Preface

This Preface contains these topics:

Audience

Oracle Database PL/SQL Packages and Types Reference is intended for programmers, systems analysts, project managers, and others interested in developing database applications. This manual assumes a working knowledge of application programming and familiarity with SQL to access information in relational database systems. Some sections also assume a knowledge of basic object-oriented programming.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at
http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit
http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit
http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

For more information, see the following documents:

- *Oracle Database Development Guide*
- *Oracle Database PL/SQL Language Reference*

Many of the examples in this book use the sample schemas, which are installed by default when you select the Basic Installation option with an Oracle Database installation. Refer to *Oracle Database Sample Schemas* for information on how these schemas were created and how you can use them yourself.

Printed documentation is available for sale in the Oracle Store at

http://shop.oracle.com/

To download free release notes, installation documentation, white papers, or other collateral, please visit the Oracle Technology Network (OTN).

http://docs.oracle.com/

Conventions

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- Conventions in Text
- Conventions in Code Examples

Conventions in Text

We use various conventions in text to help you more quickly identify special terms. The following table describes those conventions and provides examples of their use.

Convention	Meaning	Example
Bold	Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.	When you specify this clause, you create an **index-organized table**.
Italics	Italic typeface indicates book titles or emphasis.	*Oracle Database Concepts* Ensure that the recovery catalog and target database do *not* reside on the same disk.
`UPPERCASE monospace (fixed-width) font`	Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, datatypes, RMAN keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, usernames, and roles.	You can specify this clause only for a `NUMBER` column. You can back up the database by using the `BACKUP` command. Query the `TABLE_NAME` column in the `USER_TABLES` data dictionary view. Use the `DBMS_STATS.GENERATE_STATS` procedure.
`lowercase monospace (fixed-width) font`	Lowercase monospace typeface indicates executable programs, filenames, directory names, and sample user-supplied elements. Such elements include computer and database names, net service names and connect identifiers, user-supplied database objects and structures, column names, packages and classes, usernames and roles, program units, and parameter values. *Note:* Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.	Enter `sqlplus` to start SQL*Plus. The password is specified in the `orapwd` file. Back up the datafiles and control files in the `/disk1/oracle/dbs` directory. The `department_id`, `department_name`, and `location_id` columns are in the `hr.departments` table. Set the `QUERY_REWRITE_ENABLED` initialization parameter to `true`. The `JRepUtil` class implements these methods.
`lowercase italic monospace (fixed-width) font`	Lowercase italic monospace font represents placeholders or variables.	You can specify the *`parallel_clause`*. Run *`old_release`*`.SQL` where *`old_release`* refers to the release you installed prior to upgrading.

Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

Convention	Meaning	Example
`[ ]`	Anything enclosed in brackets is optional.	`DECIMAL (digits [ , precision ])`
`{ }`	Braces are used for grouping items.	`{ENABLE | DISABLE}`
`|`	A vertical bar represents a choice of two options.	`{ENABLE | DISABLE}` `[COMPRESS | NOCOMPRESS]`
`...`	Ellipsis points mean repetition in syntax descriptions.	`CREATE TABLE ... AS subquery;`
	In addition, ellipsis points can mean an omission in code examples or text.	`SELECT col1, col2, ... , coln FROM employees;`
Other symbols	You must use symbols other than brackets ([ ]), braces ({ }), vertical bars (|), and ellipsis points (...) exactly as shown.	`acctbal NUMBER(11,2);` `acct CONSTANT NUMBER(4) := 3;`

Italics	Italicized text indicates placeholders or variables for which you must supply particular values.	`enter password`
		
		`DB_NAME = database_name`

`UPPERCASE`	Uppercase typeface indicates elements supplied by the system. We show these terms in uppercase in order to distinguish them from terms you define. Unless terms appear in brackets, enter them in the order and with the spelling shown. Because these terms are not case sensitive, you can use them in either UPPERCASE or lowercase.	`SELECT last_name, employee_id FROM employees;`
		`SELECT * FROM USER_TABLES;`
		`DROP TABLE hr.employees;`

`lowercase`	Lowercase typeface indicates user-defined programmatic elements, such as names of tables, columns, or files.
	Note: Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.
		`SELECT last_name, employee_id FROM employees;`
		`sqlplus hr/hr`
		`CREATE USER mjones IDENTIFIED BY ty3MU9;`

Changes in This Release for Oracle Database PL/SQL Packages and Types Reference

This preface contains:

Changes in Oracle Database 12*c* Release 1 (12.1)

The following are changes in *Oracle Database PL/SQL Packages and Types Reference* for Oracle Database 12*c* Release 1 (12.1).

New Features

The following features are new in this release:

- Decision Tree Mining Text Data

  See DBMS_DATA_MINING
- Native Text Support

  See DBMS_DATA_MINING and DBMS_DATA_MINING_TRANSFORM
- Native Text Support

  See DBMS_DATA_MINING and DBMS_DATA_MINING_TRANSFORM
- XStream Support for XML Object Relational and Binary

  See Logical Change Record TYPEs
- Native Double in Data Mining Functions

  See DBMS_DATA_MINING and DBMS_DATA_MINING_TRANSFORM
- Feature Selection and Creation for Generalized Linear Models (GLM)

  See DBMS_DATA_MINING_TRANSFORM
- Expectation Maximization (EM) Clustering and Density Estimation

  See DBMS_DATA_MINING
- Feature Extraction Using Singular Value Decomposition

  See DBMS_DATA_MINING
- Privilege Analysis

  See DBMS_PRIVILEGE_CAPTURE
- Database Replay Support for Database Consolidation

See DBMS_WORKLOAD_REPLAY

- Rules Engine Result Cache

  See DBMS_RULE

- AQ Rules Engine Fast Evaluation of `SYS_CONTEXT` and Other Predicates

  See DBMS_RULE

- Oracle Data Redaction

  See DBMS_REDACT

- Real-Time Database Operations Monitoring

  See DBMS_MONITOR

- Support for Secure Hash Algorithm SHA-2 in Oracle Database

  See DBMS_CRYPTO

- Pluggable Databases Resource Plans

  See DBMS_RESOURCE_MANAGER

- Segment-Level Compression Tiering

  See DBMS_ILM, DBMS_ILM_ADMIN and DBMS_HEAT_MAP

- Row-Level Compression Tiering

  See DBMS_ILM, DBMS_ILM_ADMIN and DBMS_HEAT_MAP

- PL/SQL Interface for Managing ADO Policies

  See DBMS_ILM, DBMS_ILM_ADMIN and DBMS_HEAT_MAP

- Resource Manager Runaway Query Management

  See DBMS_RESOURCE_MANAGER

- Oracle Data Pump No Logging Option for Import

  See DBMS_DATAPUMP

- Synchronous Materialized View Refresh

  See DBMS_SYNC_REFRESH

- Enhanced Parallel Statement Queuing

  See DBMS_RESOURCE_MANAGER and DBMS_SESSION

- XStream New Apply Parameters

  See DBMS_APPLY_ADM

- XStream Optimized Management of Large Transactions

  See DBMS_APPLY_ADM

- Adaptive SQL Plan Management

  See DBMS_AUTO_SQLTUNE, DBMS_SPM and DBMS_XPLAN
- SQL Plan Directives

  See DBMS_SPD and DBMS_STATS
- Mechanism to Pass Results From SQL Statements Embedded in Database PL/SQL Programs Implicitly to the External Client Program

  See DBMS_SQL
- Concurrent Statistics Gathering

  See DBMS_SPD and DBMS_STATS
- Application Continuity for Java

  See DBMS_APP_CONT and DBMS_SERVICE
- SQL Translation Framework

  See DBMS_SERVICE, DBMS_SQL and DBMS_SQL_TRANSLATOR
- New Types of Optimizer Statistics

  See DBMS_SPD and DBMS_STATS
- Session-Private Statistics for Global Temporary Table

  See DBMS_SPD and DBMS_STATS
- Adaptive Query Optimization

  See DBMS_XPLAN
- Rolling Upgrade Using Active Data Guard

  See DBMS_ROLLING
- Enable Digest Authentication with Oracle Database HTTP Listener

  See DBMS_XDB, DBMS_XDB_ADMIN and DBMS_XDBZ
- XStream New Capture Parameters

  See DBMS_CAPTURE_ADM
- Online Redefinition of Multiple Partitions

  See DBMS_REDEFINITION
- Support Redefinition of Tables With VPD Policies

  See DBMS_REDEFINITION
- Lock Timeout for `FINISH_REDEF_TABLE`

  See DBMS_REDEFINITION
- New Job Types

  See DBMS_SCHEDULER
- Native Text Support

  See DBMS_DATA_MINING and DBMS_DATA_MINING_TRANSFORM
- Sharded Queues for Performance and Scalability

  See DBMS_AQ, DBMS_AQADM and DBMS_PROPAGATION_ADM

- New PL/SQL `DBMS_UTILITY.EXPAND_SQL_TEXT` Procedure

  See DBMS_UTILITY
- New PL/SQL Package `UTL_CALL_STACK`

  See UTL_CALL_STACK
- Oracle Data Pump Support for Database Consolidation: Full Transportable

  See DBMS_DATAPUMP
- Automatic Column Group Detection

  See DBMS_STATS
- Heat Map

  See DBMS_HEAT_MAP, DBMS_ILM, DBMS_ILM_ADMIN and DBMS_FLASHBACK
- New `schema` Parameter for `DBMS_SQL.PARSE` Procedure

  See DBMS_SQL
- Asynchronous Global Index Maintenance for `DROP` and `TRUNCATE` Partition

  See DBMS_PART
- VPD Fine-Grained Context-Sensitive Policies

  See DBMS_RLS
- Out-of-Place Materialized View Refresh

  See DBMS_MVIEW
- Improved Automatic Degree of Parallelism

  See DBMS_STATS
- Transparent Sensitive Data Protection

  See DBMS_TSDP_MANAGE and DBMS_TSDP_PROTECT
- Oracle Data Pump Enhanced Compression Options

  See DBMS_DATAPUMP
- Enhancements to System Statistics

  See DBMS_STATS
- Transaction Guard

  See DBMS_DATAPUMP
- Queryable Patch Inventory

  See DBMS_QOPATCH

- Enterprise Manager Database Express

  See DBMS_XDB_ADMIN and DBMS_XDB_CONFIG

1

Introduction to Oracle Supplied PL/SQL Packages & Types

Oracle supplies many PL/SQL packages with the Oracle server to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures.

This manual covers the packages provided with the Oracle database server. Packages supplied with other products, such as Oracle Developer or the Oracle Application Server, are not covered.

Note that not every package or type described in this manual or elsewhere in the Oracle Database Documentation Library is installed by default. In such cases, the documentation states this and explains how to install the object. Run this query as a suitably privileged user:

```
SELECT DISTINCT Owner, Object_Type, Object_Name FROM DBA_Objects_AE
     WHERE Owner IN (
       'SYS', 'OUTLN', 'SYSTEM', 'CTXSYS', 'DBSNMP',
       'LOGSTDBY_ADMINISTRATOR', 'ORDSYS',
       'ORDPLUGINS', 'OEM_MONITOR', 'MDSYS', 'LBACSYS',
       'DMSYS', 'WMSYS', 'OLAPDBA', 'OLAPSVR', 'OLAP_USER',
       'OLAPSYS', 'EXFSYS', 'SYSMAN', 'MDDATA',
       'SI_INFORMTN_SCHEMA', 'XDB', 'ODM')
     AND Object_Type IN ('PACKAGE', 'TYPE')
     ORDER BY Owner, Object_Type, Object_Name
```

This lists every Oracle-supplied package and type that is currently installed in the database. Note that it lists a number of objects not mentioned in the Oracle Database Documentation Library. This is deliberate. Some of the Oracle-supplied packages and types are intended to be used only by other Oracle-supplied components. Any package or type that is not described in the Oracle Database Documentation Library is not supported for direct customer use.

This chapter contains the following topics:

> **See Also:** *Oracle Database Development Guide* for information on how to create your own packages

Package Overview

A *package* is an encapsulated collection of related program objects stored together in the database. Program objects are procedures, functions, variables, constants, cursors, and exceptions.

Package Components

PL/SQL packages have two parts: the specification and the body, although sometimes the body is unnecessary. The specification is the interface to your application; it declares the types, variables, constants, exceptions, cursors, and subprograms available for use. The body fully defines cursors and subprograms, and so implements the specification.

Unlike subprograms, packages cannot be called, parameterized, or nested. However, the formats of a package and a subprogram are similar:

```
CREATE PACKAGE name AS  -- specification (visible part)
   -- public type and item declarations
   -- subprogram specifications
END [name];

CREATE PACKAGE BODY name AS  -- body (hidden part)
   -- private type and item declarations
   -- subprogram bodies
[BEGIN
   -- initialization statements]
END [name];
```

The specification holds public declarations that are visible to your application. The body holds implementation details and private declarations that are hidden from your application. You can debug, enhance, or replace a package body without changing the specification. You can change a package body without recompiling calling programs because the implementation details in the body are hidden from your application.

Using Oracle Supplied Packages

Most Oracle supplied packages are automatically installed when the database is created. Certain packages are not installed automatically. Special installation instructions for these packages are documented in the individual chapters.

To call a PL/SQL function from SQL, you must either own the function or have `EXECUTE` privileges on the function. To select from a view defined with a PL/SQL function, you must have `SELECT` privileges on the view. No separate `EXECUTE` privileges are needed to select from the view. Instructions on special requirements for packages are documented in the individual chapters.

Creating New Packages

To create packages and store them permanently in an Oracle database, use the `CREATE PACKAGE` and `CREATE PACKAGE BODY` statements. You can execute these statements interactively from SQL*Plus or Enterprise Manager.

To create a new package, do the following:

1. Create the package specification with the `CREATE PACKAGE` statement.

   You can declare program objects in the package specification. Such objects are called *public* objects. Public objects can be referenced outside the package, as well as by other objects in the package.

   Note: It is often more convenient to add the `OR REPLACE` clause in the `CREATE PACKAGE` statement. But note that `CREATE PACKAGE` warns you if you are about to overwrite an existing package with the same name while `CREATE OR REPLACE just` overwrites it with no warning.

2. Create the package body with the `CREATE PACKAGE BODY` statement.

   You can declare and define program objects in the package body.

   - You must define public objects declared in the package specification.
   - You can declare and define additional package objects, called *private* objects. Private objects are declared in the package body rather than in the package specification, so they can be referenced only by other objects in the package. They cannot be referenced outside the package.

   See Also:

   - *Oracle Database PL/SQL Language Reference*
   - *Oracle Database Development Guide*for more information on creating new packages
   - *Oracle Database Concepts*

   for more information on storing and executing packages

Separating the Specification and Body

The specification of a package declares the public types, variables, constants, and subprograms that are visible outside the immediate scope of the package. The body of a package defines the objects declared in the specification, as well as private objects that are not visible to applications outside the package.

Oracle stores the specification and body of a package separately in the database. Other schema objects that call or reference public program objects depend only on the package specification, not on the package body. Using this distinction, you can change the definition of a program object in the package body without causing Oracle to invalidate other schema objects that call or reference the program object. Oracle invalidates dependent schema objects only if you change the declaration of the program object in the package specification.

Creating a New Package: Example

The following example shows a package specification for a package named `EMPLOYEE_MANAGEMENT`. The package contains one stored function and two stored procedures.

```
CREATE PACKAGE employee_management AS
   FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
      mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
      deptno NUMBER) RETURN NUMBER;
   PROCEDURE fire_emp (emp_id NUMBER);
   PROCEDURE sal_raise (emp_id NUMBER, sal_incr NUMBER);
END employee_management;
```

The body for this package defines the function and the procedures:

```
CREATE PACKAGE BODY employee_management AS
   FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
      mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
      deptno NUMBER) RETURN NUMBER IS
```

The function accepts all arguments for the fields in the employee table except for the employee number. A value for this field is supplied by a sequence. The function returns the sequence number generated by the call to this function.

```
       new_empno    NUMBER(10);

   BEGIN
      SELECT emp_sequence.NEXTVAL INTO new_empno FROM dual;
      INSERT INTO emp VALUES (new_empno, name, job, mgr,
         hiredate, sal, comm, deptno);
      RETURN (new_empno);
   END hire_emp;

   PROCEDURE fire_emp(emp_id IN NUMBER) AS
```

The procedure deletes the employee with an employee number that corresponds to the argument `emp_id`. If no employee is found, then an exception is raised.

```
   BEGIN
      DELETE FROM emp WHERE empno = emp_id;
      IF SQL%NOTFOUND THEN
      raise_application_error(-20011, 'Invalid Employee
         Number: ' || TO_CHAR(emp_id));
   END IF;
END fire_emp;

PROCEDURE sal_raise (emp_id IN NUMBER, sal_incr IN NUMBER) AS
```

The procedure accepts two arguments. `Emp_id` is a number that corresponds to an employee number. `Sal_incr` is the amount by which to increase the employee's salary.

```
   BEGIN

   -- If employee exists, then update salary with increase.

      UPDATE emp
         SET sal = sal + sal_incr
         WHERE empno = emp_id;
      IF SQL%NOTFOUND THEN
         raise_application_error(-20011, 'Invalid Employee
            Number: ' || TO_CHAR(emp_id));
      END IF;
   END sal_raise;
END employee_management;
```

Note: If you want to try this example, then first create the sequence number `emp_sequence`. You can do this using the following SQL*Plus statement:

```
SQL> CREATE SEQUENCE emp_sequence
   > START WITH 8000 INCREMENT BY 10;
```

Referencing Package Contents

To reference the types, items, and subprograms declared in a package specification, use the dot notation. For example:

```
package_name.type_name
package_name.item_name
package_name.subprogram_name
```

Summary of Oracle Supplied PL/SQL Packages and Types

Table 1–1 lists the supplied PL/SQL server packages. These packages run as the invoking user, rather than the package owner. Unless otherwise noted, the packages are callable through public synonyms of the same name.

Caution:

- The procedures and functions provided in these packages and their external interfaces are reserved by Oracle and are subject to change.
- Modifying Oracle supplied packages can cause internal errors and database security violations. Do not modify supplied packages.

Table 1–1 Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
APEX_CUSTOM_AUTH	Provides an interface for authentication and session management
APEX_APPLICATION	Enables users to take advantage of global variables
APEX_ITEM	Enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page
APEX_UTIL	Provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users
CTX_ADM	Lets you administer servers and the data dictionary
CTX_CLS	Lets you generate CTXRULE rules for a set of documents
CTX_DDL	Lets you create and manage the preferences, section lists and stopgroups required for Text indexes
CTX_DOC	Lets you request document services
CTX_OUTPUT	Lets you manage the index log
CTX_QUERY	Lets you generate query feedback, count hits, and create stored query expressions
CTX_REPORT	Lets you create various index reports
CTX_THES	Lets you to manage and browse thesauri
CTX_ULEXER	For use with the user-lexer
DBMS_ADDM	Facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor
DBMS_ADVANCED_REWRITE	Contains interfaces for advanced query rewrite users to create, drop, and maintain functional equivalence declarations for query rewrite
DBMS_ADVISOR	Part of the SQLAccess Advisor, an expert system that identifies and helps resolve performance problems relating to the execution of SQL statements

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_ALERT	Provides support for the asynchronous notification of database events
DBMS_APPLICATION_INFO	Lets you register an application name with the database for auditing or performance tracking purposes
DBMS_APPLY_ADM	Provides administrative procedures to start, stop, and configure an apply process
DBMS_AQ	Lets you add a message (of a predefined object type) onto a queue or to dequeue a message
DBMS_AQADM	Lets you perform administrative functions on a queue or queue table for messages of a predefined object type
DBMS_AQELM	Provides procedures to manage the configuration of Advanced Queuing asynchronous notification by e-mail and HTTP
DBMS_AQIN	Plays a part in providing secure access to the Oracle JMS interfaces
DBMS_ASSERT	Provides an interface to validate properties of the input value
DBMS_AUTO_TASK_ADMIN	Used by the DBA as well as Enterprise Manager to access the AUTOTASK controls
DBMS_AW_STATS	Contains a subprogram that generates and stores optimizer statistics for cubes and dimensions
DBMS_CAPTURE_ADM	Describes administrative procedures to start, stop, and configure a capture process; used in Streams
DBMS_COMPARISON	Provides interfaces to compare and converge database objects at different databases
DBMS_COMPRESSION	Provides an interface to facilitate choosing the correct compression level for an application
DBMS_CONNECTION_POOL	Provides an interface to manage the Database Resident Connection Pool
DBMS_CQ_NOTIFICATION	Is part of a set of features that clients use to receive notifications when result sets of a query have changed. The package contains interfaces that can be used by mid-tier clients to register objects and specify delivery mechanisms.
DBMS_CRYPTO	Lets you encrypt and decrypt stored data, can be used in conjunction with PL/SQL programs running network communications, and supports encryption and hashing algorithms
DBMS_CSX_ADMIN	Provides an interface to customize the setup when transporting a tablespace containing binary XML data
DBMS_CUBE	Contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying
DBMS_CUBE_ADVISE	Contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite
DBMS_DATA_MINING	Implements the Oracle Data Mining interface for creating, evaluating, and managing mining models
DBMS_DATA_MINING_TRANSFORM	Provides subroutines that can be used to prepare data for Oracle Data Mining

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_DATAPUMP	Lets you move all, or part of, a database between databases, including both data and metadata
DBMS_DBFS_CONTENT	Provides an interface comprising a file system-like abstraction backed by one or more Store Providers
DBMS_DBFS_CONTENT_SPI	Provides the Application Programming Interface (API) specification for DBMS_DBFS_CONTENT service providers
DBMS_DBFS_HS	Provides users the ability to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management for their database tables
DBMS_DBFS_SFS	Provides an interface to operate a SecureFile-based store (SFS) for the content interface described in the DBMS_DBFS_CONTENT package
DBMS_DB_VERSION	Specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions
DBMS_DDL	Provides access to some SQL DDL statements from stored procedures, and provides special administration operations not available as DDLs
DBMS_DEBUG	Implements server-side debuggers and provides a way to debug server-side PL/SQL program units
DBMS_DEFER	Provides the user interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.
DBMS_DEFER_QUERY	Permits querying the deferred remote procedure calls (RPC) queue data that is not exposed through views. Requires the Distributed Option.
DBMS_DEFER_SYS	Provides the system administrator interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.
DBMS_DESCRIBE	Describes the arguments of a stored procedure with full name translation and security checking
DBMS_DG	Allows applications to notify the primary database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover
DBMS_DIMENSION	Enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition
DBMS_DISTRIBUTED_TRUST_ADMIN	Maintains the Trusted Database List, which is used to determine if a privileged database link from a particular server can be accepted
DBMS_EPG	Implements the embedded PL/SQL gateway that enables a Web browser to invoke a PL/SQL stored procedure through an HTTP listener
DBMS_ERRLOG	Provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back
DBMS_EXPFIL	Contains all the procedures used to manage attribute sets, expression sets, expression indexes, optimizer statistics, and privileges by Expression Filter

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_FGA	Provides fine-grained security functions
DBMS_FILE_GROUP	One of a set of Streams packages, provides administrative interfaces for managing file groups, file group versions, files and file group repositories
DBMS_FILE_TRANSFER	Lets you copy a binary file within a database or to transfer a binary file between databases
DBMS_FLASHBACK	Lets you flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN)
DBMS_FLASHBACK_ARCHIVE	Contains procedures for disassociation and re-association of a Flashback Data Archive (FDA) enabled table from/with its underlying FDA respectively.
DBMS_FREQUENT_ITEMSET	Enables frequent itemset counting
DBMS_HM	Contains constants and procedure declarations for health check management
DBMS_HPROF	Provides an interface for profiling the execution of PL/SQL applications
DBMS_HS_PARALLEL	Enables parallel processing for heterogeneous targets access
DBMS_HS_PASSTHROUGH	Lets you use Heterogeneous Services to send pass-through SQL statements to non-Oracle systems
DBMS_IOT	Creates a table into which references to the chained rows for an Index Organized Table can be placed using the ANALYZE command
DBMS_JAVA	Provides a PL/SQL interface for accessing database functionality from Java
DBMS_JOB	Schedules and manages jobs in the job queue
DBMS_LDAP	Provides functions and procedures to access data from LDAP servers
DBMS_LDAP_UTL	Provides the Oracle Extension utility functions for LDAP
DBMS_LIBCACHE	Prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution
DBMS_LOB	Provides general purpose routines for operations on Oracle Large Object (LOBs) datatypes - BLOB, CLOB (read/write), and BFILEs (read-only)
DBMS_LOCK	Lets you request, convert and release locks through Oracle Lock Management services
DBMS_LOGMNR	Provides functions to initialize and run the log reader
DBMS_LOGMNR_D	Queries the dictionary tables of the current database, and creates a text based file containing their contents
DBMS_LOGSTDBY	Describes procedures for configuring and managing the logical standby database environment
DBMS_METADATA	Lets callers easily retrieve complete database object definitions (metadata) from the dictionary

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_METADATA_DIFF	Contains the interfaces for comparing two metadata documents in SXML format. The result of the comparison is an SXML difference document. This document can be converted to other formats using the DBMS_METADATA submit interface and the CONVERT API.
DBMS_MGD_ID_UTL	Provides a set of utility subprograms
DBMS_MGWADM	Describes the Messaging Gateway administrative interface; used in Advanced Queuing
DBMS_MGWMSG	Describes object types (used by the canonical message types to convert message bodies) and helper methods, constants, and subprograms for working with the Messaging Gateway message types; used in Advanced Queuing.
DBMS_MONITOR	Let you use PL/SQL for controlling additional tracing and statistics gathering
DBMS_MVIEW	Lets you refresh snapshots that are not part of the same refresh group and purge logs. DBMS_SNAPSHOT is a synonym.
DBMS_NETWORK_ACL_ADMIN	Provides the interface to administer the network Access Control List (ACL)
DBMS_NETWORK_UTL	Provides the interface to administer the network Access Control List (ACL)
DBMS_ODCI	Returns the CPU cost of a user function based on the elapsed time of the function
DBMS_OFFLINE_OG	Provides a public interface for offline instantiation of master groups
DBMS_OLAP	Provides procedures for summaries, dimensions, and query rewrites
DBMS_OUTLN	Provides the interface for procedures and functions associated with management of stored outlines Synonymous with OUTLN_PKG
DBMS_OUTPUT	Accumulates information in a buffer so that it can be retrieved later
DBMS_PARALLEL_EXECUTE	Enables the user to incrementally update table data in parallel
DBMS_PCLXUTIL	Provides intra-partition parallelism for creating partition-wise local indexes
DBMS_PIPE	Provides a DBMS pipe service which enables messages to be sent between sessions
DBMS_PREDICTIVE_ANALYTICS	Provides subroutines that implement automatic data mining operations for predict, explain, and profile
DBMS_PREPROCESSOR	Provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form
DBMS_PROFILER	Provides a Probe Profiler API to profile existing PL/SQL applications and identify performance bottlenecks
DBMS_PROPAGATION_ADM	Provides administrative procedures for configuring propagation from a source queue to a destination queue
DBMS_RANDOM	Provides a built-in random number generator

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_RECTIFIER_DIFF	Provides an interface to detect and resolve data inconsistencies between two replicated sites
DBMS_REDEFINITION	Lets you perform an online reorganization of tables
DBMS_REFRESH	Lets you create groups of snapshots that can be refreshed together to a transactionally consistent point in time Requires the Distributed Option
DBMS_REPAIR	Provides data corruption repair procedures
DBMS_REPCAT	Provides routines to administer and update the replication catalog and environment. Requires the Replication Option.
DBMS_REPCAT_ADMIN	Lets you create users with the privileges needed by the symmetric replication facility. Requires the Replication Option.
DBMS_REPCAT_INSTANTIATE	Instantiates deployment templates. Requires the Replication Option.
DBMS_REPCAT_RGT	Controls the maintenance and definition of refresh group templates. Requires the Replication Option.
DBMS_REPUTIL	Provides routines to generate shadow tables, triggers, and packages for table replication.
DBMS_RESCONFIG	Provides an interface to operate on the Resource Configuration List, and to retrieve listener information for a resource
DBMS_RESOURCE_MANAGER	Maintains plans, consumer groups, and plan directives; it also provides semantics so that you may group together changes to the plan schema
DBMS_RESOURCE_MANAGER_PRIVS	Maintains privileges associated with resource consumer groups
DBMS_RESULT_CACHE	Provides an interface to operate on the Result Cache
DBMS_RESUMABLE	Lets you suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution
DBMS_RLMGR	Contains various procedures to create and manage rules and rule sessions by the Rules Manager
DBMS_RLS	Provides row level security administrative interface
DBMS_ROWID	Provides procedures to create rowids and to interpret their contents
DBMS_RULE	Describes the EVALUATE procedure used in Streams
DBMS_RULE_ADM	Describes the administrative interface for creating and managing rules, rule sets, and rule evaluation contexts; used in Streams
DBMS_SCHEDULER	Provides a collection of scheduling functions that are callable from any PL/SQL program
DBMS_SERVER_ALERT	Lets you issue alerts when some threshold has been violated
DBMS_SERVICE	Lets you create, delete, activate and deactivate services for a single instance

