter describes public types defined to support the DBMS_DBFS_CONTENT interface.

This chapter contains the following topics:

- Using Content Types
  - Overview
  - Security Model
- Data Structures

Using Content Types

Overview

The type definitions described in this chapter support the DBMS_DBFS_CONTENT interface in implementing metadata tables, packages, views, dependent application-side entities, and service-provider entities.

Security Model

The user can access the content operational and administrative interfaces (packages, types, tables, and so on) by way of the `DBFS_ROLE`. This role can be granted to users as needed.

Data Structures

Types that support the DBMS_DBFS_CONTENT interface include both Object and Table types.

Object Types

- DBMS_DBFS_CONTENT_CONTEXT_T Object Type
- DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type
- DBMS_DBFS_CONTENT_PROPERTY_T Object Type

Table Types

- DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type
- DBMS_DBFS_CONTENT_PROPERTIES_T Table Type
- DBMS_DBFS_CONTENT_RAW_T Table Type

DBMS_DBFS_CONTENT_CONTEXT_T Object Type

This type describes the execution context for the providers. It provides the user performing the operation with the Access Control List, the owner of the item(s), a timestamp for doing `asof` queries, and whether or not the item(s) are `read_only`. This type can be used both as input, in the case of path item creation functions, and output, in the case of path item query, or both.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_context_t
    AUTHID DEFINER
AS OBJECT (
    principal     VARCHAR2(32),
    acl           VARCHAR2(1024),
    owner         VARCHAR2(32),
    asof          TIMESTAMP,
    read_only     INTEGER);
```

Fields

Table 272–1 DBMS_DBFS_CONTENT_CONTEXT_T Fields

Field	Description
`principal`	File system user
`acl`	Access control list
`owner`	Path item owner
`asof`	Timestamp
`read_only`	Nonzero if the path item is read-only

DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type

This type describes a type to assist in listing the contents of a directory.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_item_t
    AUTHID DEFINER
AS OBJECT (
    path          VARCHAR2(1024),
    item_name     VARCHAR2(256),
    item_type     INTEGER);
```

Fields

Table 272–2 DBMS_DBFS_CONTENT_LIST_ITEM_T Fields

Field	Description
`path`	Path to the path item
`item_name`	Name of the path item
`item_type`	Type of path item. (See DBMS_DBFS_CONTENT Constants - Path Name Types

DBMS_DBFS_CONTENT_PROPERTY_T Object Type

This type describes a single (`name`, `value`, `typecode`) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

The type is used by both the client-facing interfaces and by store providers for the `DBMS_DBFS_CONTENT` interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_property_t
    AUTHID DEFINER
AS OBJECT (
    propname     VARCHAR2(32),
    propvalue    VARCHAR2(1024),
    typecode     INTEGER);
```

Fields

Table 272–3 DBMS_DBFS_CONTENT_PROPERTY_T Fields

Field	Description
`prop_name`	Name of property
`prop_value`	Value of property
`typecode`	Property type (See Constants in DBMS_TYPES)

DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type

This type is a variable-sized array of DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type. It is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_items_t AS
    TABLE OF dbms_dbfs_content_list_item_t;
```

DBMS_DBFS_CONTENT_PROPERTIES_T Table Type

This type is a variable-sized array of property tuples of DBMS_DBFS_CONTENT_PROPERTY_T Object Type. It is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_properties_t AS
    TABLE OF dbms_dbfs_content_property_t;
```

DBMS_DBFS_CONTENT_RAW_T Table Type

This type is an array of `RAW`. It is to enable `RAW` data transport for batch interfaces in the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_raw_t AS
    TABLE OF RAW(32767);
```

273

Database URI TYPEs

Oracle supports the `UriType` family of types that can be used to store and query Uri-refs inside the database. The `UriType` itself is an abstract object type and the `HTTPURITYPE`, `XDBURITYPE` and `DBURITYPE` are subtypes of it.

You can create a `UriType` column and store instances of the `DBURITYPE, XDBURITYPE` or the `HTTPURITYPE` inside of it. You can also define your own subtypes of the `UriType` to handle different URL protocols.

Oracle also provides a `UriFactory` package that can be used as a factory method to automatically generate various instances of these `UriTypes` by scanning the prefix, such as `http://` or `/oradb`. You can also register your subtype and provide the prefix that you support. For instance, if you have written a subtype to handle the gopher protocol, you can register the prefix `gopher://` to be handled by your subtype. The `UriFactory` will then generate your subtype instance for any URL starting with that prefix.

This chapter contains the following topics:

- *Oracle XML DB Developer's Guide*

Summary of URITYPE Supertype Subprograms

The `UriType` is the abstract super type. It provides a standard set of functions to get the value pointed to by the URI. The actual implementation of the protocol must be defined by the subtypes of this type.

Instances of this type cannot be created directly. However, you can create columns of this type and store subtype instances in it, and also select from columns without knowing the instance of the URL stored.

Table 273–1 URITYPE Type Subprograms

Method	Description
GETBLOB on page 273-3	Returns the `BLOB` located at the address specified by the URL.
GETCLOB on page 273-4	Returns the `CLOB` located at the address specified by the URL.
GETCONTENTTYPE on page 273-5	Returns the URL, in escaped format, stored inside the `UriType` instance.
GETEXTERNALURL on page 273-6	Returns the URL, in escaped format, stored inside the `UriType` instance.
GETURL on page 273-7	Returns the URL, in non-escaped format, stored inside the `UriType` instance.
GETXML on page 273-8	Returns the `XMLType` located at the address specified by the URL.

GETBLOB

This function returns the BLOB located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

Syntax	Description
`MEMBER FUNCTION getBlob()` `RETURN BLOB;`	This function returns the BLOB located at the address specified by the URL.

`MEMBER FUNCTION getBlob(`
`  content OUT VARCHAR2)`
`RETURN BLOB;`
	This function returns the BLOB located at the address specified by the URL and the content type.

`FUNCTION getBlob(`
`  csid IN NUMBER)`
`RETURN BLOB;`
	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error

GETCLOB

This function returns the CLOB located at the address specified by the URL. This function can be overridden in the subtype instances. This function returns either a permanent CLOB or a temporary CLOB. If a temporary CLOB is returned, it must be freed. The options are described in the following table.

Syntax	Description
`MEMBER FUNCTION getClob()` `RETURN clob;`	This function returns the CLOB located at the address specified by the URL.

`MEMBER FUNCTION getClob(`
`  content OUT VARCHAR2)`
`RETURN clob;`
	This function returns the CLOB located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function can be overridden in the subtype instances. This function returns the content type as VARCHAR2.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `UriType` instance. The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the `UriType` instance. The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

GETXML

This function returns the XMLType located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

Syntax	Description
`MEMBER FUNCTION getXML()` `RETURN XMLType;`	This function returns the XMLType located at the address specified by the URL.

`MEMBER FUNCTION getXML(`
`content OUT VARCHAR2)`
`RETURN XMLType;`
	This function returns the XMLType located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

Summary of HTTPURITYPE Subtype Subprograms

The HTTPURITYPE is a subtype of the UriType that provides support for the HTTP protocol. This uses the UTL_HTTP package underneath to access the HTTP URLs. Proxy and secure wallets are not supported in this release.

Table 273–2 HTTPURITYPE Type Subprorgams

Method	Description
CREATEURI on page 273-10	Creates an instance of HTTPURITYPE from the given URI.
GETBLOB on page 273-11	Returns the BLOB located at the address specified by the URL.
GETCLOB on page 273-12	Returns the CLOB located at the address specified by the URL.
GETCONTENTTYPE on page 273-13	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL on page 273-14	Returns the URL, in escaped format, stored inside the UriType instance.
GETURL on page 273-7	Returns the URL, in non-escaped format, stored inside the UriType instance.
GETXML on page 273-16	Returns the XMLType located at the address specified by the URL
HTTPURITYPE on page 273-17	Creates an instance of HTTPURITYPE from the given URI.

CREATEURI

This static function constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix http:// in the stored URL.

Syntax

```
STATIC FUNCTION createUri(
   url IN varchar2)
RETURN HTTPURITYPE;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid HTTP URL; escaped format.

GETBLOB

This function returns the BLOB located at the address specified by the HTTP URL.

Syntax	Description
`MEMBER FUNCTION getBlob()` `RETURN blob;`	This function returns the BLOB located at the address specified by the HTTP URL.

`MEMBER FUNCTION getBlob(`
`content OUT VARCHAR2)`
`RETURN blob;`
	This function returns the BLOB located at the address specified by the HTTP URL and the content type.

`FUNCTION getBlob(`
`csid IN NUMBER)`
`RETURN BLOB;`
	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

GETCLOB

This function returns the CLOB located by the HTTP URL address. If a temporary CLOB is returned, it must be freed.

Syntax	Description
`MEMBER FUNCTION getClob()` `RETURN clob;`	Returns the CLOB located at the address specified by the HTTP URL.

`MEMBER FUNCTION getClob(`
`content OUT VARCHAR2)`
`RETURN clob;`
	Returns the CLOB located at the address specified by the HTTP URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

GETCONTENTTYPE

Returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `HTTPURITYPE` instance. The subtype instances override this member function. The `HTTPURITYPE` function does not store the prefix `http://`, but generates it for the external URL.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the `HTTPURITYPE` instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

GETXML

This function returns the XMLType located at the address specified by the URL. An error is thrown if the address does not point to a valid XML document.

Syntax	Description
`MEMBER FUNCTION getXML()` `RETURN XMLType;`	This function returns the XMLType located at the address specified by the URL.

`MEMBER FUNCTION getXML(`
`content OUT VARCHAR2)`
`RETURN XMLType;`
	This function returns the XMLType located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

HTTPURITYPE

This constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix http:// in the stored URL.

Syntax

```
CONSTRUCTOR FUNCTION HTTPURITYPE(
   url IN varchar2);
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid HTTP URL. The URL string is expected in escaped format. For example, non-url characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

Summary of DBURITYPE Subtype Subprogams

The DBURITYPE is a subtype of the UriType that provides support for DBUri-refs. A DBUri-ref is an intra-database URL that can be used to reference any row or row-column data in the database. The URL is specified as an XPath expression over a XML visualization of the database. The schemas become elements which contain tables and views. These tables and view further contain the rows and columns inside them.

Table 273–3 DBURITYPE Type Subprograms

Method	Description
CREATEURI on page 273-19	Constructs a DBURITYPE instance.
DBURITYPE on page 273-20	Creates an instance of DBURITYPE from the given URI.
GETBLOB on page 273-21	Returns the BLOB located at the address specified by the DBURITYPE instance.
GETCLOB on page 273-22	Returns the CLOB located at the address specified by the DBURITYPE instance.
GETCONTENTTYPE on page 273-23	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL on page 273-24	Returns the URL, in escaped format, stored inside the DBURITYPE instance.
GETURL on page 273-25	Returns the URL, in non-escaped format, stored inside the DBURITYPE instance.
GETXML on page 273-26	Returns the XMLType located at the address specified by the URL

CREATEURI

This static function constructs a DBURITYPE instance. Parses the URL given and creates a DBURITYPE instance.

Syntax

```
STATIC FUNCTION createUri(
   url IN varchar2)
RETURN DBURITYPE;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid DBURITYPE.

DBURITYPE

This constructs a DBURITYPE instance.

Syntax

```
CONSTRUCTOR FUNCTION DBURITYPE(
   url IN varchar2);
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid DBURITYPE. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

GETBLOB

This function returns the BLOB located at the address specified by the URL. The options are described in the following table.

Syntax	Description
`MEMBER FUNCTION getBlob()` `RETURN blob;`	This function returns the BLOB located at the address specified by the URL.

`MEMBER FUNCTION getBlob(`
`content OUT VARCHAR2)`
`RETURN blob;`
	This function returns the BLOB located at the address specified by the URL and the content type.

`FUNCTION getBlob(`
`csid IN NUMBER)`
`RETURN BLOB;`
	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

GETCLOB

This function returns the CLOB located at the address specified by the DBURITYPE instance. If a temporary CLOB is returned, it must be freed. The document returned may be an XML document or a text document. When the DBUri-ref identifies an element in the XPath, the result is a well-formed XML document. On the other hand, if it identifies a text node, then what is returned is only the text content of the column or attribute. The options are described in the following table.

Syntax	Description
`MEMBER FUNCTION getClob()` `RETURN clob;`	Returns the CLOB located at the address specified by the DBURITYPE instance.

`MEMBER FUNCTION getClob(`
`  content OUT VARCHAR2)`
`RETURN clob;`
	Returns the CLOB located at the address specified by the DBURITYPE instance and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the DBURITYPE instance. The DBUri servlet URL that processes the DBURITYPE has to be appended before using the escaped URL in Web pages.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the DBURITYPE instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

GETXML

This function returns the XMLType located at the address specified by the URL. The options are described in the following table.

Syntax	Description
`MEMBER FUNCTION getXML()` `RETURN XMLType;`	This function returns the XMLType located at the address specified by the URL.

`MEMBER FUNCTION getXML(`
`content OUT VARCHAR2)`
`RETURN XMLType;`
	This function returns the XMLType located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

Summary of XDBURITYPE Subtype Subprograms

XDBURITYPE is a new subtype of URIType. It provides a way to expose documents in the Oracle XML DB hierarchy as URIs that can be embedded in any URIType column in a table. The URL part of the URI is the hierarchical name of the XML document it refers to. The optional fragment part uses the XPath syntax, and is separated from the URL part by '#'. The more general XPointer syntax for specifying a fragment is not currently supported.

Table 273–4 XDBURITYPE Type Subprograms

Method	Description
CREATEURI on page 273-28	Returns the UriType corresponding to the specified URL.
GETBLOB on page 273-29	Returns the BLOB corresponding to the contents of the document specified by the XDBURITYPE instance.
GETCLOB on page 273-22	Returns the CLOB corresponding to the contents of the document specified by the XDBURITYPE instance.
GETCONTENTTYPE on page 273-31	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL on page 273-24	Returns the URL, in escaped format, stored inside the XDBURITYPE instance.
GETURL on page 273-25	Returns the URL, in non-escaped format, stored inside the XDBURITYPE instance.
GETXML on page 273-34	Returns the XMLType corresponding to the contents of the document specified by the URL.
XDBURITYPE on page 273-35	Creates an instance of XDBURITYPE from the given URI.

CREATEURI

This static function constructs a XDBURITYPE instance. Parses the URL given and creates a XDBURITYPE instance.

Syntax

```
STATIC FUNCTION createUri(
   url IN varchar2)
RETURN XDBURITYPE
```

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid XDBURITYPE.

GETBLOB

This function returns the BLOB located at the address specified by the XDBURITYPE instance. The options are described in the following table.

Syntax	Description
`MEMBER FUNCTION getBlob()` `RETURN blob;`	This function returns the BLOB located at the address specified by the URL.

`MEMBER FUNCTION getBlob(`
`content OUT VARCHAR2)`
`RETURN blob;`
	This function returns the BLOB located at the address specified by the URL and the content type.

`FUNCTION getBlob(`
`csid IN NUMBER)`
`RETURN BLOB;`
	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

GETCLOB

This function returns the CLOB located at the address specified by the XDBURITYPE instance. If a temporary CLOB is returned, it must be freed. The options are described in the following table.

Syntax	Description
`MEMBER FUNCTION getClob()` `RETURN clob;`	Returns the CLOB located at the address specified by the XDBUriType instance.

`MEMBER FUNCTION getClob(`
`content OUT VARCHAR2)`
`RETURN clob;`
	Returns the CLOB located at the address specified by the XDBUriType instance and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function returns the content type as `VARCHAR2`.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `XDBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the `XDBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

GETXML

This function returns the XMLType located at the address specified by the URL. The options are described in the following table.

Syntax	Description
`MEMBER FUNCTION getXML()` `RETURN XMLType;`	This function returns the XMLType located at the address specified by the URL.

`MEMBER FUNCTION getXML(`
`content OUT VARCHAR2)`
`RETURN XMLType;`
	This function returns the XMLType located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

XDBURITYPE

This constructs a XDBURITYPE instance.

Syntax

```
CONSTRUCTOR FUNCTION XDBURITYPE(
   url     IN   VARCHAR2,
   flags   IN   RAW := NULL)
 RETURN self AS RESULT;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid XDBUriType. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.
flags	(IN)	Possible values are: ■ 1 - Expand all XInclude elements before returning the result contents. If any XInclude element cannot be successfully resolved according to the XInclude fallback semantics, then an error is raised. ■ 2 - Indicates that any errors during document retrieval should be suppressed ■ 3 - Both flag bits (1, 2) are enabled

Summary of URIFACTORY Package Subprograms

The `UriFactory` package contains factory methods that can be used to generate the appropriate instance of the URI types without having to hard code the implementation in the program.

The `UriFactory` package also provides the ability to register new subtypes of the `UriType` to handle various other protocols. For example, you can invent a new protocol `ecom://` and define a subtype of the `UriType` to handle that protocol and register it with `UriFactory`. After that any factory method would generate the new subtype instance if it sees the `ecom://` prefix.

Table 273–5 URIFACTORY Type Subprograms

Method	Description
GETURI on page 273-37	Returns the correct URL handler for the given URL string.
ESCAPEURI on page 273-38	Returns a URL in escaped format.
UNESCAPEURI on page 273-39	Returns a URL in unescaped format.
REGISTERURLHANDLER on page 273-40	Registers a particular type name for handling a particular URL.
UNREGISTERURLHANDLER on page 273-41	Unregisters a URL handler.

GETURI

This factory method returns the correct URI handler for the given URI string. It returns a subtype instance of the `UriType` that can handle the protocol. By default, it always creates an `XDBURITYPE` instance, if it cannot resolve the URL. A URL handler can be registered for a particular prefix using the REGISTERURLHANDLER function. If the prefix matches, GETURI would then use that subtype.

Syntax

```
FUNCTION getUri(
   url IN Varchar2)
RETURN UriType;
```

Parameter	IN / OUT	Description
`uri`	`(IN)`	The URL string, in escaped format, containing a valid HTTP URL.

ESCAPEURI

This function returns a URL in escaped format. The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the GETEXTERNALURL function or the GETURI function to get to the URL value instead of using the attribute present in the `UriType`.

Syntax

```
MEMBER FUNCTION escapeUri()
RETURN varchar2;
```

Parameter	IN / OUT	Description
`url`	`(IN)`	The URL string to be returned in escaped format.

UNESCAPEURI

This function returns a URL in unescaped format. This function is the reverse of the ESCAPEURI function. This function scans the string and converts any non-URL hexadecimal characters into the equivalent UTF-8 characters. Since the return type is a VARCHAR2, the characters would be converted into the equivalent characters as defined by the database character set.

Syntax

```
FUNCTION unescapeUri()
RETURN varchar2;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string to be returned in unescaped format.

REGISTERURLHANDLER

Registers a particular type name for handling a particular URL. The type specified must be valid and must be a subtype of the `UriType` or one of its subtypes. It must also implement the `createUri` static member function. This function is called by the GETURI function to generate an instance of the type. The `stripprefix` parameter indicates that the prefix must be stripped off before calling this function.

Syntax

```
PROCEDURE registerUrlHandler(
   prefix IN varchar2,
   schemaName IN varchar2,
   typename IN varchar2,
   ignoreCase IN boolean := true,
   stripprefix IN boolean := true);
```

Parameter	IN / OUT	Description
`prefix`	`(IN)`	The prefix to handle; for example, `http://`.
`schemaName`	`(IN)`	Name of the schema where the type resides; case sensitive.
`typename`	`(IN)`	The name of the type to handle the URL; case sensitive.
`ignoreCase`	`(IN)`	Ignore case when matching prefixes.
`stripprefix`	`(IN)`	Strip prefix before generating the instance of the type.

UNREGISTERURLHANDLER

This procedure unregisters a URL handler. This only unregisters user registered handler prefixes and not predefined system prefixes such as `http://`.

Syntax

```
PROCEDURE unregisterUrlHandler(
   prefix IN varchar2);
```

Parameter	IN / OUT	Description
`prefix`	`(IN)`	The prefix to be unregistered.

274

JMS Types

PL/SQL users can use the `DBMS_AQ` package to enqueue and dequeue messages from JMS queues. The JMS types member and static functions and procedures in this chapter are needed to populate JMS messages for enqueuing or to interpret a dequeued JMS message.

This chapter contains these topics:

Using JMS Types

Overview

Java Message Service (JMS) is a well known public standard interface for accessing messaging systems. Oracle JMS (OJMS) implements JMS based on Oracle Streams Advanced Queuing (AQ) and a relational database system (RDBMS). Messages are stored in queues as OJMS specific ADTs. Java clients use OJMS packages to enqueue, dequeue, and manipulate these messages.

PL/SQL users, on the other hand, use the `DBMS_AQ` package to enqueue and dequeue JMS messages and the member functions in this chapter to populate and interpret them. Oracle Database Advanced Queuing offers such member functions for the following JMS ADTs:

- `aq$_jms_header`
- `aq$_jms_message`
- `aq$_jms_text_message`
- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

In addition to these populating and interpreting member functions, Oracle Database Advanced Queuing offers:

- Casting between `aq$_jms_message` and other message ADTs.
- PL/SQL stored procedures for converting JMS selectors to equivalent Oracle Database Advanced Queuing rules

Security Model

PUBLIC is granted EXECUTE privilege on the following JMS types:

- SYS.AQ$_JMS_MESSAGE Type
- SYS.AQ$_JMS_TEXT_MESSAGE Type
- SYS.AQ$_JMS_BYTES_MESSAGE Type
- SYS.AQ$_JMS_MAP_MESSAGE Type
- SYS.AQ$_JMS_STREAM_MESSAGE Type
- SYS.AQ$_JMS_OBJECT_MESSAGE Type
- SYS.AQ$_JMS_NAMEARRAY Type
- SYS.AQ$_JMS_VALUE Type
- SYS.AQ$_JMS_EXCEPTION Type

Java Versus PL/SQL Datatypes

Datatypes do not map one-to-one between PL/SQL and Java.