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_SESSION	Provides access to SQL ALTER SESSION statements, and other session information, from stored procedures
DBMS_SHARED_POOL	Lets you keep objects in shared memory, so that they will not be aged out with the normal LRU mechanism
DBMS_SPACE	Provides segment space information not available through standard SQL
DBMS_SPACE_ADMIN	Provides tablespace and segment space administration not available through the standard SQL
DBMS_SPM	Supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements
DBMS_SQL	Lets you use dynamic SQL to access the database
DBMS_SQLDIAG	Provides an interface to the SQL Diagnosability functionality
DBMS_SQLPA	Provides an interface to implement the SQL Performance Analyzer.
DBMS_SQLTUNE	Provides the interface to tune SQL statements
DBMS_STAT_FUNCS	Provides statistical functions
DBMS_STATS	Provides a mechanism for users to view and modify optimizer statistics gathered for database objects
DBMS_STORAGE_MAP	Communicates with FMON to invoke mapping operations
DBMS_STREAMS	Describes the interface to convert SYS.AnyData objects into LCR objects and an interface to annotate redo entries generated by a session with a binary tag.
DBMS_STREAMS_ADMIN	Describes administrative procedures for adding and removing simple rules, without transformations, for capture, propagation, and apply at the table, schema, and database level
DBMS_STREAMS_ADVISOR_ADM	Provides an interface to gather information about an Oracle Streams environment and advise database administrators based on the information gathered
DBMS_STREAMS_AUTH	Provides interfaces for granting privileges to Streams administrators and revoking privileges from Streams administrators
DBMS_STREAMS_HANDLER_ADM	Provides interfaces to enqueue messages into and dequeue messages from a SYS.AnyData queue
DBMS_STREAMS_MESSAGING	Provides interfaces to enqueue messages into and dequeue messages from a SYS.AnyData queue
DBMS_STREAMS_TABLESPACE_ADM	Provides administrative procedures for copying tablespaces between databases and moving tablespaces from one database to another

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_TDB	Reports whether a database can be transported between platforms using the RMAN CONVERT DATABASE command. It verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.
DBMS_TRACE	Provides routines to start and stop PL/SQL tracing
DBMS_TRANSACTION	Provides access to SQL transaction statements from stored procedures and monitors transaction activities
DBMS_TRANSFORM	Provides an interface to the message format transformation features of Oracle Advanced Queuing
DBMS_TTS	Checks if the transportable set is self-contained
DBMS_TYPES	Consists of constants, which represent the built-in and user-defined types
DBMS_UTILITY	Provides various utility routines
DBMS_WARNING	Provides the interface to query, modify and delete current system or session settings
DBMS_WM	Describes how to use the programming interface to Oracle Database Workspace Manager to work with long transactions
DBMS_WORKLOAD_CAPTURE	Configures the Workload Capture system and produce the workload capture data.
DBMS_WORKLOAD_REPLAY	Provides an interface to replay and report on a record of a workload on a production or test system
DBMS_WORKLOAD_REPOSITORY	Lets you manage the Workload Repository, performing operations such as managing snapshots and baselines
DBMS_XA	Contains the XA/Open interface for applications to call XA interface in PL/SQL
DBMS_XDB	Describes Resource Management and Access Control interface for PL/SQL
DBMS_XDB_ADMIN	Provides an interface to implement XMLIndex administration operation
DBMS_XDBRESOURCE	Provides an interface to operate on the XDB resource's metadata and contents
DBMS_XDB_VERSION	Describes the versioning interface
DBMS_XDBT	Describes how an administrator can create a ConText index on the XML DB hierarchy and configure it for automatic maintenance
DBMS_XDBZ	Controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs)
DBMS_XEVENT	Provides event-related types and supporting subprograms
DBMS_XMLDOM	Explains access to XMLType objects
DBMS_XMLGEN	Converts the results of a SQL query to a canonical XML format
DBMS_XMLINDEX	Provides an interface to implement asychronous indexing and apply node referencing

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_XMLPARSER	Explains access to the contents and structure of XML documents
DBMS_XMLQUERY	Provides database-to-XMLType functionality
DBMS_XMLSAVE	Provides XML-to-database-type functionality
DBMS_XMLSCHEMA	Explains procedures to register and delete XML schemas
DBMS_XMLSTORE	Provides the ability to store XML data in relational tables
DBMS_XMLTRANSLATIONS	Provides an interface to perform translations so that strings can be searched or displayed in various languages
DBMS_XPLAN	Describes how to format the output of the EXPLAIN PLAN command
DBMS_XSLPROCESSOR	Explains access to the contents and structure of XML documents
DEBUG_EXTPROC	Lets you debug external procedures on platforms with debuggers that attach to a running process
HTF	Hypertext functions generate HTML tags
HTP	Hypertext procedures generate HTML tags
ORD_DICOM	Supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILEs rather than in an ORDDicom object type
ORD_DICOM_ADMIN	Used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository
OWA_CACHE	Provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications
OWA_COOKIE	Provides an interface for sending and retrieving HTTP cookies from the client's browser
OWA_CUSTOM	Provides a Global PLSQL Agent Authorization callback function
OWA_IMAGE	Provides an interface to access the coordinates where a user clicked on an image
OWA_OPT_LOCK	Contains subprograms that impose optimistic locking strategies so as to prevent lost updates
OWA_PATTERN	Provides an interface to locate text patterns within strings and replace the matched string with another string
OWA_SEC	Provides an interface for custom authentication
OWA_TEXT	Contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.
OWA_UTIL	Contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
SDO_CS	Provides functions for coordinate system transformation
SDO_CSW_PROCESS	Contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW)
SDO_GCDR	Contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses
SDO_GEOM	Provides functions implementing geometric operations on spatial objects
SDO_GEOR	Contains functions and procedures for the Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated Spatial vector geometry data and metadata
SDO_GEOR_ADMIN	Contains subprograms for administrative operations related to GeoRaster.
SDO_GEOR_UTL	Contains utility functions and procedures for the Spatial GeoRaster feature, including those related to using triggers with GeoRaster data
SDO_LRS	Provides functions for linear referencing system support
SDO_MIGRATE	Provides functions for migrating spatial data from previous releases
SDO_NET	Provides functions and procedures for working with data modeled as nodes and links in a network
SDO_NET_MEM	Contains functions and procedures for performing editing and analysis operations on network data using a network memory object
SDO_OLS	Contains functions and procedures for performing editing and analysis operations on network data using a network memory object
SDO_PC_PKG	Contains subprograms to support the use of point clouds in Spatial
SDO_SAM	Contains functions and procedures for spatial analysis and data mining
SDO_TIN_PKG	Contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial
SDO_TOPO	Provides procedures for creating and managing Spatial topologies
SDO_TOPO_MAP	Contains subprograms for editing Spatial topologies using a cache (TopoMap object)
SDO_TUNE	Provides functions for selecting parameters that determine the behavior of the spatial indexing scheme used in Oracle Spatial
SDO_UTIL	Provides utility functions and procedures for Oracle Spatial
SDO_WFS_LOCK	Contains subprograms for WFS support for registering and unregistering feature tables
SDO_WFS_PROC	Provides utility functions and procedures for Oracle Spatial

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
SEM_APIS	Contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.
SEM_PERF	Contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database
SEM_RDFCTX	Contains subprograms for managing extractor policies and semantic indexes created for documents
SEM_RDFSA	Contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS)
UTL_COLL	Enables PL/SQL programs to use collection locators to query and update
UTL_COMPRESS	Provides a set of data compression utilities
UTL_DBWS	Provides database Web services
UTL_ENCODE	Provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts
UTL_FILE	Enables your PL/SQL programs to read and write operating system text files and provides a restricted version of standard operating system stream file I/O
UTL_HTTP	Enables HTTP callouts from PL/SQL and SQL to access data on the Internet or to call Oracle Web Server Cartridges
UTL_I18N	Provides a set of services (Oracle Globalization Service) that help developers build multilingual applications
UTL_INADDR	Provides a procedure to support internet addressing
UTL_IDENT	Specifies which database or client PL/SQL is running
UTL_LMS	Retrieves and formats error messages in different languages
UTL_MAIL	A utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt
UTL_NLA	Exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs
UTL_RAW	Provides SQL functions for manipulating RAW datatypes
UTL_RECOMP	Recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallels
UTL_REF	Enables a PL/SQL program to access an object by providing a reference to the object
UTL_SMTP	Provides PL/SQL functionality to send emails
UTL_SPADV	Provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
UTL_TCP	Provides PL/SQL functionality to support simple TCP/IP-based communications between servers and the outside world
UTL_URL	Provides escape and unescape mechanisms for URL characters
WPG_DOCLOAD	Provides an interface to download files, both BLOBs and BFILEs
ANYDATA TYPE	A self-describing data instance type containing an instance of the type plus a description
ANYDATASET TYPE	Contains a description of a given type plus a set of data instances of that type
ANYTYPE TYPE	Contains a type description of any persistent SQL type, named or unnamed, including object types and collection types; or, it can be used to construct new transient type descriptions
Oracle Database Advanced Queuing Types	Describes the types used in Advanced Queuing
DBFS Content Interface Types	Describes public types defined to support the DBMS_DBFS_CONTENT interface.
Database URI Type	Contains URI Support, UriType Super Type, HttpUriType Subtype, DBUriType Subtype, XDBUriType Subtype, UriFactory Package
Expression Filter Types	Expression Filter feature is supplied with a set of predefined types and public synonyms for these types.
JMS TYPES	Describes JMS types so that a PL/SQL application can use JMS queues of JMS types
Oracle Multimedia ORDAudio TYPE	Supports the storage and management of audio data
Oracle Multimedia ORDDicom Type	Supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data
Oracle Multimedia ORDDoc TYPE	Supports the storage and management of heterogeneous media data including image, audio, and video
Oracle Multimedia ORDImage TYPE	Supports the storage, management, and manipulation of image data
Oracle Multimedia SQL/MM Still Image TYPE	Supports the SQL/MM Still Image Standard, which lets you store, retrieve, and modify images in the database and locate images using visual predicates
Oracle Multimedia ORDVideo TYPE	Supports the storage and management of video data
LOGICAL CHANGE RECORD TYPES	Describes LCR types, which are message payloads that contain information about changes to a database, used in Streams
MG_ID Package Types	Provides an extensible framework that supports current RFID tags with the standard family of EPC bit encodings for the supported encoding types
RULES TYPEs	Describes the types used with rules, rule sets, and evaluation contexts
RULES Manager Types	Rules Manager is supplied with one predefined type and a public synonym

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
`UTL Streams Types`	Describes describes abstract streams types used with Oracle XML functionality
`XMLType`	Describes the types and functions used for native XML support in the server

2

APEX_CUSTOM_AUTH

The APEX_CUSTOM_AUTH package provides an interface for authentication and session management.

- Documentation of APEX_CUSTOM_AUTH

Documentation of APEX_CUSTOM_AUTH

For a complete description of this package within the context of APEX, see `APEX_CUSTOM_AUTH` in the *Oracle Application Express API Reference.*

3

APEX_APPLICATION

The APEX_APPLICATION package enables users to take advantage of global variables.

- Documentation of APEX_APPLICATION

Documentation of APEX_APPLICATION

For a complete description of this package within the context of APEX, see `APEX_APPLICATION` in the *Oracle Application Express API Reference.*

4

APEX_ITEM

The APEX_ITEM package enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page.

Documentation of APEX_ITEM

For a complete description of this package within the context of APEX, see `APEX_ITEM` in the *Oracle Application Express API Reference*.

5

APEX_UTIL

The APEX_UTIL package provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users.

Documentation of APEX_UTIL

For a complete description of this package within the context of APEX, see `APEX_UTIL` in the *Oracle Application Express API Reference*.

6

CTX_ADM

The CTX_ADM package lets you administer the Oracle Text data dictionary. Note that you must install this package in order to use it.

Documentation of CTX_ADM

For a complete description of this package within the context of Oracle Text, see `CTX_ADM` in the *Oracle Text Reference*.

7

CTX_ANL

The CTX_ANL package is used with AUTO_LEXER and provides procedures for adding and dropping a custom dictionary from the lexer. A custom dictionary might be one that you develop for a special field of study or for your industry. In most cases, the dictionaries supplied for the supported languages with Oracle Text are more than sufficient to handle your requirements.

Documentation of CTX_ANL

For a complete description of this package within the context of Oracle Text, see `CTX_ANL` in the *Oracle Text Reference*.

8

CTX_CLS

The CTX_CLS package enables generation of CTXRULE rules for a set of documents.

Documentation of CTX_CLS

For a complete description of this package within the context of Oracle Text, see `CTX_CLS` in the *Oracle Text Reference*.

9

CTX_DDL

The CTX_DDL package lets you create and manage the preferences, section groups, and stoplists required for Text indexes. Note that you must install this package in order to use it.

Documentation of CTX_DDL

For complete description of this package within the context of Oracle Text, see `CTX_DDL` in the *Oracle Text Reference*.

10

CTX_DOC

The CTX_DOC package lets you request document services. Note that you must install this package in order to use it.

Documentation of CTX_DOC

For a complete description of this package within the context of Oracle Text, see `CTX_DOC` in the *Oracle Text Reference*.

11

CTX_ENTITY

The CTX_ENTITY package enables you to search for terms that are unknown to you without specifying a particular search text. It does this by identifying names, places, dates, and other objects when they are mentioned in a document and by tagging each occurrence (called a mention) with its type and subtype. This process enables you to produce a structured view of a document that can later be used for text and data mining and more comprehensive intelligence analysis.

Documentation of CTX_ENTITY

For the complete description of this package within the context of Oracle Text, see `CTX_ENTITY` in the *Oracle Text Reference.*

12

CTX_OUTPUT

This Oracle Text package lets you manage the index log. Note that you must install this package in order to use it.

Documentation of CTX_OUTPUT

For a complete description of this package within the context of Oracle Text, see `CTX_OUTPUT` in the *Oracle Text Reference.*

13

CTX_QUERY

This Oracle Text package lets you generate query feedback, count hits, and create stored query expressions. Note that you must install this package in order to use it.

Documentation of CTX_QUERY

For a complete description of this package within the context of Oracle Text, see CTX_QUERY in the *Oracle Text Reference.*

14

CTX_REPORT

This Oracle Text package lets you create various index reports. Note that you must install this package in order to use it.

Documentation of CTX_REPORT

For a complete description of this package within the context of Oracle Text, see `CTX_REPORT` in the *Oracle Text Reference.*

15

CTX_THES

This Oracle Text package lets you to manage and browse thesauri. Note that you must install this package in order to use it.

Documentation of CTX_THES

For a complete description of this package within the context of Oracle Text, see `CTX_THES` in the *Oracle Text Reference.*

16

CTX_ULEXER

This Oracle Text package is for use with the user-lexer. Note that you must install this package in order to use it.

Documentation of CTX_ULEXER

For a complete description of this package within the context of Oracle Text, see CTX_ULEXER in the *Oracle Text Reference.*

17

DBMS_ADDM

The DBMS_ADDM package facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor.

See Also:

- *Oracle Real Application Clusters Administration and Deployment Guide* for more information about "Automatic Workload Repository in Oracle Real Application Clusters Environments"
- *Oracle Database Performance Tuning Guide* for more information about "Automatic Performance Diagnostics"

This chapter contains the following topics:

Using DBMS_ADDM

Security Model

The DBMS_ADDM package runs with the caller's permission, not the definer's, and then applies the security constraints required by the DBMS_ADVISOR package.

> **See Also:** The DBMS_ADVISOR package for more information about "Security Model".

Summary of DBMS_ADDM Subprograms

Table 17–1 DBMS_ADDM Package Subprograms

Subprogram	Description
ANALYZE_DB Procedure on page 17-6	Creates an ADDM task for analyzing in database analysis mode and executes it
ANALYZE_INST Procedure on page 17-7	Creates an ADDM task for analyzing in instance analysis mode and executes it.
ANALYZE_PARTIAL Procedure on page 17-8	Creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it
COMPARE_CAPTURE_ REPLAY_REPORT Function on page 17-9	Produces a Compare Period ADDM report comparing the performance of a capture to a replay
COMPARE_DATABASES Function on page 17-10	Produces a Compare Period ADDM report for a database-wide performance comparison
COMPARE_INSTANCES Function on page 17-11	Produces a Compare Period ADDM report for an instance-level performance comparison
COMPARE_REPLAY_REPLAY_ REPORT Function on page 17-12	Produces a Compare Period ADDM report comparing the performance of a replay to another replay
DELETE Procedure on page 17-13	Deletes an already created ADDM task (of any kind)
DELETE_FINDING_ DIRECTIVE Procedure on page 17-14	Deletes a finding directive
DELETE_PARAMETER_ DIRECTIVE Procedure on page 17-15	Deletes a parameter directive
DELETE_SEGMENT_ DIRECTIVE Procedure on page 17-16	Deletes a segment directive
DELETE_SQL_DIRECTIVE Procedure on page 17-17	Deletes a SQL directive
GET_ASH_QUERY Function on page 17-18	Returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding
GET_REPORT Function on page 17-19	Retrieves the default text report of an executed ADDM task
INSERT_FINDING_ DIRECTIVE Procedure on page 17-20	Creates a directive to limit reporting of a specific finding type.
INSERT_PARAMETER_ DIRECTIVE Procedure on page 17-21	Creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter
INSERT_SEGMENT_ DIRECTIVE Procedure on page 17-22	Creates a directive to prevent ADDM from creating actions to "run Segment Advisor" for specific segments
INSERT_SQL_DIRECTIVE Procedure on page 17-24	Creates a directive to limit reporting of actions on specific SQL

Table 17–1 (Cont.) DBMS_ADDM Package Subprograms

Subprogram	Description
REAL_TIME_ADDM_REPORT Function on page 17-25	Produces a real-time report of ADDM activity

ANALYZE_DB Procedure

This procedure creates an ADDM task for analyzing in database analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_DB (
   task_name           IN OUT VARCHAR2,
   begin_snapshot      IN     NUMBER,
   end_snapshot        IN     NUMBER,
   db_id               IN     NUMBER := NULL);
```

Parameters

Table 17–2 ANALYZE_DB Procedure Parameters

Parameter	Description
task_name	Name of the task to be created
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

Return Values

The name of the created task is returned in the task_name parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in database analysis mode and execute it, with its name in variable tname:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_database_analysis_mode_task';
  DBMS_ADDM.ANALYZE_DB(:tname, 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

ANALYZE_INST Procedure

This procedure creates an ADDM task for analyzing in instance analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_INST (
   task_name           IN OUT VARCHAR2,
   begin_snapshot      IN     NUMBER,
   end_snapshot        IN     NUMBER,
   instance_number     IN     NUMBER := NULL,
   db_id               IN     NUMBER := NULL);
```

Parameters

Table 17–3 ANALYZE_INST Procedure Parameters

Parameter	Description
task_name	Name of the task to be created
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
instance_number	Number of the instance to analyze. By default it is the instance currently connected
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

Return Values

The name of the created task is returned in the task_name parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Usage Notes

On single instance systems (when not using Oracle RAC) the resulting task is identical to using the ANALYZE_DB procedure.

Examples

To create an ADDM task in instance analysis mode and execute it, with its name in variable tname:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

ANALYZE_PARTIAL Procedure

This procedure creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_PARTIAL (
   task_name           IN OUT VARCHAR2,
   instance_numbers    IN     VARCHAR2,
   begin_snapshot      IN     NUMBER,
   end_snapshot        IN     NUMBER,
   db_id               IN     NUMBER := NULL);
```

Parameters

Table 17–4 ANALYZE_PARTIAL Procedure Parameters

Parameter	Description
task_name	Name of the task to be created
instance_numbers	Comma separated list of instance numbers to analyze
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

Return Values

The name of the created task is returned in the task_name parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in partial analysis mode and execute it, with its name in variable tname:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_partial_analysis_modetask';
  DBMS_ADDM.ANALYZE_PARTIAL(:tname, '1,2,3', 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

COMPARE_CAPTURE_REPLAY_REPORT Function

This function produces a Compare Period ADDM report comparing the performance of a capture to a replay. The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```
DBMS_ADDM.COMPARE_CAPTURE_REPLAY_REPORT (
   replay_id             IN NUMBER,
   report_type           IN VARCHAR2 := 'HTML')
  RETURN CLOB;
```

Parameters

Table 17–5 COMPARE_CAPTURE_REPLAY_REPORT Function Parameters

Parameter	Description
`replay_id`	Replay ID to use as the base period. The base period is the baseline period to compare in order to determine improvement or regression.
`report_type`	`'HTML'` (the default) for an HTML active report, `'XML'` for an XML report

Return Values

A `CLOB` containing a compare period ADDM report

COMPARE_DATABASES Function

This function produces a Compare Period ADDM report comparing the performance of a database over two different time periods or the performance of two different databases over two different time periods.The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```
DBMS_ADDM.COMPARE_DATABASES (
   base_dbid             IN NUMBER := NULL,
   base_begin_snap_id    IN NUMBER,
   base_end_snap_id      IN NUMBER,
   comp_dbid             IN NUMBER := NULL,
   comp_begin_snap_id    IN NUMBER,
   comp_end_snap_id      IN NUMBER,
   report_type           IN VARCHAR2 := 'HTML')
  RETURN CLOB;
```

Parameters

Table 17–6 COMPARE_DATABASES Function Parameters

Parameter	Description
base_dbid	Database id (DBID) of the base period. The base period is the baseline period that we compare to in order to determine improvement or regression.
base_begin_snap_ids	Begin AWR snapshot ID of the base period.
base_end_snap_id	End AWR snapshot ID of the base period.
comp_dbid	Database id (DBID) of the comparison period. The comparison period is the period we compare to the base period.
comp_begin_snap_id	Begin AWR snapshot ID of the comparison period
comp_end_snap_id	End AWR snapshot ID of the comparison period
report_type	'HTML' (the default) for an HTML active report, 'XML' for an XML report

Return Values

A CLOB containing a compare period ADDM report

COMPARE_INSTANCES Function

This function produces a Compare Period ADDM report comparing the performance of a single instance over two different time periods or the performance of two different instances over two different time periods.The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```
DBMS_ADDM.COMPARE_INSTANCES (
   base_dbid             IN NUMBER := NULL,
   base_instance_id      IN NUMBER
   base_begin_snap_id    IN NUMBER,
   base_end_snap_id      IN NUMBER,
   comp_dbid             IN NUMBER := NULL,
   comp_instance_id      IN NUMBER,
   comp_begin_snap_id    IN NUMBER,
   comp_end_snap_id      IN  NUMBER,
   report_type           IN VARCHAR2 := 'HTML')
  RETURN CLOB;
```

Parameters

Table 17–7 COMPARE_INSTANCES Function Parameters

Parameter	Description
base_dbid	Database id (DBID) of the base period. The base period is the baseline period that we compare to in order to determine improvement or regression.
base_instance_id	Instance number of the database instance to include from the base period
base_begin_snap_id	Begin AWR snapshot ID of the base period.
base_end_snap_id	End AWR snapshot ID of the base period.
comp_dbid	Database id (DBID) of the comparison period. The comparison period is the period we compare to the base period.
comp_instance_id	Instance number of the database instance to include from the comparison period
comp_begin_snap_id	Begin AWR snapshot ID of the comparison period
comp_end_snap_id	End AWR snapshot ID of the comparison period
report_type	'HTML' (the default) for an HTML active report, 'XML' for an XML report

Return Values

A CLOB containing a compare period ADDM report

COMPARE_REPLAY_REPLAY_REPORT Function

This function produces a Compare Period ADDM report comparing the performance of a replay to another replay. The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```
DBMS_ADDM.COMPARE_CAPTURE_REPLAY_REPORT (
   replay_id1            IN NUMBER,
   replay_id2            IN NUMBER,
   report_type           IN VARCHAR2 := 'HTML')
  RETURN CLOB;
```

Parameters

Table 17–8 COMPARE_REPLAY_REPLAY_REPORT Function Parameters

Parameter	Description
`replay_id1`	Replay ID to use as the base period. The base period is the baseline period to compare in order to determine improvement or regression.
`replay_id2`	Replay ID to use as the comparison period. The comparison period is the period to compare to the base period in order to determine improvement or regression.
`report_type`	`'HTML'` (the default) for an HTML active report, `'XML'` for an XML report

Return Values

A `CLOB` containing a compare period ADDM report

DELETE Procedure

This procedure deletes an already created ADDM task (of any kind). For database analysis mode and partial analysis mode this deletes the local tasks associated with the main task.

Syntax

```
DBMS_ADDM.DELETE (
   task_name           IN VARCHAR2);
```

Parameters

Table 17–9 DELETE Procedure Parameters

Parameter	Description
task_name	Name of the task to be deleted

Examples

```
BEGIN
  DBMS_ADDM.DELETE ('my_partial_analysis_mode_task');
END
```

DELETE_FINDING_DIRECTIVE Procedure

This procedure deletes a finding directive.

Syntax

```
DBMS_ADDM.DELETE_FINDING_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 17–10 DELETE_FINDING_DIRECTIVE Procedure Parameters

Parameter	Description
`task_name`	Name of the task this directive applies to. If the value is `NULL`, it is a system directive.
`dir_name`	Name of the directive. All directives must be given unique names.

DELETE_PARAMETER_DIRECTIVE Procedure

This procedure deletes a parameter directive. This removes a specific system directive for parameters. Subsequent ADDM tasks are not affected by this directive.

Syntax

```
DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 17–11 DELETE_PARAMETER_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

Examples

```
BEGIN
   DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (NULL,'my Parameter directive');
END;
```

DELETE_SEGMENT_DIRECTIVE Procedure

This procedure deletes a segment directive.

Syntax

```
DBMS_ADDM.DELETE_SEGMENT_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 17–12 DELETE_SEGMENT_DIRECTIVE Procedure Parameters

Parameter	Description
`task_name`	Name of the task this directive applies to. If the value is `NULL`, it is a system directive.
`dir_name`	Name of the directive. All directives must be given unique names.

DELETE_SQL_DIRECTIVE Procedure

This procedure deletes a SQL directive.

Syntax

```
DBMS_ADDM.DELETE_SQL_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 17–13 DELETE_SQL_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

GET_ASH_QUERY Function

The function returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding. For most types of findings this identifies the exact rows in ASH corresponding to the finding. For some types of findings the query is an approximation and should not be used for exact identification of the finding's impact or the finding's specific activity.

Syntax

```
DBMS_ADDM.GET_ASH_QUERY (
   task_name           IN   VARCHAR2,
   finding_id          IN   NUMBER)
  RETURN VARCHAR2;
```

Parameters

Table 17–14 GET_ASH_QUERY Function Parameters

Parameter	Description
`task_name`	Name of the task
`finding`	ID of the finding within the task

Return Values

A `VARCHAR` containing an ASH query identifying the rows in ASH with impact for the finding

GET_REPORT Function

This function retrieves the default text report of an executed ADDM task.

Syntax

```
DBMS_ADDM.GET_REPORT (
   task_name           IN VARCHAR2)
  RETURN CLOB;
```

Parameters

Table 17–15 GET_REPORT Function Parameters

Parameter	Description
task_name	Name of the task

Examples

```
Set long 1000000
Set pagesize 50000
SELECT DBMS_ADDM.GET_REPORT('my_partial_analysis_mode_task') FROM DUAL;
```

INSERT_FINDING_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of a specific finding type. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_FINDING_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   finding_name          IN VARCHAR2,
   min_active_sessions   IN NUMBER := 0,
   min_perc_impact       IN NUMBER := 0);
```

Parameters

Table 17–16 INSERT_FINDING_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
finding_name	Name of an ADDM finding to which this directive applies. All valid findings names appear in the NAME column of view DBA_ADVISOR_FINDING_NAMES.
min_active_sessions	Minimal number of active sessions for the finding. If a finding has less than this number, it is filtered from the ADDM result.
min_perc_impact	Minimal number for the "percent impact" of the finding relative to total database time in the analysis period. If the finding's impact is less than this number, it is filtered from the ADDM result.

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for 'Undersized SGA' findings. The result of GET_REPORT shows only an 'Undersized SGA' finding if the finding is responsible for at least 2 average active sessions during the analysis period, and this constitutes at least 10% of the total database time during that period.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_FINDING_DIRECTIVE(
   NULL,
   'Undersized SGA directive',
   'Undersized SGA',
   2,
   10);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing 'Undersized SGA' findings regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

INSERT_PARAMETER_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   parameter_name        IN VARCHAR2);
```

Parameters

Table 17–17 INSERT_PARAMETER_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
parameter_name	Specifies the parameter to use. Valid parameter names appear in V$PARAMETER.

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all actions that recommend modifying the parameter 'sga_target'. The result of GET_REPORT does not show these actions.

```
var tname varchar2(60);
BEGIN
  DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE(
   NULL,
   'my Parameter directive',
   'sga_target');
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

INSERT_SEGMENT_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to "run Segment Advisor" for specific segments. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   owner_name            IN VARCHAR2,
   object_name           IN VARCHAR2 := NULL,
   sub_object_name       IN VARCHAR2 := NULL);

DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   object_number         IN NUMBER);
```

Parameters

Table 17–18 INSERT_SEGMENT_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
owner_name	Specifies the owner of the segment/s to be filtered. A wildcard is allowed in the same syntax used for "like" constraints.
object_name	Name of the main object to be filtered. Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.
sub_object_name	Name of the part of the main object to be filtered. This could be a partition name, or even sub partitions (separated by a '.'). Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.
object_number	Object number of the SEGMENT that this directive is to filter, found in views DBA_OBJECTS or DBA_SEGMENTS

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all segments that belong to user SCOTT. The result of GET_REPORT does not show actions for running Segment advisor for segments that belong to SCOTT.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE(NULL,
                                     'my Segment directive',
                                     'SCOTT');
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

INSERT_SQL_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of actions on specific SQL. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_SQL_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   sql_id                IN VARCHAR2,
   min_active_sessions   IN NUMBER := 0,
   min_response_time     IN NUMBER := 0);
```

Parameters

Table 17–19 INSERT_SQL_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
sql_id	Identifies which SQL statement to filter. A valid value contains exactly 13 characters from '0' to '9' and 'a' to 'z'.
min_active_sessions	Minimal number of active sessions for the SQL. If a SQL action has less than this number, it is filtered from the ADDM result.
min_response_time	Minimal value for response time of the SQL (in microseconds). If the SQL had lower response time, it is filtered from the ADDM result.

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for SQL with id 'abcd123456789'. The result of GET_REPORT shows only actions for that SQL (actions to tune the SQL, or to investigate application using it) if the SQL is responsible for at least 2 average active sessions during the analysis period, and the average response time was at least 1 second.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SQL_DIRECTIVE(
      NULL,
      'my SQL directive',
      'abcd123456789',
      2,
      1000000);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

REAL_TIME_ADDM_REPORT Function

This function produces a real-time ADDM report for ADDM-related activity for the last five minutes. In an Oracle Real Application Clusters (Oracle RAC) environment, the function assumes that executing SQL over `GV$` is possible.

Syntax

```
DBMS_ADDM.REAL_TIME_ADDM_REPORT ()
 RETURN CLOB;
```

Return Values

`CLOB` containing a real-time ADDM report

18

DBMS_ADVANCED_REWRITE

DBMS_ADVANCED_REWRITE contains interfaces for advanced query rewrite users. Using this package, you can create, drop, and maintain functional equivalence declarations for query rewrite.

> **See Also:** *Oracle Database Data Warehousing Guide* for more information about query rewrite

This chapter contains the following topics:

Using DBMS_ADVANCED_REWRITE

This section contains topics which relate to using the `DBMS_ADVANCED_REWRITE` package.

Security Model

No privileges to access these procedures are granted to anyone by default. To gain access to these procedures, you must connect as SYSDBA and explicitly grant execute access to the desired database administrators.

You can control security on this package by granting the EXECUTE privilege to selected database administrators or roles. For example, the user er can be given access to use this package by the following statement, executed as SYSDBA:

```
GRANT EXECUTE ON DBMS_ADVANCED_REWRITE TO er;
```

You may want to write a separate cover package on top of this package for restricting the alert names used. Instead of granting the EXECUTE privilege on the DBMS_ADVANCED_REWRITE package directly, you can then grant it to the cover package.

In addition, similar to the privilege required for regular materialized views, the user should be granted the privilege to create an equivalence. For example, the user er can be granted this privilege by executing the following statement as SYSDBA:

```
GRANT CREATE MATERIALIZED VIEW TO er;
```

Summary of DBMS_ADVANCED_REWRITE Subprograms

This table list the all the package subprograms in alphabetical order.

Table 18–1 DBMS_ADVANCED_REWRITE Package Subprograms

Subprogram	Description
ALTER_REWRITE_EQUIVALENCE Procedure on page 18-5	Changes the mode of the rewrite equivalence declaration to the mode you specify
BUILD_SAFE_REWRITE_EQUIVALENCE Procedure on page 18-6	Enables the rewrite of top-level materialized views using submaterialized views. Oracle Corporation does not recommend you directly use this procedure
DECLARE_REWRITE_EQUIVALENCE Procedures on page 18-7	Creates a declaration indicating that `source_stmt` is functionally equivalent to `destination_stmt` for as long as the equivalence declaration remains enabled, and that `destination_stmt` is more favorable in terms of performance
DROP_REWRITE_EQUIVALENCE Procedure on page 18-9	Drops the specified rewrite equivalence declaration
VALIDATE_REWRITE_EQUIVALENCE Procedure on page 18-10	Validates the specified rewrite equivalence declaration using the same validation method as described with the `validate` parameter

ALTER_REWRITE_EQUIVALENCE Procedure

This procedure changes the mode of the rewrite equivalence declaration to the mode you specify.

Syntax

```
DBMS_ADVANCED_REWRITE.ALTER_REWRITE_EQUIVALENCE (
   name            VARCHAR2,
   rewrite_mode    VARCHAR2);
```

Parameters

Table 18–2 ALTER_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
name	A name for the equivalence declaration to alter. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is altered in the current schema. The invoker must have the appropriate alter materialized view privileges to alter an equivalence declaration outside their own schema.
rewrite_mode	The following modes are supported, in increasing order of power: disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified destination_query. recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified destination_query for further performance enhancements whenever it uses the equivalence declaration. Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.

BUILD_SAFE_REWRITE_EQUIVALENCE Procedure

This procedure enables the rewrite and refresh of top-level materialized views using submaterialized views. It is provided for the exclusive use by scripts generated by the `DBMS_ADVISOR.TUNE_MVIEW` procedure. It is required to enable query rewrite and fast refresh when `DBMS_ADVISOR.TUNE_MVIEW` decomposes a materialized view into a top-level materialized view and one or more submaterialized views.

Oracle does not recommend you directly use the `BUILD_SAFE_REWRITE_EQUIVALENCE` procedure. You should use either the `DBMS_ADVISOR.TUNE_MVIEW` or the `DBMS_ADVANCED_REWRITE.CREATE_REWRITE_EQUIVALENCE` procedure as appropriate.

DECLARE_REWRITE_EQUIVALENCE Procedures

This procedure creates a declaration indicating that source_stmt is functionally equivalent to destination_stmt for as long as the equivalence declaration remains enabled, and that destination_stmt is more favorable in terms of performance. The scope of the declaration is system wide. The query rewrite engine uses such declarations to perform rewrite transformations in QUERY_REWRITE_INTEGRITY = trusted and stale_tolerated modes.

Because the underlying equivalences between the source and destination statements cannot be enforced by the query rewrite engine, queries can be only rewritten in trusted and stale_tolerated integrity modes.

Syntax

```
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
   name                 VARCHAR2,
   source_stmt          VARCHAR2,
   destination_stmt     VARCHAR2,
   validate             BOOLEAN    := TRUE,
   rewrite_mode         VARCHAR2   := 'TEXT_MATCH');

DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
   name                 VARCHAR2,
   source_stmt          CLOB,
   destination_stmt     CLOB,
   validate             BOOLEAN   := TRUE,
   rewrite_mode         VARCHAR2  := 'TEXT_MATCH');
```

Parameters

Table 18–3 DECLARE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
name	A name for the equivalence declaration. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is created in the current schema. The invoker must have the appropriate CREATE MATERIALIZED VIEW privileges to alter an equivalence declaration.
source_stmt	A sub-SELECT expression in either VARCHAR2 or CLOB format. This is the query statement that is the target of optimization.
destination_stmt	A sub-SELECT expression in either VARCHAR2 or CLOB format.
validate	A Boolean indicating whether to validate that the specified source_stmt is functionally equivalent to the specified destination_stmt. If validate is specified as TRUE, DECLARE_REWRITE_EQUIVALENCE evaluates the two sub-SELECTs and compares their results. If the results are not the same, DECLARE_REWRITE_EQUIVALENCE does not create the rewrite equivalence and returns an error condition. If FALSE, DECLARE_REWRITE_EQUIVALENCE does not validate the equivalence.

Table 18–3 (Cont.) DECLARE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
rewrite_mode	The following modes are supported, in increasing order of power: ■ disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. ■ text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. ■ general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified destination_query. ■ recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified destination_query for further performance enhancements whenever it uses the equivalence declaration. Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.

Exceptions

Table 18–4 DECLARE_REWRITE_EQUIVALENCE Procedure Exceptions

Exception	Description
ORA-30388	Name of the rewrite equivalence is not specified
ORA-30391	The specified rewrite equivalence does not exist
ORA-30392	The checksum analysis for the rewrite equivalence failed
ORA-30393	A query block in the statement did not write
ORA-30396	Rewrite equivalence procedures require the COMPATIBLE parameter to be set to 10.1 or greater

Usage Notes

Query rewrite using equivalence declarations occurs simultaneously and in concert with query rewrite using materialized views. The same query rewrite engine is used for both. The query rewrite engine uses the same rewrite rules to rewrite queries using both equivalence declarations and materialized views. Because the rewrite equivalence represents a specific rewrite crafted by a sophisticated user, the query rewrite engine gives priority to rewrite equivalences over materialized views when it is possible to perform a rewrite with either a materialized view or a rewrite equivalence. For this same reason, the cost-based optimizer (specifically, cost-based rewrite) will not choose an unrewritten query plan over a query plan that is rewritten to use a rewrite equivalence even if the cost of the un-rewritten plan appears more favorable. Query rewrite matches properties of the incoming request query against the equivalence declaration's source_stmt or the materialized view's defining statement, respectively, and derives an equivalent relational expression in terms of the equivalence declaration's destination_stmt or the materialized view's container table, respectively.

DROP_REWRITE_EQUIVALENCE Procedure

This procedure drops the specified rewrite equivalence declaration.

Syntax

```
DBMS_ADVANCED_REWRITE.DROP_REWRITE_EQUIVALENCE (
   name        VARCHAR2);
```

Parameters

Table 18–5 DROP_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
name	A name for the equivalence declaration to drop. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is dropped in the current schema. The invoker must have the appropriate drop materialized view privilege to drop an equivalence declaration outside their own schema.

VALIDATE_REWRITE_EQUIVALENCE Procedure

This procedure validates the specified rewrite equivalence declaration using the same validation method as described with the `VALIDATE` parameter in "VALIDATE_REWRITE_EQUIVALENCE Procedure" on page 18-10.

Syntax

```
DBMS_ADVANCED_REWRITE.VALIDATE_REWRITE_EQUIVALENCE (
   name         VARCHAR2);
```

Parameters

Table 18–6 VALIDATE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
`name`	A name for the equivalence declaration to validate. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is validated in the current schema. The invoker must have sufficient privileges to execute both the `source_stmt` and `destination_stmt` of the specified equivalence declaration.

19

DBMS_ADVISOR

DBMS_ADVISOR is part of the server manageability suite of advisors, a set of expert systems that identifies and helps resolve performance problems relating to database server components.

Some advisors have their own packages. For these advisors, Oracle recommends that you use the advisor-specific package rather than DBMS_ADVISOR. Each of the following advisors has its own package, tailored to its specific functionality:

- Automatic Database Diagnostic Monitor (DBMS_ADDM)
- SQL Performance Analyzer (DBMS_SQLPA)
- SQL Repair Advisor (DBMS_SQLDIAG)
- SQL Tuning Advisor (DBMS_SQLTUNE)
- Compression Advisor (DBMS_COMPRESSION.GET_COMPRESSION_RATIO)

SQL Access Advisor and Segment Advisor are the only advisors with common use cases for DBMS_ADVISOR. Undo Advisor and Compression Advisor do not support DBMS_ADVISOR subprograms.

See Also:

- *Oracle Database Administrator's Guide* to learn about Segment Advisor
- *Oracle Database 2 Day + Performance Tuning Guide* for information regarding how to use SQL Access Advisor in Enterprise Manager
- *Oracle Database SQL Tuning Guide* for information regarding SQL Access Advisor

This chapter contains the following topics:

Using DBMS_ADVISOR

This section contains topics which relate to using the `DBMS_ADVISOR` package.

Deprecated Subprograms

> **Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11*g*:

- ADD_SQLWKLD_REF Procedure
- CREATE_SQLWKLD Procedure
- DELETE_SQLWKLD Procedure
- DELETE_SQLWKLD_REF Procedure
- DELETE_SQLWKLD_STATEMENT Procedures
- IMPORT_SQLWKLD_SCHEMA Procedure
- IMPORT_SQLWKLD_SQLCACHE Procedure
- IMPORT_SQLWKLD_STS Procedure
- IMPORT_SQLWKLD_SUMADV Procedure
- IMPORT_SQLWKLD_USER Procedure
- RESET_SQLWKLD Procedure
- SET_SQLWKLD_PARAMETER Procedures
- UPDATE_SQLWKLD_ATTRIBUTES Procedure
- UPDATE_SQLWKLD_STATEMENT Procedure

Security Model

The ADVISOR privilege is required to use this package.

Summary of DBMS_ADVISOR Subprograms

Table 19–1 summarizes the subprograms in this package. The `Used in` column lists advisors relevant for each subprogram, but excludes ADDM, SQL Performance Analyzer, SQL Repair Advisor, and SQL Tuning Advisor because these advisors have their own packages.

Table 19–1 DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
ADD_SQLWKLD_REF Procedure on page 19-8	Adds a workload reference to an Advisor task (Caution: Deprecated Subprogram)	SQL Access Advisor
ADD_SQLWKLD_ STATEMENT Procedure on page 19-9	Adds a single statement to a workload	SQL Access Advisor
ADD_STS_REF Procedure on page 19-11	Establishes a link between the current SQL Access Advisor task and a SQL tuning set	SQL Access Advisor
CANCEL_TASK Procedure on page 19-12	Cancels a currently executing task operation	Segment Advisor, SQL Access Advisor
COPY_SQLWKLD_TO_ STS Procedure on page 19-13	Copies the contents of a SQL workload object to a SQL tuning set	SQL Access Advisor
CREATE_FILE Procedure on page 19-14	Creates an external file from a PL/SQL CLOB variable, which is useful for creating scripts and reports	SQL Access Advisor
CREATE_OBJECT Procedure on page 19-16	Creates a new task object	Segment Advisor
CREATE_SQLWKLD Procedure on page 19-18	Creates a new workload object (Caution: Deprecated Subprogram)	SQL Access Advisor
CREATE_TASK Procedures on page 19-20	Creates a new Advisor task in the repository	Segment Advisor, SQL Access Advisor
DELETE_SQLWKLD Procedure on page 19-22	Deletes an entire workload object (Caution: Deprecated Subprogram)	SQL Access Advisor
DELETE_SQLWKLD_ REF Procedure on page 19-23	Deletes an entire workload object (Caution: Deprecated Subprogram)	SQL Access Advisor
DELETE_SQLWKLD_ STATEMENT Procedures on page 19-24	Deletes one or more statements from a workload (Caution: Deprecated Subprogram)	SQL Access Advisor
DELETE_STS_REF Procedure on page 19-25	Removes a link between the current SQL Access Advisor task and a SQL tuning set object	SQL Access Advisor
DELETE_TASK Procedure on page 19-26	Deletes the specified task from the repository	SQL Access Advisor
EXECUTE_TASK Procedure on page 19-27	Executes the specified task	Segment Advisor, SQL Access Advisor
GET_REC_ATTRIBUTES Procedure on page 19-29	Retrieves specific recommendation attributes from a task	SQL Access Advisor

Table 19–1 (Cont.) DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
GET_TASK_REPORT Function on page 19-30	Creates and returns a report for the specified task	
GET_TASK_SCRIPT Function on page 19-31	Creates and returns an executable SQL script of the Advisor task's recommendations in a buffer	SQL Access Advisor
IMPLEMENT_TASK Procedure on page 19-33	Implements the recommendations for a task	SQL Access Advisor
IMPORT_SQLWKLD_ SCHEMA Procedure on page 19-34	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor
IMPORT_SQLWKLD_ SQLCACHE Procedure on page 19-36	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor
IMPORT_SQLWKLD_ STS Procedure on page 19-38	Imports data from a SQL tuning set into a SQL workload data object (Caution: Deprecated Subprogram)	SQL Access Advisor
IMPORT_SQLWKLD_ SUMADV Procedure on page 19-40	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor
IMPORT_SQLWKLD_ USER Procedure on page 19-42	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor
INTERRUPT_TASK Procedure on page 19-44	Stops a currently executing task, ending its operations as it would at a normal exit, so that the recommendations are visible	Segment Advisor, SQL Access Advisor
MARK_ RECOMMENDATION Procedure on page 19-45	Sets the `annotation_status` for a particular recommendation	Segment Advisor, SQL Access Advisor
QUICK_TUNE Procedure on page 19-46	Performs an analysis on a single SQL statement	SQL Access Advisor
RESET_SQLWKLD Procedure on page 19-48	Resets a workload to its initial starting point (Caution: Deprecated Subprogram)	SQL Access Advisor
RESET_TASK Procedure on page 19-49	Resets a task to its initial state	Segment Advisor, SQL Access Advisor
SET_DEFAULT_ SQLWKLD_ PARAMETER Procedures on page 19-50	Imports data into a workload from schema evidence	SQL Access Advisor
SET_DEFAULT_TASK_ PARAMETER Procedures on page 19-51	Modifies a default task parameter	Segment Advisor, SQL Access Advisor
SET_SQLWKLD_ PARAMETER Procedures on page 19-52	Sets the value of a workload parameter	SQL Access Advisor
SET_TASK_ PARAMETER Procedure on page 19-53	Sets the specified task parameter value	Segment Advisor, SQL Access Advisor

Table 19–1 (Cont.) DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
TUNE_MVIEW Procedure on page 19-66	Shows how to decompose a materialized view into two or more materialized views or to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite	SQL Access Advisor
UPDATE_OBJECT Procedure on page 19-68	Updates a task object	Segment Advisor
UPDATE_REC_ ATTRIBUTES Procedure on page 19-70	Updates an existing recommendation for the specified task	SQL Access Advisor
UPDATE_SQLWKLD_ ATTRIBUTES Procedure on page 19-72	Updates a workload object	SQL Access Advisor
UPDATE_SQLWKLD_ STATEMENT Procedure on page 19-73	Updates one or more SQL statements in a workload	SQL Access Advisor
UPDATE_TASK_ ATTRIBUTES Procedure on page 19-75	Updates a task's attributes	Segment Advisor, SQL Access Advisor

ADD_SQLWKLD_REF Procedure

Note: This procedure is deprecated starting in Oracle Database 11*g*.

This procedure establishes a link between the current SQL Access Advisor task and a SQL Workload object. The link allows an advisor task to access interesting data for doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Workload object is made, the workload is protected from removal or modification.

Users should use `ADD_STS_REF` instead of `ADD_SQLWKLD_REF` for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_REF (
   task_name              IN VARCHAR2,
   workload_name          IN VARCHAR2,
   is_sts                 IN NUMBER :=0);
```

Parameters

Table 19–2 ADD_SQLWKLD_REF Procedure Parameters

Parameter	Description
`task_name`	The SQL Access Advisor task name that uniquely identifies an existing task.
`workload_name`	The name of the workload object to be linked. Once a object has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workload objects. To remove the link to the workload object, use the procedure `DELETE_REFERENCE`.
`is_sts`	Indicates the type of workload source. Possible values are: ■ 0 - SQL workload object ■ 1 - SQL tuning set

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name, 1);
END;
/
```

ADD_SQLWKLD_STATEMENT Procedure

Note: This procedure is deprecated starting in Oracle Database 11*g*.

This procedure adds a single statement to the specified workload.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT (
   workload_name          IN VARCHAR2,
   module                 IN VARCHAR2,
   action                 IN VARCHAR2,
   cpu_time               IN NUMBER := 0,
   elapsed_time           IN NUMBER := 0,
   disk_reads             IN NUMBER := 0,
   buffer_gets            IN NUMBER := 0,
   rows_processed         IN NUMBER := 0,
   optimizer_cost         IN NUMBER := 0,
   executions             IN NUMBER := 1,
   priority               IN NUMBER := 2,
   last_execution_date    IN DATE := 'SYSDATE',
   stat_period            IN NUMBER := 0,
   username               IN VARCHAR2,
   sql_text               IN CLOB);
```

Parameters

Table 19–3 ADD_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The workload name that uniquely identifies an existing workload.
module	An optional business application module that will be associated with the SQL statement.
action	An optional application action that will be associated with the SQL statement.
cpu_time	The total CPU time in seconds that is consumed by the SQL statement.
elapsed_time	The total elapsed time in seconds that is consumed by the SQL statement.
disk_reads	The total disk-read operations that are consumed by the SQL statement.
buffer_gets	The total buffer-get operations that are consumed by the SQL statement.
rows_processed	The average number of rows processed by the SQL statement.
optimizer_cost	The optimizer's calculated cost value.
executions	The total execution count by the SQL statement. This value should be greater than zero.
priority	The relative priority of the SQL statement. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
last_execution_ date	The date and time at which the SQL statement last executed. If the value is NULL, then the current date and time will be used.
stat_period	Time interval in seconds from which statement statistics were calculated.

Table 19–3 (Cont.) ADD_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
username	The Oracle user name that executed the SQL statement. Because a user name is an Oracle identifier, the username value must be entered exactly as it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott as a match for SCOTT.
sql_text	The complete SQL statement. To increase the quality of a recommendation, the SQL statement should not contain bind variables.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure on page 19-49 for directions on setting a task to its initial state.

The ADD_SQLWKLD_STATEMENT procedure accepts several parameters that may be ignored by the caller. cpu_time, elapsed_time, disk_reads, buffer_gets, and optimizer_cost are only used to sort workload data when actual analysis occurs, so actual values are only necessary when the order_list task parameter references a particular statistic.To determine what statistics to provide when adding a new SQL statement to a workload, examine or set the task parameter order_list. The order_list parameter accepts any combination of the keys: buffer_gets, optimizer_cost, cpu_time, disk_reads, elapsed_time, executions, and priority. A typical setting of priority, optimizer_cost would indicate the SQL Access Advisor will sort the workload data by priority and optimizer_cost and process the highest cost statements first. Any statements added to the workload would need to include appropriate priority and optimizer_cost values. All other statistics can be defaulted or set to zero.For the statistical keys referenced by the order_list task parameter, the actual parameter values should be reasonably accurate since they will be compared to other statements in the workload. If the caller is unable to estimate values, choose values that would determine its importance relative to other statements in the workload. For example, if the current statement is considered the most critical query in your business, then an appropriate value would be anything greater than all other values for the same statistic found in the workload.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
FROM sh.sales');
END;
/
```

ADD_STS_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL tuning set. The link enables an advisor task to access data for the purpose of doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL tuning set is made, the STS is protected from removal or modification.

Use ADD_STS_REF for any STS-based advisor runs. The older method of using ADD_SQLWKLD_REF with parameter IS_STS=1 is only supported for backward compatibility. Furthermore, the ADD_STS_REF function accepts a SQL tuning set owner name, whereas ADD_SQLWKLD_REF does not.

Syntax

```
DBMS_ADVISOR.ADD_STS_REF(
  task_name       IN VARCHAR2 NOT NULL,
  sts_owner       IN VARCHAR2,
  workload_name   IN VARCHAR2 NOT NULL);
```

Parameters

Table 19–4 ADD_STS_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access Advisor task name that uniquely identifies an existing task.
sts_owner	The owner of the SQL tuning set. The value of this parameter may be NULL, in which case the advisor assumes the SQL tuning set to be owned by the currently logged-in user.
workload_name	The name of the workload to be linked. A workload consists of one or more SQL statements, plus statistics and attributes that fully describe each statement. The database stores a workload as a SQL tuning set. After a workload has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workloads. To remove the link to the workload, use the procedure DBMS_ADVISOR.DELETE_STS_REF.

Examples

```
DBMS_ADVISOR.ADD_STS_REF ('My Task', 'SCOTT', 'My Workload');
```

CANCEL_TASK Procedure

This procedure causes a currently executing operation to terminate. This call does a soft interrupt. It will not break into a low-level database access call like a hard interrupt such as `Ctrl-C`. The SQL Access Advisor periodically checks for soft interrupts and acts appropriately. As a result, this operation may take a few seconds to respond to a call.

Syntax

```
DBMS_ADVISOR.CANCEL_TASK (
   task_name      IN  VARCHAR2);
```

Parameters

Table 19–5 CANCEL_TASK Procedure Parameter

Parameter	Description
`task_name`	A valid Advisor task name that uniquely identifies an existing task.

Usage Notes

A cancel command restores the task to its condition prior to the start of the cancelled operation. Therefore, a cancelled task or data object cannot be resumed.

Because all Advisor task procedures are synchronous, to cancel an operation, you must use a separate database session.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CANCEL_TASK('My Task');
END;
/
```

COPY_SQLWKLD_TO_STS Procedure

This procedure copies the contents of a SQL workload object to a SQL tuning set.

Syntax

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

```
DBMS_ADVISOR.COPY_SQLWKLD_TO_STS (
   workload_name         IN VARCHAR2,
   sts_name              IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW');
```

Parameters

Table 19–6 COPY_SQLWKLD_TO_STS Procedure Parameter

Parameter	Description
workload_name	The SQL Workload object name to copy.
sts_name	The SQL tuning set name into which the SQL Workload object will be copied.
import_mode	Specifies the handling of the target SQL tuning set. Possible values are: ■ APPEND Causes SQL Workload data to be appended to the target SQL tuning set. ■ NEW Indicates the SQL tuning set can only contain the copied contents. If the SQL tuning set exists and has data, an error will be reported. ■ REPLACE Causes any existing data in the target SQL tuning set to be purged prior to the workload copy. In all cases, if the specified SQL tuning set does not exist, it will be created.

Usage Notes

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

Examples

```
BEGIN
   DBMS_ADVISOR.COPY_SQLWKLD_TO_STS('MY_OLD_WORKLOAD', 'MY_NEW_STS', 'NEW');
END;
/
```

CREATE_FILE Procedure

This procedure creates an external file from a PL/SQL CLOB variable, which is used for creating scripts and reports. CREATE_FILE accepts a CLOB input parameter and writes the character string contents to the specified file.

Syntax

```
DBMS_ADVISOR.CREATE_FILE (
   buffer       IN  CLOB,
   location     IN  VARCHAR2,
   filename     IN  VARCHAR2);
```

Parameters

Table 19–7 CREATE_FILE Procedure Parameters

Parameter	Description
buffer	A CLOB buffer containing report or script information.
location	Specifies the directory that will contain the new file. You must use the directory alias as defined by the CREATE DIRECTORY statement. The Advisor will translate the alias into the actual directory location.
filename	Specifies the output file to receive the script commands. The filename can only contain the name and an optional file type of the form filename.filetype.

Usage Notes

All formatting must be embedded within the CLOB.

The Oracle server restricts file access within Oracle Stored Procedures. This means that file locations and names must adhere to the known file permissions in the server.

Examples

```
CREATE DIRECTORY MY_DIR as '/homedir/user4/gssmith';
GRANT READ,WRITE ON DIRECTORY MY_DIR TO PUBLIC;

DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT(task_name),
    'MY_DIR','script.sql');

END;
```

/

CREATE_OBJECT Procedure

This procedure creates a new task object.

Syntax

```
DBMS_ADVISOR.CREATE_OBJECT (
   task_name         IN VARCHAR2,
   object_type       IN VARCHAR2,
   attr1             IN VARCHAR2 :=  NULL,
   attr2             IN VARCHAR2 :=  NULL,
   attr3             IN VARCHAR2 :=  NULL,
   attr4             IN CLOB     :=  NULL,
   object_id         OUT NUMBER);

DBMS_ADVISOR.CREATE_OBJECT (
   task_name         IN VARCHAR2,
   object_type       IN VARCHAR2,
   attr1             IN VARCHAR2 :=  NULL,
   attr2             IN VARCHAR2 :=  NULL,
   attr3             IN VARCHAR2 :=  NULL,
   attr4             IN CLOB     :=  NULL,
   attr5             IN VARCHAR2 :=  NULL,
   object_id         OUT NUMBER);
```

Parameters

Table 19–8 CREATE_OBJECT Procedure Parameters

Parameter	Description
task_name	A valid Advisor task name that uniquely identifies an existing task.
object_type	Specifies the external object type.
attr1	Advisor-specific data.
attr2	Advisor-specific data.
attr3	Advisor-specific data.
attr4	Advisor-specific data.
attr5	Advisor-specific data.
object_id	The advisor-assigned object identifier.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

Return Values

Returns the new object identifier.

Usage Notes

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level. If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be

obtained on a single segment, such as the partition or subpartition of a table, index, or LOB column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL,
                              'SELECT * FROM SH.SALES',obj_id);
END;
/
```

CREATE_SQLWKLD Procedure

Note: This procedure is deprecated starting in Oracle Database 11*g*.

This procedure creates a new private SQL Workload object for the user. A SQL Workload object manages a SQL workload on behalf of the SQL Access Advisor. A SQL Workload object must exist prior to performing any other SQL Workload operations, such as importing or updating SQL statements.

Syntax

```
DBMS_ADVISOR.CREATE_SQLWKLD (
   workload_name            IN OUT VARCHAR2,
   description              IN VARCHAR2 := NULL,
   template                 IN VARCHAR2 := NULL,
   is_template              IN VARCHAR2 := 'FALSE');
```

Parameters

Table 19–9 CREATE_SQLWKLD Procedure Parameters

Parameter	Description
workload_name	A name that uniquely identifies the created workload. If not specified, the system will generate a unique name. Names can be up to 30 characters long.
description	Specifies an optional workload description. Descriptions can be up to 256 characters.
template	An optional SQL Workload name of an existing workload data object or data object template.
is_template	An optional value that enables you to set the newly created workload as a template. Valid values are TRUE and FALSE.

Return Values

The SQL Access Advisor returns a unique workload object identifier number that must be used for subsequent activities within the new SQL Workload object.

Usage Notes

By default, workload objects are created using built-in default settings. To create a workload using the parameter settings of an existing workload or workload template, the user may specify an existing workload name.