Some Java types, such as `BYTE` and `SHORT`, are not present in PL/SQL. PL/SQL type `INT` was chosen to represent these types. If a PL/SQL `INT` value intended to hold a Java `BYTE` or `SHORT` value exceeds the corresponding range Java enforces, an out-of-range error is thrown.

Other Java types have more than one counterpart in PL/SQL with different capabilities. A Java String can be represented by both `VARCHAR2` and `CLOB`, but `VARCHAR2` has a maximum limit of 4000 bytes. When retrieving `TEXT` data from map, stream, and bytes message types, a `CLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `VARCHAR2` or `CLOB`.

Similarly, a Java `BYTE ARRAY` can be represented by both `RAW` and `BLOB`, with `RAW` having a maximum size of 32767. When retrieving `BYTE ARRAY` data from map, stream, and bytes message types, a `BLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `RAW` or `BLOB`.

> **See Also:** JMS specification 3.11.3, Conversion Provided by StreamMessage and MapMessage

New JMS Support in Oracle Database 10*g*

In Oracle Database 10*g*, a new `AQ$_JMS_VALUE` ADT has been added in the `SYS` schema for OJMS PL/SQL users. It is specifically used to implement the `read_object` procedure of `aq$_jms_stream_message` and `get_object` procedure of `aq$_jms_map_message`, to mimic the Java general object class `Object`. `AQ$_JMS_VALUE` ADT can represent any datatype that JMS `StreamMessage` and `MapMessage` can hold.

The collection ADT `AQ$_JMS_NAMEARRAY` was added for the `getNames` method of `MapMessage`. It holds an array of names.

In this release the ADT `AQ$_JMS_EXCEPTION` was added to represent a Java exception thrown in an OJMS JAVA stored procedure on the PL/SQL side. Now you can retrieve a Java exception thrown by an OJMS stored procedure and analyze it on the PL/SQL side.

More on Bytes, Stream and Map Messages

Oracle uses Java stored procedure to implement some of the procedures of `AQ$_MAP_MESSAGE`, `AQ$_JMS_STREAM_MESSAGE`, and `AQ$_JMS_BYTES_MESSAGE` types. These types have some common functionalities that are different from `AQ$_JMS_TEXT_MESSAGE` type. This section discusses these common functionalities.

This section contains these topics:

- Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages
- Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages
- Differences Between Bytes and Stream Messages
- Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages

The major difference between map, stream, bytes, and other messages is that the message payload is encoded as a byte stream by JAVA. Retrieving and updating these payloads in PL/SQL therefore requires Oracle JAVA stored procedures.

A message payload is stored in two places during processing. On the PL/SQL side it is stored as the data members of a JMS message ADT, and on the Jserv side it is stored as a static variable. (Jserv is the JVM inside Oracle Database.) When the payload is processed, the payload data is first transformed to a static variable on the Jserv side. Once the static variable is initialized, all later updates on the message payload are performed on this static variable. At the end of processing, payload data is flushed back to the PL/SQL side.

Oracle provides member procedures that maintain the status of the Jserv static variable and enforce rules when calling these member procedures. These procedures are in the following ADTs:

- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

Initialize the Jserv Static Variable

Before you make any other calls to manipulate the payload data, the Jserv static variable must be properly initialized. This is done by calling the `prepare` or `clear_body` procedure. The `prepare` procedure uses the payload data in PL/SQL ADTs to initialize the static variable, while `clear_body` initializes the static variable to an empty payload (empty hashtable or stream).

Note: It is important to call the `prepare` or `clear_body` procedure before any other calls to properly initialize the Jserv static variables. Usually these two methods are called once at the beginning. But they can be called multiple times for one message. Any call of these two methods without first calling the `flush` procedure wipes out all updates made to the messages.

Get the Payload Data Back to PL/SQL

Calling the `flush` procedure synchronizes changes made to the Jserv static variable back to the PL/SQL ADTs. The `flush` call is required when you want the changes made to be reflected in the ADT payload. It is important to synchronize the changes back to the ADT, because it is the ADT payload that matters.

Garbage Collect the Static Variable

The `clean` procedure forces garbage collection of the static variable. It is there to do cleanup and free JVM memory. You can avoid memory leaks by doing it immediately after finishing processing the message.

Use a Message Store: A Static Variable Collection

Instead of a single static variable, Oracle uses a collection of static variables to process the message payload on the Jserv side. This collection is called the message store. Each map, bytes, or stream message type has its own message store within one session.

Oracle uses the operation ID parameter to locate the correct static variable to work on within the message store. Initialization calls such as `prepare` and `clear_body` give users an operation ID, which is used in later message access.

After users complete message processing, they must call the `clean` procedure with the operation ID to clean up the message store. This avoids possible memory leaks. The `clean_all` static procedures of message ADTs `aq$_jms_bytes_message`, `aq$_jms_map_message`, and `aq$_jms_stream_message` clean up all static variables of their corresponding message stores.

Typical Calling Sequences

This section describes typical procedures for retrieving and populating messages.

Here is a typical procedure for retrieving messages

1. Call `prepare` for a message.

   This call also gives you an operation ID if you do not specify one.
2. Call multiple retrieving procedures with the provided operation ID.
3. Call the `clean` procedure with the provided operation ID.

Here is a typical procedure for populating messages:

1. Call `clear_body` for a message.

   For `aq$_jms_map_message`, you can also call `prepare` to update the message based on the existing payload. This call also gives you an operation ID if you do not specify one.
2. Call multiple updating procedures with the provided operation ID.
3. Call the `flush` method with the provided operation ID.
4. Call the `clean` procedure with the provided operation ID.

Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages

According to the JMS specification, when a message is received, its body is read-only. Users can call the `clear_body` method to make the body writable. This method erases the current message body and sets the message body to be empty.

The OJMS JAVA API follows the rule set by JMS specification. In updating the JMS message ADTs in PL/SQL, however, Oracle enforces the rule selectively:

- Map messages

  The restriction is relaxed, because adding more entries on top of a existing map payload is a convenient way for users to update the payload. Therefore there are no read-only or write-only modes for map messages.

- Stream and bytes messages

  The restriction is not relaxed, because these payloads use a stream when reading and writing data. It is difficult to update the payload while in the middle of a stream. Oracle enforces read-only and write-only modes in processing stream and bytes message payloads. Calling the `prepare` procedure initializes the message payload in read-only mode. Calling the `clear_body` procedure initializes the message payload in write-only mode.

  Calling the `reset` procedure resets the pointer to the beginning of the stream and switches the mode from write-only to read-only. The `reset` procedure keeps the updates made to the message payload in the Jserv static variable.

  The `prepare` procedure, on the other hand, overwrites the message payload in the Jserv static variable with the payload in the PL/SQL ADT.

  Oracle provides member function `get_mode` for users to query the mode.

Differences Between Bytes and Stream Messages

Member functions of bytes messages are not exactly the same as those of stream messages. Stream messages are encoded using Java `ObjectOutputStream` and bytes messages are encoded using Java `DataOutputStream`. In stream messages each primitive type is written and read as a Java Object, but in a bytes message they are written and read as raw bytes according to the encoding mechanism of `DataOutputStream`.

For stream messages, the `read_bytes` method works on a stream of bytes to the end of the byte array field written by the corresponding `write_bytes` method. The `read_bytes` method of bytes message works on a stream of bytes to the end of the whole byte stream. This is why the `read_bytes` member procedure of `aq$_bytes_message` also requires a `length` parameter to tell how long it is to read.

You will not see a type conversion error raised by bytes message, because bytes messages do not support type conversion.

Methods `get_unsigned_byte` and `get_unsigned_short` are available for bytes messages, but not for stream messages. This is because stream messages read Java objects, and there are no Java objects as unsigned bytes or unsigned shorts.

Methods `read_string` and `write_string` methods are not available for bytes messages. The bytes message ADT must enforce some character encoding. It has methods `read_utf` and `write_utf` which support `utf-8` encoding.

Note: All data written by bytes messages use `DataOutputStream` as the basis. See JDK API documentation JavaSoft.com for details on how the data is encoded into bytes.

Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

The payloads of bytes, map, and stream message types are stored as either `RAW` or `BLOB` in the database. In this release Oracle Database Advanced Queuing provides the following member functions to set and get these payloads as raw bytes without interpreting them:

```
set_bytes(payload IN BLOB)
set_bytes(payload IN RAW)
get_bytes(payload OUT BLOB)
get_bytes(payload OUT RAW)
```

These functions were provided for bytes messages in Oracle9*i* Release 2 (9.2).

Upcasting and Downcasting Between General and Specific Messages

OJMS ADT `aq$_jms_message` is used to represent a general message, so that different types of messages can reside on the same Oracle Database Advanced Queuing queue. Oracle Database Advanced Queuing supports retrieving and populating of `aq$_jms_message` by supporting upcasting and downcasting between this ADT and ADTs of specific message types.

To read an `aq$_jms_message`, you must first downcast it to a specific message type according to its `message_type` field

To populate an `aq$_jms_message`, you must first populate a specific message and upcast it to `aq$_jms_message`. This avoids copying all member functions of other specific message ADTs to this ADT. It also guarantees that the manipulation of this ADT is consistent with other specific message ADTs.

JMS Types Error Reporting

Table 274–1 lists Oracle JMS types related errors.

Table 274–1 Oracle JMS Types Errors

ORA error number	dbms_jms_plsql package constants	Explanation
ORA-24190	ERROR_DATA_OVERFLOW	The payload data exceeds the size that an out parameter can hold. For example, the get_text procedure with a VARCHAR2 parameter of aq$_jms_text_message or get_bytes procedure with a RAW parameter of aq$_jms_bytes_message.
ORA-24191	ERROR_PROP_NAME_EXIST	Setting a property that is previous set
ORA-24192	ERROR_PROP_NAME_NULL	Occurs when setting a property with null property name.
ORA-24193	ERROR_EXCEED_RANGE	PL/SQL number type exceeds the valid range of the respective Java type. For example set_byte_property, set_short_property of aq$_jms_head ADT; set_byte and set_short of aq$_jms_map_message ADT; write_byte and write_short of aq$_jms_stream_message and aq$_jms_bytes_message ADT.
ORA-24194	ERROR_TYPE_MISMATCH	The type conversion between the Java type of the retrieving method and the Java type of a field of the payload is not valid.
ORA-24195	ERROR_MAP_TOO_LARGE	The size of the map exceeds the aq$_jms_namearray ADT capacity. The current size limit is 1024. You can use the get_names function with offset and length parameters to retrieve the name array in multiple small chunks.
ORA-24196	ERROR_WRONG_MODE	The message payload is being accessed with a wrong access mode. For example, trying to read a message payload with write-only mode or trying to write a message payload with the read-only mode.
ORA-24197	ERROR_JAVA_EXCEPTION	ORA-24197 error is raised when a Java exception is raised that does not fit in any of the other error categories. You can use the get_exception static procedure of aq$_jms_map_message, aq$_jms_bytes_message, and aq$_jms_stream_message to retrieve the exception information last thrown by the Java stored procedure. A single static variable is used to store the last exception and is overwritten if another exception is thrown before you retrieve it. A new ADT aq$_jms_exception is created to represent the exception information on the PL/SQL side.
ORA-24198	ERROR_INVALID_ID	An invalid operation ID is being provided to access a message.
ORA-24199	ERROR_STORE_OVERFLOW	The number of messages (with the same type) that users are trying to manipulate exceeds the size of the message store on the Java stored procedure side. The current size of the store is 20. It unusual to need to manipulate more than 20 messages at the same time. A common mistake is to forget to call the clean procedure after using one message. The clean procedure frees the message slot for use by other messages attempting access.

Oracle JMS Type Constants

This section lists some useful constants when dealing with message type functions.

DBMS_AQ Package Constants

DBMS_AQ package constants specify different types of JMS messages. They are useful when dealing with general message types during upcasting and downcasting or constructing a general message with a specific message type:

```
JMS_TEXT_MESSAGE   CONSTANT BINARY_INTEGER;
JMS_BYTES_MESSAGE  CONSTANT BINARY_INTEGER;
JMS_STREAM_MESSAGE CONSTANT BINARY_INTEGER;
JMS_MAP_MESSAGE    CONSTANT BINARY_INTEGER;
JMS_OBJECT_MESSAGE CONSTANT BINARY_INTEGER;
```

SYS.DBMS_JMS_PLSQL Package Constants

SYS.DBMS_JMS_PLSQL package constants are new in Oracle Database 10*g*.

These constants specify the mode of message payload. They are useful when interpreting the mode of the message payload returned from the get_mode function:

```
MESSAGE_ACCESS_READONLY  CONSTANT PLS_INTEGER;
MESSAGE_ACCESS_WRITEONLY CONSTANT PLS_INTEGER;
```

These constants specify the ADT type of an Oracle Database Advanced Queuing queue. They are useful during the conversion of JMS selectors to Oracle Database Advanced Queuing rules:

```
DESTPLOAD_JMSTYPE CONSTANT PLS_INTEGER;
DESTPLOAD_USERADT CONSTANT PLS_INTEGER;
DESTPLOAD_ANYDATA CONSTANT PLS_INTEGER;
```

These constants specify the type of data that can be held by a aq$_jms_value type. They are useful when interpreting the aq$_jms_value returned by the get_object method of AQ$_JMS_MAP_MESSAGE or read_object method of AQ$_JMS_STREAM_MESSAGE:

```
DATA_TYPE_BYTE           CONSTANT PLS_INTEGER;
DATA_TYPE_SHORT          CONSTANT PLS_INTEGER;
DATA_TYPE_INTEGER        CONSTANT PLS_INTEGER;
DATA_TYPE_LONG           CONSTANT PLS_INTEGER;
DATA_TYPE_FLOAT          CONSTANT PLS_INTEGER;
DATA_TYPE_DOUBLE         CONSTANT PLS_INTEGER;
DATA_TYPE_BOOLEAN        CONSTANT PLS_INTEGER;
DATA_TYPE_CHARACTER      CONSTANT PLS_INTEGER;
DATA_TYPE_STRING         CONSTANT PLS_INTEGER;
DATA_TYPE_BYTES          CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_BYTE  CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_SHORT CONSTANT PLS_INTEGER;
```

These constants specify the error number of the ORA errors that can be raised by the functions of message type ADTs. They are useful in user error handlers:

```
ERROR_DATA_OVERFLOW   CONSTANT PLS_INTEGER := -24190;
ERROR_PROP_NAME_EXIST CONSTANT PLS_INTEGER := -24191;
ERROR_PROP_NAME_NULL  CONSTANT PLS_INTEGER := -24192;
ERROR_EXCEED_RANGE    CONSTANT PLS_INTEGER := -24193;
ERROR_TYPE_MISMATCH   CONSTANT PLS_INTEGER := -24194;
ERROR_MAP_TOO_LARGE   CONSTANT PLS_INTEGER := -24195;
ERROR_WRONG_MODE      CONSTANT PLS_INTEGER := -24196;
```

```
ERROR_JAVA_EXCEPTION  CONSTANT PLS_INTEGER := -24197;
ERROR_INVALID_ID      CONSTANT PLS_INTEGER := -24198;
ERROR_STORE_OVERFLOW  CONSTANT PLS_INTEGER := -24199;
```

CONVERT_JMS_SELECTOR

Oracle Database includes three stored procedures to help users convert JMS selectors into Oracle Database Advanced Queuing rules. These rules can be used in `ADD_SUBSCRIBER` operations as subscriber rules or in `DEQUEUE` operations as dequeue conditions. These procedures are in the `SYS.dbms_jms_plsql` package.

Convert with Minimal Specification

The first procedure assumes the destination payload type is one of the JMS ADTs whose corresponding constant is `dbms_jms_plsql.DESTPLOAD_JMSTYPE` and also assumes that the J2EE compliant mode is true.

Syntax

```
Function convert_jms_selector(selector IN VARCHAR2) RETURN VARCHAR2
```

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type Specified

The second procedure takes one more parameter: `dest_pload_type`. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if this parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if `dest_pload_type` parameter is none of these three constants.

This function assumes that the J2EE compliant mode is true.

Syntax

```
Function convert_jms_selector(
   selector IN VARCHAR2,
   dest_pload_type IN PLS_INTEGER)
RETURN VARCHAR2
```

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type and Compliant Mode Specified

The third procedure takes a `dest_pload_type` parameter and a `compliant` parameter. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the

same VARCHAR2 value as the selector parameter if the dest_pload_type parameter is SYS.dbms_jms_plsql.DESTPLOAD_USERADT. The function returns null if the dest_pload_type parameter is none of these three constants.

The compliant parameter controls if the conversion is in J2EE compliant mode or not. The noncompliant conversion of a JMS selector is for backward compatibility.

Syntax

```
Function convert_jms_selector(
   selector         IN  VARCHAR2,
   dest_pload_type  IN  PLS_INTEGER,
   compliant        IN  BOOLEAN )
```

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Summary of JMS Types

- SYS.AQ$_JMS_MESSAGE Type
- SYS.AQ$_JMS_TEXT_MESSAGE Type
- SYS.AQ$_JMS_BYTES_MESSAGE Type
- SYS.AQ$_JMS_MAP_MESSAGE Type
- SYS.AQ$_JMS_STREAM_MESSAGE Type
- SYS.AQ$_JMS_OBJECT_MESSAGE Type
- SYS.AQ$_JMS_NAMEARRAY Type
- SYS.AQ$_JMS_VALUE Type
- SYS.AQ$_JMS_EXCEPTION Type

SYS.AQ$_JMS_MESSAGE Type

This ADT type can represent any of five different JMS message types: text message, bytes message, stream message, map message, or object message. Queues created using this ADT can therefore store all five types of JMS messages.

This section contains these topics:

Syntax

```
TYPE AQ$_JMS_MESSAGE AS OBJECT(
 header        aq$_jms_header,
 senderid      varchar2(100),
 message_type  INT,
 text_len      INT,
 bytes_len     INT,
 text_vc       varchar2(4000),
 bytes_raw     raw(2000),
 text_lob      clob,
 bytes_lob     blob,
 STATIC FUNCTION  construct (mtype      IN  INT)
   RETURN aq$_jms_message,
 STATIC FUNCTION  construct (text_msg   IN  aq$_jms_text_message)
   RETURN aq$_jms_message,
 STATIC FUNCTION  construct (bytes_msg  IN  aq$_jms_bytes_message)
   RETURN aq$_jms_message,
 STATIC FUNCTION  construct (stream_msg IN  aq$_jms_stream_message)
   RETURN aq$_jms_message,
 STATIC FUNCTION  construct (map_msg    IN  aq$_jms_map_message)
   RETURN aq$_jms_message,
 STATIC FUNCTION  construct (object_msg IN  aq$_jms_object_message)
   RETURN aq$_jms_message,
 MEMBER FUNCTION  cast_to_bytes_msg  RETURN aq$_jms_bytes_message,
 MEMBER FUNCTION  cast_to_map_msg    RETURN aq$_jms_map_message,
 MEMBER FUNCTION  cast_to_object_msg RETURN aq$_jms_object_message,
 MEMBER FUNCTION  cast_to_stream_msg RETURN aq$_jms_stream_message,
 MEMBER FUNCTION  cast_to_text_msg   RETURN aq$_jms_text_message,
 MEMBER PROCEDURE set_replyto  (replyto IN sys.aq$_agent),
 MEMBER PROCEDURE set_type     (type     IN  VARCHAR),
 MEMBER PROCEDURE set_userid   (userid   IN  VARCHAR),

MEMBER PROCEDURE set_bytes    (payload  IN  BLOB),
MEMBER PROCEDURE get_text     (payload  OUT VARCHAR2),
MEMBER PROCEDURE get_text     (payload  OUT CLOB),
MEMBER PROCEDURE get_bytes    (payload  OUT RAW),
MEMBER PROCEDURE get_bytes    (payload  OUT BLOB));
```

CONSTRUCT Static Functions

There are six `CONSTRUCT` static functions in this type.

STATIC FUNCTION construct (mtype IN INT) RETURN aq$_jms_message
Creates an instance of `aq$_jms_message`, which can hold a specific type of JMS message (TextMessage, BytesMessage, MapMessage, StreamMessage or ObjectMessage). The message type of the created `aq$_jms_message` instance depends on the `mtype` parameter passed to the construct method. Once a message has been constructed, it can be used to store JMS messages of the type it has been constructed to hold.

The `mtype` parameter must be one of the following constants described in "Oracle JMS Type Constants" on page 274-12:

```
DBMS_AQ.JMS_TEXT_MESSAGE
DBMS_AQ.JMS_BYTES_MESSAGE
DBMS_AQ.JMS_STREAM_MESSAGE
DBMS_AQ.JMS_MAP_MESSAGE
DBMS_AQ.JMS_OBJECT_MESSAGE
```

STATIC FUNCTION construct (text_msg IN aq$_jms_text_message) RETURN aq$_jms_message
Creates an `aq$_jms_message` from an `aq$_jms_text_message`.

STATIC FUNCTION construct (bytes_msg IN aq$_jms_bytes_message) RETURN aq$_

jms_message;
Creates an aq$_jms_message from an aq$_jms_bytes_message.

STATIC FUNCTION construct (stream_msg IN aq$_jms_stream_message) RETURN aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_stream_message.

STATIC FUNCTION construct (map_msg IN aq$_jms_map_message) RETURN aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_map_message.

STATIC FUNCTION construct (object_msg IN aq$_jms_object_message) RETURN aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_object_message.