After a SQL Workload object is present, it can then be referenced by one or more SQL Access Advisor tasks using the ADD_SQLWKLD_REF procedure.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
END;
```

/

CREATE_TASK Procedures

This procedure creates a new Advisor task in the repository.

Syntax

```
DBMS_ADVISOR.CREATE_TASK (
   advisor_name          IN VARCHAR2,
   task_id               OUT NUMBER,
   task_name             IN OUT VARCHAR2,
   task_desc             IN VARCHAR2 := NULL,
   template              IN VARCHAR2 := NULL,
   is_template           IN VARCHAR2 := 'FALSE',
   how_created           IN VARCHAR2 := NULL);

DBMS_ADVISOR.CREATE_TASK (
   advisor_name          IN VARCHAR2,
   task_name             IN VARCHAR2,
   task_desc             IN VARCHAR2 := NULL,
   template              IN VARCHAR2 := NULL,
   is_template           IN VARCHAR2 := 'FALSE',
   how_created           IN VARCHAR2 := NULL);

DBMS_ADVISOR.CREATE_TASK (
   parent_task_name      IN VARCHAR2,
   rec_id                IN NUMBER,
   task_id               OUT NUMBER,
   task_name             IN OUT VARCHAR2,
   task_desc             IN VARCHAR2,
   template              IN VARCHAR2);
```

Parameters

Table 19–10 CREATE_TASK Procedure Parameters

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
task_id	A number that uniquely identifies the created task. The number is generated by the procedure and returned to the user.
task_name	Specifies a new task name. Names must be unique among all tasks for the user. When using the second form of the CREATE_TASK syntax listed above (with OUT), a unique name can be generated. Names can be up to 30 characters long.
task_desc	Specifies an optional task description. Descriptions can be up to 256 characters in length.
template	An optional task name of an existing task or task template. To specify built-in SQL Access Advisor templates, use the template name as described earlier.
is_template	An optional value that allows the user to set the newly created task as template. Valid values are: TRUE and FALSE.
how_created	An optional value that identifies how the source was created.

Return Values

Returns a unique task ID number and a unique task name if one is not specified.

Usage Notes

A task must be associated with an advisor, and once the task has been created, it is permanently associated with the original advisor. By default, tasks are created using built-in default settings. To create a task using the parameter settings of an existing task or task template, the user may specify an existing task name.

For the SQL Access Advisor, use the identifier `DBMS_ADVISOR.SQLACCESS_ADVISOR` as the `advisor_name`.

The SQL Access Advisor provides three built-in task templates, using the following constants:

- `DBMS_ADVISOR.SQLACCESS_OLTP`

  Parameters are preset to favor an OLTP application environment.

- `DBMS_ADVISOR.SQLACCESS_WAREHOUSE`

  Parameters are preset to favor a data warehouse application environment.

- `DBMS_ADVISOR.SQLACCESS_GENERAL`

  Parameters are preset to favor a hybrid application environment where both OLTP and data warehouse operations may occur. For the SQL Access Advisor, this is the default template.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
END;
/
```

DELETE_SQLWKLD Procedure

> **Note:** This procedure is deprecated starting in Oracle Database 11*g*.

This procedure deletes an existing SQL Workload object from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD (
   workload_name        IN VARCHAR2);
```

Parameters

Table 19–11 DELETE_SQLWKLD Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload. The wildcard % is supported as a WORKLOAD_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the WORKLOAD_NAME. If a wildcard is provided, the DELETE_SQLWKLD operation will not delete any workloads marked as READ_ONLY or TEMPLATE.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the RESET_TASK Procedure on page 19-49 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.DELETE_SQLWKLD(workload_name);
END;
/
```

DELETE_SQLWKLD_REF Procedure

> **Note:** This procedure is deprecated starting in Oracle Database 11*g*.

This procedure removes a link between the current SQL Access task and a SQL Workload data object.

Use `DELETE_STS_REF` instead of `DELETE_SQLWKLD_REF` for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_REF (
   task_name              IN VARCHAR2,
   workload_name          IN VARCHAR2,
   is_sts                 IN NUMBER :=0);
```

Parameters

Table 19–12 DELETE_SQLWKLD_REF Procedure Parameters

Parameter	Description
`task_name`	The SQL Access task name that uniquely identifies an existing task.
`workload_name`	The name of the workload object to be unlinked. The wildcard `%` is supported as a `workload_name`. The rules of use are identical to the `LIKE` operator. For example, to remove all links to workload objects, use the wildcard `%` as the `workload_name`.
`is_sts`	Indicates the type of workload source. Possible values are: ■ 0 - SQL workload object ■ 1 - SQL tuning set

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.DELETE_SQLWKLD_REF(task_name, workload_name);
END;
/
```

DELETE_SQLWKLD_STATEMENT Procedures

This procedure has been deprecated.

This procedure deletes one or more statements from a workload.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
   workload_name        IN VARCHAR2,
   sql_id               IN NUMBER);

DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
   workload_name        IN VARCHAR2,
   search               IN VARCHAR2,
   deleted              OUT NUMBER);
```

Parameters

Table 19–13 DELETE_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant ADVISOR_ALL.
search	Disabled.
deleted	Returns the number of statements deleted by the searched deleted operation.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the RESET_TASK Procedure on page 19-49 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  deleted NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'YEARLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');

   SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
   WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

DELETE_STS_REF Procedure

This procedure removes a link between the current SQL Access Advisor task and a SQL tuning set.Use DELETE_STS_REF for any STS-based advisor runs. The older method of using DELETE_SQLWKLD_REF with parameter IS_STS=1 is only supported for backward compatibility. Furthermore, the DELETE_STS_REF function accepts an STS owner name, whereas DELETE_SQLWKLD_REF does not.

Syntax

```
DBMS_ADVISOR.DELETE_STS_REF (
  task_name      IN VARCHAR2 NOT NULL,
  sts_owner      IN VARCHAR2,
  workload_name  IN VARCHAR2 NOT NULL);
```

Parameters

Table 19–14 DELETE_STS_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access Advisor task name that uniquely identifies an existing task.
sts_owner	The owner of the SQL tuning set. The value of this parameter may be NULL, in which case the advisor assumes the SQL tuning set to be owned by the currently logged-in user.
workload_name	The name of the workload to be unlinked. A workload consists of one or more SQL statements, plus statistics and attributes that fully describe each statement. The database stores a workload as a SQL tuning set. The wildcard % is supported as a workload name. The rules of use are identical to the SQL LIKE operator. For example, to remove all links to SQL tuning set objects, use the wildcard % as the STS_NAME.

Examples

```
DBMS_ADVISOR.DELETE_STS_REF ('My task', 'SCOTT', 'My workload');
```

DELETE_TASK Procedure

This procedure deletes an existing task from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 19–15 DELETE_TASK Procedure Parameters

Parameter	Description
task_name	A single Advisor task name that will be deleted from the repository. The wildcard % is supported as a TASK_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the TASK_NAME. If a wildcard is provided, the DELETE_TASK operation will not delete any tasks marked as READ_ONLY or TEMPLATE.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.DELETE_TASK(task_name);
END;
/
```

EXECUTE_TASK Procedure

This procedure performs the Advisor analysis or evaluation for the specified task. The procedure is overloaded.

The execution-related arguments are optional and you do not need to set them for advisors that do not allow their tasks to be executed multiple times.

Advisors can execute a task multiple times and use the results for further processing and analysis.

Syntax

```
DBMS_ADVISOR.EXECUTE_TASK (
   task_name          IN VARCHAR2);

DBMS_ADVISOR.EXECUTE_TASK (
   task_name         IN VARCHAR2,
   execution_type    IN VARCHAR2             := NULL,
   execution_name    IN VARCHAR2             := NULL,
   execution_params  IN dbms_advisor.argList := NULL,
   execution_desc    IN VARCHAR2             := NULL,
RETURN VARCHAR2;
```

Parameters

Table 19–16 EXECUTE_TASK Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
execution_type	The type of action to be performed by the function. If NULL, it will default to the value of the DEFAULT_EXECUTION_TYPE parameter. As an example, the SQL Performance Analyzer accepts the following possible values: ■ EXPLAIN PLAN: Generate an explain plan for a SQL statement. This is similar to an EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task. ■ TEST EXECUTE: Test execute the SQL statement and collect its execute plan and statistics. The resulting plans and statistics are stored in the advisor framework. ■ ANALYZE PERFORMANCE: Analyze and compare two versions of SQL performance data. The performance data is generated by test executing a SQL statement or generating its explain plan.
execution_name	A name to qualify and identify an execution. If not specified, it will be generated by the Advisor and returned by function.
execution_params	A list of parameters (name, value) for the specified execution. Note that execution parameters are real task parameters, but they affect only the execution they are specified for. As an example, consider the following: DBMS_ADVISOR.ARGLIST('time_limit', 12, 'username', 'hr')
execution_desc	A 256-length string describing the execution.

Usage Notes

Task execution is a synchronous operation. Control will not be returned to the caller until the operation has completed, or a user-interrupt was detected.

Upon return, you can check the DBA_ADVISOR_LOG table for the execution status.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

GET_REC_ATTRIBUTES Procedure

This procedure retrieves a specified attribute of a new object as recommended by Advisor analysis.

Syntax

```
DBMS_ADVISOR.GET_REC_ATTRIBUTES (
   workload_name         IN VARCHAR2,
   rec_id                IN NUMBER,
   action_id             IN NUMBER,
   attribute_name        IN VARCHAR2,
   value                 OUT VARCHAR2,
   owner_name            IN VARCHAR2 := NULL);
```

Parameters

Table 19–17 GET_REC_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
rec_id	The Advisor-generated identifier number that is assigned to the recommendation.
action_id	The Advisor-generated action identifier that is assigned to the particular command.
attribute_name	Specifies the attribute to change.
value	The buffer to receive the requested attribute value.
owner_name	Optional owner name of the target task. This permits access to task data not owned by the current user.

Return Values

The requested attribute value is returned in the VALUE argument.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.GET_REC_ATTRIBUTES(task_name, 1, 1, 'NAME', attribute);
END;
/
```

GET_TASK_REPORT Function

This function creates and returns a report for the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_REPORT (
   task_name      IN VARCHAR2,
   type           IN VARCHAR2 := 'TEXT',
   level          IN VARCHAR2 := 'TYPICAL',
   section        IN VARCHAR2 := 'ALL',
   owner_name     IN VARCHAR2 := NULL,
   execution_name IN VARCHAR2 := NULL,
   object_id      IN NUMBER   := NULL)
RETURN CLOB;
```

Parameters

Table 19–18 GET_TASK_REPORT Function Parameters

Parameter	Description
task_name	The name of the task from which the script will be created.
type	The only valid value is TEXT.
level	The possible values are BASIC, TYPICAL, and ALL.
section	Advisor-specific report sections.
owner_name	Owner of the task. If specified, the system will check to see if the current user has read privileges to the task data.
execution_name	An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.
object_id	An identifier of an advisor object that can be targeted by the script.

Return Values

Returns the buffer receiving the script.

GET_TASK_SCRIPT Function

This function creates a SQL*Plus-compatible SQL script and sends the output to file. The script will contain all of the accepted recommendations from the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_SCRIPT (
   task_name          IN VARCHAR2
   type               IN VARCHAR2 := 'IMPLEMENTATION',
   rec_id             IN NUMBER   := NULL,
   act_id             IN NUMBER   := NULL,
   owner_name         IN VARCHAR2 := NULL,
   execution_name     IN VARCHAR2 := NULL,
   object_id          IN NUMBER   := NULL)
RETURN CLOB;
```

Parameters

Table 19–19 GET_TASK_SCRIPT Function Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
type	Specifies the type of script to generate. The possible values are IMPLEMENTATION and UNDO.
rec_id	An optional recommendation identifier number that can be used to extract a subset of the implementation script. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all accepted recommendations would be included. The default is to include all accepted recommendations for the task.
act_id	Optional action identifier number that can be used to extract a single action as a DDL command. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all actions for the recommendation would be included. The default is to include all actions for a recommendation.
owner_name	An optional task owner name.
execution_name	An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.
object_id	An identifier of an advisor object that can be targeted by the script.

Return Values

Returns the script as a CLOB buffer.

Usage Notes

Though the script is ready to execute, Oracle recommends that the user review the script for acceptable locations for new materialized views and indexes.

For a recommendation to appear in a generated script, it must be marked as accepted.

Examples

```
DECLARE
  task_id NUMBER;
```

```
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  buf CLOB;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
    buf := DBMS_ADVISOR.GET_TASK_SCRIPT(task_name);
END;
/
```

IMPLEMENT_TASK Procedure

This procedure implements the recommendations of the specified task.

Syntax

```
DBMS_ADVISOR.IMPLEMENT_TASK (
   task_name          IN VARCHAR2,
   rec_id             IN NUMBER := NULL,
   exit_on_error      IN BOOLEAN := NULL);
```

Parameters

Table 19–20 IMPLEMENT_TASK Procedure Parameters

Parameter	Description
task_name	The name of the task.
rec_id	An optional recommendation ID.
exit_on_error	An optional boolean to exit on the first error.

IMPORT_SQLWKLD_SCHEMA Procedure

Note: This procedure is deprecated starting in Oracle Database 11*g*.

This procedure constructs and loads a SQL workload based on schema evidence. The workload is also referred to as a hypothetical workload.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA (
   workload_name         IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 19–21 IMPORT_SQLWKLD_SCHEMA Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
failed_rows	Returns the number or rows that were not saved due to syntax or validation errors
saved_rows	Returns the number of rows actually saved in the repository.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

To successfully import a hypothetical workload, the target schemas must contain dimensions.

If the VALID_TABLE_LIST parameter is not set, the search space may become very large and require a significant amount of time to complete. Oracle recommends that you limit your search space to specific set of tables.

If a task contains valid recommendations from a prior run, adding or modifying task will mark the task as invalid, preventing the viewing and reporting of potentially valuable recommendation data.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA(workload_name, 'REPLACE', 1, saved,
     failed);
END;
/
```

IMPORT_SQLWKLD_SQLCACHE Procedure

Note: This procedure is deprecated starting in Oracle Database 11*g*.

This procedure creates a SQL workload from the current contents of the server's SQL cache.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE (
   workload_name         IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 19–22 IMPORT_SQLWKLD_SQLCACHE Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following 1-HIGH, 2-MEDIUM, or 3-LOW.
saved_rows	Returns the number of rows saved as output parameters.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure on page 19-49 to set a task to its initial state.

Examples

```
DECLARE
```

```
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE(workload_name, 'REPLACE', 1, saved,
     failed);
END;
/
```

IMPORT_SQLWKLD_STS Procedure

Note: This procedure is deprecated starting in Oracle Database 11*g*.

This procedure loads a SQL workload from an existing SQL tuning set. A SQL tuning set is typically created from the server workload repository using various time and data filters.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
   workload_name         IN VARCHAR2,
   sts_name              IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);

DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
   workload_name         IN VARCHAR2,
   sts_owner             IN VARCHAR2,
   sts_name              IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 19–23 IMPORT_SQLWKLD_STS Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
sts_owner	The optional owner of the SQL tuning set.
sts_name	The name of an existing SQL tuning set workload from which the data will be imported. If the sts_owner value is not provided, the owner will default to the current user.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW. The default value is 2.
saved_rows	Returns the number of rows actually saved in the repository.

Table 19–23 (Cont.) IMPORT_SQLWKLD_STS Procedure Parameters

Parameter	Description
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure on page 19-49 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_STS(workload_name, 'MY_SQLSET', 'REPLACE', 1,
     saved, failed);
END;
/
```

IMPORT_SQLWKLD_SUMADV Procedure

Note: This procedure is deprecated starting in Oracle Database 11*g*.

This procedure collects a SQL workload from a Summary Advisor workload. This procedure is intended to assist Oracle9*i* Database Summary Advisor users in the migration to SQL Access Advisor.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV (
   workload_name         IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   sumadv_id             IN NUMBER,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 19–24 IMPORT_SQLWKLD_SUMADV Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the default application priority for each statement that is saved in the workload object. If a Summary Advisor workload statement contains a priority of zero, the default priority will be applied. If the workload statement contains a valid priority, then the Summary Advisor priority will be converted to a comparable SQL Access Advisor priority. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
sumadv_id	Specifies the Summary Advisor workload identifier number.
saved_rows	Returns the number of rows actually saved in the repository.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure on page 19-49 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
  sumadv_id NUMBER;
BEGIN
  workload_name := 'My Workload';
  sumadv_id := 394;

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV(workload_name, 'REPLACE', 1, sumadv_id,
    saved, failed);
END;
/
```

IMPORT_SQLWKLD_USER Procedure

Note: This procedure is deprecated starting in Oracle Database 11*g*.

This procedure collects a SQL workload from a specified user table.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_USER (
   workload_name          IN VARCHAR2,
   import_mode            IN VARCHAR2 := 'NEW',
   owner_name             IN VARCHAR2,
   table_name             IN VARCHAR2,
   saved_rows             OUT NUMBER,
   failed_rows            OUT NUMBER);
```

Parameters

Table 19–25 IMPORT_SQLWKLD_USER Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
owner_name	Specifies the owner name of the table or view from which workload data will be collected.
table_name	Specifies the name of the table or view from which workload data will be collected.
saved_rows	Returns the number of rows actually saved in the workload object.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure on page 19-49 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_USER(workload_name, 'REPLACE', 'SH',
    'USER_WORKLOAD', saved, failed);
END;
/
```

INTERRUPT_TASK Procedure

This procedure stops a currently executing task. The task will end its operations as it would at a normal exit. The user will be able to access any recommendations that exist to this point.

Syntax

```
DBMS_ADVISOR.INTERRUPT_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 19–26 INTERRUPT_TASK Procedure Parameters

Parameter	Description
task_name	A single Advisor task name that will be interrupted.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

While this session is executing its task, you can interrupt the task from a second session using the following statement:

```
BEGIN
  DBMS_ADVISOR.INTERRUPT_TASK('My Task');
END;
/
```

MARK_RECOMMENDATION Procedure

This procedure marks a recommendation for import or implementation.

Syntax

```
DBMS_ADVISOR.MARK_RECOMMENDATION (
   task_name          IN VARCHAR2
   id                 IN NUMBER,
   action             IN VARCHAR2);
```

Parameters

Table 19–27 MARK_RECOMMENDATION Procedure Parameters

Parameter	Description
task_name	Name of the task.
id	The recommendation identifier number assigned by the Advisor.
action	The recommendation action setting. The possible actions are: ■ ACCEPT Marks the recommendation as accepted. With this setting, the recommendation will appear in implementation and undo scripts. ■ IGNORE Marks the recommendation as ignore. With this setting, the recommendation will not appear in an implementation or undo script. ■ REJECT Marks the recommendation as rejected. With this setting, the recommendation will not appear in any implementation or undo scripts.

Usage Notes

For a recommendation to be implemented, it must be marked as accepted. By default, all recommendations are considered accepted and will appear in any generated scripts.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
  rec_id NUMBER;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

  rec_id := 1;
  DBMS_ADVISOR.MARK_RECOMMENDATION(task_name, rec_id, 'REJECT');
END;
/
```

QUICK_TUNE Procedure

This procedure performs an analysis and generates recommendations for a single SQL statement.

This provides a shortcut method of all necessary operations to analyze the specified SQL statement. The operation creates a task using the specified task name. The task will be created using a specified Advisor task template. Finally, the task will be executed and the results will be saved in the repository.

Syntax

```
DBMS_ADVISOR.QUICK_TUNE (
   advisor_name           IN VARCHAR2,
   task_name              IN VARCHAR2,
   attr1                  IN CLOB,
   attr2                  IN VARCHAR2 := NULL,
   attr3                  IN NUMBER := NULL,
   task_or_template       IN VARCHAR2 := NULL);
```

Parameters

Table 19–28 QUICK_TUNE Procedure Parameters

Parameter	Description
advisor_name	Name of the Advisor that will perform the analysis.
task_name	Name of the task.
attr1	Advisor-specific attribute in the form of a CLOB variable.
attr2	Advisor-specific attribute in the form of a VARCHAR2 variable.
attr3	Advisor-specific attribute in the form of a NUMBER.
task_or_template	An optional task name of an existing task or task template.

Usage Notes

If indicated by the user, the final recommendations can be implemented by the procedure.

The task will be created using either a specified SQL Access task template or the built-in default template of SQLACCESS_GENERAL. The workload will only contain the specified statement, and all task parameters will be defaulted.

attr1 must be the single SQL statement to tune. For the SQL Access Advisor, attr2 is the user who would execute the single statement. If omitted, the current user will be used.

Examples

```
DECLARE
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.QUICK_TUNE(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_name,
                  'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id=10');
END;
```

/

RESET_SQLWKLD Procedure

Note: This procedure is deprecated starting in Oracle Database 11*g*.

This procedure resets a workload to its initial starting point. This has the effect of removing all journal messages, log messages, and recalculating necessary volatility and usage statistics.

Syntax

```
DBMS_ADVISOR.RESET_SQLWKLD (
   workload_name        IN VARCHAR2);
```

Parameters

Table 19–29 RESET_SQLWKLD Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.

Usage Notes

RESET_SQLWKLD should be executed after any workload adjustments such as adding or removing SQL statements.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');

  DBMS_ADVISOR.RESET_SQLWKLD(workload_name);
END;
/
```

RESET_TASK Procedure

This procedure re-initializes the metadata for the specified task. The task status will be set to INITIAL.

Syntax

```
DBMS_ADVISOR.RESET_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 19–30 RESET_TASK Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.RESET_TASK(task_name);
END;
/
```

SET_DEFAULT_SQLWKLD_PARAMETER Procedures

Note: This procedure is deprecated starting in Oracle Database 11*g*.

This procedure modifies the default value for a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting. When a default value is changed for a parameter, workload objects will inherit the new value when they are created.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
   parameter            IN VARCHAR2,
   value                IN VARCHAR2);

DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
   parameter            IN VARCHAR2,
   value                IN NUMBER);
```

Parameters

Table 19–31 SET_DEFAULT_SQLWKLD_PARAMETER Procedure Parameters

Parameter	Description
parameter	The name of the data parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the workload object type, but not necessarily unique to all workload object types. Various object types may use the same parameter name for different purposes.
value	The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER('VALID_TABLE_LIST','SH.%');
END;
/
```

SET_DEFAULT_TASK_PARAMETER Procedures

This procedure modifies the default value for a user parameter within a task or a template. A user parameter is a simple variable that stores various attributes that affect various Advisor operations. When a default value is changed for a parameter, tasks will inherit the new value when they are created.

A default task is different from a regular task. The default value is the initial value that will be inserted into a newly created task, while setting a task parameter with SET_TASK_PARAMETER sets the local value only. Thus, SET_DEFAULT_TASK_PARAMETER has no effect on an existing task.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
   advisor_name        IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN VARCHAR2);

DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
   advisor_name        IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN NUMBER);
```

Parameters

Table 19–32 SET_DEFAULT_TASK_PARAMETER Procedure Parameters

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number.

Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER(DBMS_ADVISOR.SQLACCESS_ADVISOR,
   'VALID_TABLE_LIST', 'SH.%');
END;
/
```

SET_SQLWKLD_PARAMETER Procedures

Note: This procedure is deprecated starting in Oracle Database 11*g*.

This procedure modifies a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
   workload_name        IN VARCHAR2,
   parameter            IN VARCHAR2,
   value                IN VARCHAR2);

DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
   workload_name        IN VARCHAR2,
   parameter            IN VARCHAR2,
   value                IN NUMBER);
```

Parameters

Table 19–33 SET_SQLWKLD_PARAMETER Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.
parameter	The name of the data parameter to be modified. Parameter names are not case sensitive.
value	The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST','SH.%');
END;
/
```

SET_TASK_PARAMETER Procedure

This procedure modifies a user parameter within an Advisor task or a template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```
DBMS_ADVISOR.SET_TASK_PARAMETER (
   task_name            IN VARCHAR2
   parameter            IN VARCHAR2,
   value                IN VARCHAR2);

DBMS_ADVISOR.SET_TASK_PARAMETER (
   task_name            IN VARCHAR2
   parameter            IN VARCHAR2,
   value                IN NUMBER);
```

Parameters

Table 19–34 SET_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number. If the value is DEFAULT, the value will be reset to the default value.

Usage Notes

A task cannot be modified unless it is in its initial state. See RESET_TASK Procedure on page 19-49 to set a task to its initial state. See your Advisor-specific documentation for further information on using this procedure.

SQL Access Advisor Task Parameters

Table 19–35 lists SQL Access Advisor task parameters.

Table 19–35 SQL Access Advisor Task Parameters

Parameter	Description
ANALYSIS_SCOPE	A comma-separated list that specifies the tuning artifacts to consider during analysis. The possible values are: ■ ALL Short name for specifying INDEX, MVIEW, TABLE, and PARTITION. ■ EVALUATION Causes a read-only evaluation of the specified workload. No new recommendations will be made. Can only be specified alone. ■ INDEX Allows the SQL Access Advisor to recommend index structure changes. ■ MVIEW Allows the SQL Access Advisor to recommend materialized view and log changes. ■ PARTITION Allows the SQL Access Advisor to recommend partition options. Use this in conjunction with the INDEX, MVIEW, and TABLE options. ■ TABLE Allows the SQL Access Advisor to make base-table recommendations. In this release, the only base-table recommendation is partitioning. Using the new keywords, the following combinations are valid: ■ INDEX ■ MVIEW ■ INDEX, PARTITION ■ INDEX, MVIEW, PARTITION ■ INDEX, TABLE, PARTITION ■ MVIEW, PARTITION ■ MIVEW, TABLE, PARTITION ■ INDEX, MVIEW, TABLE, PARTITION ■ TABLE, PARTITION ■ EVALUATION The default value is INDEX. The datatype is STRINGLIST.
CREATION_COST	When set to true (default), the SQL Access Advisor will weigh the cost of creation of the access structure (index or materialized view) against the frequency of the query and potential improvement in the query execution time. When set to false, the cost of creation is ignored. The datatype is STRING.
DAYS_TO_EXPIRE	Specifies the expiration time in days for the current SQL Access Advisor task. The value is relative to the last modification date. Once the task expires, it will become a candidate for removal by an automatic purge operation. Specifies the expiration time in days for the current Access Advisor task. The value is relative to the last modification date. The datatype is NUMBER. Once the task expires, it becomes a candidate for removal by an automatic purge operation. The possible values are: ■ an integer in the range of 0 to 2147483647 ■ ADVISOR_UNLIMITED ■ ADVISOR_UNUSED The default value is 30.
DEF_EM_TEMPLATE	Contains the default task or template name from which the Enterprise Manager SQL Access Advisor Wizard reads its initial values. The default value is SQLACCESS_EMTASK. The datatype is STRING.
DEF_INDEX_OWNER	Specifies the default owner for new index recommendations. When a script is created, this value will be used to qualify the index name. Possible values are: ■ Existing schema name. Quoted identifiers are supported. ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRING.

Table 19–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
DEF_INDEX_ TABLESPACE	Specifies the default tablespace for new index recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are: ■ Existing tablespace name. Quoted identifiers are supported. ■ ADVISOR_UNUSED No tablespace clause will be present in the script for indexes. The default value is ADVISOR_UNUSED. The datatype is STRING.
DEF_MVIEW_OWNER	Specifies the default owner for new materialized view recommendations. When a script is created, this value will be used to qualify the materialized view name. Possible values are: ■ Existing schema name. Quoted identifiers are supported. ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRING.
DEF_MVIEW_ TABLESPACE	Specifies the default tablespace for new materialized view recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are ■ Existing tablespace name. Quoted identifiers are supported. ■ ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs. The default value is ADVISOR_UNUSED. The datatype is STRING.
DEF_MVLOG_ TABLSPACE	Specifies the default tablespace for new materialized view log recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are: ■ Existing tablespace name. Quoted identifiers are supported. ■ ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs. The default value is ADVISOR_UNUSED. The datatype is STRING.
DEF_PARTITION_ TABLESPACE	Specifies the default tablespace for new partitioning recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are: ■ Existing tablespace name. Quoted identifiers are supported. ■ ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized views. The default value is ADVISOR_UNUSED. The datatype is STRING.
DML_VOLATILITY	When set to TRUE, the SQL Access Advisor will consider the impact of index maintenance and materialized view refresh in determining the recommendations. It will limit the access structure recommendations involving columns or tables that are frequently updated. For example, if there are too many DML statements on a column, then it may favor a B-tree index over a bitmap index on that column. For this process to be effective, the workload must include DML (insert/update/delete/merge/direct path inserts) statements that represent the update behavior of the application. The datatype is STRING. See the related parameter refresh_mode.
END_TIME	Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where: ■ DD is the numeric date ■ MM is the numeric month ■ YYYY is the numeric year ■ HH is the hour in 24 hour format ■ MI is the minute ■ SS is the second The datatype is STRING.

Table 19–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
EVALUATION_ONLY	This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter. If set to TRUE, causes SQL Access Advisor to analyze the workload, but only comment on how well the current configuration is supporting it. No tuning recommendations will be generated. Possible values are: ■ FALSE ■ TRUE The default value is FALSE. The datatype is STRING.
EXECUTION_TYPE	This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter. The translated values are: ■ FULL => FULL ■ INDEX_ONLY => INDEX ■ MVIEW_ONLY => MVIEW ■ MVIEW_LOG_ONLY => MVIEW_LOG_ONLY The type of recommendations that is desired. Possible values: ■ FULL All supported recommendation types will be considered. ■ INDEX_ONLY The SQL Access Advisor will only consider index solutions as recommendations. ■ MVIEW_ONLY The SQL Access Advisor will consider materialized view and materialized view log solutions as recommendations. ■ MVIEW_LOG_ONLY The SQL Access Advisor will only consider materialized view log solutions as recommendations. The default value is FULL. The datatype is STRINGLIST.
IMPLEMENT_EXIT_ON_ERROR	When performing an IMPLEMENT_TASK operation, this parameter will control behavior when an action fails to implement. If set to TRUE, IMPLEMENT_TASK will stop on the first unexpected error. The possible values are: ■ TRUE ■ FALSE The default value is TRUE. The datatype is STRING.
INDEX_NAME_TEMPLATE	Specifies the method by which new index names are formed. If the *TASK_ID* is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the *TASK_ID* in the template. Once formatted, the maximum size of a name is 30 characters. Valid keywords are: ■ Any literal value up to 22 characters. ■ TABLE Causes the parent table name to be substituted into the index name. If the name is too long, it will be trimmed to fit. ■ TASK_ID Causes the current task identifier number to be inserted in hexadecimal form. ■ SEQ Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. The default template is *table*_IDX$$_*task_idsequence*. The datatype is STRING.
INVALID_ACTION_LIST	Contains a fully qualified list of actions that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During a task execution, if a SQL statement's action matches a name in the action list, it will not be processed by the task. An action name is case sensitive. The possible values are: ■ single action ■ comma-delimited action list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.