Cast Methods

cast_to_bytes_msg RETURN aq$_jms_bytes_message
Casts an aq$_jms_message to an aq$_jms_bytes_message. Returns an aq$_jms_bytes_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_BYTES_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_BYTES_MESSAGE.

cast_to_map_msg RETURN aq$_jms_map_message
Casts an aq$_jms_message to an aq$_jms_map_message. Returns an aq$_jms_map_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_MAP_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_MAP_MESSAGE.

cast_to_object_msg RETURN aq$_jms_object_message
Casts an aq$_jms_message to an aq$_jms_object_message. Returns an aq$_jms_object_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_OBJECT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_OBJECT_MESSAGE.

cast_to_stream_msg RETURN aq$_jms_stream_message
Casts an aq$_jms_message to an aq$_jms_stream_message. Returns an aq$_jms_stream_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_STREAM_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_STREAM_MESSAGE.

cast_to_text_msg RETURN aq$_jms_text_message
Casts an aq$_jms_message to an aq$_jms_text_message. Returns an aq$_jms_text_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_TEXT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_TEXT_MESSAGE.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the replyto parameter, which corresponds to JMSReplyTo.

get_replyto RETURN sys.aq$_agent
Returns replyto, which corresponds to JMSReplyTo.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text and corresponds to `JMSType`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID`.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID`.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID`.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq`.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN VARCHAR
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value` in an internal representation (a `NUMBER` type). Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If it is not null, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `byte` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because the `INT` datatype is 38 bits in PL/SQL and Oracle Database. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_text (payload IN VARCHAR2)
Sets the payload, a `VARCHAR2` value, to an internal representation.

set_text (payload IN CLOB),
Sets the payload, a `CLOB` value, to an internal representation.

set_bytes (payload IN RAW)
Sets the payload, a `RAW` value, to an internal representation.

set_bytes (payload IN BLOB)
Sets the payload, a `BLOB` value, to an internal representation.

get_text (payload OUT VARCHAR2)
Puts the internal representation of the payload into a `VARCHAR2` variable payload.

get_text (payload OUT CLOB)
Puts the internal representation of the payload into a `CLOB` variable payload.

get_bytes (payload OUT RAW)
Puts the internal representation of the payload into a `RAW` variable payload.

get_bytes (payload OUT BLOB)
Puts the internal representation of the payload into a `BLOB` variable payload.

SYS.AQ$_JMS_TEXT_MESSAGE Type

This type is the ADT used to store a `TextMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

Syntax

```
TYPE AQ$_JMS_TEXT_MESSAGE AS OBJECT(
 header    aq$_jms_header,
 text_len  INT,
 text_vc   varchar2(4000),
 text_lob  clob,
 STATIC FUNCTION construct    RETURN aq$_jms_text_message,
 MEMBER PROCEDURE set_replyto  (replyto  IN  sys.aq$_agent),
 MEMBER PROCEDURE set_type     (type     IN  VARCHAR),
 MEMBER FUNCTION  get_replyto RETURN sys.aq$_agent,
 MEMBER FUNCTION  get_type    RETURN VARCHAR,
 MEMBER PROCEDURE set_userid   (userid   IN  VARCHAR),
 MEMBER PROCEDURE set_appid    (appid    IN  VARCHAR),
 MEMBER PROCEDURE set_groupid  (groupid  IN  VARCHAR),
 MEMBER PROCEDURE set_groupseq (groupseq IN  INT),
 MEMBER FUNCTION get_userid   RETURN VARCHAR,
 MEMBER FUNCTION get_appid    RETURN VARCHAR,
 MEMBER FUNCTION get_groupid  RETURN VARCHAR,
 MEMBER FUNCTION get_groupseq RETURN INT,
 MEMBER PROCEDURE clear_properties,
 MEMBER PROCEDURE set_boolean_property(property_name IN VARCHAR,
   property_value IN BOOLEAN),
 MEMBER PROCEDURE set_byte_property   (property_name IN VARCHAR,
   property_value IN INT),

MEMBER PROCEDURE set_text            (payload  IN  CLOB),
MEMBER PROCEDURE get_text            (payload  OUT VARCHAR2),
MEMBER PROCEDURE get_text            (payload  OUT CLOB));
```

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_text_message
Creates an empty `aq$_jms_text_message`.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN INT
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether property_name is null or exists. If not, the procedure stores property_value in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether property_name is null or exists. If not, the procedure stores property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR)
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_text (payload IN VARCHAR2)
Sets the payload, a `VARCHAR2` value, to an internal representation.

set_text (payload IN CLOB)
Sets the payload, a `CLOB` value, to an internal representation.

get_text (payload OUT VARCHAR2)
Puts the internal representation of the payload into a `VARCHAR2` variable payload.

get_text (payload OUT CLOB)
Puts the internal representation of the payload into a `CLOB` variable payload.

SYS.AQ$_JMS_BYTES_MESSAGE Type

This type is the ADT used to store a `BytesMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```
TYPE AQ$_JMS_BYTES_MESSAGE AS OBJECT(
 header     aq$_jms_header,

```

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_bytes_message
Creates an empty `aq$_jms_bytes_message`.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload in RAW)
Sets the payload, a `RAW` value, to an internal representation.

set_bytes (payload in BLOB)
Sets the payload, a `BLOB` value, to an internal representation.

get_bytes (payload out RAW)
Puts the internal representation of the payload into a `RAW` variable payload. Raises exception ORA-24190 if the length of the internal payload is more than 32767 (the maximum length of `RAW` in PL/SQL).

get_bytes (payload out BLOB)
Puts the internal representation of the payload into a `BLOB` variable payload.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in aq$_jms_bytes_message and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)
Resets the starting position of the stream to the beginning and puts the bytes message in read-only mode. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to the `aq$_jms_bytes_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session

memory. If id is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to MESSAGE_ACCESS_WRITEONLY. Later calls of read_XXX procedure raise ORA-24196 error. Users can call the reset or prepare procedures to set the message access mode to MESSAGE_ACCESS_READONLY. Write-only and read-only modes affect only the payload functions of AQ$_JMS_BYTES_MESSAGE. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)

Closes and cleans up the DataInputStream or DataOutputStream at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER

Returns the current mode of this message. The return value is either SYS.dbms_jms.plsql.MESSAGE_ACCESS_READONLY or SYS.dbms_jms.plsql.MESSAGE_ACCESS_WRITEONLY. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN

Reads a Boolean value from the bytes message and returns the Boolean value read. Null is returned if the end of the message stream has been reached. Parameter id is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads a BYTE value from the bytes message and returns the BYTE value read. Null is returned if the end of the stream has been reached. Because there is no BYTE type in PL/SQL, Oracle Database uses PLS_INTEGER to represent a BYTE. Although PL/SQL users get a PLS_INTEGER, they are guaranteed that the value is in the Java BYTE value range. If this value is issued with a write_byte function, then there will not be an out of range error. Parameter id is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_bytes (id IN PLS_INTEGER, value OUT NO COPY BLOB, length IN PLS_INTEGER) RETURN PLS_INTEGER

Reads length of the bytes from bytes message stream into value and returns the total number of bytes read. If there is no more data (because the end of the stream has been reached), then it returns -1. Raises exceptions ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_char (id IN PLS_INTEGER) RETURN CHAR
Reads a character value from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION
Reads a double from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT
Reads a float from the bytes message and returns the float read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN INT
Reads an `INT` from the bytes message and returns the `INT` read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER
Reads a long from the bytes message and returns the long read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads a short value from the bytes message and returns the short value read. Null is returned if the end of the stream has been reached. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `SHORT`. Although PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads an unsigned 8-bit number from the bytes message stream and returns the next byte from the bytes message stream, interpreted as an unsigned 8-bit number. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_short (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads an unsigned 16-bit number from the bytes message stream and returns the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_utf (id IN PLS_INTEGER, value OUT NOCOPY CLOB)
Reads a string that has been encoded using a UTF-8 format from the bytes message. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)
Writes a Boolean to the bytes message stream as a 1-byte value. The value `true` is written as the value (byte)1. The value `false` is written as the value (byte)0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_byte (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a byte to the bytes message. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW)
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN PLS_INTEGER, length IN PLS_INTEGER)
Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBounds exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)
Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBounds exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)
Writes a character value to the bytes message. If this value has multiple characters, it is the first character that is written. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)
Writes a double to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_float (id IN PLS_INTEGER, value IN FLOAT)
Writes a float to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes an `INT` to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)
Writes a long to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a short to the bytes message as two bytes, high byte first. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exception ORA-24193 if the parameter value exceeds the valid range, ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN VARCHAR2)
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN CLOB)
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

SYS.AQ$_JMS_MAP_MESSAGE Type

This type is the ADT used to store a `MapMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

Syntax

```
TYPE aq$_jms_map_message AS object(
 header     aq$_jms_header,
 bytes_len  int,
 bytes_raw  raw(2000),
 bytes_lob  blob,
 STATIC FUNCTION  construct   RETURN aq$_jms_map_message,
 MEMBER PROCEDURE set_replyto  (replyto IN sys.aq$_agent),
 MEMBER PROCEDURE set_type     (type    IN VARCHAR),

  RETURN BOOLEAN);
```

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_map_message
Creates an empty `aq$_jms_map_message` object.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether property_name is null or exists. If not, the procedure stores property_value in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether property_name is null or exists. If not, the procedure stores property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload IN RAW)
Sets the internal payload as a RAW variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a RAW variable without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as a BLOB variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a BLOB variable without interpreting it.

get_bytes (payload OUT RAW)
Puts the internal payload into a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exceptions ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)
Puts the internal payload into a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in `aq$_jms_map_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is

stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

flush (id IN PLS_INTEGER)

Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_map_message`. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

set_boolean (id IN PLS_INTEGER, name IN VARCHAR2, value IN BOOLEAN)

Sets the Boolean value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_byte (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)

Sets the `BYTE` value with the specified name in the map. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW))

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW, offset IN INT, length IN INT)

Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset … offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure and this procedure raises an ORA-24197 error. The index starts from 0.

Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB)
Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB, offset IN INT, length IN INT)
Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset … offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure, and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_char (id IN PLS_INTEGER, name IN VARCHAR2, value IN CHAR)
Sets the character value with the specified name in the map. If this value has multiple characters, then it is the first character that is used. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_double (id IN PLS_INTEGER, name IN VARCHAR2, value IN DOUBLE PRECISION)
Sets the double value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_float (id IN PLS_INTEGER, name IN VARCHAR2, value IN FLOAT)
This procedure is to set the float value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_int (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)
Sets the int value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_long (id IN PLS_INTEGER, name IN VARCHAR2, value IN NUMBER)
Sets the long value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_short (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)
Sets the short value with the specified name in the map. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a short. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN VARCHAR2)
Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN CLOB))
Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_boolean (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN
Retrieves the Boolean value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_byte (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the `BYTE` value with the specified name. If there is no item by this name, then null is returned. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `set_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY BLOB)
Retrieves the byte array value with the specified name. If there is no item by this name, then null is returned. Because the size of the array might be larger than the limit of PL/SQL `RAW` type, a `BLOB` is always returned here. The `BLOB` returned is a copy, which means it can be modified without affecting the message payload. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_char (id IN PLS_INTEGER, name IN VARCHAR2) RETURN CHAR
Retrieves and returns the character value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_double (id IN PLS_INTEGER, name IN VARCHAR2) RETURN DOUBLE PRECISION
Retrieves and returns the double value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_float (id IN PLS_INTEGER, name IN VARCHAR2) RETURN FLOAT
Retrieves the float value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_int (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the `INT` value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_long (id IN PLS_INTEGER, name IN VARCHAR2) RETURN NUMBER
Retrieves the long value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type

of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_short (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the short value with the specified name. If there is no item by this name, then null is returned. Because there is no `short` type in PL/SQL, `INT` is used to represent a `short`. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `set_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_string (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY CLOB)
Retrieves the string value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_names (id IN PLS_INTEGER) RETURN aq$_jms_namearray
Retrieves all the names within the map message and returns them in a varray. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if the size of the name array of the payload exceeds the limit. Raises exception ORA-24195 if the size of the name array or the size of a name exceeds the limit.

get_names (id IN PLS_INTEGER, names OUT aq$_jms_namearray, offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER
Retrieves a portion of the names within the map message. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if either limits are exceeded during the retrieval. (This means there is no sense to put a `length` parameter greater than 1024.) The index of the names of a map messages begins from 0. Parameter `offset` is the offset from which to start retrieving.

The function returns the number of names that have been retrieved. The names retrieved is the intersection of the interval [offset, offset+length-1] and interval [0, size-1] where size is the size of this map message. If the intersection is an empty set, then names will be returned as null and the function returns 0 as the number of names retrieved. If users iterate the names by retrieving in small steps, then this can be used to test that there are no more names to read from map message.

Raises exception ORA-24195 if the size of the name array or the size of a name exceed the limit, ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_object (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ$_JMS_VALUE)
Returns a general value ADT `AQ$_JMS_VALUE`. If there is no item by this name, then null is returned.Users can use the `type` attribute of this ADT to interpret the data. See the map in the `AQ$_JMS_VALUE` ADT for the correspondence among `dbms_jms_plsql` package constants, Java datatype and `AQ$_JMS_VALUE` attribute. Note this member procedure might bring additional overhead compared to other `get` member procedures or functions. It is used only if the user does not know the datatype of the fields within a message before hand. Otherwise it is a good idea to use a specific `get` member procedure or function. Raises exception ORA-24197 if the Java stored

procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_size (id IN PLS_INTEGER) RETURN PLS_INTEGER
Retrieves the size of the map message. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

item_exists (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN
Indicates that an item exists in this map message by returning `TRUE`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

SYS.AQ$_JMS_STREAM_MESSAGE Type

This type is the ADT used to store a `StreamMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```
TYPE aq$_jms_stream_message AS object(
 header     aq$_jms_header,

```

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_stream_message
Creates an empty `aq$_jms_stream_message` object.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

get_bytes (payload OUT RAW)
Puts the internal payload into a RAW variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exception ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)
Puts the internal payload into a BLOB variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` variable without interpreting it.

set_bytes (payload IN RAW)
Sets the internal payload as the RAW variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as raw bytes without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as the `BLOB` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `BLOB` variable without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in `aq$_jms_stream_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)
Resets the starting position of the stream to the beginning and puts the stream message in `MESSAGE_ACCESS_READONLY` mode.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_stream_message`. This procedure will not affect the underlying access mode. This

procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)
Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER
Returns the current mode of this message. The return value is either `SYS.dbms_aqjms.READ_ONLY` or SYS.`dbms_aqjms.WRITE_ONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN
Reads and returns a Boolean value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads and returns a byte value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_bytes (id IN PLS_INTEGER) RETURN BLOB
Reads and returns a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

read_bytes (id IN PLS_INTEGER, value OUT NOCOPY BLOB)
Reads a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_char (id IN PLS_INTEGER) RETURN CHAR
Reads and returns a character value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION
Reads and returns a double from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT
Reads and returns a float from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads and returns an `INT` from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER
Reads and returns a long from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads and returns a short value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `SHORT`. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the

expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_string RETURN CLOB
Reads and returns a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

read_string (id IN PLS_INTEGER, value OUT NOCOPY CLOB)
Reads a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_object (id IN PLS_INTEGER, value OUT NOCOPY AQ$_JMS_VALUE)
Returns a general value ADT `AQ$_JMS_VALUE`. Users can use the type attribute of this ADT to interpret the data. See Table 274–2 on page 274-58 for the correspondence among `dbms_jms_plsql` package constants, Java datatype and `AQ$_JMS_VALUE` attribute. This member procedure might bring additional overhead compared to other read member procedures or functions. It is used only if the user does not know the datatype of the fields within a message beforehand. Otherwise it is a good idea to use a specific read member procedure or function.

Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)
Writes a Boolean to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_byte (id IN PLS_INTEGER, value IN INT)
Writes a byte to the stream message. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW)
Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN INT, length IN INT)
Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)
Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)
Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)
Writes a character value to the stream message. If this value has multiple characters, then it is the first character that is written. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)
Writes a double to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_float (id IN PLS_INTEGER, value IN FLOAT)
Writes a float to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes an `INT` to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)
Writes a long to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a short to the stream message. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN VARCHAR2)
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN CLOB)
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

SYS.AQ$_JMS_OBJECT_MESSAGE Type

This type is the ADT used to store an `ObjectMessage` in an Oracle Database Advanced Queuing queue.

Syntax

```
TYPE aq$_jms_object_message AS object(
  header     aq$_jms_header,
  bytes_len  int,
  bytes_raw  raw(2000),
  bytes_lob  blob);
```

SYS.AQ$_JMS_NAMEARRAY Type

This type represents the name array returned by the `get_names` procedure of `aq$_jms_map_message`. The maximum number of names this type can hold is 1024. The maximum length of each name is 200 characters.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_NAMEARRAY AS VARRAY(1024) OF VARCHAR(100);
```

Usage Notes

If the names array in the message payload is greater than 1024, then use the following function to retrieve the names in multiple portions:

```
MEMBER FUNCTION get_names(id IN PLS_INTEGER, names OUT aq$_jms_namearray,
   offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER;
```

SYS.AQ$_JMS_VALUE Type

This type represents the general data returned by the `get_object` procedure of `aq$_jms_map_message` and the `read_object` procedure of `aq$_jms_stream_message`. The `type` field in this ADT is used to decide which type of data this object is really holding. Table 274–2 lists the mapping between the `sys.dbms_jms_plsql` type constants, the corresponding Java type, and the data field of ADT `aq$_jms_value` which effectively holds the data.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_VALUE AS object(
 type      number(2),
 num_val   number,
 char_val  char(1),
 text_val  clob,
 bytes_val blob);
```

Table 274–2 AQ$_JMS_VALUE Type Fields and Java Fields

Type	Java Type	aq$_jms_value Data Field
`DBMS_JMS_PLSQL.DATA_TYPE_BYTE`	byte	num_val
`DBMS_JMS_PLSQL.DATA_TYPE_SHORT`	short	num_val
`DBMS_JMS_PLSQL.DATA_TYPE_INTEGER`	int	num_val
`DBMS_JMS_PLSQL.DATA_TYPE_LONG`	long	num_val
`DBMS_JMS_PLSQL.DATA_TYPE_FLOAT`	float	num_val
`DBMS_JMS_PLSQL.DATA_TYPE_DOUBLE`	double	num_val
`DBMS_JMS_PLSQL.DATA_TYPE_BOOLEAN`	boolean	num_val: 0 FALSE, 1 TRUE
`DBMS_JMS_PLSQL.DATA_TYPE_CHARACTER`	char	char_val
`DBMS_JMS_PLSQL.DATA_TYPE_STRING`	java.lang.String	text_val
`DBMS_JMS_PLSQL.DATA_TYPE_BYTES`	byte[]	bytes_val

SYS.AQ$_JMS_EXCEPTION Type

This type represents a Java exception thrown on the Java stored procedure side. The `id` field is reserved for future use. The `exp_name` stores the Java exception name, the `err_msg` field stores the Java exception error message, and the `stack` field stores the stack trace of the Java exception.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_EXCEPTION AS OBJECT (
   id          number, -- Reserved and not used. Right now always return 0.
   exp_name    varchar(200),
   err_msg     varchar(500),
   stack       varchar(4000));
```

275

Logical Change Record TYPEs

This chapter describes the logical change record (LCR) types.

This chapter contains these topics:

Using Logical Change Record Types

This section contains topics that relate to using the logical change record (LCR) types.

Overview

In Oracle Streams, logical change records (LCRs) are message payloads that contain information about changes to a database. These changes can include changes to the data, which are data manipulation language (DML) changes, and changes to database objects, which are data definition language (DDL) changes.

When you use Oracle Streams, the capture process captures changes in the form of LCRs and enqueues them into a queue. These LCRs can be propagated from a queue in one database to a queue in another database. Finally, the apply process can apply LCRs at a destination database. You also have the option of creating, enqueuing, and dequeuing LCRs manually.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about LCRs

Security Model

PUBLIC is granted EXECUTE privilege on the types described in this chapter.

Summary of Logical Change Record Types

Table 275–1 Logical Change Record (LCR) Types

Type	Description
LCR$_DDL_RECORD Type on page 275-6	Represents a data definition language (DDL) change to a database object
LCR$_ROW_RECORD Type on page 275-15	Represents a data manipulation language (DML) change to a database object
LCR$_ROW_LIST Type on page 275-47	Identifies a list of column values for a row in a table
LCR$_ROW_UNIT Type on page 275-48	Identifies the value for a column in a row

These logical change record (LCR) types can be used with the following Oracle-supplied PL/SQL packages:

- DBMS_APPLY_ADM
- DBMS_AQ
- DBMS_AQADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS_RULE
- DBMS_RULE_ADM
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_TRANSFORM

LCR$_DDL_RECORD Type

This type represents a data definition language (DDL) change to a database object.

If you create or modify a DDL logical change record (DDL LCR), then make sure the `ddl_text` is consistent with the `base_table_name`, `base_table_owner`, `object_type`, `object_owner`, `object_name`, and `command_type` attributes.

This section contains information about the constructor for row LCRs and information about the member subprograms for this type:

- LCR$_DDL_RECORD Constructor
- Summary of LCR$_DDL_RECORD Subprograms, which also include the subprograms described in "Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD" on page 275-36

Note:

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

LCR$_DDL_RECORD Constructor

Creates a `SYS.LCR$_DDL_RECORD` object with the specified information.