Table 19–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
INVALID_MODULE_LIST	Contains a fully qualified list of modules that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During a task execution, if a SQL statement's module matches a name in the list, it will not be processed by the task. A module name is case sensitive. The possible values are: ■ single application ■ comma-delimited module list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
INVALID_SQLSTRING_LIST	Contains a fully qualified list of text strings that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted values are supported. A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness. During a task execution, if a SQL statement contains a string in the SQL string list, it will not be processed by the task. The possible values are: ■ single string ■ comma-delimited string list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
INVALID_USERNAME_LIST	Contains a fully qualified list of user names that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement's user name matches a name in the user name list, it will not be processed by the task. A user name is not case sensitive unless it is quoted. The possible values are: ■ single user name ■ comma-delimited user name list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
JOURNALING	Controls the logging of messages to the journal (DBA_ADVISOR_JOURNAL and USER_ADVISOR_JOURNAL views). The higher the setting, the more information is logged to the journal. Possible values are: ■ UNUSED: no journal messages ■ FATAL: explanation of fatal conditions ■ ERROR: explanation of errors ■ WARNING: explanation of warnings ■ INFORMATION: information message ■ INFORMATION2: common information ■ INFORMATION3: common information ■ INFORMATION4: common information ■ INFORMATION5: common information ■ INFORMATION6: common information Each journal value represents all recorded messages at that level or lower. For example, when choosing WARNING, all messages marked WARNING as well as ERROR and FATAL will be recorded in the repository. INFORMATION6 represents the most thorough message recording and UNUSED is the least. The default value is INFORMATION. The datatype is NUMBER.

Table 19–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
LIMITED_ PARTITION_ SCHEMES	User can suggest that the Partition Expert cut off the number of partitioning schemes to investigate. This can help with cutting down the run time of the advisor. Possible values are: ■ An integer in the range of 1 to 10 ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is NUMBER.
MAX_NUMBER_ PARTITIONS	Limits the number of partitions the advisor will recommend for any base table, index, or materialized view. Possible values are: ■ An integer in the range of 1 to 4294967295 ■ ADVISOR_UNLIMITED ■ ADVISOR_UNUSED The default value is ADVISOR_UNLIMITED. The datatype is NUMBER.
MODE	Specifies the mode by which Access Advisor will operate during an analysis. Valid values are: ■ LIMITED Indicates the Advisor will attempt to a quick job by limiting the search-space of candidate recommendations, and correspondingly, the results may be of a low quality. ■ COMPREHENSIVE Indicates the Advisor will search a large pool of candidates that may take long to run, but the resulting recommendations will be of the highest quality. The default value is COMPREHENSIVE. The datatype is STRING.
MVIEW_NAME_ TEMPLATE	Specifies the method by which new materialized view names are formed. If the *TASK_ID* is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the *TASK_ ID* in the template. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters. Valid tokens are: ■ Any literal value up to 22 characters. ■ *TASK_ID* Causes the current task identifier number to be inserted in hexadecimal form. ■ *SEQ* Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. The default template is: MV$$_*task_idsequence*. The datatype is STRING.
ORDER_LIST	This parameter has been deprecated. Contains the primary natural order in which the Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, Access Advisor sorts the workload using ORDER_ LIST values. A comma must separate multiple order keys. Possible values are: ■ BUFFER_GETS Sets the order using the SQL statement's buffer-get count value. ■ CPU_TIME Sets the order using the SQL statement's CPU time value. ■ DISK_READS Sets the order using the SQL statement's disk-read count value. ■ ELAPSED_TIME Sets the order using the SQL statement's elapsed time value. ■ EXECUTIONS Sets the order using the SQL statement's execution frequency value. ■ OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value. ■ I/O Sets the order using the SQL statement's I/O count value. ■ PRIORITY Sets the order using the user-supplied business priority value. All values are accessed in descending order, where a high value is considered more interesting than a low value. The default value is PRIORITY, OPTIMIZER_COST. The datatype is STRINGLIST.

Table 19–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
PARTITION_NAME_ TEMPLATE	Specifies the method by which new partition names are formed. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters. Valid tokens are: ■ Any literal value up to 22 characters. ■ *table* - Causes the parent table name to be substituted into the partition name. If the name is too long, it will be trimmed to fit. ■ *task_id* - Causes the current task identifier number to be inserted in hexadecimal form. ■ *sequence* - Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. The default template is PTN$$_*table_task_idsequence*. The datatype is STRING.
PARTITIONING_ GOAL	Specifies the approach used to make partitioning recommendations. One possible value is PERFORMANCE, which is the default. The datatype is STRING.
PARTITIONING_ TYPES	Specifies the type of partitioning used. Possible values are RANGE and HASH. The datatype is STRING.
RANKING_MEASURE	Contains the primary natural order in which the SQL Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, SQL Access Advisor sorts the workload using RANKING_MEASURE values. A comma must separate multiple order keys. Possible values are: ■ BUFFER_GETS Sets the order using the SQL statement's buffer-get count value. ■ CPU_TIME Sets the order using the SQL statement's CPU time value. ■ DISK_READS Sets the order using the SQL statement's disk-read count value. ■ ELAPSED_TIME Sets the order using the SQL statement's elapsed time value. ■ EXECUTIONS Sets the order using the SQL statement's elapsed time value. ■ OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value. ■ PRIORITY Sets the order using the user-supplied business priority value. All values are accessed in descending order, where a high value is considered more interesting than a low value. The default value is PRIORITY, OPTIMIZER_COST. The datatype is STRINGLIST.
RECOMMEND_MV_ EXACT_TEXT_MATCH	When considering candidate materialized views, exact text match solutions will only be included if this parameter contains TRUE. The possible values are: ■ TRUE ■ FALSE The default value is TRUE. The datatype is STRING.
RECOMMENDED_ TABLESPACES	Allows the SQL Access Advisor to recommend optimal tablespaces for any partitioning scheme. If this is not set, the SQL Access Advisor will simply recommend a partitioning method but give no advice on physical storage. Possible values are: ■ TRUE ■ FALSE (the default) The datatype is STRING.
REFRESH_MODE	Specifies whether materialized views are refreshed ON_DEMAND or ON_COMMIT. This will be used to weigh the impact of materialized view refresh when the parameter dml_volatility is set to TRUE. Possible values are: ■ ON_DEMAND ■ ON_COMMIT The default value is ON_DEMAND. The datatype is STRING.
REPORT_DATE_ FORMAT	This is the default date and time formatting template. The default format is DD/MM/YYYYHH24:MI. The datatype is STRING.

Table 19–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
SHOW_RETAINS	Controls the display of RETAIN actions within an implementation script and the SQL Access Advisor wizard. The possible values are: ■ TRUE ■ FALSE The default value is TRUE. The datatype is STRING.
SQL_LIMIT	Specifies the number of SQL statements to be analyzed. The SQL_LIMIT filter is applied after all other filters have been applied. For example, if only statements referencing the table foo.bar are to be accepted, the SQL_LIMIT value will be only apply to those statements. When used in conjunction with the parameter ORDER_LIST, SQL Access Advisor will process the most interesting SQL statements by ordering the statements according to the specified sort keys. The possible values are: ■ an integer in the range of 1 to 2147483647 ■ ADVISOR_UNLIMITED ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is NUMBER.
START_TIME	Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where: ■ DD is the numeric date ■ MM is the numeric month ■ YYYY is the numeric year ■ HH is the hour in 24 hour format ■ MI is the minute ■ SS is the second The datatype is STRING.
STORAGE_CHANGE	Contains the amount of space adjustment that can be consumed by SQL Access Advisor recommendations. Zero or negative values are only permitted if the workload scope is marked as FULL. When the SQL Access Advisor produces a set of recommendations, the resultant physical structures must be able to fit into the budgeted space. A space budget is computed by adding the STORAGE_CHANGE value to the space quantity currently used by existing access structures. A negative STORAGE_CHANGE value may force SQL Access Advisor to remove existing structures in order to shrink space demand. Possible values: ■ Any valid integer including negative values, zero and positive values. The default value is ADVISOR_UNLIMITED. The datatype is NUMBER.
TIME_LIMIT	Specifies the time in minutes that the SQL Access Advisor can use to perform an analysis operation. If the SQL Access Advisor reaches a specified recommendation quality or all input data has been analyzed, processing will terminate regardless of any remaining time. Possible values: ■ An integer in the range of 1 to 10,000 ■ ADVISOR_UNLIMITED The default value is 720 (12 hours). The datatype is NUMBER. Note that specifying ADVISOR_UNLIMITED has the same effect as setting the parameter to the maximum of 10,000 (about one week). The SQL Access Advisor will never run for more than 10,000 minutes.

Table 19–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
VALID_ACTION_LIST	Contains a fully qualified list of actions that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During a task execution, if a SQL statement's action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive. The possible values are: ■ single action ■ comma-delimited action list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
VALID_MODULE_LIST	Contains a fully qualified list of application modules that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During a task execution, if a SQL statement's module does not match a name in the module list, it will not be processed by the task. A module name is case sensitive. The possible values are: ■ single application ■ comma-delimited module list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
VALID_SQLSTRING_LIST	Contains a fully qualified list of text strings that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness. During a task execution, if a SQL statement does not contain string in the SQL string list, it will not be processed by the task. The possible values are: ■ single string ■ comma-delimited string list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.

Table 19–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
VALID_TABLE_LIST	Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user's scope are eligible for tuning. Supported wildcard character is %. A % wildcard matches any set of consecutive characters. When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid. The valid syntax for a table reference is: ▪ schema.table ▪ schema ▪ schema.% (equivalent to schema) ▪ comma-delimited action list ▪ ADVISOR_UNUSED The possible values are: ▪ single table reference ▪ comma-delimited reference list ▪ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is TABLELIST.
VALID_USERNAME_LIST	Contains a fully qualified list of user names that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement's user name does not match a name in the user name list, it will not be processed by the task. A user name is not case sensitive unless it is quoted. The possible values are: ▪ single user name ▪ comma-delimited user name list ▪ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
WORKLOAD_SCOPE	Describes the level of application coverage the workload represents. Possible values are FULL and PARTIAL. FULL Should be used if the workload contains all interesting application SQL statements for the targeted tables. PARTIAL (default) Should be used if the workload contains anything less than a full representation of the interesting application SQL statements for the targeted tables. The datatype is STRING.

Segment Advisor Parameters

Table 19–36 lists the input task parameters that can be set in the Segment Advisor using the SET_TASK_PARAMETER procedure.

Table 19–36 Segment Advisor Task Parameters

Parameter	Description
MODE	The data to use for analysis. The default value is COMPREHENSIVE, and the possible values are: ▪ LIMITED: Analysis restricted to statistics available in the Automatic Workload Repository ▪ COMPREHENSIVE: Analysis based on sampling and Automatic Workload Repository statistics
TIME_LIST	The time limit for which the Advisor should run. It is specified in seconds, and the default and possible values are UNLIMITED.

Table 19–36 (Cont.) Segment Advisor Task Parameters

Parameter	Description
RECOMMEND_ALL	Whether to generate recommendations for all segments. The default value is TRUE. If set to TRUE, it generates recommendations all segments specified by the user. If set to FALSE, it generates recommendations for only those objects that are eligible for shrink.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

   DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
   DBMS_ADVISOR.SET_TASK_PARAMETER(task_name, 'VALID_TABLELIST',
      'SH.%,SCOTT.EMP');
END;
/
```

Undo Advisor Task Parameters

Table 19–37 lists the input task parameters that can be set in the Undo Advisor using the SET_TASK_PARAMETER procedure.

Table 19–37 Undo Advisor Task Parameters

Parameter	Description
TARGET_OBJECTS	The undo tablespace of the system. There is no default value, and the possible value is UNDO_TBS.
START_SNAPSHOT	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.
END_SNAPSHOT	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.
BEGIN_TIME_SEC	The number of seconds between the beginning time of the period and now. Describes a period of time for the system to perform analysis. BEGIN_TIME_SEC should be greater than END_TIME_SEC. There is no default value and the possible values are any positive integer.
END_TIME_SEC	The number of seconds between the ending time of the period and now. END_TIME_SEC should be less than BEGIN_TIME_SEC. There is no default value and the possible values are any positive integer.

Examples

```
DECLARE
   tname  VARCHAR2(30);
   oid    NUMBER;
   BEGIN
     DBMS_ADVISOR.CREATE_TASK('Undo Advisor', tid, tname, 'Undo Advisor Task');
```

```
    DBMS_ADVISOR.CREATE_OBJECT(tname, 'UNDO_TBS', null, null, null, 'null', oid);
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'TARGET_OBJECTS', oid);
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', 1);
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', 2);
    DBMS_ADVISOR.EXECUTE_TASK(tname);
  END;
/
```

Automatic Database Diagnostic Monitor (ADDM) Task Parameters

Table 19–38 lists the input task parameters that can be set in ADDM using the SET_TASK_PARAMETER procedure. See *Oracle Database Performance Tuning Guide* for more information on using these parameters.

Table 19–38 ADDM Task Parameters

Parameter	Description
START_SNAPSHOT	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.
END_SNAPSHOT	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.
DB_ID	The database for START_SNAPSHOT and END_SNAPSHOT. The default value is the current database ID.
INSTANCE	The instance for START_SNAPSHOT and END_SNAPSHOT. The default value is 0 or UNUSED, and the possible values are all positive integers. By default, all instances are analyzed.
INSTANCES	If the INSTANCE parameter has been set, INSTANCES is ignored. The default value is UNUSED, and the possible values are comma-separated list of instance numbers (for example, "1, 3, 5"). By default, all instances are analyzed.
DBIO_EXPECTED	The average time to read the database block in microseconds. The default value is 10 milliseconds, and the possible values are system-dependent.

Examples

The following creates and executes an ADDM task for the current database and an AWR snapshot range between 19 and 26. Note that this example will analyze all instances, whether you have only one or an Oracle RAC database.

```
DECLARE
  tid     NUMBER;
  tname VARCHAR2(30) := 'ADDM_TEST';
BEGIN
  DBMS_ADVISOR.CREATE_TASK('ADDM', tid, tname, 'my test');
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', '19');
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', '26');
  DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/
```

- The DBMS_ADDM package for details on how to create and execute ADDM tasks

SQL Tuning Advisor Task Parameters

See the DBMS_SQLTUNE package on page 154-1 and *Oracle Database SQL Tuning Guide* for more information.

TUNE_MVIEW Procedure

This procedure shows how to decompose a materialized view into two or more materialized views and to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite. It also shows how to fix materialized view logs and to enable query rewrite.

Syntax

```
DBMS_ADVISOR.TUNE_MVIEW (
   task_name IN OUT VARCHAR2,
   mv_create_stmt IN [CLOB | VARCHAR2]);
```

Parameters

Table 19–39 TUNE_MVIEW Procedure Parameters

Parameter	Description
task_name	The task name for looking up the results in a catalog view. If not specified, the system will generate a name and return.
mv_create_stmt	The original materialized view creation statement.

> **See Also:** *Oracle Database SQL Tuning Guide* for more information about using the TUNE_MVIEW procedure

Usage Notes

Executing TUNE_MVIEW generates two sets of output results: one is for CREATE implementation and the other is for undoing the CREATE MATERIALIZED VIEW implementation. The output results are accessible through USER_TUNE_MVIEW and DBA_TUNE_MVIEW views. You can also use DBMS_ADVISOR.GET_TASK_SCRIPT and DBMS_ADVISOR.CREATE_FILE to output the TUNE_MVIEW results into a script file for later execution.

USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

These views are to get the result after executing the TUNE_MVIEW procedure.

Table 19–40 USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

Column Name	Column Description
OWNER	The materialized view owner's name.
TASK_NAME	The task name as a key to access the set of recommendations
SCRIPT_TYPE	Recommendation ID used to indicate the row is for IMPLEMENTATION or UNDO script.
ACTION_ID	Action ID used as the command order number.
STATEMENT	For TUNE_MVIEW output, this column represents the following statements, and includes statement properties such as REFRESH and REWRITE options: ■ CREATE MATERIALIZED VIEW LOG ■ ALTER MATERIALIZED VIEW LOG FORCE ■ [CREATE | DROP] MATERIALIZED VIEW

Examples

```
name VARCHAR2(30);
DBMS_ADVISOR.TUNE_MVIEW.(name, 'SELECT AVG(C1) FROM my_fact_table WHERE c10 = 7');
```

The following is an example to show how to use TUNE_MVIEW to optimize a CREATE MATERIALIZED VIEW statement:

```
NAME VARCHAR2(30) := 'my_tune_mview_task';
EXECUTE DBMS_ADVISOR.TUNE_MVIEW (name, 'CREATE MATERIALIZED VIEW MY_MV
REFRESH FAST AS SELECT C2, AVG(C1) FROM MY_FACT_TABLE WHERE C10 = 7
GROUP BY C2');
```

You can view the CREATE output results by querying USER_TUNE_MVIEW or DBA_TUNE_MVIEW as the following example:

```
SELECT * FROM USER_TUNE_MVIEW WHERE TASK_NAME='my_tune_mview_task' AND
SCRIPT_TYPE='CREATE';
```

Alternatively, you can save the output results in an external script file as in the following example:

```
CREATE DIRECTORY TUNE_RESULTS AS  ''/myscript_dir'' ;
GRANT READ, WRITE ON DIRECTORY TUNE_RESULTS TO PUBLIC;
EXECUTE DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT('my_tune_mview_
task'), -
'/homes/tune','my_tune_mview_create.sql');
```

The preceding statement will save the CREATE output results in /myscript_dir/my_tune_mview_create.sql.

UPDATE_OBJECT Procedure

This procedure updates an existing task object. Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level.

Syntax

```
DBMS_ADVISOR.UPDATE_OBJECT (
   task_name       IN VARCHAR2
   object_id       IN NUMBER,
   attr1           IN VARCHAR2 := NULL,
   attr2           IN VARCHAR2 := NULL,
   attr3           IN VARCHAR2 := NULL,
   attr4           IN CLOB := NULL,
   attr5           IN VARCHAR2 := NULL);
```

Parameters

Table 19–41 UPDATE_OBJECT Procedure Parameters

Parameter	Description
task_name	A valid advisor task name that uniquely identifies an existing task.
object_id	The advisor-assigned object identifier.
attr1	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr2	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr3	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr4	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr5	Advisor-specific data. If set to null, there will be no effect on the target object.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

Usage Notes

If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or lob column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
BEGIN
  task_name := 'My Task';
```

```
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL,
                              'SELECT * FROM SH.SALES',obj_id);
  DBMS_ADVISOR.UPDATE_OBJECT (task_name, obj_id,NULL,NULL,NULL,
                              'SELECT count(*) FROM SH.SALES');
END;
/
```

UPDATE_REC_ATTRIBUTES Procedure

This procedure updates the owner, name, and tablespace for a recommendation.

Syntax

```
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES (
   task_name            IN VARCHAR2
   rec_id               IN NUMBER,
   action_id            IN NUMBER,
   attribute_name       IN VARCHAR2,
   value                IN VARCHAR2);
```

Parameters

Table 19–42 UPDATE_REC_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
rec_id	The Advisor-generated identifier number that is assigned to the recommendation.
action_id	The Advisor-generated action identifier that is assigned to the particular command.
attribute_name	Name of the attribute to be changed. The valid values are: ■ owner The new owner of the object. ■ name The new name of the object. ■ tablespace The new tablespace for the object.
value	Specifies the new value for the recommendation attribute.

Usage Notes

Recommendation attributes cannot be modified unless the task has successfully executed.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

attribute := 'SH';
```

```
  DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES(task_name, 1, 3, 'OWNER', attribute);
END;
/
```

UPDATE_SQLWKLD_ATTRIBUTES Procedure

Note: This procedure is deprecated starting in Oracle Database 11*g*.

This procedure changes various attributes of a SQL Workload object or template.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES (
   workload_name        IN VARCHAR2,
   new_name             IN VARCHAR2 := NULL,
   description          IN VARCHAR2 := NULL,
   read_only            IN VARCHAR2 := NULL,
   is_template          IN VARCHAR2 := NULL,
   how_created          IN VARCHAR2 := NULL);
```

Parameters

Table 19–43 UPDATE_SQLWKLD_ATTRIBUTES Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
new_name	The new workload object name. If the value is NULL or contains the value ADVISOR_UNUSED, the workload will not be renamed. A task name can be up to 30 characters long.
description	A new workload description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Set to TRUE so it cannot be changed.
is_template	TRUE if workload is to be used as a template.
how_created	Indicates a source application name that initiated the workload creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES(workload_name,'New workload name');
END;
/
```

UPDATE_SQLWKLD_STATEMENT Procedure

Note: This procedure is deprecated starting in Oracle Database 11*g*.

This procedure updates an existing SQL statement in a specified SQL workload.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
   workload_name     IN VARCHAR2,
   sql_id            IN NUMBER,
   application       IN VARCHAR2 := NULL,
   action            IN VARCHAR2 := NULL,
   priority          IN NUMBER := NULL,
   username          IN VARCHAR2 := NULL);

DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
   workload_name     IN VARCHAR2,
   search            IN VARCHAR2,
   updated           OUT NUMBER,
   application       IN VARCHAR2 := NULL,
   action            IN VARCHAR2 := NULL,
   priority          IN NUMBER := NULL,
   username          IN VARCHAR2 := NULL);
```

Parameters

Table 19–44 UPDATE_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant DBMS_ADVISOR.ADVISOR_ALL.
updated	Returns the number of statements changed by a searched update.
application	Specifies a business application name that will be associated with the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.
action	Specifies the application action for the statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.
priority	The relative priority of the SQL statement. The value must be one of the following: 1 - HIGH, 2 - MEDIUM, or 3 - LOW. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.

Table 19–44 (Cont.) UPDATE_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
username	The Oracle user name that executed the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository. Because a user name is an Oracle identifier, the username value must be entered exactly like it is stored in the database. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. The database does not recognize the user scott as a match for SCOTT.
search	Disabled.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure on page 19-49 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  updated NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');

   SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
   WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

UPDATE_TASK_ATTRIBUTES Procedure

This procedure changes various attributes of a task or a task template.

Syntax

```
DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES (
   task_name          IN VARCHAR2
   new_name           IN VARCHAR2 := NULL,
   description        IN VARCHAR2 := NULL,
   read_only          IN VARCHAR2 := NULL,
   is_template        IN VARCHAR2 := NULL,
   how_created        IN VARCHAR2 := NULL);
```

Parameters

Table 19–45 UPDATE_TASK_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
new_name	The new Advisor task name. If the value is NULL or contains the value ADVISOR_UNUSED, the task will not be renamed. A task name can be up to 30 characters long.
description	A new task description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Sets the task to read-only. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
is_template	Marks the task as a template. Physically, there is no difference between a task and a template; however, a template cannot be executed. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
how_created	Indicates a source application name that initiated the task creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES(task_name,'New Task Name');
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES('New Task Name',NULL,'New description');
END;
/
```

20

DBMS_ALERT

DBMS_ALERT supports asynchronous notification of database events (alerts). By appropriate use of this package and database triggers, an application can notify itself whenever values of interest in the database are changed.

This chapter contains the following topics:

Using DBMS_ALERT

Overview

Suppose a graphics tool is displaying a graph of some data from a database table. The graphics tool can, after reading and graphing the data, wait on a database alert (`WAITONE`) covering the data just read. The tool automatically wakes up when the data is changed by any other user. All that is required is that a trigger be placed on the database table, which performs a signal (`SIGNAL`) whenever the trigger is fired.

Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. `EXECUTE` privilege on this cover package can then be granted rather than on this package.

Constants

The DBMS_ALERT package uses the constants shown in Table 20–1:

Table 20–1 DBMS_ALERT Constants

Name	Type	Value	Description
MAXWAIT	INTEGER	86400000	The maximum time to wait for an alert (1000 days which is essentially forever).

Restrictions

Because database alerters issue commits, they cannot be used with Oracle Forms. For more information on restrictions on calling stored procedures while Oracle Forms is active, refer to your Oracle Forms documentation.

Exceptions

DBMS_ALERT raises the application error -20000 on error conditions. Table 20–2 shows the messages and the procedures that can raise them.

Operational Notes

The following notes relate to general and specific applications:

- Alerts are transaction-based. This means that the waiting session is not alerted until the transaction signalling the alert commits. There can be any number of concurrent signalers of a given alert, and there can be any number of concurrent waiters on a given alert.
- A waiting application is blocked in the database and cannot do any other work.
- An application can register for multiple events and can then wait for any of them to occur using the `WAITANY` procedure.
- An application can also supply an optional `timeout` parameter to the `WAITONE` or `WAITANY` procedures. A `timeout` of 0 returns immediately if there is no pending alert.
- The signalling session can optionally pass a message that is received by the waiting session.
- Alerts can be signalled more often than the corresponding application wait calls. In such cases, the older alerts are discarded. The application always gets the latest alert (based on transaction commit times).
- If the application does not require transaction-based alerts, the `DBMS_PIPE` package may provide a useful alternative.

  See Also: Chapter 112, "DBMS_PIPE"

- If the transaction is rolled back after the call to `SIGNAL`, no alert occurs.
- It is possible to receive an alert, read the data, and find that no data has changed. This is because the data changed after the *prior* alert, but before the data was read for that *prior* alert.
- Usually, Oracle is event-driven; this means that there are no polling loops. There are two cases where polling loops can occur:
  - Shared mode. If your database is running in shared mode, a polling loop is required to check for alerts from another instance. The polling loop defaults to one second and can be set by the `SET_DEFAULTS` procedure.
  - `WAITANY` procedure. If you use the `WAITANY` procedure, and if a signalling session does a signal but does not commit within one second of the signal, a polling loop is required so that this uncommitted alert does not camouflage other alerts. The polling loop begins at a one second interval and exponentially backs off to 30-second intervals.

Table 20–2 DBMS_ALERT Error Messages

Error Message	Procedure
`ORU-10001 lock request error, status: N`	`SIGNAL`
`ORU-10015 error: N waiting for pipe status`	`WAITANY`
`ORU-10016 error: N sending on pipe 'X'`	`SIGNAL`
`ORU-10017 error: N receiving on pipe 'X'`	`SIGNAL`
`ORU-10019 error: N on lock request`	`WAIT`
`ORU-10020 error: N on lock request`	`WAITANY`

Table 20–2 (Cont.) DBMS_ALERT Error Messages

Error Message	Procedure
ORU-10021 lock request error; status: N	REGISTER
ORU-10022 lock request error, status: N	SIGNAL
ORU-10023 lock request error; status N	WAITONE
ORU-10024 there are no alerts registered	WAITANY
ORU-10025 lock request error; status N	REGISTER
ORU-10037 attempting to wait on uncommitted signal from same session	WAITONE

Examples

Suppose you want to graph average salaries by department, for all employees. Your application needs to know whenever EMP is changed. Your application would look similar to this code:

```
DBMS_ALERT.REGISTER('emp_table_alert');
    <<readagain>>:
   /* ... read the emp table and graph it */
      DBMS_ALERT.WAITONE('emp_table_alert', :message, :status);
      if status = 0 then goto <<readagain>>; else
      /* ... error condition */
```

The EMP table would have a trigger similar to this:

```
CREATE TRIGGER emptrig AFTER INSERT OR UPDATE OR DELETE ON emp
    BEGIN
      DBMS_ALERT.SIGNAL('emp_table_alert', 'message_text');
   END;
```

When the application is no longer interested in the alert, it makes this request:

```
DBMS_ALERT.REMOVE('emp_table_alert');
```

This reduces the amount of work required by the alert signaller. If a session exits (or dies) while registered alerts exist, the alerts are eventually cleaned up by future users of this package.

The example guarantees that the application always sees the latest data, although it may not see every intermediate value.

Summary of DBMS_ALERT Subprograms

Table 20–3 DBMS_ALERT Package Subprograms

Subprogram	Description
REGISTER Procedure on page 20-12	Receives messages from an alert
REMOVE Procedure on page 20-13	Disables notification from an alert
REMOVEALL Procedure on page 20-14	Removes all alerts for this session from the registration list
SET_DEFAULTS Procedure on page 20-15	Sets the polling interval
SIGNAL Procedure on page 20-16	Signals an alert (send message to registered sessions)
WAITANY Procedure on page 20-17	Waits `timeout` seconds to receive alert message from an alert registered for session
WAITONE Procedure on page 20-18	Waits `timeout` seconds to receive message from named alert

REGISTER Procedure

This procedure lets a session register interest in an alert.

Syntax

```
DBMS_ALERT.REGISTER (
   name      IN  VARCHAR2,
   cleanup   IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 20–4 REGISTER Procedure Parameters

Parameter	Description
name	Name of the alert in which this session is interested
cleanup	Specifies whether to perform cleanup of any extant orphaned pipes used by the DBMS_ALERT package. This cleanup is only performed on the first call to REGISTER for each package instantiation. The default for the parameter is TRUE.

Caution: Alert names beginning with 'ORA$' are reserved for use for products provided by Oracle. Names must be 30 bytes or less. The name is case insensitive.

Usage Notes

A session can register interest in an unlimited number of alerts. Alerts should be deregistered when the session no longer has any interest, by calling REMOVE.

REMOVE Procedure

This procedure enables a session that is no longer interested in an alert to remove that alert from its registration list. Removing an alert reduces the amount of work done by signalers of the alert.