```
STATIC FUNCTION CONSTRUCT(
   source_database_name  IN  VARCHAR2,
   command_type          IN  VARCHAR2,
   object_owner          IN  VARCHAR2,
   object_name           IN  VARCHAR2,
   object_type           IN  VARCHAR2,
   ddl_text              IN  CLOB,
   logon_user            IN  VARCHAR2,
   current_schema        IN  VARCHAR2,
   base_table_owner      IN  VARCHAR2,
   base_table_name       IN  VARCHAR2,
   tag                   IN  RAW       DEFAULT NULL,
   transaction_id        IN  VARCHAR2  DEFAULT NULL,
   scn                   IN  NUMBER    DEFAULT NULL,
   position              IN  RAW       DEFAULT NULL,
   edition_name          IN  VARCHAR2  DEFAULT NULL,
   root_name             IN  VARCHAR2  DEFAULT NULL)
RETURN SYS.LCR$_DDL_RECORD;
```

LCR$_DDL_RECORD Constructor Function Parameters

Table 275–2 Constructor Function Parameters for LCR$_DDL_RECORD

Parameter	Description
source_database_name	The database where the DDL statement occurred If the LCRs originated in a multitenant container database (CDB), then this field specifies the global name of the container where the DDL change occurred. If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the function specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.
command_type	The type of command executed in the DDL statement Set this parameter to a non-NULL value. **See Also:** The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types The following command types *are not supported* in DDL LCRs: ALTER MATERIALIZED VIEW ALTER MATERIALIZED VIEW LOG ALTER SUMMARY CREATE SCHEMA CREATE MATERIALIZED VIEW CREATE MATERIALIZED VIEW LOG CREATE SUMMARY DROP MATERIALIZED VIEW DROP MATERIALIZED VIEW LOG DROP SUMMARY RENAME The snapshot equivalents of the materialized view command types are also not supported.
object_owner	The user who owns the object on which the DDL statement was executed
object_name	The database object on which the DDL statement was executed

Table 275–2 (Cont.) Constructor Function Parameters for LCR$_DDL_RECORD

Parameter	Description
object_type	The type of object on which the DDL statement was executed The following are valid object types: CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW LINK represents a database link. NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.
ddl_text	The text of the DDL statement Set this parameter to a non-NULL value.
logon_user	The user whose session executed the DDL statement
current_schema	The schema that is used if no schema is specified explicitly for the modified database objects in ddl_text If a schema is specified in ddl_text that differs from the one specified for current_schema, then the function uses the schema specified in ddl_text. Set this parameter to a non-NULL value.
base_table_owner	If the DDL statement is a table-related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_owner specifies the owner of the table involved. Otherwise, base_table_owner is NULL.
base_table_name	If the DDL statement is a table-related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_name specifies the name of the table involved. Otherwise, base_table_name is NULL.
tag	A binary tag that enables tracking of the LCR For example, this tag can be used to determine the original source database of the DDL statement if apply forwarding is used. **See Also:** *Oracle Streams Replication Administrator's Guide*
transaction_id	The identifier of the transaction
scn	The SCN at the time when the change record for a captured LCR was written to the redo log The SCN value is meaningless for a user-created LCR.

Table 275–2 (Cont.) Constructor Function Parameters for LCR$_DDL_RECORD

Parameter	Description
position	The position of the LCR LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product. **See Also:** *Oracle Database XStream Guide*
edition_name	The name of the edition in which the DDL statement was executed
root_name	If the LCRs is associated with a CDB, then this field specifies the global name of the root in the CDB. If the LCR is associated with a non-CDB, then this field is NULL.

Summary of LCR$_DDL_RECORD Subprograms

Table 275–3 LCR$_DDL_RECORD Type Subprograms

Subprogram	Description
EXECUTE Member Procedure on page 275-10	Executes the LCR under the security domain of the current user
GET_BASE_TABLE_NAME Member Function on page 275-10	Gets the base (dependent) table name
GET_BASE_TABLE_OWNER Member Function on page 275-10	Gets the base (dependent) table owner
GET_CURRENT_SCHEMA Member Function on page 275-10	Gets the default schema (user) name
GET_DDL_TEXT Member Procedure on page 275-10	Gets the DDL text in a CLOB
GET_EDITION_NAME Member Function on page 275-11	Gets the name of the edition in which the DDL statement was executed
GET_LOGON_USER Member Function on page 275-11	Gets the logon user name
GET_OBJECT_TYPE Member Function on page 275-11	Gets the type of the object involved for the DDL
SET_BASE_TABLE_NAME Member Procedure on page 275-12	Sets the base (dependent) table name
SET_BASE_TABLE_OWNER Member Procedure on page 275-12	Sets the base (dependent) table owner
SET_CURRENT_SCHEMA Member Procedure on page 275-12	Sets the default schema (user) name
SET_DDL_TEXT Member Procedure on page 275-12	Sets the DDL text
SET_EDITION_NAME Member Procedure on page 275-13	Sets the name of the edition in which the DDL statement was executed
SET_LOGON_USER Member Procedure on page 275-13	Sets the logon user name
SET_OBJECT_TYPE Member Procedure on page 275-13	Sets the object type

Table 275–3 (Cont.) LCR$_DDL_RECORD Type Subprograms

Subprogram	Description
Common Subprograms	See "Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD" on page 275-36 for a list of subprograms common to the SYS.LCR$_ROW_RECORD and SYS.LCR$_DDL_RECORD types

EXECUTE Member Procedure

Executes the DDL LCR under the security domain of the current user. Apply handlers are not run when the LCR is applied using this procedure.

Note: The EXECUTE member procedure can be invoked only in an apply handler for an Oracle Streams apply process.

Syntax

```
MEMBER PROCEDURE EXECUTE;
```

GET_BASE_TABLE_NAME Member Function

Gets the base (dependent) table name.

Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_NAME()
RETURN VARCHAR2;
```

GET_BASE_TABLE_OWNER Member Function

Gets the base (dependent) table owner.

Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_OWNER()
RETURN VARCHAR2;
```

GET_CURRENT_SCHEMA Member Function

Gets the current schema name.

Syntax

```
MEMBER FUNCTION GET_CURRENT_SCHEMA()
RETURN VARCHAR2;
```

GET_DDL_TEXT Member Procedure

Gets the DDL text in a CLOB.

For example, the following PL/SQL code uses this procedure to get the DDL text in a DDL LCR:

```
CREATE OR REPLACE PROCEDURE ddl_in_lcr (ddl_lcr in SYS.LCR$_DDL_RECORD)
IS
  ddl_text   CLOB;
```

```
BEGIN
  DBMS_OUTPUT.PUT_LINE( '  ----------------------------------------' );
  DBMS_OUTPUT.PUT_LINE( '  Displaying DDL text in a DDL LCR: ' );
  DBMS_OUTPUT.PUT_LINE( '  ----------------------------------------' );
  DBMS_LOB.CREATETEMPORARY(ddl_text, true);
  ddl_lcr.GET_DDL_TEXT(ddl_text);
  DBMS_OUTPUT.PUT_LINE('DDL text:' || ddl_text);
  DBMS_LOB.FREETEMPORARY(ddl_text);
END;
/
```

Note: `GET_DDL_TEXT` is a member procedure and not a member function to make it easier for you to manage the space used by the `CLOB`. Notice that the previous example creates temporary space for the `CLOB` and then frees the temporary space when it is no longer needed.

Syntax

```
MEMBER FUNCTION GET_DDL_TEXT(
  ddl_text  IN/OUT  CLOB);
```

Parameter

Table 275–4 GET_DDL_TEXT Procedure Parameter

Parameter	Description
`ddl_text`	The DDL text in the DDL LCR

GET_EDITION_NAME Member Function

Gets the name of the edition in which the DDL statement was executed.

See Also: *Oracle Database Development Guide*

Syntax

```
MEMBER FUNCTION GET_EDITION_NAME()
RETURN VARCHAR2;
```

GET_LOGON_USER Member Function

Gets the logon user name.

Syntax

```
MEMBER FUNCTION GET_LOGON_USER()
RETURN VARCHAR2;
```

GET_OBJECT_TYPE Member Function

Gets the type of the object involved for the DDL.

Syntax

```
MEMBER FUNCTION GET_OBJECT_TYPE()
RETURN VARCHAR2;
```

SET_BASE_TABLE_NAME Member Procedure

Sets the base (dependent) table name.

Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_NAME(
   base_table_name  IN  VARCHAR2);
```

Parameter

Table 275–5 SET_BASE_TABLE_NAME Procedure Parameter

Parameter	Description
base_table_name	The name of the base table

SET_BASE_TABLE_OWNER Member Procedure

Sets the base (dependent) table owner.

Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_OWNER(
   base_table_owner  IN  VARCHAR2);
```

Parameter

Table 275–6 SET_BASE_TABLE_OWNER Procedure Parameter

Parameter	Description
base_table_owner	The name of the base table owner

SET_CURRENT_SCHEMA Member Procedure

Sets the default schema (user) name.

Syntax

```
MEMBER PROCEDURE SET_CURRENT_SCHEMA(
   current_schema  IN  VARCHAR2);
```

Parameter

Table 275–7 SET_CURRENT_SCHEMA Procedure Parameter

Parameter	Description
current_schema	The name of the schema to set as the current schema Set this parameter to a non-NULL value.

SET_DDL_TEXT Member Procedure

Sets the DDL text.

Syntax

```
MEMBER PROCEDURE SET_DDL_TEXT(
   ddl_text  IN  CLOB);
```

Parameter

Table 275–8 SET_DDL_TEXT Procedure Parameter

Parameter	Description
ddl_text	The DDL text Set this parameter to a non-NULL value.

SET_EDITION_NAME Member Procedure

Sets the name of the edition in which the DDL statement was executed.

See Also: *Oracle Database Development Guide*

Syntax

```
MEMBER PROCEDURE SET_EDITION_NAME(
   edition_name  IN  VARCHAR2);
```

Parameter

Table 275–9 SET_EDITION_NAME Procedure Parameter

Parameter	Description
edition_name	Name of the edition

SET_LOGON_USER Member Procedure

Sets the logon user name.

Syntax

```
MEMBER PROCEDURE SET_LOGON_USER(
   logon_user  IN  VARCHAR2);
```

Parameter

Table 275–10 SET_LOGON_USER Procedure Parameter

Parameter	Description
logon_user	The name of the schema to set as the logon user

SET_OBJECT_TYPE Member Procedure

Sets the object type.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_TYPE(
   object_type  IN  VARCHAR2);
```

Parameter

Table 275–11 SET_OBJECT_TYPE Procedure Parameter

Parameter	Description
object_type	The object type The following are valid object types: CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW LINK represents a database link. NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.

LCR$_ROW_RECORD Type

This type represents a data manipulation language (DML) change to a row in a table. This type uses the `LCR$_ROW_LIST` type.

If you create or modify a row logical change record (row LCR), then make sure the `command_type` attribute is consistent with the presence or absence of old column values and the presence or absence of new column values.

This section contains information about the constructor for DDL LCRs and information about the member subprograms for this type:

- LCR$_ROW_RECORD Constructor
- Summary of LCR$_ROW_RECORD Subprograms, which also include the subprograms described in Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD on page 275-36

Note:

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

See Also: LCR$_ROW_LIST Type on page 275-47

LCR$_ROW_RECORD Constructor

Creates a `SYS.LCR$_ROW_RECORD` object with the specified information.

```
STATIC FUNCTION CONSTRUCT(
   source_database_name  IN  VARCHAR2,
   command_type          IN  VARCHAR2,
   object_owner          IN  VARCHAR2,
   object_name           IN  VARCHAR2,
   tag                   IN  RAW                DEFAULT NULL,
   transaction_id        IN  VARCHAR2           DEFAULT NULL,
   scn                   IN  NUMBER             DEFAULT NULL,
   old_values            IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,
   new_values            IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,
   position              IN  RAW                DEFAULT NULL,
   root_name             IN  VARCHAR2           DEFAULT NULL)
RETURN SYS.LCR$_ROW_RECORD;
```

LCR$_ROW_RECORD Constructor Function Parameters

Table 275–12 Constructor Function Parameters for LCR$_ROW_RECORD

Parameter	Description
source_database_name	The database where the row change occurred If the LCRs originated in a CDB, then this field specifies the global name of the container where the row change occurred. If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the function specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.
command_type	The type of command executed in the DML statement Set this parameter to a non-NULL value. Valid values are the following: INSERT UPDATE DELETE LOB ERASE LOB WRITE LOB TRIM If INSERT, then ensure that the LCR has a new_values collection that is not empty and an empty or NULL old_values collection. If UPDATE, then ensure that the LCR has a new_values collection that is not empty and an old_values collection that is not empty. If DELETE, then ensure that the LCR has a NULL or empty new_values collection and an old_values collection that is not empty. If LOB ERASE, LOB WRITE, or LOB TRIM, then ensure that the LCR has a new_values collection that is not empty and an empty or NULL old_values collection.
object_owner	The user who owns the table on which the row change occurred Set this parameter to a non-NULL value.
object_name	The table on which the DML statement was executed Set this parameter to a non-NULL value.
tag	A binary tag that enables tracking of the LCR For example, this tag can be used to determine the original source database of the DML change when apply forwarding is used. **See Also:** *Oracle Streams Replication Administrator's Guide*
transaction_id	The identifier of the transaction
scn	The SCN at the time when the change record was written to the redo log The SCN value is meaningless for a user-created LCR.
old_values	The column values for the row before the DML change If the DML statement is an UPDATE or a DELETE statement, then this parameter contains the values of columns in the row before the DML statement. If the DML statement is an INSERT statement, then there are no old values.

Table 275–12 (Cont.) Constructor Function Parameters for LCR$_ROW_RECORD

Parameter	Description
new_values	The column values for the row after the DML change If the DML statement is an UPDATE or an INSERT statement, then this parameter contains the values of columns in the row after the DML statement. If the DML statement is a DELETE statement, then there are no new values. If the LCR reflects a LOB operation, then this parameter contains the supplementally logged columns and any relevant LOB information.
position	The position of the LCR LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product. **See Also:** *Oracle Database XStream Guide*
root_name	If the LCRs is associated with a CDB, then this field specifies the global name of the root in the CDB. If the LCR is associated with a non-CDB, then this field is NULL.

Summary of LCR$_ROW_RECORD Subprograms

Table 275–13 LCR$_ROW_RECORD Type Subprograms

Subprogram	Description
ADD_COLUMN Member Procedure on page 275-18	Adds the value as old or new, depending on the value type specified, for the column
CONVERT_LONG_TO_LOB_CHUNK Member Procedure on page 275-19	Converts LONG data in a row LCR into fixed width CLOB, or converts LONG RAW data in a row LCR into a BLOB
DELETE_COLUMN Member Procedure on page 275-20	Deletes the old value, the new value, or both, for the specified column, depending on the value type specified
EXECUTE Member Procedure on page 275-20	Executes the LCR under the security domain of the current user
GET_LOB_INFORMATION Member Function on page 275-21	Gets the LOB information for the column
GET_LOB_OFFSET Member Function on page 275-22	Gets the LOB offset for the specified column
GET_LOB_OPERATION_SIZE Member Function on page 275-23	Gets the operation size for the LOB column
GET_LONG_INFORMATION Member Function on page 275-23	Gets the LONG information for the column
GET_ROW_TEXT Member Procedure on page 275-24	Gets the SQL statement for the change that is encapsulated in the LCR
GET_VALUE Member Function on page 275-25	Gets the old or new value for the specified column, depending on the value type specified
GET_VALUES Member Function on page 275-25	Gets a list of old or new values, depending on the value type specified
GET_WHERE_CLAUSE Member Procedure on page 275-26	Gets a WHERE clause for the change that is encapsulated in the row LCR

Table 275–13 (Cont.) LCR$_ROW_RECORD Type Subprograms

Subprogram	Description
GET_XML_INFORMATION Member Function on page 275-28	Gets the XML information for the specified column
KEEP_COLUMNS Member Procedure on page 275-28	Keeps a list of columns a row LCR
RENAME_COLUMN Member Procedure on page 275-29	Renames a column in an LCR
SET_LOB_INFORMATION Member Procedure on page 275-29	Sets LOB information for the column
SET_LOB_OFFSET Member Procedure on page 275-30	Sets the LOB offset for the specified column
SET_LOB_OPERATION_SIZE Member Procedure on page 275-30	Sets the operation size for the LOB column
SET_VALUE Member Procedure on page 275-31	Overwrites the value of the specified column
SET_VALUES Member Procedure on page 275-33	Replaces the existing old or new values for the LCR, depending on the value type specified
SET_XML_INFORMATION Member Procedure on page 275-35	Sets the XML information for the column
Common Subprograms	See Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD on page 275-36 for a list of subprograms common to the `SYS.LCR$_ROW_RECORD` and `SYS.LCR$_DDL_RECORD` types

ADD_COLUMN Member Procedure

Adds the value as old or new, depending on the value type specified, for the column. An error is raised if a value of the same type already exists for the column.

Note: To set a column value that already exists, run `SET_VALUE`.

See Also: SET_VALUE Member Procedure on page 275-31

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler and the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), you use this member procedure in the handler procedure to add a LOB column to a row LCR. If `assemble_lobs` is set to `FALSE` for the handler, then you cannot use this member procedure to add a LOB column to a row LCR.

To use a DML or error handler to add a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `ADD_COLUMN` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to add an LOB column that is set incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be `10.2.0` or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure to add a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure to add a `LONG` or `LONG RAW` column.

Syntax

```
MEMBER PROCEDURE ADD_COLUMN(
   value_type    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   column_value  IN  ANYDATA);
```

Parameters

Table 275–14 ADD_COLUMN Procedure Parameters

Parameter	Description
`value_type`	The type of value to add for the column Specify `old` to add the old value of the column. Specify `new` to add the new value of the column.
`column_name`	The column name This name is not validated. An error can be raised during application of the LCRs if an invalid name is specified.
`column_value`	The value of the column If `NULL`, then this procedure raises an error. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then a LOB locator can be specified. A `NULL` column value can be specified by encapsulating the `NULL` value in an `ANYDATA` wrapper.

CONVERT_LONG_TO_LOB_CHUNK Member Procedure

Converts `LONG` data in a row LCR into a `CLOB`, or converts `LONG RAW` data in a row LCR into a `BLOB`.

This procedure can change the operation code from `LONG WRITE` to `LOB WRITE` for the row LCR.

This member procedure can be used in rule-based transformations.

The following restrictions apply to this member procedure:

- This member procedure cannot be used in apply handlers.

- LONG data can be sent as a part of a row LCR with one of the following operation codes: INSERT, UPDATE, or LONG_WRITE. Because LONG data can be sent in multiple pieces, make sure that this method is invoked on either none or all LONG pieces.
- LOB to LONG conversion is not supported.
- A row LCR on which this procedure is executed must have been created by a capture process. That is, this procedure does not support persistent row LCRs.

See Also: *Oracle Streams Replication Administrator's Guide*

Syntax

```
MEMBER PROCEDURE CONVERT_LONG_TO_LOB_CHUNK;
```

DELETE_COLUMN Member Procedure

Deletes the old value, the new value, or both, for the specified column, depending on the value type specified.

Syntax

```
MEMBER PROCEDURE DELETE_COLUMN(
   column_name  IN  VARCHAR2,
   value_type   IN  VARCHAR2  DEFAULT '*');
```

Parameters

Table 275–15 DELETE_COLUMN Procedure Parameters

Parameter	Description
column_name	The column name An error is raised if the column does not exist in the LCR.
value_type	The type of value to delete for the column Specify old to delete the old value of the column. Specify new to delete the new value of the column. If * is specified, then the procedure deletes both the old and new values.

EXECUTE Member Procedure

Executes the row LCR under the security domain of the current user. Any apply handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

This member procedure can be run on a row LCR under any of the following conditions:

- The LCR is being processed by an apply handler.
- The LCR is in a queue and was last enqueued by a mechanism other than an Oracle Streams capture process, such as an Oracle Streams apply process or an application.
- The LCR has been constructed using the LCR$_ROW_RECORD constructor function but has not been enqueued.
- The LCR is in the error queue.

Note: Do not run this member procedure in a custom rule-based transformation on a row LCR. Doing so could execute the row LCR outside of its transactional context.

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), this member procedure executes the assembled row LCR. An assembled row LCR represents a LOB value with a LOB locator or `NULL`.

If `assemble_lobs` is set to `FALSE` for the handler, then this member procedure executes the nonassembled row LCRs. Nonassembled row LCRs represent LOB values with `VARCHAR2` and `RAW` data types. These nonassembled row LCRs might have been modified by the handler.

An error is raised under the following conditions:

- A DML or error handler configured with `assemble_lobs` set to `FALSE` attempts to execute a row LCR that contains a LOB locator.
- A DML or error handler configured with `assemble_lobs` set to `TRUE` attempts to execute a row LCR that contains one or more LOB values represented with `VARCHAR2` or `RAW` data types.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Syntax

```
MEMBER PROCEDURE EXECUTE(
   conflict_resolution  IN  BOOLEAN);
```

Parameters

Table 275–16 EXECUTE Procedure Parameters

Parameter	Description
`conflict_resolution`	If `TRUE`, then any conflict resolution defined for the table using the `SET_UPDATE_CONFLICT_HANDLER` procedure in the `DBMS_APPLY_ADM` package is used to resolve conflicts resulting from the execution of the LCR. If `FALSE`, then conflict resolution is not used. An error is raised if this parameter is not specified or is set to `NULL`.

GET_LOB_INFORMATION Member Function

Gets the LOB information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LOB        CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LOB         CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LOB       CONSTANT NUMBER := 3;
DBMS_LCR.EMPTY_LOB        CONSTANT NUMBER := 4;
DBMS_LCR.LOB_CHUNK        CONSTANT NUMBER := 5;
DBMS_LCR.LAST_LOB_CHUNK   CONSTANT NUMBER := 6;
```

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of the columns.

Syntax

```
MEMBER FUNCTION GET_LOB_INFORMATION(
  value_type   IN  VARCHAR2,
  column_name  IN  VARCHAR2,
  use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

Table 275–17 GET_LOB_INFORMATION Function Parameters

Parameter	Description
value_type	The type of value to return for the column, either old or new
column_name	The name of the column
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_LOB_OFFSET Member Function

Gets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB. That is, the information is DBMS_LCR.LAST_LOB_CHUNK or DBMS_LCR.LOB_CHUNK
- The command type is LOB ERASE or LOB WRITE

Otherwise, returns NULL.