Syntax

```
DBMS_ALERT.REMOVE (
   name  IN  VARCHAR2);
```

Parameters

Table 20–5 REMOVE Procedure Parameters

Parameter	Description
name	Name of the alert (case-insensitive) to be removed from registration list.

Usage Notes

Removing alerts is important because it reduces the amount of work done by signalers of the alert. If a session dies without removing the alert, that alert is eventually (but not immediately) cleaned up.

REMOVEALL Procedure

This procedure removes all alerts for this session from the registration list. You should do this when the session is no longer interested in any alerts.

This procedure is called automatically upon first reference to this package during a session. Therefore, no alerts from prior sessions which may have terminated abnormally can affect this session.

This procedure always performs a commit.

Syntax

```
DBMS_ALERT.REMOVEALL;
```

SET_DEFAULTS Procedure

In case a polling loop is required, use the SET_DEFAULTS procedure to set the polling interval.

Syntax

```
DBMS_ALERT.SET_DEFAULTS (
   sensitivity  IN  NUMBER);
```

Parameters

Table 20–6 SET_DEFAULTS Procedure Parameters

Parameter	Description
sensitivity	Polling interval, in seconds, to sleep between polls. The default interval is five seconds.

SIGNAL Procedure

This procedure signals an alert. The effect of the `SIGNAL` call only occurs when the transaction in which it is made commits. If the transaction rolls back, `SIGNAL` has no effect.

All sessions that have registered interest in this alert are notified. If the interested sessions are currently waiting, they are awakened. If the interested sessions are not currently waiting, they are notified the next time they do a wait call.

Multiple sessions can concurrently perform signals on the same alert. Each session, as it signals the alert, blocks all other concurrent sessions until it commits. This has the effect of serializing the transactions.

Syntax

```
DBMS_ALERT.SIGNAL (
   name     IN  VARCHAR2,
   message  IN  VARCHAR2);
```

Parameters

Table 20–7 SIGNAL Procedure Parameters

Parameter	Description
`name`	Name of the alert to signal.
`message`	Message, of 1800 bytes or less, to associate with this alert. This message is passed to the waiting session. The waiting session might be able to avoid reading the database after the alert occurs by using the information in the message.

WAITANY Procedure

Call this procedure to wait for an alert to occur for any of the alerts for which the current session is registered.

Syntax

```
DBMS_ALERT.WAITANY (
   name      OUT  VARCHAR2,
   message   OUT  VARCHAR2,
   status    OUT  INTEGER,
   timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

Table 20–8 WAITANY Procedure Parameters

Parameter	Description
name	Returns the name of the alert that occurred.
message	Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITANY, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.
status	Values returned: 0 - alert occurred 1 - timeout occurred
timeout	Maximum time to wait for an alert. If no alert occurs before timeout seconds, this returns a status of 1.

Usage Notes

An implicit COMMIT is issued before this procedure is executed. The same session that waits for the alert may also first signal the alert. In this case remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Exceptions

```
-20000, ORU-10024: there are no alerts registered.
```

WAITONE Procedure

This procedure waits for a specific alert to occur. An implicit COMMIT is issued before this procedure is executed. A session that is the first to signal an alert can also wait for the alert in a subsequent transaction. In this case, remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Syntax

```
DBMS_ALERT.WAITONE (
   name      IN   VARCHAR2,
   message   OUT  VARCHAR2,
   status    OUT  INTEGER,
   timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

Table 20–9 WAITONE Procedure Parameters

Parameter	Description
name	Name of the alert to wait for.
message	Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITONE, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.
status	Values returned: 0 - alert occurred 1 - timeout occurred
timeout	Maximum time to wait for an alert. If the named alert does not occurs before timeout seconds, this returns a status of 1.

21

DBMS_APP_CONT

The DBMS_APP_CONT package provides an interface to determine if the in-flight transaction on a now unavailable session committed or not, and if the last call on that session completed or not.

> **See Also:** *Oracle Database Development Guide* for explanations of application continuity and Transaction Guard, and the relationship between these two features:
>
> - "Using Transaction Guard"
> - "Ensuring Application Continuity"

This chapter contains the following topics:

Using DBMS_APP_CONT

Overview

Problem Description

One of the fundamental problems for recovering applications after an outage is that the commit message that is sent back to the client is not durable. If there is a break between the client and the server, the client sees an error message indicating that the communication failed. This error does not inform the application whether the submission executed any commit operations or if a procedural call, ran to completion executing all expected commits and session state changes or failed part way through or yet worse, is still running disconnected from the client.

GET_LTXID_OUTCOME

The purpose of the GET_LTXID_OUTCOME Procedure is to determine if the in-flight transaction on a now unavailable session completed or not. It is used when the original session returned an error due to unavailability. Situations that can cause such session unavailability may occur at the session, instance, server, or network, and result from planned or unplanned outages. When such an outage occurs, the application receives a disconnection error. Such an error provides no insight as to whether the transaction committed. It also does not reveal what the application might have been expecting from that commit if it had returned.

> **See Also:** *Oracle Database Concepts* for explanation of Logical Transaction ID

Security Model

Applications must have the EXECUTE privilege on the DBMS_APP_CONT package. To grant this privilege, ask your database administrator to run the following SQL statement:

```
GRANT execute on DBMS_APP_CONT to application user ;
```

Summary of DBMS_APP_CONT Subprograms

Table 21–1 DBMS_APP_CONT Package Subprograms

Subprogram	Description
GET_LTXID_OUTCOME Procedure on page 21-6	Lets customer applications and third party application servers determine the transactional status of the last session when that session becomes unavailable.

GET_LTXID_OUTCOME Procedure

This procedure lets customer applications and third party application servers determine the transactional status of the last session when that session becomes unavailable.

Syntax

```
DBMS_APP_CONT.GET_LTXID_OUTCOME (
 client_ltxid          IN    RAW,
 committed             OUT   BOOLEAN,
 user_call_completed   OUT   BOOLEAN)
```

Parameters

Table 21–2 GET_LTXID_OUTCOME Procedure Parameters

Parameter	Description
client_ltxid	Client-side logical transaction ID. Obtain the LTXID from the previous failed session using the client driver provided APIs - getLTXID for JDBC, and LogicalTransactionId for ODP.net., and OCI_ATTR_GET with LTXID for OCI.
committed	Returns TRUE if the transaction with the named logical LTXID has COMMITTED. Returns FALSE if the logical LTXID has not COMMITTED. When returning FALSE, the procedure blocks the LTXID from further use so that there is no possibility of previous in-flight work committing this LTXID.
user_call_completed	Whether all information has been returned to the client. Examples of such messages are the number of rows processed when using autocommit or commit on success, parameter and function results when calling PL/SQL, or PL/SQL with more work to do after the COMMIT. Applications that expect to use data returned from the commit in order to function correctly must look at this second parameter.

Exceptions

Table 21–3 GET_LTXID_OUTCOME Procedure Exceptions

Exception	Description
ORA-14950 - SERVER_AHEAD	The server is ahead so the transaction is both an old transaction and one which has already committed. This is an error as the application is passing an older LTXID that is the not the last used for that session. The purpose of GET_LTXID_OUTCOME is to return the current transaction outcome for that session after a recoverable outage.
ORA-14951 - CLIENT_AHEAD	The client is ahead of the server. This can happen if the server has been flashed backed, recovered using media recovery, or is a standby that has opened earlier with data loss.
ORA-14906 - SAME_SESSION	Executing GET_LTXID_OUTCOME is not supported on the session owning the LTXID as it blocks further processing on that session after a recoverable outage.
ORA-14909 - COMMIT_BLOCKED	Your session has been blocked from committing by another user with the same username using GET_LTXID_OUTCOME. GET_LTXID_OUTCOME should only be called on dead sessions. Please check with your application administrator.

Table 21–3 (Cont.) GET_LTXID_OUTCOME Procedure Exceptions

Exception	Description
ORA-14952 - ERROR	The outcome cannot be determined. During processing an error happened. The error stack shows the error detail.

22

DBMS_APPLICATION_INFO

Application developers can use the `DBMS_APPLICATION_INFO` package with Oracle Trace and the SQL trace facility to record names of executing modules or transactions in the database for later use when tracking the performance of various modules and debugging.

This chapter contains the following topics:

Using DBMS_APPLICATION_INFO

Overview

Registering the application allows system administrators and performance tuning specialists to track performance by module. System administrators can also use this information to track resource use by module. When an application registers with the database, its name and actions are recorded in the `V$SESSION` and `V$SQLAREA` views.

Security Model

> **Note:** The public synonym for `DBMS_APPLICATION_INFO` is not dropped before creation so that you can redirect the public synonym to point to your own package.

No further privileges are required. The `DBMSAPIN.SQL` script is already run as a part of standard database creation.

Operational Notes

Your applications should set the name of the module and name of the action automatically each time a user enters that module. The module name could be the name of a form in an Oracle Forms application, or the name of the code segment in an Oracle Precompilers application. The action name should usually be the name or description of the current transaction within a module.

If you want to gather your own statistics based on module, you can implement a wrapper around this package by writing a version of this package in another schema that first gathers statistics and then calls the `SYS` version of the package. The public synonym for `DBMS_APPLICATION_INFO` can then be changed to point to the DBA's version of the package.

Summary of DBMS_APPLICATION_INFO Subprograms

Table 22–1 DBMS_APPLICATION_INFO Package Subprograms

Subprogram	Description
READ_CLIENT_INFO Procedure on page 22-7	Reads the value of the `client_info` field of the current session
READ_MODULE Procedure on page 22-8	Reads the values of the module and action fields of the current session
SET_ACTION Procedure on page 22-9	Sets the name of the current action within the current module
SET_CLIENT_INFO Procedure on page 22-10	Sets the `client_info` field of the session
SET_MODULE Procedure on page 22-11	Sets the name of the module that is currently running to a new module
SET_SESSION_LONGOPS Procedure on page 22-12	Sets a row in the `V$SESSION_LONGOPS` table

READ_CLIENT_INFO Procedure

This procedure reads the value of the `client_info` field of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_CLIENT_INFO (
   client_info OUT VARCHAR2);
```

Parameters

Table 22–2 READ_CLIENT_INFO Procedure Parameters

Parameter	Description
`client_info`	Last client information value supplied to the `SET_CLIENT_INFO` procedure.

READ_MODULE Procedure

This procedure reads the values of the module and action fields of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_MODULE (
   module_name OUT VARCHAR2,
   action_name OUT VARCHAR2);
```

Parameters

Table 22–3 READ_MODULE Procedure Parameters

Parameter	Description
module_name	Last value that the module name was set to by calling SET_MODULE.
action_name	Last value that the action name was set to by calling SET_ACTION or SET_MODULE.

Usage Notes

Module and action names for a registered application can be retrieved by querying V$SQLAREA or by calling the READ_MODULE procedure. Client information can be retrieved by querying the V$SESSION view, or by calling the READ_CLIENT_INFO Procedure.

Examples

The following sample query illustrates the use of the MODULE and ACTION column of the V$SQLAREA.

```
SELECT sql_text, disk_reads, module, action
FROM v$sqlarea
WHERE module = 'add_employee';

SQL_TEXT DISK_READS MODULE ACTION
------------------- ---------- ------------------ ----------------
INSERT INTO emp 1 add_employee insert into emp
(ename, empno, sal, mgr, job, hiredate, comm, deptno)
VALUES
(name, next.emp_seq, manager, title, SYSDATE, commission, department)

1 row selected.
```

SET_ACTION Procedure

This procedure sets the name of the current action within the current module.

Syntax

```
DBMS_APPLICATION_INFO.SET_ACTION (
   action_name IN VARCHAR2);
```

Parameters

Table 22–4 SET_ACTION Procedure Parameters

Parameter	Description
action_name	The name of the current action within the current module. When the current action terminates, call this procedure with the name of the next action if there is one, or NULL if there is not. Names longer than 32 bytes are truncated.

Usage Notes

The action name should be descriptive text about the current action being performed. You should probably set the action name before the start of every transaction.

Set the transaction name to NULL after the transaction completes, so that subsequent transactions are logged correctly. If you do not set the transaction name to NULL, subsequent transactions may be logged with the previous transaction's name.

Example

The following is an example of a transaction that uses the registration procedure:

```
CREATE OR REPLACE PROCEDURE bal_tran (amt IN NUMBER(7,2)) AS
BEGIN

-- balance transfer transaction

   DBMS_APPLICATION_INFO.SET_ACTION(
      action_name => 'transfer from chk to sav');
   UPDATE chk SET bal = bal + :amt
      WHERE acct# = :acct;
   UPDATE sav SET bal = bal - :amt
      WHERE acct# = :acct;
   COMMIT;
   DBMS_APPLICATION_INFO.SET_ACTION(null);

END;
```

SET_CLIENT_INFO Procedure

This procedure supplies additional information about the client application.

Syntax

```
DBMS_APPLICATION_INFO.SET_CLIENT_INFO (
   client_info IN VARCHAR2);
```

Parameters

Table 22–5 SET_CLIENT_INFO Procedure Parameters

Parameter	Description
client_info	Supplies any additional information about the client application. This information is stored in the V$SESSION view. Information exceeding 64 bytes is truncated.

Note: CLIENT_INFO is readable and writable by any user. For storing secured application attributes, you can use the application context feature.

SET_MODULE Procedure

This procedure sets the name of the current application or module.

Syntax

```
DBMS_APPLICATION_INFO.SET_MODULE (
   module_name IN VARCHAR2,
   action_name IN VARCHAR2);
```

Parameters

Table 22–6 SET_MODULE Procedure Parameters

Parameter	Description
module_name	Name of module that is currently running. When the current module terminates, call this procedure with the name of the new module if there is one, or NULL if there is not. Names longer than 48 bytes are truncated.
action_name	Name of current action within the current module. If you do not want to specify an action, this value should be NULL. Names longer than 32 bytes are truncated.

Usage Notes

Example

```
CREATE or replace PROCEDURE add_employee(
  name VARCHAR2,
  salary NUMBER,
  manager NUMBER,
  title VARCHAR2,
  commission NUMBER,
  department NUMBER) AS
BEGIN
  DBMS_APPLICATION_INFO.SET_MODULE(
    module_name => 'add_employee',
    action_name => 'insert into emp');
  INSERT INTO emp
    (ename, empno, sal, mgr, job, hiredate, comm, deptno)
    VALUES (name, emp_seq.nextval, salary, manager, title, SYSDATE,
            commission, department);
  DBMS_APPLICATION_INFO.SET_MODULE(null,null);
END;
```

SET_SESSION_LONGOPS Procedure

This procedure sets a row in the V$SESSION_LONGOPS view. This is a view that is used to indicate the on-going progress of a long running operation. Some Oracle functions, such as parallel execution and Server Managed Recovery, use rows in this view to indicate the status of, for example, a database backup.

Applications may use the SET_SESSION_LONGOPS procedure to advertise information on the progress of application specific long running tasks so that the progress can be monitored by way of the V$SESSION_LONGOPS view.

Syntax

```
DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS (
   rindex      IN OUT BINARY_INTEGER,
   slno        IN OUT BINARY_INTEGER,
   op_name     IN     VARCHAR2       DEFAULT NULL,
   target      IN     BINARY_INTEGER DEFAULT 0,
   context     IN     BINARY_INTEGER DEFAULT 0,
   sofar       IN     NUMBER         DEFAULT 0,
   totalwork   IN     NUMBER         DEFAULT 0,
   target_desc IN     VARCHAR2       DEFAULT 'unknown target',
   units       IN     VARCHAR2       DEFAULT NULL)

set_session_longops_nohint constant BINARY_INTEGER := -1;
```

Parameters

Table 22–7 SET_SESSION_LONGOPS Procedure Parameters

Parameter	Description
rindex	A token which represents the v$session_longops row to update. Set this to set_session_longops_nohint to start a new row. Use the returned value from the prior call to reuse a row.
slno	Saves information across calls to set_session_longops: It is for internal use and should not be modified by the caller.
op_name	Specifies the name of the long running task. It appears as the OPNAME column of v$session_longops. The maximum length is 64 bytes.
target	Specifies the object that is being worked on during the long running operation. For example, it could be a table ID that is being sorted. It appears as the TARGET column of v$session_longops.
context	Any number the client wants to store. It appears in the CONTEXT column of v$session_longops.
sofar	Any number the client wants to store. It appears in the SOFAR column of v$session_longops. This is typically the amount of work which has been done so far.
totalwork	Any number the client wants to store. It appears in the TOTALWORK column of v$session_longops. This is typically an estimate of the total amount of work needed to be done in this long running operation.
target_desc	Specifies the description of the object being manipulated in this long operation. This provides a caption for the target parameter. This value appears in the TARGET_DESC field of v$session_longops. The maximum length is 32 bytes.

Table 22–7 (Cont.) SET_SESSION_LONGOPS Procedure Parameters

Parameter	Description
units	Specifies the units in which sofar and totalwork are being represented. It appears as the UNITS field of v$session_longops. The maximum length is 32 bytes.

Example

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates V$SESSION_LONGOPS on the procedure's progress.

```
DECLARE
        rindex    BINARY_INTEGER;
        slno      BINARY_INTEGER;
        totalwork number;
        sofar     number;
        obj       BINARY_INTEGER;

      BEGIN
        rindex := dbms_application_info.set_session_longops_nohint;
        sofar := 0;
        totalwork := 10;

        WHILE sofar < 10 LOOP
          -- update obj based on sofar
          -- perform task on object target

          sofar := sofar + 1;
          dbms_application_info.set_session_longops(rindex, slno,
            "Operation X", obj, 0, sofar, totalwork, "table", "tables");
        END LOOP;
      END;
```

23

DBMS_APPLY_ADM

The `DBMS_APPLY_ADM` package provides subprograms to configure and manage Oracle Streams apply processes, XStream outbound servers, and XStream inbound servers.

This chapter contains the following topics:

See Also:

- *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and apply processes
- *Oracle Database XStream Guide* for more information about XStream outbound servers and inbound servers

Using DBMS_APPLY_ADM

This section contains topics which relate to using the `DBMS_APPLY_ADM` package.

Overview

This package provides interfaces to start, stop, and configure Oracle Streams apply processes, XStream outbound servers, and XStream inbound servers. This package includes subprograms for configuring apply handlers, setting enqueue destinations for messages, and specifying execution directives for messages. This package also provides administrative subprograms that set the instantiation SCN for objects at a destination database. This package also includes subprograms for managing apply errors.

XStream inbound servers and outbound servers can be used in an XStream configuration in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

Note:

- For simplicity, this chapter refers to apply processes, XStream outbound servers, and XStream inbound servers as **apply components**. This chapter identifies a specific type of apply component when necessary.
- Using XStream requires purchasing a license for the Oracle GoldenGate product.

See Also:

- *Oracle Streams Concepts and Administration*
- *Oracle Streams Replication Administrator's Guide*
- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs

Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the `DBMS_APPLY_ADM` package is used to manage an Oracle Streams configuration, it requires that the user is granted the privileges of an Oracle Streams administrator.

When the `DBMS_APPLY_ADM` package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.

Note: The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as setting an apply user. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.

See Also:

- *Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator
- *Oracle Database XStream Guide* for information about configuring an XStream administrator

Operational Notes

The following sections contain operational notes for this package:

- Deprecated Apply Component Parameter Value

Deprecated Apply Component Parameter Value

Note: Oracle recommends that you do not use deprecated apply component parameter values. Support for deprecated features is for backward compatibility only.

The `NONE` value for the `commit_serialization` apply component parameter is deprecated. It is replaced by the `DEPENDENT_TRANSACTIONS` value.

See Also: SET_PARAMETER Procedure on page 23-56

Summary of DBMS_APPLY_ADM Subprograms

Table 23–1 DBMS_APPLY_ADM Package Subprograms

Subprogram	Description
ADD_STMT_HANDLER Procedure on page 23-8	Adds a statement DML handler for a specified operation on a specified database object to a single apply component or to all apply components in the database
ALTER_APPLY Procedure on page 23-10	Alters an apply component
COMPARE_OLD_VALUES Procedure on page 23-16	Specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply
CREATE_APPLY Procedure on page 23-18	Creates an apply component
CREATE_OBJECT_DEPENDENCY Procedure on page 23-24	Creates an object dependency
DELETE_ALL_ERRORS Procedure on page 23-25	Deletes all the error transactions for the specified apply component
DELETE_ERROR Procedure on page 23-26	Deletes the specified error transaction
DROP_APPLY Procedure on page 23-27	Drops an apply component
DROP_OBJECT_DEPENDENCY Procedure on page 23-29	Drops an object dependency
EXECUTE_ALL_ERRORS Procedure on page 23-30	Reexecutes the error transactions for the specified apply component
EXECUTE_ERROR Procedure on page 23-31	Reexecutes the specified error transaction
GET_ERROR_MESSAGE Function on page 23-34	Returns the message payload from the error queue for the specified message number and transaction identifier
REMOVE_STMT_HANDLER on page 23-36	Removes a statement DML handler for a specified operation on a specified database object from a single apply component or from all apply components in the database
SET_CHANGE_HANDLER Procedure on page 23-38	Sets or unsets a statement DML handler that tracks changes for a specified operation on a specified database object for a single apply component
SET_DML_HANDLER Procedure on page 23-41	Sets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply component or for all apply components in the database
SET_ENQUEUE_DESTINATION Procedure on page 23-46	Sets the queue where the apply component automatically enqueues a message that satisfies the specified rule
SET_EXECUTE Procedure on page 23-48	Specifies whether a message that satisfies the specified rule is executed by an apply component

Table 23–1 (Cont.) DBMS_APPLY_ADM Package Subprograms

Subprogram	Description
SET_GLOBAL_INSTANTIATION_SCN Procedure on page 23-50	Records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas
SET_KEY_COLUMNS Procedures on page 23-53	Records the set of columns to be used as the substitute primary key for local apply purposes and removes existing substitute primary key columns for the specified object if they exist
SET_PARAMETER Procedure on page 23-56	Sets an apply parameter to the specified value
SET_SCHEMA_INSTANTIATION_SCN Procedure on page 23-74	Records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database
SET_TABLE_INSTANTIATION_SCN Procedure on page 23-77	Records the specified instantiation SCN for the specified table in the specified source database
SET_UPDATE_CONFLICT_HANDLER Procedure on page 23-80	Adds, updates, or drops an update conflict handler for the specified object
SET_VALUE_DEPENDENCY Procedure on page 23-84	Sets or removes a value dependency
START_APPLY Procedure on page 23-86	Directs the apply component to start applying messages
STOP_APPLY Procedure on page 23-87	Stops the apply component from applying any messages and rolls back any unfinished transactions being applied

Note: All procedures commit unless specified otherwise. However, the `GET_ERROR_MESSAGE` function does not commit.

ADD_STMT_HANDLER Procedure

This procedure adds a statement DML handler for a specified operation on a specified database object. The procedure adds the statement DML handler to a single apply component or to all apply components in the database.

This procedure is overloaded. One version of this procedure contains the `statement` and `comment` parameters, and the other does not. The `statement` parameter enables you to create the statement DML handler and add it to one or more processes in one step. Otherwise, create the statement DML handler using the `DBMS_STREAMS_HANDLER_ADM` package before adding it to one or more processes.

See Also:

- Chapter 162, "DBMS_STREAMS_HANDLER_ADM"
- *Oracle Streams Concepts and Administration*

Syntax

```
DBMS_APPLY_ADM.ADD_STMT_HANDLER(
   object_name     IN  VARCHAR2,
   operation_name  IN  VARCHAR2,
   handler_name    IN  VARCHAR2,
   statement       IN  CLOB,
   apply_name      IN  VARCHAR2  DEFAULT NULL,
   comment         IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.ADD_STMT_HANDLER(
   object_name     IN  VARCHAR2,
   operation_name  IN  VARCHAR2,
   handler_name    IN  VARCHAR2,
   apply_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 23–2 ADD_STMT_HANDLER Procedure Parameters

Parameter	Description
`object_name`	The name of the source object specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure. If `NULL`, then the procedure raises an error.
`operation_name`	The name of the operation, which can be specified as: ■ `INSERT` ■ `UPDATE` ■ `DELETE` If `NULL`, then the procedure raises an error. **Note:** Statement DML handlers cannot be specified for LOB operations.

Table 23–2 (Cont.) ADD_STMT_HANDLER Procedure Parameters

Parameter	Description
handler_name	The name of the statement DML handler. If the specified statement DML handler exists, then the statement in the statement parameter is added to the existing handler. Ensure that the existing statement DML handler is for the same operation on the same database object as the settings for the operation_name and object_name parameters, respectively. If the existing handler is for a different operation or database object, then an apply error results when the handler is invoked. If the specified statement DML handler does not exist and a non-NULL statement parameter is specified, then this procedure creates the statement DML handler. If the specified statement DML handler does not exist and the statement parameter is not specified or is NULL, then this procedure raises an error. If NULL, then the procedure raises an error.
statement	The text of the SQL statement to add to the statement DML handler. If NULL, then the procedure raises an error.
apply_name	The name of the apply component that uses the statement DML handler. If NULL, then the procedure adds the statement DML handler as a general handler to all apply components in the database.
comment	A comment for the statement DML handler. If NULL, then no comment is recorded for the statement DML handler.

Usage Notes

The following usage notes apply to this procedure:

- The ADD_STMT_HANDLER Procedure and XStream Outbound Servers
- The ADD_STMT_HANDLER Procedure and XStream Inbound Servers

The ADD_STMT_HANDLER Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers. Outbound servers ignore all apply handlers.

The ADD_STMT_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

ALTER_APPLY Procedure

This procedure alters an apply component.

Syntax

```
DBMS_APPLY_ADM.ALTER_APPLY(
   apply_name                IN  VARCHAR2,
   rule_set_name             IN  VARCHAR2  DEFAULT NULL,
   remove_rule_set           IN  BOOLEAN   DEFAULT FALSE,
   message_handler           IN  VARCHAR2  DEFAULT NULL
   remove_message_handler    IN  BOOLEAN   DEFAULT FALSE,
   ddl_handler               IN  VARCHAR2  DEFAULT NULL,
   remove_ddl_handler        IN  BOOLEAN   DEFAULT FALSE,
   apply_user                IN  VARCHAR2  DEFAULT NULL,
   apply_tag                 IN  RAW       DEFAULT NULL,
   remove_apply_tag          IN  BOOLEAN   DEFAULT FALSE,
   precommit_handler         IN  VARCHAR2  DEFAULT NULL,
   remove_precommit_handler  IN  BOOLEAN   DEFAULT FALSE,
   negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
   remove_negative_rule_set  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 23–3 ALTER_APPLY Procedure Parameters

Parameter	Description
apply_name	The name of the apply component being altered. You must specify the name of an existing apply component. Do not specify an owner.
rule_set_name	The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages. If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_rule_set parameter is set to FALSE, then this procedure retains any existing positive rule set for the specified apply component. If you specify NULL and the remove_rule_set parameter is set to TRUE, then this procedure removes any existing positive rule set from the specified apply component.

Table 23–3 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
remove_rule_set	If TRUE, then the procedure removes the positive rule set for the specified apply component. If you remove the positive rule set for an apply component, and the apply component does not have a negative rule set, then the apply component dequeues all messages in its queue. If you remove the positive rule set for an apply component, and a negative rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified apply component. If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.
message_handler	A user-defined procedure that processes non-LCR messages in the queue for the apply component. See "Usage Notes" on page 23-22 in the CREATE_APPLY Procedure for more information about a message handler procedure.
remove_message_handler	If TRUE, then the procedure removes the message handler for the specified apply component. If FALSE, then the procedure retains any message handler for the specified apply component. If the message_handler parameter is non-NULL, then this parameter should be set to FALSE.
ddl_handler	A user-defined procedure that processes DDL logical change records (DDL LCRs) in the queue for the apply component. All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically. See "Usage Notes" on page 23-22 in the CREATE_APPLY Procedure for more information about a DDL handler procedure.
remove_ddl_handler	If TRUE, then the procedure removes the DDL handler for the specified apply component. If FALSE, then the procedure retains any DDL handler for the specified apply component. If the ddl_handler parameter is non-NULL, then this parameter should be set to FALSE.

Table 23–3 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
apply_user	The user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations, and runs apply handlers. If NULL, then the apply user is not changed. If a non-NULL value is specified to change the apply user, then the user who invokes the ALTER_APPLY procedure must be granted the DBA role. Only the SYS user can set the apply_user to SYS. If you change the apply user, then this procedure grants the new apply user dequeue privilege on the queue used by the apply component. It also configures the user as a secure queue user of the queue. In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user: ■ The necessary privileges to perform DML and DDL changes on the apply objects ■ EXECUTE privilege on the rule sets used by the apply component ■ EXECUTE privilege on all rule-based transformation functions used in the rule set ■ EXECUTE privilege on all apply handler procedures These privileges can be granted directly to the apply user, or they can be granted through roles. In addition, the apply user must be granted the EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles. By default, this parameter is set to the user who created the apply component by running either the CREATE_APPLY procedure in this package or a procedure in the DBMS_STREAMS_ADM package. **Note:** If the apply user for an apply component is dropped using DROP USER. . . CASCADE, then the apply component is also dropped automatically.
apply_tag	A binary tag that is added to redo entries generated by the specified apply component. The tag is a binary value that can be used to track LCRs. The tag is relevant only if a capture process at the database where the apply component is running captures changes made by the apply component. If so, then the captured changes include the tag specified by this parameter. If NULL, the default, then the apply tag for the apply component is not changed. The following is an example of a tag with a hexadecimal value of 17: HEXTORAW('17') **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 23–3 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
remove_apply_tag	If TRUE, then the procedure sets the apply tag for the specified apply component to NULL, and the apply component generates redo entries with NULL tags. If FALSE, then the procedure retains any apply tag for the specified apply component. If the apply_tag parameter is non-NULL, then this parameter should be set to FALSE.
precommit_handler	A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component. An internal commit directive is enqueued in the following ways: ▪ When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs. ▪ When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically. For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user message, the commit SCN is generated by the apply component. The precommit handler procedure must conform to the following restrictions: ▪ Any work that commits must be an autonomous transaction. ▪ Any rollback must be to a named savepoint created in the procedure. If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue. See "Usage Notes" on page 23-22 in the CREATE_APPLY Procedure for more information about a precommit handler procedure.
remove_precommit_handler	If TRUE, then the procedure removes the precommit handler for the specified apply component. If FALSE, then the procedure retains any precommit handler for the specified apply component. If the precommit_handler parameter is non-NULL, then this parameter should be set to FALSE.

Table 23–3 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
negative_rule_set_name	The name of the negative rule set for the apply component. The negative rule set contains the rules that instruct the apply component to discard messages. If you want to use a negative rule set for the apply component, then you must specify an existing rule set in the form *[schema_name.]rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter hr.neg_apply_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for an apply component, then the negative rule set is always evaluated first.
remove_negative_rule_set	If TRUE, then the procedure removes the negative rule set for the specified apply component. If you remove the negative rule set for an apply component, and the apply component does not have a positive rule set, then the apply component dequeues all messages in its queue. If you remove the negative rule set for an apply component, and a positive rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified apply component. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.

Usage Notes

The following usage notes apply to this procedure:

- Automatic Restart of Apply Components
- The ALTER_APPLY Procedure and XStream Outbound Servers
- The ALTER_APPLY Procedure and XStream Inbound Servers

Automatic Restart of Apply Components

An apply component is stopped and restarted automatically when you change the value of one or more of the following ALTER_APPLY procedure parameters:

- message_handler
- ddl_handler
- apply_user
- apply_tag
- precommit_handler

The ALTER_APPLY Procedure and XStream Outbound Servers

The following usage notes apply to this procedure and XStream outbound servers:

- The `apply_user` parameter can change the connect user for an outbound server.
- You cannot specify an apply handler for an outbound server. An outbound server ignores the settings for the following parameters: `message_handler`, `ddl_handler`, and `precommit_handler`.

  The client application can perform custom processing of the LCRs instead if necessary.
- An outbound server cannot set an apply tag for the changes it processes. An outbound server ignores the setting for the `apply_tag` parameter.

The ALTER_APPLY Procedure and XStream Inbound Servers

Inbound servers can use apply handlers and process only DML and DDL LCRs. Therefore, inbound servers ignore message handlers specified in the `message_handler` parameter.

COMPARE_OLD_VALUES Procedure

This procedure specifies whether to compare the old values of one or more columns in a row logical change record (row LCR) with the current values of the corresponding columns at the destination site during apply. This procedure is relevant only for `UPDATE` and `DELETE` operations because only these operations result in old column values in row LCRs. The default is to compare old values for all columns.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about conflict detection and resolution in an Oracle Streams environment

Syntax

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
   object_name         IN VARCHAR2,
   column_list         IN VARCHAR2,
   operation           IN VARCHAR2 DEFAULT 'UPDATE',
   compare             IN BOOLEAN  DEFAULT TRUE,
   apply_database_link IN VARCHAR2 DEFAULT NULL);

DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
   object_name         IN VARCHAR2,
   column_table        IN DBMS_UTILITY.LNAME_ARRAY,
   operation           IN VARCHAR2 DEFAULT 'UPDATE',
   compare             IN BOOLEAN  DEFAULT TRUE,
   apply_database_link IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 23–4 COMPARE_OLD_VALUES Procedure Parameters

Parameter	Description
`object_name`	The name of the source table specified as `[`*`schema_name.`*`]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`column_list`	A comma-delimited list of column names in the table. There must be no spaces between entries. Specify `*` to include all nonkey columns.
`column_table`	A PL/SQL associative array of type `DBMS_UTILITY.LNAME_ARRAY` that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be `NULL` terminated.
`operation`	The name of the operation, which can be specified as: ■ `UPDATE` for `UPDATE` operations ■ `DELETE` for `DELETE` operations ■ `*` for both `UPDATE` and `DELETE` operations
`compare`	If `compare` is `TRUE`, the old values of the specified columns are compared during apply. If `compare` is `FALSE`, the old values of the specified columns are not compared during apply.

Table 23–4 (Cont.) COMPARE_OLD_VALUES Procedure Parameters

Parameter	Description
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.

Usage Notes

The following usage notes apply to this procedure:

- Conflict Detection
- The COMPARE_OLD_VALUES Procedure and XStream Outbound Servers
- The COMPARE_OLD_VALUES Procedure and XStream Inbound Servers

Conflict Detection

By default, an apply component uses the old column values in a row LCR to detect conflicts. You can choose not to compare old column values to avoid conflict detection for specific tables. For example, if you do not want to compare the old values for a set of columns during apply, then, using the COMPARE_OLD_VALUES procedure, specify the set of columns in the column_list or column_table parameter, and set the compare parameter to FALSE.

In addition, when the compare_key_only apply component parameter is set to Y, automatic conflict detection is disabled, and the apply component only uses primary key and unique key columns to identify the table row for a row LCR. When the compare_key_only apply component parameter is set to N, automatic conflict detection is enabled, and the apply component uses all of the old values in a row LCR to identify the table row for a row LCR.

Note:

- An apply component compares old values for non-key columns when they are present in a row LCR and when the apply component parameter compare_key_only is set to N.
- This procedure raises an error if a key column is specified in column_list or column_table and the compare parameter is set to FALSE.

See Also: SET_PARAMETER Procedure on page 23-56 for more information about the compare_key_only apply component parameter

The COMPARE_OLD_VALUES Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The COMPARE_OLD_VALUES Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

CREATE_APPLY Procedure

This procedure creates an apply component.

Syntax

```
DBMS_APPLY_ADM.CREATE_APPLY(
   queue_name              IN  VARCHAR2,
   apply_name              IN  VARCHAR2,
   rule_set_name           IN  VARCHAR2  DEFAULT NULL,
   message_handler         IN  VARCHAR2  DEFAULT NULL,
   ddl_handler             IN  VARCHAR2  DEFAULT NULL,
   apply_user              IN  VARCHAR2  DEFAULT NULL,
   apply_database_link     IN  VARCHAR2  DEFAULT NULL,
   apply_tag               IN  RAW       DEFAULT '00',
   apply_captured          IN  BOOLEAN   DEFAULT FALSE,
   precommit_handler       IN  VARCHAR2  DEFAULT NULL,
   negative_rule_set_name  IN  VARCHAR2  DEFAULT NULL,
   source_database         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 23–5 CREATE_APPLY Procedure Parameters

Parameter	Description
queue_name	The name of the queue from which the apply component dequeues messages. You must specify an existing queue in the form [*schema_name*.]*queue_name*. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. **Note:** The queue_name setting cannot be altered after the apply component is created.
apply_name	The name of the apply component being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing apply component or messaging client. **Note:** The apply_name setting cannot be altered after the apply component is created.
rule_set_name	The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages. If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no negative rule set is specified, then the apply component applies either all captured messages or all messages in the persistent queue, depending on the setting of the apply_captured parameter. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

Table 23–5 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
message_handler	A user-defined procedure that processes non-LCR messages in the queue for the apply component. See "Usage Notes" on page 23-22 for more information about a message handler procedure.
ddl_handler	A user-defined procedure that processes DDL logical change record (DDL LCRs) in the queue for the apply component. All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically. See "Usage Notes" on page 23-22 for more information about a DDL handler procedure.
apply_user	The user who applies all DML and DDL changes that satisfy the apply component rule sets and who runs user-defined apply handlers. If NULL, then the user who runs the CREATE_APPLY procedure is used. The apply user is the user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply component rules, and runs apply handlers configured for the apply component. This user must have the necessary privileges to apply changes. This procedure grants the apply user dequeue privilege on the queue used by the apply component and configures the user as a secure queue user of the queue. In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user: ▪ The necessary privileges to perform DML and DDL changes on the apply objects ▪ EXECUTE privilege on the rule sets used by the apply component ▪ EXECUTE privilege on all rule-based transformation functions used in the rule set ▪ EXECUTE privilege on all apply handler procedures These privileges can be granted directly to the apply user, or they can be granted through roles. In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles. You can use the packages DBMS_STREAMS_AUTH and DBMS_XSTREAM_AUTH to grant and revoke administrative privileges in Oracle Streams and XStream configurations, respectively. These packages do not configure the necessary privileges to perform DML or DDL changes on the apply objects. **Note:** If the apply user for an apply component is dropped using DROP USER . . . CASCADE, then the apply component is also dropped automatically. See "Usage Notes" on page 23-22 for more information about this parameter.

Table 23–5 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
apply_database_link	The database at which the apply component applies messages. This parameter is used by an apply component when applying changes from Oracle to non-Oracle systems, such as Sybase. Set this parameter to NULL to specify that the apply component applies messages at the local database. **Note:** The apply_database_link setting cannot be altered after the apply component is created.
apply_tag	A binary tag that is added to redo entries generated by the specified apply component. The tag is a binary value that can be used to track LCRs. The tag is relevant only if a capture process at the database where the apply component is running captures changes made by the apply component. If so, then the captured changes include the tag specified by this parameter. By default, the tag for an apply component is the hexadecimal equivalent of '00' (double zero). The following is an example of a tag with a hexadecimal value of 17: HEXTORAW('17') If NULL, then the apply component generates redo entries with NULL tags. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
apply_captured	Either TRUE or FALSE. If TRUE, then the apply component applies only the captured LCRs in the queue. Captured LCRs are LCRs that were captured by an Oracle Streams capture process. If FALSE, then the apply component applies only the messages in a persistent queue. These are messages that were not captured by an Oracle Streams capture process, such as persistent LCRs or user messages. To apply both captured LCRs and messages in a persistent queue, you must create at least two apply components. **Note:** The apply_captured setting cannot be altered after the apply component is created. **See Also:** *Oracle Streams Concepts and Administration* for more information about processing messages with an apply component

Table 23–5 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
precommit_handler	A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component. An internal commit directive is enqueued in the following ways: ▪ When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs. ▪ When a synchronous capture captures row LCRs, the persistent LCRs that were enqueued by the synchronous capture are organized into a message group. The synchronous capture records the transaction identifier in each persistent LCR in a transaction. ▪ When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically. For a row LCR captured by a capture process or synchronous capture, a commit directive contains the commit SCN of the transaction from the source database. For a message enqueued by a user or application, the commit SCN is generated by the apply component. The precommit handler procedure must conform to the following restrictions: ▪ Any work that commits must be an autonomous transaction. ▪ Any rollback must be to a named savepoint created in the procedure. If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue. See "Usage Notes" on page 23-22 for more information about a precommit handler procedure.
negative_rule_set_name	The name of the negative rule set for the apply component. The negative rule set contains the rules that instruct the apply component to discard messages. If you want to use a negative rule set for the apply component, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter hr.neg_apply_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no positive rule set is specified, then the apply component applies either all captured LCRs or all of the messages in the persistent queue, depending on the setting of the apply_captured parameter. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify both a positive and a negative rule set for an apply component, then the negative rule set is always evaluated first.

Table 23–5 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
source_database	The global name of the source database for the changes that will be applied by the apply component. The source database is the database where the changes originated. If an apply component applies captured messages, then the apply component can apply messages from only one capture process at one source database. If NULL, then the source database name of the first LCR received by the apply component is used for the source database. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically. The rules in the apply component rule sets determine which messages are dequeued by the apply component. If the apply component dequeues an LCR with a source database that is different than the source database for the apply component, then an error is raised. You can determine the source database for an apply component by querying the DBA_APPLY_PROGRESS data dictionary view.

Usage Notes

The following sections describe usage notes for this procedure:

- DBA Role Requirement
- Handler Procedure Names
- Message Handler and DDL Handler Procedure
- Precommit Handler Procedure
- The CREATE_APPLY Procedure and XStream Outbound Servers
- The CREATE_APPLY Procedure and XStream Inbound Servers

DBA Role Requirement

If the user who invokes this procedure is different from the user specified in the apply_user parameter, then the invoking user must be granted the DBA role. If the user who invokes this procedure is the same as the user specified in the apply_user parameter, then the DBA role is not required for the invoking user. Only the SYS user can set the apply_user to SYS.

Handler Procedure Names

For the message_handler, ddl_handler, and precommit_handler parameters, specify an existing procedure in one of the following forms:

- *[schema_name.]procedure_name*
- *[schema_name.]package_name.procedure_name*

If the procedure is in a package, then the package_name must be specified. For example, to specify a procedure in the apply_pkg package in the hr schema named process_ddls, enter hr.apply_pkg.process_ddls. An error is returned if the specified procedure does not exist.

The user who invokes the CREATE_APPLY procedure must have EXECUTE privilege on a specified handler procedure. Also, if the *schema_name* is not specified, then the user who invokes the CREATE_APPLY procedure is the default.

Message Handler and DDL Handler Procedure

The procedure specified in both the message_handler parameter and the ddl_handler parameter must have the following signature:

```
PROCEDURE handler_procedure (
   parameter_name  IN  ANYDATA);
```

Here, *handler_procedure* stands for the name of the procedure and *parameter_name* stands for the name of the parameter passed to the procedure. For the message handler, the parameter passed to the procedure is a ANYDATA encapsulation of a user message. For the DDL handler procedure, the parameter passed to the procedure is a ANYDATA encapsulation of a DDL LCR.

> **See Also:** Chapter 275, "Logical Change Record TYPEs" for information about DDL LCRs

Precommit Handler Procedure

The procedure specified in the precommit_handler parameter must have the following signature:

```
PROCEDURE handler_procedure (
   parameter_name   IN  NUMBER);
```

Here, *handler_procedure* stands for the name of the procedure and *parameter_name* stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is the commit SCN of a commit directive.

The CREATE_APPLY Procedure and XStream Outbound Servers

This procedure cannot create an XStream outbound server. To create an XStream outbound server, use the DBMS_XSTREAM_ADM package.

The CREATE_APPLY Procedure and XStream Inbound Servers

The following usage notes apply to this procedure and XStream inbound servers:

- The CREATE_APPLY procedure always creates an apply process. The apply process remains an apply process if it receives messages from a source other than an XStream client application, such as a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives messages from any other source. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.
- When creating an inbound server using the CREATE_APPLY procedure, set the apply_captured parameter to TRUE. Inbound servers only process LCRs captured by a capture process.
- Inbound servers can use apply handlers. Inbound servers process only DML and DDL LCRs. Therefore, inbound servers ignore message handlers specified in the message_handler parameter.

CREATE_OBJECT_DEPENDENCY Procedure

This procedure creates an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

An apply component schedules execution of transactions that involve the child object after all transactions with a lower commit system change number (commit SCN) that involve the parent object have been committed. An apply component uses the object identifier of the objects in the logical change records (LCRs) to detect dependencies. The apply component does not use column values in the LCRs to detect dependencies.

Note: An error is raised if `NULL` is specified for either of the procedure parameters.

See Also:

- DROP_OBJECT_DEPENDENCY Procedure on page 23-29
- *Oracle Streams Concepts and Administration*

Syntax

```
DBMS_APPLY_ADM.CREATE_OBJECT_DEPENDENCY(
   object_name         IN  VARCHAR2,
   parent_object_name  IN  VARCHAR2);
```

Parameters

Table 23–6 CREATE_OBJECT_DEPENDENCY Procedure Parameters

Parameter	Description
`object_name`	The name of the child database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`parent_object_name`	The name of the parent database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.departments`. If the schema is not specified, then the current user is the default.

Usage Notes

The following usage notes apply to this procedure:

- The CREATE_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers
- The CREATE_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers

The CREATE_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The CREATE_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

DELETE_ALL_ERRORS Procedure

This procedure deletes all the error transactions for the specified apply component.

Syntax

```
DBMS_APPLY_ADM.DELETE_ALL_ERRORS(
   apply_name  IN  VARCHAR2 DEFAULT NULL);
```

Parameter

Table 23–7 DELETE_ALL_ERRORS Procedure Parameter

Parameter	Description
apply_name	The name of the apply component that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply components are deleted.

Usage Notes

The following usage notes apply to this procedure:

- The DELETE_ALL_ERRORS Procedure and XStream Outbound Servers
- The DELETE_ALL_ERRORS Procedure and XStream Inbound Servers

The DELETE_ALL_ERRORS Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

The DELETE_ALL_ERRORS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

DELETE_ERROR Procedure

This procedure deletes the specified error transaction.

Syntax

```
DBMS_APPLY_ADM.DELETE_ERROR(
   local_transaction_id  IN  VARCHAR2);
```

Parameter

Table 23–8 DELETE_ERROR Procedure Parameter

Parameter	Description
`local_transaction_id`	The identification number of the error transaction to delete. If the specified transaction does not exist in the error queue, then an error is raised.

Usage Notes

The following usage notes apply to this procedure:

The DELETE_ERROR Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

The DELETE_ERROR Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

DROP_APPLY Procedure

This procedure drops an apply component.

Syntax

```
DBMS_APPLY_ADM.DROP_APPLY(
   apply_name             IN  VARCHAR2,
   drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 23–9 DROP_APPLY Procedure Parameters

Parameter	Description
apply_name	The name of the apply component being dropped. You must specify an existing apply component name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified apply component if these rule sets are not used by any other Oracle Streams or XStream component. These components include capture processes, propagations, apply processes, inbound servers, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified apply component, and the rule sets retain their rules.

Usage Notes

The following usage notes apply to this procedure:

- The DROP_APPLY Procedure and Rules
- The DROP_APPLY Procedure and XStream Outbound Servers
- The DROP_APPLY Procedure and XStream Inbound Servers

The DROP_APPLY Procedure and Rules

When you use this procedure to drop an apply component, information about rules created for the apply component using the DBMS_STREAMS_ADM package is removed from the data dictionary views for rules. Information about such a rule is removed even if the rule is not in either the positive or negative rule set for the apply component. The following are the data dictionary views for rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES

- DBA_STREAMS_TABLE_RULES

See Also: *Oracle Streams Concepts and Administration* for more information about Oracle Streams data dictionary views

The DROP_APPLY Procedure and XStream Outbound Servers

When the DROP_APPLY procedure is executed on an outbound server, it runs the DROP_OUTBOUND procedure in the DBMS_XSTREAM_ADM package. Therefore, it might also drop the outbound server's capture process and queue.

The DROP_APPLY Procedure and XStream Inbound Servers

When the DROP_APPLY procedure is executed on an inbound server, it runs the DROP_INBOUND procedure in the DBMS_XSTREAM_ADM package. Therefore, it might also drop the inbound server's queue.

DROP_OBJECT_DEPENDENCY Procedure

This procedure drops an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

Note:

- An error is raised if an object dependency does not exist for the specified database objects.
- An error is raised if `NULL` is specified for either of the procedure parameters.

See Also:

- CREATE_OBJECT_DEPENDENCY Procedure on page 23-24
- *Oracle Streams Concepts and Administration*

Syntax

```
DBMS_APPLY_ADM.DROP_OBJECT_DEPENDENCY(
   object_name         IN  VARCHAR2,
   parent_object_name  IN  VARCHAR2);
```

Parameters

Table 23–10 DROP_OBJECT_DEPENDENCY Procedure Parameters

Parameter	Description
`object_name`	The name of the child database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`parent_object_name`	The name of the parent database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.departments`. If the schema is not specified, then the current user is the default.

Usage Notes

The following usage notes apply to this procedure:

The DROP_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The DROP_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

EXECUTE_ALL_ERRORS Procedure

This procedure reexecutes the error transactions in the error queue for the specified apply component.

The transactions are reexecuted in commit SCN order. Error reexecution stops if an error is raised.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about the error queue

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ALL_ERRORS(
   apply_name       IN  VARCHAR2  DEFAULT NULL,
   execute_as_user  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 23–11 EXECUTE_ALL_ERRORS Procedure Parameters

Parameter	Description
apply_name	The name of the apply component that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply components are reexecuted.
execute_as_user	If TRUE, then the procedure reexecutes the transactions in the security context of the current user. If FALSE, then the procedure reexecutes each transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction. The user who executes the transactions must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component.

Usage Notes

The following usage notes apply to this procedure:

- The EXECUTE_ALL_ERRORS Procedure and XStream Outbound Servers
- The EXECUTE_ALL_ERRORS Procedure and XStream Inbound Servers

The EXECUTE_ALL_ERRORS Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The EXECUTE_ALL_ERRORS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

EXECUTE_ERROR Procedure

This procedure reexecutes the specified error transaction in the error queue.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about the error queue

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ERROR(
   local_transaction_id  IN  VARCHAR2,
   execute_as_user       IN  BOOLEAN   DEFAULT FALSE,
   user_procedure        IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 23–12 EXECUTE_ERROR Procedure Parameters

Parameter	Description
`local_transaction_id`	The identification number of the error transaction to execute. If the specified transaction does not exist in the error queue, then an error is raised.
`execute_as_user`	If `TRUE`, then the procedure reexecutes the transaction in the security context of the current user. If `FALSE`, then the procedure reexecutes the transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The `DBA_APPLY_ERROR` data dictionary view lists the original receiver for each error transaction. The user who executes the transaction must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component.
`user_procedure`	A user-defined procedure that modifies the error transaction so that it can be successfully executed. Specify `NULL` to execute the error transaction without running a user procedure. **See Also:** "Usage Notes" on page 23-31 for more information about the user procedure

Usage Notes

The following usage notes apply to this procedure:

- The User Procedure
- The EXECUTE_ERROR Procedure and XStream Outbound Servers
- The EXECUTE_ERROR Procedure and XStream Inbound Servers

The User Procedure

You must specify the full procedure name for the `user_procedure` parameter in one of the following forms:

- [*schema_name.*]*package_name.procedure_name*
- [*schema_name.*]*procedure_name*

If the procedure is in a package, then the *package_name* must be specified. The user who invokes the EXECUTE_ERROR procedure must have EXECUTE privilege on the specified procedure. Also, if the *schema_name* is not specified, then the user who invokes the EXECUTE_ERROR procedure is the default.

For example, suppose the procedure_name has the following properties:

- strmadmin is the *schema_name*.
- fix_errors is the *package_name*.
- fix_hr_errors is the *procedure_name*.

In this case, specify the following:

```
strmadmin.fix_errors.fix_hr_errors
```

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
     in_anydata                    IN      ANYDATA,
     error_record                  IN      DBA_APPLY_ERROR%ROWTYPE,
     error_message_number          IN      NUMBER,
     messaging_default_processing  IN OUT  BOOLEAN,
     out_anydata                   OUT     ANYDATA);
```

The user procedure has the following parameters:

- in_anydata: The ANYDATA encapsulation of a message that the apply component passes to the procedure. A single transaction can include multiple messages. A message can be a row logical change record (row LCR), a DDL logical change record (DDL LCR), or a user message.
- error_record: The row in the DBA_APPLY_ERROR data dictionary view that identifies the transaction
- error_message_number: The message number of the ANYDATA object in the in_anydata parameter, starting at 1
- messaging_default_processing: If TRUE, then the apply component continues processing the message in the in_anydata parameter, which can include executing DML or DDL statements and invoking apply handlers.

  If FALSE, then the apply component skips processing the message in the in_anydata parameter and moves on to the next message in the in_anydata parameter.
- out_anydata: The ANYDATA object processed by the user procedure and used by the apply component if messaging_default_processing is TRUE.

If an LCR is executed using the EXECUTE LCR member procedure in the user procedure, then the LCR is executed directly, and the messaging_default_processing parameter should be set to FALSE. In this case, the LCR is not passed to any apply handlers.

Processing an error transaction with a user procedure results in one of the following outcomes:

- The user procedure modifies the transaction so that it can be executed successfully.
- The user procedure fails to make the necessary modifications, and an error is raised when transaction execution is attempted. In this case, the transaction is rolled back and remains in the error queue.

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction.
- Do not modify LONG, LONG RAW or LOB column data in an LCR.
- If the ANYDATA object in the in_anydata parameter is a row LCR, then the out_anydata parameter must be row LCR if the messaging_default_processing parameter is set to TRUE.
- If the ANYDATA object in the in_anydata parameter is a DDL LCR, then the out_anydata parameter must be DDL LCR if the messaging_default_processing parameter is set to TRUE.
- The user who runs the user procedure must have the SELECT or READ privilege on the DBA_APPLY_ERROR data dictionary view.

Note: LCRs containing transactional directives, such as COMMIT and ROLLBACK, are not passed to the user procedure.

The EXECUTE_ERROR Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The EXECUTE_ERROR Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

GET_ERROR_MESSAGE Function

This function returns the message payload from the error queue for the specified message number and transaction identifier. The message can be a logical change record (LCR) or a non-LCR message.

This function is overloaded. One version of this function contains two `OUT` parameters. These `OUT` parameters contain the destination queue into which the message should be enqueued, if one exists, and whether the message should be executed. The destination queue is specified using the `SET_ENQUEUE_DESTINATION` procedure, and the execution directive is specified using the `SET_EXECUTE` procedure.

See Also:

- SET_ENQUEUE_DESTINATION Procedure on page 23-46
- SET_EXECUTE Procedure on page 23-48

Syntax

```
DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
   message_number          IN   NUMBER,
   local_transaction_id    IN   VARCHAR2,
   destination_queue_name  OUT  VARCHAR2,
   execute                 OUT  BOOLEAN)
RETURN ANYDATA;

DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
   message_number          IN   NUMBER,
   local_transaction_id    IN   VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 23–13 GET_ERROR_MESSAGE Function Parameters

Parameter	Description
`message_number`	The identification number of the message. This number identifies the position of the message in the transaction. Query the `DBA_APPLY_ERROR` data dictionary view to view the message number of each apply error.
`local_transaction_id`	Identifier of the error transaction for which to return a message
`destination_queue_name`	Contains the name of the queue into which the message should be enqueued. If the message should not be enqueued into a queue, then this parameter contains `NULL`.
`execute`	Contains `TRUE` if the message should be executed Contains `FALSE` if the message should not be executed

Usage Notes

The following usage notes apply to this procedure:

- The GET_ERROR_MESSAGE Procedure and XStream Outbound Servers
- The GET_ERROR_MESSAGE Procedure and XStream Inbound Servers

The GET_ERROR_MESSAGE Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The GET_ERROR_MESSAGE Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

REMOVE_STMT_HANDLER

This procedure removes a statement DML handler for a specified operation on a specified database object from a single apply component or from all apply components in the database.

See Also:

- Chapter 162, "DBMS_STREAMS_HANDLER_ADM"
- *Oracle Streams Concepts and Administration*

Syntax

```
DBMS_APPLY_ADM.REMOVE_STMT_HANDLER(
   object_name     IN  VARCHAR2,
   operation_name  IN  VARCHAR2,
   handler_name    IN  VARCHAR2,
   apply_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 23–14 REMOVE_STMT_HANDLER Procedure Parameters

Parameter	Description
`object_name`	The name of the source object specified as `[schema_name.]object_name`. For example, `hr.employees`. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure. If `NULL`, then the procedure raises an error.
`operation_name`	The name of the operation, which can be specified as: ■ `INSERT` ■ `UPDATE` ■ `DELETE` If `NULL`, then the procedure raises an error.
`handler_name`	The name of the statement DML handler. If `NULL`, then the procedure raises an error.
`apply_name`	The name of the apply component that uses the statement DML handler. If `NULL`, then the procedure removes the statement DML handler from all apply components in the database.

Usage Notes

The following usage notes apply to this procedure:

- The REMOVE_STMT_HANDLER Procedure and XStream Outbound Servers
- The REMOVE_STMT_HANDLER Procedure and XStream Inbound Servers

The REMOVE_STMT_HANDLER Procedure and XStream Outbound Servers

Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

The REMOVE_STMT_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

SET_CHANGE_HANDLER Procedure

This procedure sets or unsets a change handler that tracks changes for a specified operation on a specified database object for a single apply component.

A change handler is a special type of statement DML handler that tracks table changes and was created by either the DBMS_STREAMS_ADM.MAINTAIN_CHANGE_TABLE procedure or this SET_CHANGE_HANDLER procedure. Information about change handlers is stored in the ALL_APPLY_CHANGE_HANDLERS and DBA_APPLY_CHANGE_HANDLERS views.

This procedure automatically generates the statement that is added to the change handler based on values specified in the procedure parameters. You should only run this procedure when a configuration that tracks database changes exists.

Note: Use the MAINTAIN_CHANGE_TABLE Procedure to configure an environment that tracks table changes

Syntax

```
DBMS_APPLY_ADM.SET_CHANGE_HANDLER(
   change_table_name    IN  VARCHAR2,
   source_table_name    IN  VARCHAR2,
   capture_values       IN  VARCHAR2,
   apply_name           IN  VARCHAR2,
   operation_name       IN  VARCHAR2,
   change_handler_name  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 23–15 SET_CHANGE_HANDLER Procedure Parameters

Parameter	Description
change_table_name	The table that records changes to the source table. Specify the table as [*schema_name.*]*table_name*. For example, hr.jobs_change_table. If the schema is not specified, then the current user is the default. If NULL, then the procedure raises an error.
source_table_name	The table at the source database for which changes are recorded. Specify the table as [*schema_name.*]*table_name*. For example, hr.jobs. If the schema is not specified, then the current user is the default. If NULL, then the procedure raises an error.