Syntax

```
GET_LOB_OFFSET(
   value_type   IN  VARCHAR2,
   column_name  IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 275–18 GET_LOB_OFFSET Function Parameters

Parameter	Description
value_type	The type of value to return for the column Currently, only new can be specified.
column_name	The name of the LOB column

GET_LOB_OPERATION_SIZE Member Function

Gets the operation size for the LOB column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB
- The command type is LOB ERASE or LOB TRIM
- The information is DBMS_LCR.LAST_LOB_CHUNK

Otherwise, returns NULL.

Syntax

```
MEMBER FUNCTION GET_LOB_OPERATION_SIZE(
  value_type   IN  VARCHAR2,
  column_name  IN  VARCHAR2)
RETURN NUMBER,
```

Parameters

Table 275–19 GET_LOB_OPERATION_SIZE Function Parameters

Parameter	Description
value_type	The type of value to return for the column Currently, only new can be specified.
column_name	The name of the LOB column

GET_LONG_INFORMATION Member Function

Gets the LONG information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LONG        CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LONG         CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LONG       CONSTANT NUMBER := 3;
DBMS_LCR.LONG_CHUNK        CONSTANT NUMBER := 4;
DBMS_LCR.LAST_LONG_CHUNK   CONSTANT NUMBER := 5;
```

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of the columns.

Syntax

```
MEMBER FUNCTION GET_LONG_INFORMATION(
  value_type   IN  VARCHAR2,
  column_name  IN  VARCHAR2,
  use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

Table 275–20 GET_LONG_INFORMATION Function Parameters

Parameter	Description
value_type	The type of value to return for the column, either old or new
column_name	The name of the column
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_ROW_TEXT Member Procedure

Gets the SQL statement for the change that is encapsulated in the row LCR. This method performs SQL generation in PL/SQL.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

The following procedure returns the SQL statement in a CLOB datatype.

```
MEMBER PROCEDURE GET_ROW_TEXT(
   row_text  IN/OUT  CLOB);
```

The following procedure returns the SQL statement with bind variables in a CLOB datatype.

```
MEMBER PROCEDURE GET_ROW_TEXT(
   row_text         IN/OUT  CLOB,
   variable_list    IN/OUT  LCR$_ROW_LIST,
   bind_var_syntax  IN      VARCHAR2  DEFAULT ':');
```

See Also: "LCR$_ROW_LIST Type" on page 275-47

Parameters

Table 275–21 GET_ROW_TEXT Procedure Parameters

Parameter	Description
row_text	The SQL statement for the change that is encapsulated in the LCR

Table 275–21 (Cont.) GET_ROW_TEXT Procedure Parameters

Parameter	Description
variable_list	The values for the bind variables in the order of the bind variables
bind_var_syntax	The syntax for the bind variables One of the following values is valid: ■ Specify :, the default, for bind values to be in the form :1, :2, and so on. ■ Specify ? for bind values to be in the form ?.

GET_VALUE Member Function

Gets the old or new value for the specified column, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of a column.

Syntax

```
MEMBER FUNCTION GET_VALUE(
   value_type   IN  VARCHAR2,
   column_name  IN  VARCHAR2,
   use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN ANYDATA;
```

Parameters

Table 275–22 GET_VALUE Function Parameters

Parameter	Description
value_type	The type of value to return for the column Specify old to get the old value for the column. Specify new to get the new value for the column.
column_name	The column name If the column is present and has a NULL value, then the function returns an ANYDATA instance containing a NULL value. If the column value is absent, then the function returns a NULL.
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function returns NULL if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_VALUES Member Function

Gets a list of old or new values, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the values of all columns.

Syntax

```
MEMBER FUNCTION GET_VALUES(
   value_type  IN  VARCHAR2,
   use_old     IN  VARCHAR2  DEFAULT 'Y')
RETURN SYS.LCR$_ROW_LIST;
```

Parameters

Table 275–23 GET_VALUES Function Parameters

Parameter	Description
value_type	The type of values to return Specify old to return a list of old values. Specify new to return a list of new values.
use_old	If Y and value_type is new, then the function returns a list of all new values in the LCR. If a new value does not exist in the list, then the function returns the corresponding old value. Therefore, the returned list contains all existing new values and the old values where there are no new values. If N and value_type is new, then the function returns a list of all new values in the LCR without returning any old values. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_WHERE_CLAUSE Member Procedure

Gets a WHERE clause for the change that is encapsulated in the row LCR.

Use the WHERE clause returned by GET_WHERE_CLAUSE instead of using the ROWID, because the ROWID is not ANSI compatible. The generated WHERE clause might not match the WHERE clause in the original DML operation.

The ROWID of an INSERT statement is the ROWID of the new row created by the INSERT. The WHERE clause generated for an INSERT operation identifies the new row. Therefore, the generated WHERE clause includes all of the new values inserted.

For example, consider the following insert into the hr.departments table:

```
INSERT INTO hr.departments (
   department_id, department_name, manager_id, location_id)
   VALUES (10, 'HR', 20, 40);
```

The generated WHERE clause represents the row with the values 10, 'HR', 20, and 40. Hence, the generated WHERE clause is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'HR' AND
      "MANAGER_ID" = 20 AND "LOCATION_ID" = 40
```

The ROWID of an UPDATE statement is the ROWID of the row that was updated. The WHERE clause generated for an UPDATE operation identifies the row after the UPDATE executes. The generated WHERE clause is based on the old and new values of the UPDATE.

For example, consider the following update to the hr.departments table:

```
UPDATE hr.departments SET department_name='Management'
 WHERE department_name='Administration' AND location_id = 20 AND
       manager_id = 30 AND department_id = 10;
```

The values of the row after the UPDATE are 10, 'Management', 30, and 20. Hence, the generated WHERE clause to identify the row is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'MANAGEMENT' AND
      "MANAGER_ID" = 30 AND "LOCATION_ID" = 20
```

Notice that the new value is used for "DEPARTMENT_NAME", because the new value is the value of the column after the UPDATE. For the rest of the columns, the old values are used.

The ROWID of a DELETE operation is the row that existed before it was deleted. The generated WHERE clause consists of all the old column values present in the DELETE operation.

LOB columns do not appear in generated WHERE clauses. The generated WHERE clause is not affected by the presence of LOB columns in the LCR.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

The following procedure returns the WHERE clause of a SQL statement in a CLOB datatype.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
   where_clause  IN/OUT  CLOB);
```

The following procedure returns the WHERE clause of a SQL statement with bind variables in a CLOB datatype.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
   where_clause     IN/OUT  CLOB,
   variable_list    IN/OUT  LCR$_ROW_LIST,
   bind_var_syntax  IN      VARCHAR2  DEFAULT ':');
```

See Also:

- LCR$_ROW_LIST Type on page 275-47
- *Oracle Streams Concepts and Administration*

Parameters

Table 275–24 GET_WHERE_CLAUSE Procedure Parameters

Parameter	Description
where_clause	The WHERE clause of the SQL statement for the change that is encapsulated in the LCR
variable_list	The values for the bind variables in the order of the bind variables
bind_var_syntax	The syntax for the bind variables One of the following values is valid: ■ Specify :, the default, for bind values to be in the form :1, :2, and so on. ■ Specify ? for bind values to be in the form ?.

GET_XML_INFORMATION Member Function

Gets the XML information for the specified column.

The return value can be one of the following:

```
DBMS_LCR.NOT_XML   CONSTANT NUMBER := 1;
DBMS_LCR.XML_DOC   CONSTANT NUMBER := 2;
DBMS_LCR.XML_DIFF  CONSTANT NUMBER := 3;
```

`DBMS_LCR.NOT_XML` indicates that the column is not an `XMLType` column.

`DBMS_LCR.XML_DOC` indicates that the column contains an XML document.

`DBMS_LCR.XML_DIFF` indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.

Returns `NULL` if the specified column does not exist.

Syntax

```
MEMBER FUNCTION GET_XML_INFORMATION(
   column_name  IN  VARCHAR2)
RETURN NUMBER;
```

Parameter

Table 275–25 GET_XML_INFORMATION Function Parameter

Parameter	Description
`column_name`	The column name

KEEP_COLUMNS Member Procedure

This procedure keeps a list of columns in a row LCR. The procedure deletes columns that are not in the list from the row LCR.

Syntax

```
MEMBER PROCEDURE KEEP_COLUMNS(
   column_list  IN  VARCHAR2,
   value_type   IN  VARCHAR2  DEFAULT '*');
```

Parameters

Table 275–26 KEEP_COLUMNS Procedure Parameters

Parameter	Description
`column_list`	The names of the columns kept for the row LCR Specify a comma-delimited list of type `VARCHAR2`. This procedure removes columns that are not in the list from the current row LCR.

Table 275–26 (Cont.) KEEP_COLUMNS Procedure Parameters

Parameter	Description
value_type	The type of value for which to keep the columns Specify old to keep the old values of the columns. An error is raised if the old values do not exist in the LCR. Specify new to keep the new values of the columns. An error is raised if the new values do not exist in the LCR. If * is specified, then the procedure keeps both the old and the new columns.

RENAME_COLUMN Member Procedure

Renames a column in a row LCR.

Syntax

```
MEMBER PROCEDURE RENAME_COLUMN(
   from_column_name  IN  VARCHAR2,
   to_column_name    IN  VARCHAR2,
   value_type        IN  VARCHAR2  DEFAULT '*');
```

Parameters

Table 275–27 RENAME_COLUMN Procedure Parameters

Parameter	Description
from_column_name	The existing column name
to_column_name	The new column name An error is raised if a column with the specified name already exists.
value_type	The type of value for which to rename the column Specify old to rename the old value of the column. An error is raised if the old value does not exist in the LCR. Specify new to rename the new value of the column. An error is raised if the new value does not exist in the LCR. If * is specified, then the procedure renames the column names for both old and new value. The procedure raises an error if either column value does not exist in the LCR.

SET_LOB_INFORMATION Member Procedure

Sets LOB information for the column.

Note: When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_INFORMATION(
  value_type       IN  VARCHAR2,
  column_name      IN  VARCHAR2,
  lob_information  IN  NUMBER);
```

Parameters

Table 275–28 SET_LOB_INFORMATION Procedure Parameters

Parameter	Description
value_type	The type of value to set for the column, either old or new Specify old only if lob_information is set to DBMS_LCR.NOT_A_LOB.
column_name	The name of the column. An exception is raised if the column value does not exist. You might need to set this parameter for non-LOB columns.
lob_information	Specify one of the following values: DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1; DBMS_LCR.NULL_LOB CONSTANT NUMBER := 2; DBMS_LCR.INLINE_LOB CONSTANT NUMBER := 3; DBMS_LCR.EMPTY_LOB CONSTANT NUMBER := 4; DBMS_LCR.LOB_CHUNK CONSTANT NUMBER := 5; DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;

SET_LOB_OFFSET Member Procedure

Sets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns.

Note: When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_OFFSET(
   value_type   IN  VARCHAR2,
   column_name  IN  VARCHAR2,
   lob_offset   IN  NUMBER);
```

Parameters

Table 275–29 SET_LOB_OFFSET Procedure Parameters

Parameter	Description
value_type	The type of value to set for the column Currently, only new can be specified.
column_name	The column name An error is raised if the column value does not exist in the LCR.
lob_offset	The LOB offset number Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.

SET_LOB_OPERATION_SIZE Member Procedure

Sets the operation size for the LOB column in the number of characters for CLOB columns and bytes for BLOB columns.

Note: When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_OPERATION_SIZE(
  value_type          IN  VARCHAR2,
  column_name         IN  VARCHAR2,
  lob_operation_size  IN  NUMBER);
```

Parameters

Table 275–30 SET_LOB_OPERATION_SIZE Procedure Parameters

Parameter	Description
value_type	The type of value to set for the column Currently, only new can be specified.
column_name	The name of the LOB column An exception is raised if the column value does not exist in the LCR.
lob_operation_size	If lob_information for the LOB is or will be DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. Otherwise, set to NULL.

SET_VALUE Member Procedure

Overwrites the old or new value of the specified column.

One reason to overwrite an old value for a column is to resolve an error that resulted from a conflict.

Note: To add a column to a row LCR, run ADD_COLUMN.

See Also: ADD_COLUMN Member Procedure on page 275-18

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the assemble_lobs parameter is set to TRUE for the handler), you can use this member procedure in the handler procedure on a LOB column in a row LCR. If assemble_lobs is set to FALSE for the handler, then you cannot use this member procedure on a LOB column.

To use a DML or error handler to set the value of a LOB column, specify the LOB locator for the column_value parameter in the member procedure. The SET_VALUE member procedure verifies that an ANYDATA encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on a LONG or LONG RAW column.

Considerations for XMLType Columns

When processing a row LCR with XMLType columns with a procedure DML handler or error handler, any XMLType columns and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value an XMLType column, specify the XMLType for the column_value parameter. The SET_VALUE member procedure verifies that an ANYDATA encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated XMLType.
- An attempt is made to set a XMLType column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType column is represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be 11.1.0 or higher to process row LCRs with XMLType columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on XMLType columns.

Syntax

```
MEMBER PROCEDURE SET_VALUE(
   value_type    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   column_value  IN  ANYDATA);
```

Parameters

Table 275–31 SET_VALUE Procedure Parameters

Parameter	Description
value_type	The type of value to set Specify old to set the old value of the column. Specify new to set the new value of the column.
column_name	The column name An error is raised if the specified column_value does not exist in the LCR for the specified column_type.
column_value	The new value of the column If NULL is specified, then this procedure raises an error. To set the value to NULL, encapsulate the NULL in an ANYDATA instance. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify a LOB locator for LOB columns.

SET_VALUES Member Procedure

Replaces all old values or all new values for the LCR, depending on the value type specified.

Considerations for LOB Columns

You can use this procedure when processing a row LCR with LOB columns with a procedure DML handler or error handler. If the handler is using LOB assembly (the assemble_lobs parameter is set to TRUE for the handler), then you can use this member procedure in the handler procedure. If assemble_lobs is set to FALSE for the handler, then you cannot use this member procedure on a row LCR.

To use a DML or error handler to set the value of one or more LOB columns in a row LCR, specify a LOB locator for each LOB column in the value_list parameter. The SET_VALUES member procedure verifies that an ANYDATA encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB columns are represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be `10.2.0` or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on LOB columns.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on `LONG` or `LONG RAW` columns.

Considerations for XMLType Columns

When processing a row LCR with `XMLType` columns with a procedure DML handler or error handler, any `XMLType` and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more `XMLType` columns.

To use a DML or error handler to set the value of one or more `XMLType` columns in a row LCR, specify an `XMLType` for each `XMLType` column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated `XMLType` is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated `XMLType`.
- An attempt is made to set a `XMLType` incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the `XMLType` columns are represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be `11.1.0` or higher to process row LCRs with `XMLType` columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on `XMLType` columns.

Syntax

```
MEMBER PROCEDURE SET_VALUES(
   value_type  IN  VARCHAR2,
   value_list  IN  SYS.LCR$_ROW_LIST);
```

Parameters

Table 275–32 SET_VALUES Procedure Parameters

Parameter	Description
value_type	The type of values to replace Specify old to replace the old values. Specify new to replace the new values.
value_list	List of values to replace the existing list Use a NULL or an empty list to remove all values. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify one or more LOB locators for LOB columns.

SET_XML_INFORMATION Member Procedure

Sets the XML information for the column.

Syntax

```
MEMBER PROCEDURE SET_XML_INFORMATION(
   column_name      IN  VARCHAR2,
   xml_information  IN  NUMBER);
```

Parameters

Table 275–33 SET_XML_INFORMATION Procedure Parameters

Parameter	Description
column_name	The name of the column An exception is raised if the column value does not exist in the LCR.

xml_information	Specify one of the following values:
	`DBMS_LCR.NOT_XML CONSTANT NUMBER := 1;`
	`DBMS_LCR.XML_DOC CONSTANT NUMBER := 2;`
	`DBMS_LCR.XML_DIFF CONSTANT NUMBER := 3;`
	DBMS_LCR.NOT_XML indicates that the column is not an XMLType column.
	DBMS_LCR.XML_DOC indicates that the column contains an XML document.
	DBMS_LCR.XML_DIFF indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.

Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD

The following functions and procedures are common to both the `LCR$_DDL_RECORD` and `LCR$_ROW_RECORD` type.

> **See Also:** For descriptions of the subprograms for these types that are exclusive to each type:
>
> - "Summary of LCR$_DDL_RECORD Subprograms" on page 275-9
> - "Summary of LCR$_ROW_RECORD Subprograms" on page 275-17

Table 275–34 Summary of Common Subprograms for DDL and Row LCR Types

Subprogram	Description
GET_COMMAND_TYPE Member Function on page 275-37	Gets the command type of the logical change record (LCR)
GET_COMMIT_SCN Member Function on page 275-37	Gets the commit system change number (SCN) of the transaction to which the current LCR belongs
GET_COMMIT_SCN_FROM_POSITION Static Function on page 275-38	Gets the commit SCN of a transaction from the input position, which is generated by an XStream outbound server
GET_COMMIT_TIME on page 275-38	Gets the commit time of the transaction to which the current LCR belongs
GET_COMPATIBLE Member Function on page 275-38	Gets the minimal database compatibility required to support the LCR
GET_EXTRA_ATTRIBUTE Member Function on page 275-39	Gets the value for the specified extra attribute in the LCR
GET_OBJECT_NAME Member Function on page 275-40	Gets the name of the object that is changed by the LCR
GET_OBJECT_OWNER Member Function on page 275-40	Gets the owner of the object that is changed by the LCR
GET_POSITION Member Function on page 275-41	Gets the position of the current LCR
GET_ROOT_NAME Member Function on page 275-41	Gets the global name of the root for a CDB.
GET_SCN Member Function on page 275-41	Gets the SCN of the LCR
GET_SCN_FROM_POSITION Static Function on page 275-41	Gets the SCN from the input position, which is generated by an XStream outbound server
GET_SOURCE_DATABASE_NAME Member Function on page 275-42	Gets the source database name.
GET_SOURCE_TIME Member Function on page 275-42	Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created
GET_TAG Member Function on page 275-42	Gets the tag for the LCR

Table 275–34 (Cont.) Summary of Common Subprograms for DDL and Row LCR Types

Subprogram	Description
GET_THREAD_NUMBER Member Function on page 275-42	Gets the thread number of the database instance that made the change that is encapsulated in the LCR
GET_TRANSACTION_ID Member Function on page 275-42	Gets the transaction identifier of the LCR
IS_NULL_TAG Member Function on page 275-42	Returns `Y` if the tag for the LCR is `NULL`, or returns `N` if the tag for the LCR is not `NULL`
SET_COMMAND_TYPE Member Procedure on page 275-43	Sets the command type in the LCR
SET_EXTRA_ATTRIBUTE Member Procedure on page 275-43	Sets the value for the specified extra attribute in the LCR
SET_OBJECT_NAME Member Procedure on page 275-44	Sets the name of the object that is changed by the LCR
SET_OBJECT_OWNER Member Procedure on page 275-45	Sets the owner of the object that is changed by the LCR
SET_ROOT_NAME Member Procedure on page 275-45	Sets the global name of the root in a CDB.
SET_SOURCE_DATABASE_NAME Member Procedure on page 275-45	Sets the source database name of the object that is changed by the LCR
SET_TAG Member Procedure on page 275-46	Sets the tag for the LCR

GET_COMMAND_TYPE Member Function

Gets the command type of the LCR.

> **See Also:** The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

Syntax

```
MEMBER FUNCTION GET_COMMAND_TYPE()
RETURN VARCHAR2;
```

GET_COMMIT_SCN Member Function

Gets the commit system change number (SCN) of the transaction to which the current LCR belongs.

The commit SCN for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit SCN might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit SCN. If the commit SCN is not available for an LCR, then this function returns `NULL`.

Syntax

```
MEMBER FUNCTION GET_COMMIT_SCN()
RETURN NUMBER;
```

GET_COMMIT_SCN_FROM_POSITION Static Function

Gets the commit system change number (SCN) of a transaction from the input position, which is generated by an XStream outbound server.

Syntax

```
STATIC FUNCTION GET_COMMIT_SCN_FROM_POSITION(
   position  IN  RAW)
RETURN NUMBER;
```

Parameters

Table 275–35 GET_COMMIT_SCN_FROM_POSITION Function Parameter

Parameter	Description
position	The position You can obtain the position by using the GET_POSITION member function or by querying the DBA_XSTREAM_OUTBOUND_PROGRESS data dictionary view.

Note: Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

GET_COMMIT_TIME

Gets the commit time of the transaction to which the current LCR belongs.

The commit time for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit time might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit time. If the commit time is not available for an LCR, then this function returns NULL.

Syntax

```
MEMBER FUNCTION GET_COMMIT_TIME()
RETURN DATE;
```

GET_COMPATIBLE Member Function

Gets the minimal database compatibility required to support the LCR. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

The return value for this function can be one of the following:

Return Value	COMPATIBLE Initialization Parameter Equivalent
DBMS_STREAMS.COMPATIBLE_9_2	9.2.0
DBMS_STREAMS.COMPATIBLE_10_1	10.1.0
DBMS_STREAMS.COMPATIBLE_10_2	10.2.0
DBMS_STREAMS.COMPATIBLE_11_1	11.1.0

Return Value	COMPATIBLE Initialization Parameter Equivalent
DBMS_STREAMS.COMPATIBLE_11_2	11.2.0

DDL LCRs always return DBMS_STREAMS.COMPATIBLE_9_2.

You can use the following functions in the DBMS_STREAMS package for constant compatibility return values:

- The COMPATIBLE_9_2 function returns the DBMS_STREAMS.COMPATIBLE_9_2 constant.
- The COMPATIBLE_10_1 function returns DBMS_STREAMS.COMPATIBLE_10_1 constant.
- The COMPATIBLE_10_2 function returns DBMS_STREAMS.COMPATIBLE_10_2 constant.
- The COMPATIBLE_11_1 function returns DBMS_STREAMS.COMPATIBLE_11_1 constant.
- The COMPATIBLE_11_2 function returns DBMS_STREAMS.COMPATIBLE_11_2 constant.
- The MAX_COMPATIBLE function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

You can use these functions with the GET_COMPATIBLE member function for an LCR in rule conditions and apply handlers.

Note: You can determine which database objects in a database are not supported by Oracle Streams by querying the DBA_STREAMS_UNSUPPORTED data dictionary view.

See Also:

- *Oracle Streams Concepts and Administration* for examples of rules that discard changes that are not supported by Oracle Streams
- Chapter 158, "DBMS_STREAMS" and Chapter 159, "DBMS_STREAMS_ADM"
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

Syntax

```
MEMBER FUNCTION GET_COMPATIBLE()
RETURN NUMBER;
```

GET_EXTRA_ATTRIBUTE Member Function

Gets the value for the specified extra attribute in the LCR. The returned extra attribute is contained within an ANYDATA instance. You can use the INCLUDE_EXTRA_ATTRIBUTE procedure in the DBMS_CAPTURE_ADM package to instruct a capture process to capture one or more extra attributes.

See Also: INCLUDE_EXTRA_ATTRIBUTE Procedure on page 34-33

Syntax

```
MEMBER FUNCTION GET_EXTRA_ATTRIBUTE(
   attribute_name  IN  VARCHAR2)
```

```
RETURN ANYDATA;
```

Parameters

Table 275–36 GET_EXTRA_ATTRIBUTE Function Parameter

Parameter	Description
attribute_name	The name of the extra attribute to return Valid names are: ■ row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is UROWID. ■ serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. ■ session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. ■ thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. ■ tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. ■ username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2. An error is raised if the specified attribute_name is not valid. If no value exists for the specified extra attribute, then the function returns a NULL. **See Also:** *Oracle Database PL/SQL Language Reference* for more information about the current user

GET_OBJECT_NAME Member Function

Gets the name of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_NAME()
RETURN VARCHAR2;
```

GET_OBJECT_OWNER Member Function

Gets the owner of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_OWNER()
RETURN VARCHAR2;
```

GET_POSITION Member Function

Gets the position of the current LCR. The position uniquely identifies each LCR. The position strictly increases within each transaction and across transactions.

LCR position is commonly used in XStream configurations.

Syntax

```
MEMBER FUNCTION GET_POSITION()
RETURN RAW;
```

Note: Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

GET_ROOT_NAME Member Function

Gets the global name of the root in a CDB, which is the root name for the LCR.

Syntax

```
MEMBER FUNCTION GET_ROOT_NAME()
RETURN VARCHAR2;
```

GET_SCN Member Function

Gets the system change number (SCN) of the LCR.

Syntax

```
MEMBER FUNCTION GET_SCN()
RETURN NUMBER;
```

GET_SCN_FROM_POSITION Static Function

Gets the system change number (SCN) from the input position, which is generated by an XStream outbound server.

Syntax

```
STATIC FUNCTION GET_SCN_FROM_POSITION(
   position  IN  RAW)
RETURN NUMBER;
```

Parameters

Table 275–37 GET_SCN_FROM_POSITION Function Parameter

Parameter	Description
`position`	The position You can obtain the position by using the `GET_POSITION` member function or by querying the `DBA_XSTREAM_OUTBOUND_PROGRESS` data dictionary view.

Note: Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

GET_SOURCE_DATABASE_NAME Member Function

Gets the global name of the source database. The source database is the database where the change occurred.

Syntax

```
MEMBER FUNCTION GET_SOURCE_DATABASE_NAME()
RETURN VARCHAR2;
```

GET_SOURCE_TIME Member Function

Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.

Syntax

```
MEMBER FUNCTION GET_SOURCE_TIME()
RETURN DATE;
```

GET_TAG Member Function

Gets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML or DDL change when apply forwarding is used.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
MEMBER FUNCTION GET_TAG()
RETURN RAW;
```

GET_THREAD_NUMBER Member Function

Gets the thread number of the database instance that made the change that is encapsulated in the LCR. Typically, the thread number is relevant in an Oracle Real Application Clusters configuration.

> **See Also:** *Oracle Real Application Clusters Administration and Deployment Guide*

Syntax

```
MEMBER FUNCTION GET_THREAD_NUMBER()
RETURN NUMBER;
```

GET_TRANSACTION_ID Member Function

Gets the transaction identifier of the LCR.

Syntax

```
MEMBER FUNCTION GET_TRANSACTION_ID()
RETURN VARCHAR2;
```

IS_NULL_TAG Member Function

Returns `Y` if the tag for the LCR is `NULL`, or returns `N` if the tag for the LCR is not `NULL`.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
MEMBER FUNCTION IS_NULL_TAG()
RETURN VARCHAR2;
```

SET_COMMAND_TYPE Member Procedure

Sets the command type in the LCR. If the command type specified cannot be interpreted, then this procedure raises an error. For example, changing `INSERT` to `GRANT` would raise an error.

See Also:

- The description of the `command_type` parameter in LCR$_DDL_RECORD Constructor Function Parameters on page 275-7
- The description of the command_type parameter in LCR$_ROW_RECORD Type on page 275-15
- The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

Syntax

```
MEMBER PROCEDURE SET_COMMAND_TYPE(
   command_type  IN  VARCHAR2);
```

Parameter

Table 275–38 SET_COMMAND_TYPE Procedure Parameter

Parameter	Description
`command_type`	The command type Set this parameter to a non-`NULL` value.

SET_EXTRA_ATTRIBUTE Member Procedure

Sets the value for the specified extra attribute in the LCR. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

See Also: INCLUDE_EXTRA_ATTRIBUTE Procedure on page 34-33

Syntax

```
MEMBER PROCEDURE SET_EXTRA_ATTRIBUTE(
   attribute_name   IN  VARCHAR2,
   attribute_value  IN  ANYDATA);
```

Parameters

Table 275–39 SET_EXTRA_ATTRIBUTE Procedure Parameter

Parameter	Description
attribute_name	The name of the extra attribute to set Valid names are: ■ row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is VARCHAR2. ■ serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. ■ session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. ■ thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. ■ tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. ■ username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2. An error is raised if the specified attribute_name is not valid. **See Also:** *Oracle Database PL/SQL Language Reference* for more information about the current user
attribute_value	The value to which the specified extra attribute is set If set to NULL, then this procedure removes the specified extra attribute from the LCR. To set to NULL, encapsulate the NULL in an ANYDATA instance.

SET_OBJECT_NAME Member Procedure

Sets the name of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_NAME(
   object_name  IN  VARCHAR2);
```

Parameter

Table 275–40 SET_OBJECT_NAME Procedure Parameter

Parameter	Description
object_name	The name of the object

SET_OBJECT_OWNER Member Procedure

Sets the owner of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_OWNER(
   object_owner  IN  VARCHAR2);
```

Parameter

Table 275–41 SET_OBJECT_OWNER Procedure Parameter

Parameter	Description
object_owner	The schema that contains the object

SET_ROOT_NAME Member Procedure

Sets the global name of the root in a CDB. The setting is the root name for the LCR.

Syntax

```
MEMBER PROCEDURE SET_ROOT_NAME(
   root_name  IN  VARCHAR2);
```

Parameter

Table 275–42 SET_OBJECT_OWNER Procedure Parameter

Parameter	Description
root_name	The global name of the root.

SET_SOURCE_DATABASE_NAME Member Procedure

Sets the source database name of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_SOURCE_DATABASE_NAME(
   source_database_name  IN  VARCHAR2);
```

Parameter

Table 275–43 SET_SOURCE_DATABASE_NAME Procedure Parameter

Parameter	Description
source_database_name	The source database of the change If you do not include the domain name, then the procedure appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.

SET_TAG Member Procedure

Sets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the change when apply forwarding is used.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
MEMBER PROCEDURE SET_TAG(
   tag  IN  RAW);
```

Parameter

Table 275–44 SET_TAG Procedure Parameter

Parameter	Description
`tag`	The binary tag for the LCR The size limit for a tag value is two kilobytes.

LCR$_ROW_LIST Type

Identifies a list of column values for a row in a table.

This type uses the `LCR$_ROW_UNIT` type and is used in the `LCR$_ROW_RECORD` type.

See Also:

- LCR$_ROW_UNIT Type on page 275-48
- LCR$_ROW_RECORD Type on page 275-15

Syntax

```
CREATE TYPE SYS.LCR$_ROW_LIST AS TABLE OF SYS.LCR$_ROW_UNIT
/
```

LCR$_ROW_UNIT Type

Identifies the value for a column in a row.

This type is used in the LCR$_ROW_LIST type.

See Also: LCR$_ROW_LIST Type on page 275-47

Syntax

```
CREATE TYPE LCR$_ROW_UNIT AS OBJECT (
  column_name         VARCHAR2(4000),
  data                ANYDATA,
  lob_information     NUMBER,
  lob_offset          NUMBER,
  lob_operation_size  NUMBER
  long_information    NUMBER);
/
```

Attributes

Table 275–45 LCR$_ROW_UNIT Attributes

Attribute	Description
column_name	The name of the column
data	The data contained in the column
lob_information	Contains the LOB information for the column and contains one of the following values: DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1; DBMS_LCR.NULL_LOB CONSTANT NUMBER := 2; DBMS_LCR.INLINE_LOB CONSTANT NUMBER := 3; DBMS_LCR.EMPTY_LOB CONSTANT NUMBER := 4; DBMS_LCR.LOB_CHUNK CONSTANT NUMBER := 5; DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;
lob_offset	The LOB offset specified in the number of characters for CLOB columns and the number of bytes for BLOB columns Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.
lob_operation_size	If lob_information for the LOB is DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. If lob_information is not DBMS_LCR.LAST_LOB_CHUNK and for all other operations, is NULL.
long_information	Contains the LONG information for the column and contains one of the following values: DBMS_LCR.not_a_long CONSTANT NUMBER := 1; DBMS_LCR.null_long CONSTANT NUMBER := 2; DBMS_LCR.inline_long CONSTANT NUMBER := 3; DBMS_LCR.long_chunk CONSTANT NUMBER := 4; DBMS_LCR.last_long_chunk CONSTANT NUMBER := 5;

276

Oracle Multimedia ORDAudio TYPE

The `Oracle Multimedia ORDAudio` object type supports the storage and management of audio data.

Audio data can have different formats, encoding types, compression types, numbers of channels, sampling rates, sample sizes, and playing times (duration) depending upon how the audio data is digitally recorded. `Oracle Multimedia ORDAudio` can store and retrieve audio data of any data format. `Oracle Multimedia ORDAudio` can extract metadata from audio data of a variety of popular audio formats. `Oracle Multimedia ORDAudio` can also extract application attributes and store them in the `comments` attribute of the object in XML form.

- Documentation of ORDAudio

Documentation of ORDAudio

For a complete description of this type within the context of Oracle Multimedia, see `ORDAudio` in the *Oracle Multimedia Reference*.

277

Oracle Multimedia ORDDicom TYPE

The `Oracle Multimedia ORDDicom` object type supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other objects. These include objects such as single frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

`Oracle Multimedia ORDDicom` provides methods to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM objects. `Oracle Multimedia ORDDicom` also provides methods to check DICOM objects for conformance based on a set of user-specified conformance rules, and to make DICOM objects anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

- Documentation of ORDDicom

Documentation of ORDDicom

For a complete description of this type within the context of Oracle Multimedia, see `ORDDicom` in the *Oracle Multimedia DICOM Developer's Guide*.

278

Oracle Multimedia ORDDoc TYPE

The `Oracle Multimedia ORDDoc` object type supports the storage and management of heterogeneous media data including image, audio, and video.

Heterogeneous media data can have different formats depending upon the application generating the media data. `Oracle Multimedia` can store and retrieve media data of any data format. `Oracle Multimedia ORDDoc` datatype can be used in applications that require you to store different types of heterogeneous media data in the same column so you can build a common metadata index on all the different types of media data. Using this index, you can search across all the different types of heterogeneous media data. However, you cannot use this same search technique if the different types of heterogeneous media data are stored in different types of objects in different columns of relational tables.

- Documentation of ORDDoc

Documentation of ORDDoc

For a complete description of this type within the context of Oracle Multimedia, see `ORDDoc` in the *Oracle Multimedia Reference*.

279

Oracle Multimedia ORDImage TYPE

The `Oracle Multimedia ORDImage` object type supports the storage, management, and manipulation of image data.

Digitized images consist of the image data (digitized bits) and attributes that describe and characterize the image data.

The image data (pixels) can have varying depths (bits for each pixel) depending on how the image was captured, and can be organized in various ways. The organization of the image data is known as the data format. `Oracle Multimedia ORDImage` can store and retrieve image data of any data format. `Oracle Multimedia ORDImage` can process (cut, scale, and generate thumbnails) of images, convert the format of images, extract properties of images of a variety of popular data formats, and extract and embed application metadata in images.

- Documentation of ORDImage

Documentation of ORDImage

For a complete description of this type within the context of Oracle Multimedia, see `ORDImage` in the *Oracle Multimedia Reference*.

280

Oracle Multimedia SQL/MM Still Image TYPES

Oracle Multimedia provides support for the SQL/MM Still Image Standard, which supports the storage, retrieval, and modification of images in the database and the ability to locate images using visual predicates.

The following object relational types for images and image characteristics are included in this support:

```
SI_StillImage
SI_AverageColor
SI_Color
SI_ColorHistogram
SI_FeatureList
SI_PositionalColor
SI_Texture
```

- Documentation of SQL/MM Still Image

Documentation of SQL/MM Still Image

For a complete description of this type within the context of Oracle Multimedia, see `SQL/MM Still Image` in the *Oracle Multimedia Reference*.

281

Oracle Multimedia ORDVideo TYPE

The `Oracle Multimedia ORDVideo` object type supports the storage and management of video data.

Digitized video consists of the video data (digitized bits) and the attributes that describe and characterize the video data. Video applications sometimes associate application-specific information, such as the description of the video training tape, date recorded, instructor's name, producer's name, and so on, within the video data.

The video data can have different formats, compression types, frame rates, frame sizes, frame resolutions, playing times, compression types, number of colors, and bit rates depending upon how the video data was digitally recorded. `Oracle Multimedia ORDVideo` can store and retrieve video data of any data format. `Oracle Multimedia ORDVideo` can extract metadata from video data of a variety of popular video formats. `Oracle Multimedia ORDVideo` can also extract application attributes and store them in the `comments` attribute of the object in XML form.

- Documentation of ORDVideo

Documentation of ORDVideo

For a complete description of this type within the context of Oracle Multimedia, see `ORDVideo` in the *Oracle Multimedia Reference.*

282

MGD_ID Package Types

The MGD_ID package provides an extensible framework that supports current radio-frequency ID (RFID) tags with the standard family of EPC bit encodings for the supported encoding types. The MGD_ID Package also supports new and evolving tag encodings that are not included in the current EPC standard (EPC v1.1 specification). The MGD_ID package contains several predefined types.

See Also: *Oracle Database Development Guide* for more information.

This chapter contains the following topics:

- Using MGD_ID Package Object Types
- Summary of Types
- Summary of MGD_ID Subprograms

The method described in this reference chapter show examples based on the examples shown in the constructor functions.

The examples in this chapter assume that the you have run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

Using MGD_ID Package Object Types

This section contains topics that relate to using the `MGD_ID` package object types.

- Security Model

Security Model

You must run the `catmgd.sql` script to load the `DBMS_MGD_ID_UTL` package and create the required Identity Code Package schema objects in the `MGDSYS` schema.

`MGD_ID` is a `MGDSYS`-owned object type. Any `MGD_ID` subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted connect and resource roles to use the `MGD_ID` object type and its subprograms.

`EXECUTE` privilege is granted to `PUBLIC` for this ADT: `MGD_ID`.

A public synonym, by the same name, is created for this ADT: `MGD_ID`.

Summary of Types

Table 282–1 describes the MGD_ID Package object types.

Table 282–1 MGD_ID Package Object Types

Object Type Name	Description
MGD_ID_COMPONENT Object Type	Datatype that specifies the name and value pair attributes that define a component
MGD_ID_COMPONENT_VARRAY Object Type	Datatype that specifies a list of up to 128 components as name-value attribute pairs used in two constructor functions for creating an identity code type object
MGD_ID Object Type	Represents an MGD_ID object that specifies the category identifier for the code category for this identity code and its list of components

MGD_ID_COMPONENT Object Type

The MGD_ID_COMPONENT type is a datatype that specifies the name and value pair attributes that define a component.

Syntax

```
MGD_ID_COMPONENT as object (name  VARCHAR2(256),
                            value VARCHAR2(1024));
```

Attributes

Table 282–2 MGD_ID_COMPONENT Attributes

Attribute	Description
name	Name of component
value	Value of the component as a character

Examples

See the MGD_ID Constructor Function for an example.

MGD_ID_COMPONENT_VARRAY Object Type

The `MGD_ID_COMPONENT_VARRAY` type is a datatype that specifies a list of up to 128 components as name-value attribute pairs for use in two constructor functions for creating a product code type object with its list of components.

Syntax

```
MGD_ID_COMPONENT_VARRAY is VARRAY (128) of MGD_ID_COMPONENT;
```

Examples

See the MGD_ID Constructor Function for an example.

MGD_ID Object Type

The MGD_ID type represents an identity code in an RFID application. This type represents RFID tags with standard EPC bit encoding as well as tag encodings that are not included in the EPC standard.

Syntax

```
MGD_ID as object (category_id  VARCHAR2(256),
                  components   MGD_ID_COMPONENT_VARRAY);
```

Attributes

Table 282–3 MGD_ID Object Type Attributes

Attribute	Description
category_id	Category identifier for the code category of this code
components	List of components as name-value attributes

Methods

Table 282–5 describes the methods of the MGD_ID object type.

Table 282–4 MGD_ID Methods

Method	Description
MGD_ID constructor function	Creates an MGD_ID object based on the parameters passed in and returns self as a result
FORMAT function	Returns the string representation of the MGD_ID in the specified format
GET_COMPONENT function	Returns the string value of the specified MGD_ID component
TO_STRING function	Returns the string value of semicolon (;) separated component name value pairs of the MGD_ID object
TRANSLATE function	Returns the result of the conversion of the identifier from one format to the specified format

Examples

See the Summary of MGD_ID Subprograms section and the section about using the Identity Code package in *Oracle Database Development Guide* for examples.

Summary of MGD_ID Subprograms

Table 282–5 describes the subprograms in the MGD_ID object type.

All the values and names passed to the procedures defined in the MGD_ID object type are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

Table 282–5 MGD_ID Object Type Subprograms

Subprogram	Description
MGD_ID Constructor Function	Creates an MGD_ID object based on the parameters passed in and returns self as a result
FORMAT Function	Returns the string representation of the MGD_ID object in the specified format
GET_COMPONENT Function	Returns the string value of the specified MGD_ID component
TO_STRING Function	Returns the string value of semicolon (;) separated component name value pairs of the MGD_ID object
TRANSLATE Function	Returns the result of the conversion of the identifier from one format to the specified format

MGD_ID Constructor Function

This constructor function constructs an identity code type object, MGD_ID. The constructor function is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Constructs an MGD_ID object type based on the category ID and a list of components.

```
MGD_ID (
   category_id      IN VARCHAR2,
   components       IN MGD_ID_COMPONENT_VARRAY)
 RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category ID, the identifier string, and the list of additional parameters required to create it.

```
MGD_ID (
   category_id        VARCHAR2,
   identifier         VARCHAR2,
   parameter_list      VARCHAR2)
 RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category name, category version, and a list of components.

```
MGD_ID (
   category_name      VARCHAR2,
   category_version   VARCHAR2,
   components         MGD_ID_COMPONENT_VARRAY)
 RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category name, category version, the identifier string, and the list of additional parameters required to create it.

```
MGD_ID (
   category_name      VARCHAR2,
   category_version   VARCHAR2,
   identifier         VARCHAR2,
   parameter_list      VARCHAR2)
 RETURN SELF AS RESULT DETERMINISTIC;
```

Parameters

Table 282–6 MGD_ID Constructor Function Parameters

Parameter	Description
category_id	Category identifier
components	List of component name value pairs
category_name	Category name, such as EPC
category_version	Category version. If NULL, the latest version for the specified category name will be used.

Table 282–6 (Cont.) MGD_ID Constructor Function Parameters

Parameter	Description
identifier	Identifier string in any format of an encoding scheme in the specified category. For example, for SGTIN-96 encoding, the identifier can be in the format of BINARY, PURE_IDENTITY, TAG_ENCODING, or LEGACY. Express this identifier as a string according to the appropriate grammar or pattern in the tag data translation (TDT) markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as gtin=00037000302414;serial=10419703 for a SGTIN coding scheme.
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96

Usage Notes

- Use MGD_ID_UTL.EPC_ENCODING_CATEGORY_ID as category_id.
- If the category is not already registered, an error is raised.
- If the bit_length parameter is NULL, the bit_length is 8* the length of bit_encoding.
- If the component list does not contain all required components, an exception MGD_ID_UTL.e_LackComponent will be thrown.

Examples

The following examples construct identity code type objects.

Construct an MGD_ID object (SGTIN-64) passing in the category ID and a list of components.

```
--Contents of constructor11.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
              MGD_ID_COMPONENT_VARRAY(
               MGD_ID_COMPONENT('companyprefix','0037000'),
               MGD_ID_COMPONENT('itemref','030241'),
               MGD_ID_COMPONENT('serial','1041970'),
               MGD_ID_COMPONENT('schemes','SGTIN-64')
              )
             ) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor11.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('itemref', '030241'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
```

```
.
.
.
```

Constructs an MGD_ID object (SGTIN-64) passing in the category ID, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor22.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
              'urn:epc:id:sgtin:0037000.030241.1041970',
              'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor22.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('companyprefixlength', '7'),
                                    MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('itemref', '030241')))
.
.
.
```

Construct an MGD_ID object (SGTIN-64) passing in the category name, category version (if NULL, then the latest version will be used), and a list of components.

```
--Contents of constructor33.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
              MGD_ID_COMPONENT_VARRAY(
               MGD_ID_COMPONENT('companyprefix','0037000'),
               MGD_ID_COMPONENT('itemref','030241'),
               MGD_ID_COMPONENT('serial','1041970'),
               MGD_ID_COMPONENT('schemes','SGTIN-64')
              )
             ) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor33.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('itemref', '030241'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
.
.
.
```

Constructs an MGD_ID object (SGTIN-64) passing in the category name and category version, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor44.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
              'urn:epc:id:sgtin:0037000.030241.1041970',
              'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor4.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('companyprefixlength', '7'),
                                    MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('itemref', '030241')))
.
.
.
```

FORMAT Function

This function returns the string representation of the MGD_ID object in the specified format.

Syntax

```
FORMAT (parameter_list  IN VARCHAR2,
        output_format   IN VARCHAR2)
 RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 282–7 FORMAT Function Parameters

Parameter	Description
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96
output_format	One of the supported output formats into which an MGD_ID component is formatted: ■ BINARY ■ LEGACY ■ TAG_ENCODING ■ PURE_IDENTITY ■ ONS_HOSTNAME

Examples

See the example for the GET_COMPONENT Function.

GET_COMPONENT Function

This function returns the value of the specified MGD_ID component.

Syntax

```
GET_COMPONENT (
   component_name  IN  VARCHAR2)
 RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 282–8 GET_COMPONENT Function Parameter

Parameter	Description
component_name	Name of component

Usage Notes

- If the code is an invalid code, meaning its structure is not defined in the metadata table, an error is raised.
- If the code is valid, but it does not contain the required component, NULL is returned.

Examples

The following example returns the general manager, object class, and serial number components for this GID-96 identity component:

```
--Contents of get_components.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id  MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
    ---------------
    --PURE_IDENTIT
    ---------------
    dbms_output.put_line('..Testing constructor with pure identity');
    ------------------------------------------------------------------------
    -- PURE_IDENTITY representation can be translated to BINARY and
    -- TAG_ENCODING ONLY when BOTH scheme and filer are provided.
    ------------------------------------------------------------------------
    id := MGD_ID('EPC', NULL, 'urn:epc:id:sgtin:0037000.030241.1041970',
'scheme=SGTIN-64;filter=3');
    dbms_output.put_line(id.to_string);
    dbms_output.put_line('filter         = ' || id.get_component('filter'));
    dbms_output.put_line('company prefix = ' || id.get_component('companyprefix'));
    dbms_output.put_line('itemref        = ' || id.get_component('itemref'));
    dbms_output.put_line('serial         = ' || id.get_component('serial'));
    dbms_output.put_line('BINARY format  = ' || id.format(NULL, 'BINARY'));
    dbms_output.put_line('PURE_IDENTITY format  = ' || id.format(NULL, 'PURE_IDENTITY'));
    dbms_output.put_line('TAG_ENCODING format   = ' || id.format(NULL, 'TAG_ENCODING'));
END;
/
SHOW ERRORS;
```

```
call DBMS_MGD_ID_UTL.remove_proxy();
SQL> @get_component.sql
.
.
.
..Testing constructor with pure identity

PL/SQL procedure successfully completed.
.
.
.
```

TO_STRING Function

This function returns the semicolon (;) separated component name value pairs of the MGD_ID object.

Syntax

```
TO_STRING
 RETURN VARCHAR2;
```

Examples

The following example converts the MGD_ID object into a string value:

```
-- Contents of tostring3.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id          MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
 dbms_output.put_line('..Testing to_string');
   id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970', 'scheme=GID-96');
      DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
      DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
connect / as sysdba;
drop user mgduser cascade;

SQL> @tostring3.sql
.
.
.
..Testing to_string
mgd_id object as a string
category_id =1;schemes = GID-96;objectclass = 30241;generalmanager =
0037000;scheme = GID-96;1 = 1;serial = 1041970
PL/SQL procedure successfully completed.
.
.
```

TRANSLATE Function

This static function translates between different representations directly without first constructing an MGD_ID object. This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Converts the identifier in one format to another given the category name, the tag identifier, the parameter list, and the output format.

```
TRANSLATE (
   category_name    IN VARCHAR2,
   identifier       IN VARCHAR2,
   parameter_list   IN VARCHAR2,
   output_format    IN VARCHAR2)
 RETURN VARCHAR2 DETERMINISTIC;
```

Converts the identifier in one format to another given the category name, category version, the tag identifier, the parameter list, and the output format.

```
TRANSLATE (
   category_name    IN VARCHAR2,
   category_version IN VARCHAR2,
   identifier       IN VARCHAR2,
   parameter_list   IN VARCHAR2,
   output_format    IN VARCHAR2)
 RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 282–9 TRANSLATE Function Parameters

Parameter	Description
category_name	Name of category
category_version	Category version. If NULL, the latest version of the specified category name will be used.
identifier	EPC identifier, expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as gtin=00037000302414;serial=10419703 for a SGTIN coding scheme.
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96

Table 282–9 (Cont.) TRANSLATE Function Parameters

Parameter	Description
output_format	One of the supported output formats into which an MGD_ID component shall be converted: ■ BINARY ■ LEGACY ■ TAG_ENCODING ■ PURE_IDENTITY ■ ONS_HOSTNAME

Usage Notes

When converting from a pure identity representation to a binary representation, the filter value must be supplied as a value using the parameter_list parameter.

Examples

The following examples translates one GID-96 representation into another:

```
-- Contents of translate1.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id          MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is BINARY');
  dbms_output.put_line(
    mgd_id.translate('EPC',

Rule TYPEs

This chapter describes the types used with rules, rule sets, and evaluation contexts.

This chapter contains the following topics:

Using Rule Types

This section contains topics that relate to using the types used with rules, rule sets, and evaluation contexts.

Overview

This types in this chapter are used in rules and enable clients to evaluate rules with the rules engine.

See Also:

- Chapter 138, "DBMS_RULE"
- Chapter 139, "DBMS_RULE_ADM"
- *Oracle Streams Extended Examples* for examples that use rule types

Security Model

`PUBLIC` is granted `EXECUTE` privilege on the types described in this chapter.

See Also: *Oracle Database Security Guide* for more information about user group `PUBLIC`

Summary of Rule Types

Table 283–1 Rule Types

Type	Description
RE$ATTRIBUTE_VALUE Type on page 283-7	Specifies the value of a variable attribute
RE$ATTRIBUTE_VALUE_LIST Type on page 283-8	Identifies a list of attribute values
RE$COLUMN_VALUE Type on page 283-9	Specifies the value of a table column
RE$COLUMN_VALUE_LIST Type on page 283-10	Identifies a list of column values
RE$NAME_ARRAY Type on page 283-11	Identifies a list of names
RE$NAME_ARRAY Type on page 283-11	Identifies a list of name-value pairs
RE$NV_LIST Type on page 283-13	Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context and the action context for a rule
RE$NV_NODE Type on page 283-15	Identifies a name-value pair
RE$RULE_HIT Type on page 283-16	Specifies a rule found because of evaluation
RE$RULE_HIT_LIST Type on page 283-17	Identifies a list of rules found because of evaluation
RE$TABLE_ALIAS Type on page 283-18	Provides the table corresponding to an alias used in a rule evaluation context
RE$TABLE_ALIAS_LIST Type on page 283-19	Identifies a list of table aliases used in a rule evaluation context
RE$TABLE_VALUE Type on page 283-20	Specifies the value of a table row using a `ROWID`
RE$TABLE_VALUE_LIST Type on page 283-21	Identifies a list of table values
RE$VARIABLE_TYPE Type on page 283-22	Provides the type of a variable used in a rule evaluation context
RE$VARIABLE_TYPE_LIST Type on page 283-24	Identifies a list of variables and their types used in a rule evaluation context
RE$VARIABLE_VALUE Type on page 283-25	Specifies the value of a variable
RE$VARIABLE_VALUE_LIST Type on page 283-26	Identifies a list of variable values

Rule types are used with the following Oracle-supplied PL/SQL packages:

- `DBMS_RULE`
- `DBMS_RULE_ADM`

You can use the `DBMS_RULE_ADM` package to create and administer rules, rule sets, and evaluation contexts, and you can use the `DBMS_RULE` package to evaluate rules.

When you use Oracle Streams, rules determine which changes are captured by a capture process, which messages are propagated by a propagation, which messages are applied by an apply process, and which messages are dequeued by a messaging client. The following Oracle Streams packages use rules:

- DBMS_APPLY_ADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_STREAMS_AUTH

See Also: *Oracle Streams Concepts and Administration*

RE$ATTRIBUTE_VALUE Type

Specifies the value of a variable attribute.

> **Note:** Enclose the variable name and attribute name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE (
   variable_name    VARCHAR2(32),
   attribute_name   VARCHAR2(4000),
   attribute_value  ANYDATA);
```

Attributes

Table 283–2 RE$ATTRIBUTE_VALUE Attributes

Attribute	Description
`variable_name`	Specifies the variable used in a rule
`attribute_name`	Specifies the attribute name. The attribute name can be a multi-component name, such as `a1.b2.c3`.
`attribute_value`	Specifies the attribute value

RE$ATTRIBUTE_VALUE_LIST Type

Identifies a list of attribute values.

Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$ATTRIBUTE_VALUE;
```

RE$COLUMN_VALUE Type

Specifies the value of a table column.

> **Note:** Enclose the column name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE (
   table_alias   VARCHAR2(32),
   column_name   VARCHAR2(4000),
   column_value  ANYDATA);
```

Attributes

Table 283–3 RE$COLUMN_VALUE Attributes

Attribute	Description
table_alias	Specifies the alias used for the table in a rule
column_name	Specifies the column name
column_value	Specifies the column value

RE$COLUMN_VALUE_LIST Type

Identifies a list of column values.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE_LIST AS VARRAY(1024) OF SYS.RE$COLUMN_VALUE;
```

RE$NAME_ARRAY Type

Identifies a list of names.

Syntax

```
TYPE SYS.RE$NAME_ARRAY AS VARRAY(1024) OF VARCHAR2(30);
```

RE$NV_ARRAY Type

Identifies a list of name-value pairs.

Syntax

```
TYPE SYS.RE$NV_ARRAY AS VARRAY(1024) OF SYS.RE$NV_NODE;
```

RE$NV_LIST Type

Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context for rule set evaluation and the action context for a rule.

Syntax

```
TYPE SYS.RE$NV_LIST AS OBJECT(
   actx_list  SYS.RE$NV_ARRAY);
```

Attributes

Table 283–4 RE$NV_LIST Attributes

Attribute	Description
actx_list	The list of name-value pairs

RE$NV_LIST Subprograms

This section describes the following member procedures and member functions of the SYS.RE$NV_LIST type:

- ADD_PAIR Member Procedure
- GET_ALL_NAMES Member Function
- GET_VALUE Member Function
- REMOVE_PAIR Member Procedure

ADD_PAIR Member Procedure

Adds a name-value pair to the list of name-value pairs.

Note: Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE ADD_PAIR(
   name   IN  VARCHAR2,
   value  IN  ANYDATA);
```

Parameters

Table 283–5 ADD_PAIR Procedure Parameters

Parameter	Description
name	The name in the name-value pair being added to the list. If the name exists in the list, then this procedure raises an error.
value	The value in the name-value pair being added to the list

GET_ALL_NAMES Member Function

Returns a list of all the names in the name-value pair list.

Syntax

```
MEMBER FUNCTION GET_ALL_NAMES()
RETURN SYS.RE$NAME_ARRAY;
```

GET_VALUE Member Function

Returns the value for the specified name in a name-value pair list.

> **Note:** Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER FUNCTION GET_VALUE(
   name  IN  VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 283–6 GET_VALUE Function Parameters

Parameter	Description
name	The name whose value to return

REMOVE_PAIR Member Procedure

Removes the name-value pair with the specified name from the name-value pair list.

> **Note:** Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE REMOVE_PAIR(
   name  IN  VARCHAR2);
```

Parameters

Table 283–7 REMOVE_PAIR Procedure Parameters

Parameter	Description
name	The name of the pair to remove

RE$NV_NODE Type

Identifies a name-value pair.

> **Note:** Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$NV_NODE (
   nvn_name   VARCHAR2(30),
   nvn_value  ANYDATA);
```

Attributes

Table 283–8 RE$NV_NODE Attributes

Attribute	Description
nvn_name	Specifies the name in the name-value pair
nvn_value	Specifies the value in the name-value pair

RE$RULE_HIT Type

Specifies a rule found because of an evaluation.

See Also:

- CREATE_RULE Procedure on page 139-15
- ALTER_RULE Procedure on page 139-11

Syntax

```
TYPE SYS.RE$RULE_HIT (
   rule_name            VARCHAR2(65),
   rule_action_context  RE$NV_LIST);
```

Attributes

Table 283–9 RE$RULE_HIT Attributes

Attribute	Description
`rule_name`	The rule name in the form *`schema_name.rule_name`*. For example, a rule named `employee_rule` in the `hr` schema is returned in the form `"hr"."employee_rule"`.
`rule_action_context`	The rule action context as specified in the `CREATE_RULE` or `ALTER_RULE` procedure of the `DBMS_RULE_ADM` package

RE$RULE_HIT_LIST Type

Identifies a list of rules found because of an evaluation.

Syntax

```
TYPE SYS.RE$RULE_HIT_LIST AS VARRAY(1024) OF SYS.RE$RULE_HIT;
```

RE$TABLE_ALIAS Type

Provides the table corresponding to an alias used in a rule evaluation context. A specified table name must satisfy the schema object naming rules.

Note: Enclose the table name in double quotation marks (") if the name contains special characters.

See Also: *Oracle Database SQL Language Reference* for information about schema object naming rules

Syntax

```
TYPE SYS.RE$TABLE_ALIAS IS OBJECT(
   table_alias  VARCHAR2(32),
   table_name   VARCHAR2(194));
```

Attributes

Table 283–10 RE$TABLE_ALIAS Attributes

Attribute	Description
`table_alias`	The alias used for the table in a rule
`table_name`	The table name referred to by the alias. A synonym can be specified. The table name is resolved in the evaluation context schema. The format is one of the following: *`schema_name.table_name`* *`table_name`* For example, if the *`schema_name`* is `hr` and the *`table_name`* is `employees`, then enter the following: `hr.employees`

RE$TABLE_ALIAS_LIST Type

Identifies a list of table aliases used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$TABLE_ALIAS_LIST AS VARRAY(1024) OF SYS.RE$TABLE_ALIAS;
```

RE$TABLE_VALUE Type

Specifies the value of a table row using a `ROWID`.

Syntax

```
TYPE SYS.RE$TABLE_VALUE(
   table_alias  VARCHAR2(32),
   table_rowid  VARCHAR2(18));
```

Attributes

Table 283–11 RE$TABLE_VALUE Attributes

Attribute	Description
`table_alias`	Specifies the alias used for the table in a rule
`table_rowid`	Specifies the rowid for the table row

RE$TABLE_VALUE_LIST Type

Identifies a list of table values.

Note: Each table alias in the list in the list must be unique.

Syntax

```
TYPE SYS.RE$TABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$TABLE_VALUE;
```

RE$VARIABLE_TYPE Type

Provides the type of a variable used in a rule evaluation context. A specified variable name must satisfy the schema object naming rules.

Note: Enclose the variable name in double quotation marks (") if the name contains special characters.

See Also: *Oracle Database SQL Language Reference* for information about schema object naming rules

Syntax

```
TYPE SYS.RE$VARIABLE_TYPE (
   variable_name             VARCHAR2(32),
   variable_type             VARCHAR2(4000),
   variable_value_function   VARCHAR2(228),
   variable_method_function  VARCHAR2(228));
```

Attributes

Table 283–12 RE$VARIABLE_TYPE Attributes

Attribute	Description
`variable_name`	The variable name used in a rule
`variable_type`	The type that is resolved in the evaluation context schema. Any valid Oracle built-in datatype, user-defined type, or Oracle-supplied type can be specified. See the *Oracle Database SQL Language Reference* for more information about these types.
`variable_value_function`	A value function that can be specified for implicit variables. A synonym can be specified. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the "Usage Notes" for more information.
`variable_method_function`	Specifies a value function, which can return the result of a method invocation. Specifying such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. The function can be a synonym or a remote function. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the "Usage Notes" for more information.

Usage Notes

The functions for both the for the `variable_value_function` parameter and `variable_method_function` parameter have the following format:

`schema_name.package_name.function_name@dblink`

Any of the following parts of the format can be omitted: *schema_name*, *package_name*, and *@dblink*.

For example, if the *schema_name* is hr, the *package_name* is var_pac, the *function_name* is func_value, and the *dblink* is dbs1.net, then enter the following:

```
hr.var_pac.func_value@dbs1.net
```

The following sections describe the signature of the functions.

Signature for variable_value_function

The function must have the following signature:

```
FUNCTION variable_value_function_name(
  evaluation_context_schema  IN VARCHAR2,
  evaluation_context_name    IN VARCHAR2,
  variable_name              IN VARCHAR2,
  event_context              IN SYS.RE$NV_LIST )
RETURN SYS.RE$VARIABLE_VALUE;
```

Signature for variable_method_function

This function must have the following signature:

```
FUNCTION variable_method_function_name(
  evaluation_context_schema  IN VARCHAR2,
  evaluation_context_name    IN VARCHAR2,
  variable_value             IN SYS.RE$VARIABLE_VALUE,
  method_name                IN VARCHAR2,
  event_context              IN SYS.RE$NV_LIST)
RETURN SYS.RE$ATTRIBUTE_VALUE;
```

RE$VARIABLE_TYPE_LIST Type

Identifies a list of variables and their types used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$VARIABLE_TYPE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_TYPE;
```

RE$VARIABLE_VALUE Type

Specifies the value of a variable.

> **Note:** Enclose the variable name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$VARIABLE_VALUE (
   variable_name  VARCHAR2(32),
   variable_data  ANYDATA);
```

Attributes

Table 283–13 RE$VARIABLE_VALUE Attributes

Attribute	Description
variable_name	Specifies the variable name used in a rule
variable_data	Specifies the data for the variable value

RE$VARIABLE_VALUE_LIST Type

Identifies a list of variable values.

Syntax

```
TYPE SYS.RE$VARIABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_VALUE;
```

284

UTL Streams Types

`UTL Streams Types` describes abstract types used with Oracle XML functionality. Four abstract PL/SQL streams are introduced and defined within the '`SYS`' schema. The streams may be referenced by `PUBLIC` and are described in the following sections.

> **See Also:** For more information, see Oracle XML DB Developer's Guide

This chapter contains the following topics:

- Using UTL Streams Types
- Summary of UTL Binary Streams Types

Using UTL Streams Types

- Security Model

Security Model

EXECUTE on UTL Streams Types is granted to PUBLIC.

Summary of UTL Binary Streams Types

Table 284–1 UTL Streams Types

Type	Description
UTL_BINARYINPUTSTREAM Type on page 284-5	Reads bytes and closes a stream.
UTL_BINARYOUTPUTSTREAM Type on page 284-6	Writes bytes and closes a stream.
UTL_CHARACTERINPUTSTREAM Type on page 284-7	Reads chars and closes a stream.
UTL_CHARACTEROUTPUTSTREAM Type on page 284-8	Writes chars and closes a stream.

UTL_BINARYINPUTSTREAM Type

This type is similar to `java.io.InputStream` in that it can only read and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryInputStream AS OBJECT (

   MEMBER FUNCTION available (
        self    IN OUT NOCOPY  Utl_BinaryInputStream)
     RETURN INTEGER,

   MEMBER FUNCTION read (                                  -- #1
      self      IN OUT NOCOPY  Utl_BinaryInputStream,
      numBytes  IN             INTEGER DEFAULT 1)
    RETURN RAW,

  MEMBER PROCEDURE read (                                  -- #2
     self       IN OUT NOCOPY   Utl_BinaryInputStream,
     bytes      IN OUT NOCOPY  RAW,
     numBytes   IN OUT         INTEGER),

  MEMBER PROCEDURE read (                                  -- #3
     self       IN OUT NOCOPY   Utl_BinaryInputStream,
     bytes      IN OUT NOCOPY   RAW,
     offset     IN INTEGER,
     numBytes   IN OUT          INTEGER),

  member function close (
     self       In Out Nocopy   Utl_BinaryInputStream)

 ) NOT FINAL;
```

Attributes

Table 284–2 UTL_BINARYINPUTSTREAM Type Member Subprograms

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	■ #1 - Reads the number of bytes specified by numBytes (default is 1) and returns the bytes as a RAW. If there are no remaining bytes a value of NULL is returned. ■ #2 - Reads the number of bytes specified in numBytes into the parameter bytes. Additionally, the actual number of bytes read is returned in parameter numBytes. If this parameter is set to 0 then there are no more bytes to be read. ■ #3 - Reads the number of bytes specified in numBytes into the parameter bytes, beginning at the offset specified by parameter offset. The actual number of bytes read is returned in parameter numBytes. If this value is 0, then there are no additional bytes to be read.
CLOSE	Releases all resources held on the node to support the stream

UTL_BINARYOUTPUTSTREAM Type

This type is similar to `java.io.OutputStream` in that it can only write and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryOutputStream AS OBJECT (

  MEMBER FUNCTION write (                                  -- #1
       self       IN OUT NOCOPY   sys.utl_BinaryOutputStream,
       bytes      IN              RAW,
       numBytes   IN              INTEGER DEFAULT 1)
  RETURN INTEGER,

  MEMBER PROCEDURE write (                                 -- #2
       self       IN OUT NOCOPY  sys.utl_BinaryOutputStream,
       bytes      IN NOCOPY      RAW,
       numBytes   IN OUT         INTEGER),

  MEMBER PROCEDURE write (                                 -- #3
       self       IN OUT NOCOPY  utl_BinaryOutputStream,        bytes      IN
NOCOPY      RAW,
       offset     IN             INTEGER,
       numBytes   IN OUT         INTEGER),

  MEMBER PROCEDURE flush (
       self       IN OUT NOCOPY  utl_BinaryOutputStream),

  MEMBER PROCEDURE close (
       self       IN OUT NOCOPY utl_BinaryOutputStream)

 ) NOT FINAL;
```

Attributes

Table 284–3 UTL_BINARYOUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
`WRITE`	■ #1 - Writes the number of bytes specified by `numBytes` (default is 1) from `RAW` into the stream. The actual number of bytes written is returned. ■ #2 - Writes the number of bytes specified in parameter `numBytes` from parameter bytes to the stream. The actual number of bytes written is returned in parameter `numBytes`. ■ #3 - Writes the number of bytes specified by `numBytes` to the stream, beginning at the offset specified by parameter offset. The actual number of bytes written is returned in parameter `numBytes`.
`FLUSH`	Insures that any buffered bytes are copied to the node destination
`CLOSE`	Frees all resources associated with the stream

UTL_CHARACTERINPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_CharacterInputStream AS OBJECT (

   MEMBER FUNCTION available (
       self       IN OUT NOCOPY   utl_CharacterInputStream)     RETURN INTEGER,
MEMBER FUNCTION read (                                  -- #1
     self      IN OUT NOCOPY  utl_CharacterInputStream,      numChars   IN

MEMBER PROCEDURE close (
      self       IN OUT NOCOPY    utl_CharacterInputStream)  ) NOT FINAL;
```

Attributes

Table 284–4 UTL_CHARACTERINPUTSTREAM Type Member Subprograms

Member Subprogram	Description
`AVAILABLE`	Returns the number of bytes available to be read
`READ`	■ #1 - Returns the number of characters remaining to be read ■ #2 - Reads the number of characters specified by `numChars` (default value is 1) and returns the characters as a `VARCHAR2`. If the value of `lineFeed` is true (default value is `FALSE`) then the reading stops if a linefeed character is found. If there are no remaining characters a value of `NULL` is returned. ■ #3 - Reads reads the number of characters specified by parameter `numChars` into the parameter chars. Additionally, the actual number of characters read is returned in parameter `numChars`. If this value is 0, then there are no more characters to be read. If the value of `lineFeed` is `TRUE` (default is `FALSE`), then reading stops if a linefeed character is encountered.
`CLOSE`	Releases all resources held by the stream

UTL_CHARACTEROUTPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

Syntax

```
CREATE OR REPLACE TYPE utl_CharacterOutputStream  AS OBJECT (

 MEMBER FUNCTION write (                                  -- #1
     self      IN OUT NOCOPY   utl_CharacterOutputStream,
     chars     IN              VARCHAR2,
     numChars  IN              INTEGER DEFAULT 1,
     lineFeed  IN              BOOLEAN DEFAULT FALSE)
  RETURN INTEGER,

 MEMBER PROCEDURE write (                                  -- #2
     self      IN OUT NOCOPY   utl_CharacterOutputStream,
     chars     IN OUT NOCOPY   VARCHAR2,
     numChars  IN OUT          INTEGER,
     lineFeed  IN              BOOLEAN DEFAULT FALSE),

 member procedure write (                                  -- #3
     self     IN OUT NOCOPY    utl_CharacterOutputStream,
     chars    IN  NOCOPY       varchar2,
     offset   IN               integer,
     numChars IN OUT           integer,
    lineFeed  IN               boolean default false),

 MEMBER PROCEDURE flush (
     self     IN OUT NOCOPY    utl_CharacterOutputStream),

MEMBER PROCEDURE close (
     self     IN OUT NOCOPY utl_CharacterOutputStream)

 ) NOT FINAL;
```

Attributes

Table 284–5 UTL_CHARACTEROUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
`WRITE`	■ #1 - Writes the number of characters specified by `numChars` (default is 1) from parameter chars into the stream and returns the actual number of characters written. If the value of `lineFeed` is TRUE (default is `FALSE`) a `lineFeed` character is inserted after the last character. ■ #2 - writes the number of characters specified by parameter `numChars`, from parameter `chars` into the stream. The actual number of characters written is returned in parameter `numChars`. If the value of `lineFeed` is true (default is `FALSE`) a `lineFeed` character is inserted after the last character. ■ #3 - Writes the number of characters specified by parameter `numChars`, from parameter `chars`, beginning at `offset` specified by parameter offset. The actual number of characters written is returned in parameter `numChars`. If the value of `lineFeed` is true (default is `FALSE`) a `lineFeed` character is inserted after the last character .
`FLUSH`	Copies all characters that may be contained within buffers to the node value

Table 284–5 (Cont.) UTL_CHARACTEROUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
CLOSE	Releases all resources held by the stream

285

XMLTYPE

`XMLType` is a system-defined opaque type for handling XML data. It as predefined member functions on it to extract XML nodes and fragments.

You can create columns of `XMLType` and insert XML documents into it. You can also generate XML documents as `XMLType` instances dynamically using the `SYS_XMLAGG SQL` function.

This chapter contains the following topics:

- Summary of XMLType Subprograms

See Also:

- *Oracle XML DB Developer's Guide*

Summary of XMLType Subprograms

Table 285–1 summarizes functions and procedures of the `XMLType`.

Table 285–1 XMLTYPE Subprograms

Method	Description
CREATENONSCHEMABASEDXML on page 285-4	Creates a non schema based XML from the input schema based instance.
CREATESCHEMABASEDXML on page 285-5	Creates a schema based `XMLType` instance from the non-schema based instance using the input schema URL.
CREATEXML on page 6	Static function for creating and returning an `XMLType` instance.
EXISTSNODE on page 285-8	Takes a `XMLType` instance and a `XPath` and returns 1 or 0 indicating if applying the `XPath` returns a non-empty set of nodes.
EXTRACT on page 285-9	Takes a `XMLType` instance and an `XPath`, applies the XPath expression and returns the results as an `XMLType`.
GETBLOBVAL on page 285-10	Returns the value of the `XMLType` instance as a `BLOB`
GETCLOBVAL on page 285-11	Returns the value of the `XMLType` instance as a `CLOB`.
GETNAMESPACE on page 285-12	Returns the namespace for the top level element in a schema based document.
GETNUMBERVAL on page 285-13	Returns the value of the `XMLType` instance as a `NUMBER`. This is only valid if the input `XMLType` instance contains a simple text node and is convertible to a number.
GETROOTELEMENT on page 285-14	Returns the root element of the input instance. Returns `NULL` if the instance is a fragment
GETSCHEMAURL on page 285-15	Returns the XML schema URL if the input is an XML Schema based.
GETSTRINGVAL on page 285-16	Returns the value of the `XMLType` instance as a string.
ISFRAGMENT on page 285-17	Checks if the input `XMLType` instance is a fragment or not. A fragment is a XML instance, which has more than one root element.
ISSCHEMABASED on page 285-18	Returns 1 or 0 indicating if the input `XMLType` instance is a schema based one or not.
ISSCHEMAVALID on page 285-19	Checks if the input instance is schema valid according to the given schema URL.
ISSCHEMAVALIDATED on page 285-20	Checks if the instance has been validated against the schema.
SCHEMAVALIDATE on page 285-21	Validates the input instance according to the XML Schema. Raises error if the input instance is non-schema based.
SETSCHEMAVALIDATED on page 285-22	Sets the schema valid flag to avoid costly schema validation.
TOOBJECT on page 285-23	Converts the `XMLType` instance to an object type.
TRANSFORM on page 285-24	Takes an `XMLType` instance and an associated stylesheet (which is also an `XMLType` instance), applies the stylesheet and returns the result as XML.

Table 285–1 (Cont.) XMLTYPE Subprograms

Method	Description
XMLTYPE on page 285-25	Constructs an instance of the `XMLType` datatype. The constructor can take in the XML as a `CLOB`, `VARCHAR2` or take in a object type.

CREATENONSCHEMABASEDXML

Member function. Creates a non-schema based XML document from a schema based instance.

Syntax

```
MEMBER FUNCTION CREATENONSCHEMABASEDXML
return XMLType deterministic;
```

CREATESCHEMABASEDXML

Member function. Creates a schema based XMLType instance from a non-schema based XMLType value. It uses either the supplied SCHEMA URL, or the SCHEMALOCATION attribute of the instance.

Syntax

```
MEMBER FUNCTION createSchemaBasedXML(
schema IN varchar2 := NULL)
return XMLType deterministic;
```

Parameter	Description
schema	Optional XMLSchema URL used to convert the value to the specified schema.

CREATEXML

Static function for creating and returning an XMLType instance. The string and CLOB parameters used to pass in the date must contain well-formed and valid XML documents. The options are described in the following table.

Syntax	Description

`STATIC FUNCTION createXML(`
`  xmlData IN varchar2)`
`RETURN XMLType deterministic;`
	Creates the XMLType instance from a string.

`STATIC FUNCTION createXML(`
`  xmlData IN clob)`
`RETURN XMLType deterministic;`
	Creates the XMLType instance from a CLOB.

`STATIC FUNCTION createXML (`
`  xmlData IN clob,`
`  schema IN varchar2,`
`  validated IN number := 0,`
`  wellformed IN number := 0 )`
`RETURN XMLType deterministic;`
	This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.

`STATIC FUNCTION createXML (`
`  xmlData IN varchar2,`
`  schema IN varchar2,`
`  validated IN number := 0,`
`  wellformed IN number := 0)`
`RETURN XMLType deterministic;`
	This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.

`STATIC FUNCTION createXML (`
`  xmlData IN "<ADT_1>",`
`  schema IN varchar2 := NULL,`
`  element IN varchar2 := NULL,`
`  validated IN NUMBER := 0)`
`RETURN XMLType deterministic;`
	Creates an XML instance from an instance of an user-defined type.

`STATIC FUNCTION createXML (`
`  xmlData IN SYS_REFCURSOR,`
`  schema in varchar2 := NULL,`
`  element in varchar2 := NULL,`
`  validated in number := 0)`
`RETURN XMLType deterministic;`
	Creates an XML instance from a cursor reference. You can pass in any arbitrary SQL query as a CURSOR.

Syntax	Description
STATIC FUNCTION createXML (xmlData IN AnyData, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) RETURN sys.XMLType deterministic parallel_enable	Creates an XML instance from ANYDATA.If the ANYDATAinstance contains an ADT, the XMLTypereturned is the same as would be returned for a call directly on the ADT. If the ANYDATAcontains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.
STATIC FUNCTION createXML (xmlData IN blob, csid IN number, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) return sys.XMLType deterministic	Creates an XML instance from a BLOB.
STATIC FUNCTION createXML (xmlData IN bfile, csid IN number, Schema IN varchar2, validated IN number := 0, wellformed IN number := 0) return sys.XMLType deterministic	Creates an XML instance from a BFILE.

Parameter	Description
xmlData	The actual data in the form of a BFILE, BLOB, CLOB, REF cursor, VARCHAR2 or object type.
schema	Optional Schema URL to be used to make the input conform to the given schema. **Caution**: Oracle does not support use of types generated by Schema Registration (see *Oracle XML DB Developer's Guide*).
validated	Flag to indicate that the instance is valid according to the given XML Schema. (Default is 0)
wellformed	Flag to indicate that the input is well formed. If set, then the database would not do well formed check on the input instance. (Default is 0)
element	Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL). **Caution**: Oracle does not support use of types generated by Schema Registration (see *Oracle XML DB Developer's Guide*).
csid	The character set id of input XML data.

EXISTSNODE

Member function. Checks if the node exists. If the XPath string is `NULL` or the document is empty, then a value of 0 is returned, otherwise returns 1. The options are described in the following table.

Syntax	Description

`MEMBER FUNCTION existsNode(`
`  xpath IN varchar2)`
`RETURN number deterministic;`
	Given an XPath expression, checks if the XPath applied over the document can return any valid nodes.

`MEMBER FUNCTION existsNode(`
`  xpath in varchar2,`
`  nsmap in varchar2)`
`RETURN number deterministic;`
	This member function uses the XPath expression with the namespace information and checks if applying the XPath returns any nodes or not.

Parameter	Description
`xpath`	The XPath expression to test.
`nsmap`	Optional namespace mapping.

EXTRACT

Member function. Extracts an XMLType fragment and returns an XMLType instance containing the result node(s). If the XPath does not result in any nodes, then returns NULL. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION extract(xpath IN varchar2) RETURN XMLType deterministic;	Given an XPath expression, applies the XPath to the document and returns the fragment as an XMLType.
MEMBER FUNCTION extract(xpath IN varchar2, nsmap IN varchar2) RETURN XMLType deterministic;	This member function applies the XPath expression and namespace mapping, over the XML data to return a XMLType instance containing the resultant fragment.

Parameter	Description
xpath	The XPath expression to apply.
nsmap	Optional prefix to namespace mapping information.

GETBLOBVAL

Member function. Returns a BLOB containing the serialized XML representation; if the BLOB returned is temporary, it must be freed after use.

Syntax

```
MEMBER FUNCTION getBlobVal(
   csid   IN   NUMBER)
 RETURN BLOB DETERMINISTIC;
```

Parameter	Description
csid	The desired character set ID of output BLOB

GETCLOBVAL

Member function. Returns a `CLOB` containing the serialized XML representation; if the `CLOB` returned is temporary, it must be freed after use.

Syntax

```
MEMBER FUNCTION getClobVal()
RETURN clob deterministic;
```

GETNAMESPACE

Member function. Returns the namespace of the top level element in the instance. Returns `NULL` if the input is a fragment or is a non-schema based instance.

Syntax

```
MEMBER FUNCTION getNamespace
return varchar2 deterministic;
```

GETNUMBERVAL

Member function. Returns a numeric value, formatted from the text value pointed to by the `XMLType` instance. The `XMLType` must point to a valid text node that contains a numerical value. The options are described in the following table.

Syntax

```
MEMBER FUNCTION getNumberVal()
RETURN number deterministic;
```

GETROOTELEMENT

Member function. Gets the root element of the `XMLType` instance. Returns `NULL` if the instance is a fragment.

Syntax

```
MEMBER FUNCTION getRootElement
return varchar2 deterministic;
```

GETSCHEMAURL

Member function. Returns the XML Schema URL corresponding to the `XMLType` instance, if the `XMLType` instance is a schema-based document. Otherwise returns `NULL`.

Syntax

```
MEMBER FUNCTION getSchemaURL
return varchar2 deterministic;
```

GETSTRINGVAL

Member function. Returns the document as a string. Returns s string containing the seralized XML representation, or in case of text nodes, the text itself. If the XML document is bigger than the maximum size of the `VARCHAR2`, which is 4000, then an error is raised at run time.

Syntax

```
MEMBER FUNCTION getStringVal()
RETURN varchar2 deterministic;
```

ISFRAGMENT

Determines if the XMLType instance corresponds to a well-formed document, or a fragment. Returns 1 or 0 indicating if the XMLType instance contains a fragment or a well-formed document.

Syntax

```
MEMBER FUNCTION isFragment()
RETURN number deterministic;
```

ISSCHEMABASED

Member function. Determines whether the `XMLType` instance is schema-based or not. Returns 1 or 0 depending on whether the `XMLType` instance is schema-based.

Syntax

```
MEMBER FUNCTION isSchemaBased
return number deterministic;
```

ISSCHEMAVALID

Member function. Checks if the input instance is conformant to a specified schema. Does not change the validation status of the XML instance. If a XML Schema URL is not specified and the xml document is schema based, the conformance is checked against the `XMLType` instance's own schema.

Syntax

```
member function isSchemaValid(
schurl IN VARCHAR2 := NULL,
elem IN VARCHAR2 := NULL)
return NUMBER deterministic;
```

Parameter	IN / OUT	Description
`schurl`	`(IN)`	The URL of the XML Schema against which to check conformance.
`elem`	`(IN)`	Element of a specified schema, against which to validate. This is useful when we have a XML Schema which defines more than one top level element, and we want to check conformance against a specific one of these elements.

ISSCHEMAVALIDATED

Member function. Returns the validation status of the `XMLType` instance -- tells if a schema based instance has been actually validated against its schema. Returns 1 if the instance has been validated against the schema, 0 otherwise.

Syntax

```
MEMBER FUNCTION isSchemaValidated
return NUMBER deterministic;
```

SCHEMAVALIDATE

Member procedure. Validates the XML instance against its schema if it hasn't already been done. For non-schema based documents an error is raised. If validation fails an error is raised; else, the document's status is changed to validated.

Syntax

```
MEMBER PROCEDURE schemaValidate(
   self IF OUT NOCOPY XMLType);
```

Parameter	IN / OUT	Description
self	(OUT)	XML instance being validated against the schema.

SETSCHEMAVALIDATED

Member function. Sets the `VALIDATION` state of the input XML instance.

Syntax

```
MEMBER PROCEDURE setSchemaValidated(
self IF OUT NOCOPY XMLType,
   flag IN BINARY_INTEGER := 1);
```

Parameter	IN / OUT	Description
`self`	`(OUT)`	XML instance.
`flag`	`(IN)`	0 - `NOT VALIDATED`; 1 - `VALIDATED` (Default)

TOOBJECT

Member procedure. Converts the XML value to an object type using the XMLSCHEMA mapping, if available. If a SCHEMA is not supplied or the input is a non-schema based XML, the procedure uses cannonical mapping between elements and object type attributes.

Syntax

```
MEMBER PROCEDURE toObject(
SELF in XMLType,
object OUT "<ADT_1>",
schema in varchar2 := NULL,
element in varchar2 := NULL);
```

Parameter	IN / OUT	Description
SELF	(IN)	Instance to be converted. Implicit if used as a member procedure.
object	(IN)	Converted object. An object instance of the required type may be passed in to this function
schema	(IN)	Schema URL. The mapping of the XMLType instance to the converted object instance may be specified using a schema. **Caution**: Oracle does not support use of types generated by Schema Registration (see *Oracle XML DB Developer's Guide*).
element	(IN)	Top-level element name. An XML Schema document does not specify the top-level element for a conforming XML instance document without this parameter. **Caution**: Oracle does not support use of types generated by Schema Registration (see *Oracle XML DB Developer's Guide*).

TRANSFORM

Member function. This member function transforms the XML data using the XSL stylesheet argument and the top-level parameters passed as a string of name=value pairs. If any of the arguments other than the parammap is `NULL`, then a `NULL` is returned.

Syntax

```
MEMBER FUNCTION transform(
xsl IN XMLType,
parammap in varchar2 := NULL)
RETURN XMLType deterministic;
```

Parameter	IN / OUT	Description
`xsl`	`(IN)`	The XSL stylesheet describing the transformation
`parammap`	`(IN)`	Top level parameters to the XSL - string of name=value pairs

XMLTYPE

XMLType constructor. The options are described in the following table.

Syntax	Description
constructor function XMLType(xmlData IN clob, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN Number := 0) return self as result deterministic;	This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.
constructor function XMLType(xmlData IN varchar2, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic;	This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.
constructor function XMLType (xmlData IN "w<ADT_1>", schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic;	This constructor function creates an optionally schema-based XMLType instance from the specified object type parameter.
constructor function XMLType(xmlData IN SYS_REFCURSOR, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) return self as result deterministic;	This constructor function creates an optionally schema-based XMLType instance from the specified REF CURSOR parameter.
constructor function XMLType(xmlData IN AnyData, schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic parallel_enable	This constructor function creates an optionally schema-based XMLType instance from the specified ANYDATA parameter.If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.
constructor function XMLType(xmlData IN blob, csid IN number, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic	This constructor function creates an optionally schema-based XMLType instance from the specified BLOB parameter.

Syntax	Description

`constructor function XMLType(`
`  xmlData IN bfile,`
`  csid IN number,`
`  schema IN varchar2 := NULL,`
`  validated IN number := 0,`
`  wellformed IN number := 0)`
`return self as result deterministic`
	This constructor function creates an optionally schema-based `XMLType` instance from the specified `BFILE` parameter.

Parameter	Description
`xmlData`	The data in the form of a `BFILE`, `BLOB`, `CLOB`, `REF`s, `VARCHAR2` or object type.
`schema`	Optional Schema URL to be used to make the input conform to the given schema. **Caution**: Oracle does not support use of types generated by Schema Registration (see *Oracle XML DB Developer's Guide*).
`validated`	Indicates that the instance is valid to the given XML Schema.
`wellformed`	Indicates that the input is well formed. If set, then the database would not do well formed check on the input instance.
`element`	Optional element name in the case of the `ADT_1` or `REF CURSOR` constructors. (Default is `NULL`). **Caution**: Oracle does not support use of types generated by Schema Registration (see *Oracle XML DB Developer's Guide*).
`csid`	The character set id of input XML data.