Table 23–15 (Cont.) SET_CHANGE_HANDLER Procedure Parameters

Parameter	Description
capture_values	Specify which values to record in the change table when update operations are performed on the source table: ■ old - To record the original values for an updated column in the source table ■ new - To record the new values for an updated column in the source table ■ * - To record both the original and the new values for an updated column in the source table If NULL, then the procedure raises an error. **Note:** For insert operations, only new column values are captured. For delete operations, only old column values are captured.
apply_name	The name of the apply component that applies changes to the change table. Do not specify an owner. If NULL, then the procedure raises an error.
operation_name	The name of the operation, which can be specified as: ■ INSERT ■ UPDATE ■ DELETE If NULL, then the procedure raises an error. **Note:** Change handlers cannot be specified for LOB operations.
change_handler_name	The name of the change handler. If the specified change handler exists, then a statement is added to the existing handler. Ensure that the existing change handler is for the same operation on the same table as the settings for the operation_name and source_table_name parameters, respectively. If the existing handler is for a different operation or table, then an apply error results when the handler is invoked. If non-NULL and the specified change handler does not exist, then this procedure creates the change handler. If NULL and a change handler exists for the same operation on the same table as the settings for the operation_name and source_table_name parameters, respectively, then the existing change handler is removed. If NULL and the specified change handler does not exist, then the procedure raises an error. **See Also:** "Usage Notes" on page 23-39 for more information about this parameter.

Usage Notes

The following usage notes apply to this procedure:

- Checking for an Existing Change Handler
- The SET_CHANGE_HANDLER Procedure and XStream Outbound Servers
- The SET_CHANGE_HANDLER Procedure and XStream Inbound Servers

Checking for an Existing Change Handler

To check for an existing change handler for a specific operation on a specific source table, run the following query:

```
SELECT HANDLER_NAME, APPLY_NAME FROM DBA_APPLY_CHANGE_HANDLERS
 WHERE  operation_name     = 'operation'
   AND  source_table_owner = 'source_table_owner'
   AND  source_table_name  = 'source_table_name'
   AND  change_table_owner = 'change_table_owner'
   AND  change_table_name  = 'change_table_name';
```

where:

- *operation* is operation specified for the new handler, either `INSERT`, `UPDATE`, or `DELETE`
- *source_table_owner* is the owner of the source table
- *source_table_name* is the name of the source table
- *change_table_owner* is the owner of the change table
- *change_table_owner* is the owner of the change table

The SET_CHANGE_HANDLER Procedure and XStream Outbound Servers

Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

The SET_CHANGE_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

SET_DML_HANDLER Procedure

This procedure sets or unsets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply component or for all apply components in the database. The user procedure alters the apply behavior for the specified operation on the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_DML_HANDLER(
   object_name          IN  VARCHAR2,
   object_type          IN  VARCHAR2,
   operation_name       IN  VARCHAR2,
   error_handler        IN  BOOLEAN   DEFAULT FALSE,
   user_procedure       IN  VARCHAR2,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL,
   apply_name           IN  VARCHAR2  DEFAULT NULL,
   assemble_lobs        IN  BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 23–16 SET_DML_HANDLER Procedure Parameters

Parameter	Description
object_name	The name of the source object specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure.
object_type	The type of the source object. Currently, TABLE is the only possible source object type.
operation_name	The name of the operation, which can be specified as: ■ INSERT ■ UPDATE ■ DELETE ■ LOB_UPDATE ■ DEFAULT For example, suppose you run this procedure twice for the hr.employees table. In one call, you set operation_name to UPDATE and user_procedure to employees_update. In another call, you set operation_name to INSERT and user_procedure to employees_insert. Both times, you set error_handler to FALSE. In this case, the employees_update procedure is run for UPDATE operations on the hr.employees table, and the employees_insert procedure is run for INSERT operations on the hr.employees table. Specify DEFAULT to set the procedure as the default procedure DML handler for the database object. In this case, the procedure DML handler is used for any INSERT, UPDATE, DELETE, and LOB_WRITE on the database object, if another procedure DML handler is not specifically set for the operation on the database object.

Table 23–16 (Cont.) SET_DML_HANDLER Procedure Parameters

Parameter	Description
error_handler	If TRUE, then the specified user procedure is run when a row logical change record (row LCR) involving the specified operation on the specified object raises an apply error. You can code the user procedure to resolve possible error conditions, notify administrators of the error, log the error, or any combination of these actions. If FALSE, then the handler being set is run for all row LCRs involving the specified operation on the specified object.
user_procedure	A user-defined procedure that is invoked during apply for the specified operation on the specified object. If the procedure is a procedure DML handler, then it is invoked instead of the default apply performed by Oracle. If the procedure is an error handler, then it is invoked when an apply error is encountered. Specify NULL to unset a procedure DML handler that is set for the specified operation on the specified object.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.
apply_name	The name of the apply component that uses the procedure DML handler or error handler. If NULL, then the procedure sets the procedure DML handler or error handler as a general handler for all apply components in the database. If the user_procedure parameter is set to NULL to unset a handler, and the handler being unset is set for a specific apply component, then use the apply_name parameter to specify the apply component to unset the handler.
assemble_lobs	If TRUE, then LOB assembly is used for LOB columns in LCRs processed by the handler. LOB assembly combines multiple LCRs for a LOB column resulting from a single row change into one row LCR before passing the LCR to the handler. Database compatibility must be 10.2.0 or higher to use LOB assembly. If FALSE, then LOB assembly is not used for LOB columns in LCRs processed by the handler.

Usage Notes

The following usage notes apply to this procedure:

- Run the SET_DML_HANDLER Procedure at the Destination Database
- Procedure DML Handlers and Error Handlers
- The apply_name Parameter
- Signature of a DML Handler Procedure or Error Handler Procedure
- LOB Assembly
- The SET_DML_HANDLER Procedure and XStream Outbound Servers
- The SET_DML_HANDLER Procedure and XStream Inbound Servers

Run the SET_DML_HANDLER Procedure at the Destination Database

Run this procedure at the destination database. The SET_DML_HANDLER procedure provides a way for users to apply logical change records containing DML changes (row LCRs) using a customized apply.

Procedure DML Handlers and Error Handlers

If the error_handler parameter is set to TRUE, then it specifies that the user procedure is an error handler. An error handler is invoked only when a row LCR raises an apply error. Such an error can result from a data conflict if no conflict handler is specified or if the update conflict handler cannot resolve the conflict. If the error_handler parameter is set to FALSE, then the user procedure is a procedure DML handler, not an error handler, and a procedure DML handler is always run instead of performing the specified operation on the specified object.

This procedure either sets a procedure DML handler or an error handler for a particular operation on an object. It cannot set both a procedure DML handler and an error handler for the same object and operation.

Note: Currently, setting an error handler for an apply component that is applying changes to a non-Oracle database is not supported.

The apply_name Parameter

If the apply_name parameter is non-NULL, then the procedure DML handler or error handler is set for the specified apply component. In this case, this handler is not invoked for other apply components at the local destination database. If the apply_name parameter is NULL, the default, then the handler is set as a general handler for all apply components at the destination database. When a handler is set for a specific apply component, then this handler takes precedence over any general handlers. For example, consider the following scenario:

- A procedure DML handler named handler_hr is specified for an apply component named apply_hr for UPDATE operations on the hr.employees table.
- A general procedure DML handler named handler_gen also exists for UPDATE operations on the hr.employees table.

In this case, the apply_hr apply component uses the handler_hr procedure DML handler for UPDATE operations on the hr.employees table.

At the source database, you must specify an unconditional supplemental log group for the columns needed by a DML or error handler.

Signature of a DML Handler Procedure or Error Handler Procedure

You can use the SET_DML_HANDLER procedure to set either a procedure DML handler or an error handler for row LCRs that perform a specified operation on a specified object. The signatures of a DML handler procedure and of an error handler procedure are described following this section.

In either case, you must specify the full procedure name for the user_procedure parameter in one of the following forms:

- [*schema_name*.]*package_name.procedure_name*
- [*schema_name*.]*procedure_name*

If the procedure is in a package, then the *package_name* must be specified. The user who invokes the SET_DML_HANDLER procedure must have EXECUTE privilege on the

specified procedure. Also, if the *schema_name* is not specified, then the user who invokes the SET_DML_HANDLER procedure is the default.

For example, suppose the procedure_name has the following properties:

- hr is the *schema_name*.
- apply_pkg is the *package_name*.
- employees_default is the *procedure_name*.

In this case, specify the following:

```
hr.apply_pkg.employees_default
```

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction that contains the LCR.
- If you are manipulating a row using the EXECUTE member procedure for the row LCR, then do not attempt to manipulate more than one row in a row operation. You must construct and execute manually any DML statements that manipulate more than one row.
- If the command type is UPDATE or DELETE, then row operations resubmitted using the EXECUTE member procedure for the LCR must include the entire key in the list of old values. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.
- If the command type is INSERT, then row operations resubmitted using the EXECUTE member procedure for the LCR should include the entire key in the list of new values. Otherwise, duplicate rows are possible. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all of the table columns, except for columns of the following data types: LOB, LONG, LONG RAW, user-defined types (including object types, REFs, varrays, nested tables), and Oracle-supplied types (including Any types, XML types, spatial types, and media types).

> **See Also:** *Oracle Streams Replication Administrator's Guide* for information about and restrictions regarding procedure DML handlers and LOB, LONG, and LONG RAW data types

The procedure specified in the user_procedure parameter must have the following signature:

```
PROCEDURE user_procedure (
   parameter_name  IN  ANYDATA);
```

Here, *user_procedure* stands for the name of the procedure and *parameter_name* stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is a ANYDATA encapsulation of a row LCR.

> **See Also:** Chapter 275, "Logical Change Record TYPEs" for more information about LCRs

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
```

```
message            IN  ANYDATA,
error_stack_depth  IN  NUMBER,
error_numbers      IN  DBMS_UTILITY.NUMBER_ARRAY,
error_messages     IN  emsg_array);
```

If you want to retry the DML operation within the error handler, then have the error handler procedure run the `EXECUTE` member procedure for the LCR. The last error raised is on top of the error stack. To specify the error message at the top of the error stack, use `error_numbers(1)` and `error_messages(1)`.

Note:

- Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.
- The `emsg_array` value must be a user-defined array that is a table of type `VARCHAR2` with at least 76 characters.

Running an error handler results in one of the following outcomes:

- The error handler successfully resolves the error and returns control to the apply component.
- The error handler fails to resolve the error, and the error is raised. The raised error causes the transaction to be rolled back and placed in the error queue.

LOB Assembly

Do not modify `LONG`, `LONG RAW`, or nonassembled LOB column data in an LCR with procedure DML handlers, error handlers, or custom rule-based transformation functions. Procedure DML handlers and error handlers can modify LOB columns in row LCRs that have been constructed by LOB assembly.

The SET_DML_HANDLER Procedure and XStream Outbound Servers

Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

The SET_DML_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

SET_ENQUEUE_DESTINATION Procedure

This procedure sets the queue where the apply component automatically enqueues a message that satisfies the specified rule.

This procedure modifies the specified rule's action context to specify the queue. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A queue destination specified by this procedure always consists of the following name-value pair in an action context:

- The name is APPLY$_ENQUEUE.
- The value is an ANYDATA instance containing the queue name specified as a VARCHAR2.

Syntax

```
DBMS_APPLY_ADM.SET_ENQUEUE_DESTINATION(
  rule_name               IN  VARCHAR2,
  destination_queue_name  IN  VARCHAR2);
```

Parameters

Table 23–17 SET_ENQUEUE_DESTINATION Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name*.]*rule_name*. For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the queue into which the apply component enqueues the message. Specify the queue in the form [*schema_name*.]*queue_name*. Only local queues can be specified. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. If NULL, then an existing name-value pair with the name APPLY$_ENQUEUE is removed. If no name-value pair exists with the name APPLY$_ENQUEUE for the rule, then no action is taken. If non-NULL and a name-value pair exists for the rule with the name APPLY$_ENQUEUE, then it is removed, and a new name-value pair with the value specified by this parameter is added.

Usage Notes

The following usage notes apply to this procedure:

- The SET_ENQUEUE_DESTINATION Procedure and Apply Handlers
- Considerations for the SET_ENQUEUE_DESTINATION Procedure
- The SET_ENQUEUE_DESTINATION Procedure and XStream Outbound Servers

The SET_ENQUEUE_DESTINATION Procedure and Apply Handlers

If an apply handler, such as a procedure DML handler, DDL handler, or message handler, processes a message that also is enqueued into a destination queue, then the apply handler processes the message before it is enqueued.

Considerations for the SET_ENQUEUE_DESTINATION Procedure

The following are considerations for using this procedure:

- This procedure does not verify that the specified queue exists. If the queue does not exist, then an error is raised when an apply component tries to enqueue a message into it.
- Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The apply user of the apply component using the specified rule must have the necessary privileges to enqueue messages into the specified queue. If the queue is a secure queue, then the apply user must be a secure queue user of the queue.
- The specified rule must be in the positive rule set for an apply component. If the rule is in the negative rule set for an apply component, then the apply component does not enqueue the message into the destination queue.
- If the commit SCN for a message is less than or equal to the relevant instantiation SCN for the message, then the message is not enqueued into the destination queue, even if the message satisfies the apply component rule sets.

The SET_ENQUEUE_DESTINATION Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_ENQUEUE_DESTINATION Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

SET_EXECUTE Procedure

This procedure specifies whether a message that satisfies the specified rule is executed by an apply component.

This procedure modifies the specified rule's action context to specify message execution. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A message execution directive specified by this procedure always consists of the following name-value pair in an action context:

- The name is APPLY$_EXECUTE.
- The value is an ANYDATA instance that contains NO as a VARCHAR2. When the value is NO, an apply component does not execute the message and does not send the message to any apply handler.

Syntax

```
DBMS_APPLY_ADM.SET_EXECUTE(
  rule_name  IN  VARCHAR2,
  execute    IN  BOOLEAN);
```

Parameters

Table 23–18 SET_EXECUTE Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name*.]*rule_name*. For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.
execute	If TRUE, then the procedure removes the name-value pair with the name APPLY$_EXECUTE for the specified rule. Removing the name-value pair means that the apply component executes messages that satisfy the rule. If no name-value pair with name APPLY$_EXECUTE exists for the rule, then no action is taken. If FALSE, then the procedure adds a name-value pair to the rule's action context. The name is APPLY$_EXECUTE and the value is NO. An apply component does not execute a message that satisfies the rule and does not send the message to any apply handler. If a name-value pair exists for the rule with the name APPLY$_EXECUTE, then it is removed, and a new one with the value NO is added. If NULL, then the procedure raises an error.

Usage Notes

The following usage notes apply to this procedure:

- Considerations for the SET_EXECUTE Procedure
- The SET_EXECUTE Procedure and XStream Outbound Servers
- The SET_EXECUTE Procedure and XStream Inbound Servers

Considerations for the SET_EXECUTE Procedure

The following are considerations for using this procedure:

- If the message is a logical change record (LCR) and the message is not executed, then the change encapsulated in the LCR is not made to the relevant local database object. Also, if the message is not executed, then it is not sent to any apply handler.
- Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The specified rule must be in the positive rule set for an apply component for the apply component to follow the execution directive. If the rule is in the negative rule set for an apply component, then the apply component ignores the execution directive for the rule.

The SET_EXECUTE Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_EXECUTE Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

SET_GLOBAL_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas. This procedure overwrites any existing instantiation SCN for the database, and, if it sets the instantiation SCN for a schema or a table, then it overwrites any existing instantiation SCN for the schema or table.

This procedure gives you precise control over which DDL logical change records (DDL LCRs) from a source database are ignored and which DDL LCRs are applied by an apply component.

Syntax

```
DBMS_APPLY_ADM.SET_GLOBAL_INSTANTIATION_SCN(
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  recursive             IN  BOOLEAN   DEFAULT FALSE,
  source_root_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 23–19 SET_GLOBAL_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source database from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.
recursive	If TRUE, then the procedure sets the instantiation SCN for the source database, all schemas in the source database, and all tables owned by the schemas in the source database. This procedure selects the schemas and tables from the ALL_USERS and ALL_TABLES data dictionary views, respectively, at the source database under the security context of the current user. If FALSE, then the procedure sets the global instantiation SCN for the source database, but does not set the instantiation SCN for any schemas or tables **Note:** If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.

Table 23–19 (Cont.) SET_GLOBAL_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_root_name	The global name of the source root database. In a non-CDB, this parameter must be NULL. In a CDB, if you want to do the instantiation for a specific container than you must specify both source_database and source_root_name. If you want to do the instantiation for all the containers in the CDB, specify the source_root_name for the database and leave the source_database name as NULL.

Usage Notes

The following usage notes apply to this procedure:

- Instantiation SCNs and DDL LCRs
- The recursive Parameter
- Considerations for the SET_GLOBAL_INSTANTIATION_SCN Procedure
- The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Outbound Servers
- The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Inbound Servers
- The SET_GLOBAL_INSTANTIATION_SCN Procedure and CDBs

See Also:

- SET_SCHEMA_INSTANTIATION_SCN Procedure on page 23-74
- SET_TABLE_INSTANTIATION_SCN Procedure on page 23-77
- LCR$_DDL_RECORD Type on page 275-6 for more information about DDL LCRs
- *Oracle Streams Replication Administrator's Guide*

Instantiation SCNs and DDL LCRs

If the commit SCN of a DDL LCR for a database object from a source database is less than or equal to the instantiation SCN for that source database at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The global instantiation SCN specified by this procedure is used for a DDL LCR only if the DDL LCR does not have object_owner, base_table_owner, and base_table_name specified. For example, the global instantiation SCN set by this procedure is used for DDL LCRs with a command_type of CREATE USER.

The recursive Parameter

If the recursive parameter is set to TRUE, then this procedure sets the instantiation SCN for each schema at a source database and for the tables owned by these schemas. This procedure uses the SET_SCHEMA_INSTANTIATION_SCN procedure to set the instantiation SCN for each schema, and it uses the SET_TABLE_INSTANTIATION_SCN procedure to set the instantiation SCN for each table. Each schema instantiation SCN is used for DDL LCRs on the schema, and each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any schemas or tables.

Considerations for the SET_GLOBAL_INSTANTIATION_SCN Procedure

The following are considerations for using this procedure:

- Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.
- The instantiation SCN is not set for the `SYS` or `SYSTEM` schemas.

The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

> **See Also:** *Oracle Database XStream Guide* for more information about outbound servers and instantiation SCNs

The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

The SET_GLOBAL_INSTANTIATION_SCN Procedure and CDBs

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.

SET_KEY_COLUMNS Procedures

This procedure records the set of columns to be used as the substitute primary key for apply purposes and removes existing substitute primary key columns for the specified object if they exist.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

Syntax

```
DBMS_APPLY_ADM.SET_KEY_COLUMNS(
   object_name          IN  VARCHAR2,
   column_list          IN  VARCHAR2,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.SET_KEY_COLUMNS(
   object_name          IN  VARCHAR2,
   column_table         IN  DBMS_UTILITY.NAME_ARRAY,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 23–20 SET_KEY_COLUMNS Procedure Parameters

Parameter	Description
`object_name`	The name of the table specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. If the apply component is applying changes to a non-Oracle database in a heterogeneous environment, then the object name is not verified.
`column_list`	A comma-delimited list of the columns in the table to use as the substitute primary key, with no spaces between the column names. If the `column_list` parameter is empty or `NULL`, then the current set of key columns is removed.
`column_table`	A PL/SQL associative array of type `DBMS_UTILITY.NAME_ARRAY` of the columns in the table to use as the substitute primary key. The index for `column_table` must be 1-based, increasing, dense, and terminated by a `NULL`. If the `column_table` parameter is empty or `NULL`, then the current set of key columns is removed.
`apply_database_link`	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.

Usage Notes

The following usage notes apply to this procedure:

- Considerations for the SET_KEY_COLUMNS Procedure
- Duplicate Rows and Substitute Primary Key Columns
- The SET_KEY_COLUMNS Procedure and XStream Outbound Servers

- The SET_KEY_COLUMNS Procedure and XStream Inbound Servers
- The SET_KEY_COLUMNS Procedure and CDBs

Considerations for the SET_KEY_COLUMNS Procedure

The following are considerations for using this procedure:

- When not empty, the specified set of columns takes precedence over any primary key for the specified object. Do not specify substitute key columns if the object has primary key columns and you want to use those primary key columns as the key.
- Run this procedure at the destination database. At the source database, you must specify an unconditional supplemental log group for the substitute key columns.
- Unlike true primary keys, columns specified as substitute key column columns can contain `NULL`s. However, Oracle recommends that each column you specify as a substitute key column be a `NOT NULL` column. You also should create a single index that includes all of the columns in a substitute key. Following these guidelines improves performance for updates, deletes, and piecewise updates to LOBs because Oracle can locate the relevant row more efficiently.
- Do not permit applications to update the primary key or substitute key columns of a table. This ensures that Oracle can identify rows and preserve the integrity of the data.
- If there is neither a primary key, nor a unique index that has at least one `NOT NULL` column, nor a substitute key for a table, then the key consists of all of the table columns, except for columns of the following data types: LOB, `LONG`, `LONG RAW`, user-defined types (including object types, `REF`s, varrays, nested tables), and Oracle-supplied types (including `Any` types, XML types, spatial types, and media types).

Duplicate Rows and Substitute Primary Key Columns

A table has duplicate rows when all of the column values are identical for two or more rows in the table, excluding LOB, `LONG`, and `LONG RAW` columns. You can specify substitute primary key columns for a table at a destination database using by the `SET_KEY_COLUMNS` procedure. When substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply component parameter is set to `Y`, meet the following requirements to keep the table data synchronized at the source and destination databases:

- Ensure that supplemental logging is specified at source database for the columns specified as substitute key columns at the destination database. The substitute key columns must be in an unconditional log group at the source database.
- Ensure that the substitute key columns uniquely identify each row in the table at the destination database.

The rest of this section provides more details about these requirements.

When there is no key for a table and the `allow_duplicate_rows` apply component parameter is set to `Y`, a single row LCR with an `UPDATE` or `DELETE` command type only is applied to one of the duplicate rows. In this case, if the table at the source database and the table at the destination database have corresponding duplicate rows, then a change that changes all of the duplicate rows at the source database also changes all the duplicate rows at the destination database when the row LCRs resulting from the change are applied.

For example, suppose a table at a source database has two duplicate rows. An update is performed on the duplicate rows, resulting in two row LCRs. At the destination

database, one row LCR is applied to one of the duplicate rows. At this point, the rows are no longer duplicate at the destination database because one of the rows has changed. When the second row LCR is applied at the destination database, the rows are duplicate again. Similarly, if a delete is performed on these duplicate rows at the source database, then both rows are deleted at the destination database when the row LCRs resulting from the source change are applied.

When substitute primary key columns are specified for a table, row LCRs are identified with rows in the table during apply using the substitute primary key columns. If substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply component parameter is set to `Y`, then an update performed on duplicate rows at the source database can result in different changes when the row LCRs are applied at the destination database. Specifically, if the update does not change one of the columns specified as a substitute primary key column, then the same duplicate row can be updated multiple times at the destination database, while other duplicate rows might not be updated.

Also, if the substitute key columns do not identify each row in the table at the destination database uniquely, then a row LCR identified with multiple rows can update any one of the rows. In this case, the update in the row LCR might not be applied to the correct row in the table at the destination database.

An apply component ignores substitute primary key columns when it determines whether rows in a table are duplicates. An apply component determines that rows are duplicates only if all of the column values in the rows are identical (excluding LOB, `LONG`, and `LONG RAW` columns). Therefore, an apply component always raises an error if a single update or delete changes two or more nonduplicate rows in a table.

For example, consider a table with columns `c1`, `c2`, and `c3` on which the `SET_KEY_COLUMNS` procedure is used to designate column `c1` as the substitute primary key. If two rows have the same key value for the `c1` column, but different value for the `c2` or `c3` columns, then an apply component does not treat the rows as duplicates. If an update or delete modifies more than one row because the `c1` values in the rows are the same, then the apply component raises an error regardless of the setting for the `allow_duplicate_rows` apply component parameter.

> **See Also:** SET_PARAMETER Procedure on page 23-56 for more information about the `allow_duplicate_rows` apply component parameter

The SET_KEY_COLUMNS Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_KEY_COLUMNS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

The SET_KEY_COLUMNS Procedure and CDBs

This procedure defines the columns that are used as a substitute primary key. You must perform the `SET_KEY_COLUMNS` procedure in the appropriate PDB.

SET_PARAMETER Procedure

This procedure sets an apply parameter to the specified value.

Syntax

```
DBMS_APPLY_ADM.SET_PARAMETER (
   apply_name  IN  VARCHAR2,
   parameter   IN  VARCHAR2,
   value       IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 23–21 SET_PARAMETER Procedure Parameters

Parameter	Description
apply_name	The apply component name. Do not specify an owner.
parameter	The name of the parameter you are setting. See "Apply Component Parameters" on page 23-56 for a list of these parameters.
value	The value to which the parameter is set. If NULL, then the parameter is set to its default value.

Apply Component Parameters

The following table lists the parameters for an apply component.

Table 23–22 Apply Component Parameters

Parameter Name	Possible Values	Default	Description
allow_duplicate_rows	Y or N	N	If Y and more than one row is changed by a single row logical change record (row LCR) with an UPDATE or DELETE command type, then the apply component only updates or deletes one of the rows. If N, then the apply component raises an error when it encounters a single row LCR with an UPDATE or DELETE command type that changes more than one row in a table. **Note:** Regardless of the setting for this parameter, apply components do not allow changes to duplicate rows for tables with LOB, LONG, or LONG RAW columns. **See Also:** "Usage Notes" on page 23-71 and "Duplicate Rows and Substitute Primary Key Columns" on page 23-54
apply_sequence_nextval	Y or N	N for apply processes Y for XStream outbound servers and XStream inbound servers	Controls whether the apply component checks and adjusts sequence values. If Y, then the apply component checks and adjusts sequence values. For ascending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or greater than the source sequence values. For descending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or less than the source sequence values. If N, then the apply component does not check or adjust sequence values. **Note:** This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** SET_PARAMETER Procedure on page 34-42 for information about the capture_sequence_nextval capture process parameter

Table 23–22 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
commit_serialization	DEPENDENT_TRANSACTIONS or FULL	DEPENDENT_TRANSACTIONS	The order in which applied transactions are committed. Apply servers can apply nondependent transactions at the destination database in an order that is different from the commit order at the source database. Dependent transactions are always applied at the destination database in the same order as they were committed at the source database. You control whether the apply servers can apply nondependent transactions in a different order at the destination database using the commit_serialization apply parameter. This parameter has the following settings: ■ DEPENDENT_TRANSACTIONS - The apply component can commit nondependent transactions in any order. Performance is best if you specify DEPENDENT_TRANSACTIONS. ■ FULL - The apply component commits applied transactions in the order in which they were committed at the source database. Regardless of the specification, applied transactions can execute in parallel subject to data dependencies and constraint dependencies. If you specify DEPENDENT_TRANSACTIONS, then a destination database might commit changes in a different order than the source database. For example, suppose two nondependent transactions are committed at the source database in the following order: 1. Transaction A 2. Transaction B At the destination database, these transactions might be committed in the opposite order: 1. Transaction B 2. Transaction A If you specify DEPENDENT_TRANSACTIONS and there are application constraints that are not enforced by the database, then use virtual dependency definitions or add RELY constraints to account for the application constraints. See *Oracle Streams Concepts and Administration* for information about virtual dependency definitions and *Oracle Database Data Warehousing Guide* for information about RELY constraints. **Note:** The NONE value is deprecated for this parameter. It is replaced by the DEPENDENT_TRANSACTIONS value. **See Also:** "Usage Notes" on page 23-71
compare_key_only	Y or N	N for apply processes Y for XStream inbound servers	If Y, then disables automatic conflict detection and only uses primary and unique key columns to identify the table row for a row LCR. If N, then enables automatic conflict detection and uses all of the old values in a row LCR to identify the table row for a row LCR. **Note:** The COMPARE_OLD_VALUES procedure in this package can disable comparison of old values for specified columns during apply. See COMPARE_OLD_VALUES Procedure on page 23-16. **See Also:** "Usage Notes" on page 23-71 and *Oracle Streams Replication Administrator's Guide* for information about automatic conflict detection

Table 23–22 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
compute_lcr_dep_on_arrival	Y or N	N	If Y, the dependencies are computed as the LCRs for the transaction are received. If N, the dependencies are computed only after all the LCRs for a transaction are received. If the target table has all of the same constraints as the source table, you can improve the performance by setting this parameter to Y. If the number of LCRs in transaction exceeds the value of the number of the eager_size parameter, then the dependencies for that transaction are calculated on arrival regardless of the setting of compute_lcr_dep_on_arrival. **Note:** This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations.
disable_on_error	Y or N	Y	If Y, then the apply component is disabled on the first unresolved error, even if the error is not irrecoverable. If N, then the apply component continues regardless of unresolved errors.
disable_on_limit	Y or N	N	If Y, then the apply component is disabled if the apply component terminates because it reached a value specified by the time_limit parameter or transaction_limit parameter. If N, then the apply component is restarted immediately after stopping because it reached a limit. When an apply component is restarted, it gets a new session identifier, and the processes associated with the apply component also get new session identifiers. However, the coordinator process number (APnn) remains the same.

Table 23–22 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
eager_size	A positive integer	9500	The apply component usually waits until it receives a commit record before starting to apply changes of a transaction. If XStream is enabled and more than eager_size LCRs arrive for a given transaction, then apply starts processing the changes. If XStream is not enabled and more than eager_size LCRs arrive for a given transaction, then apply waits until the complete transaction is received before processing the changes. Since it is possible that all existing apply servers are handling complete transactions from the source, additional apply servers are automatically created to handle outstanding eager transactions. The apply parameter max_parallelism limits the maximum number of apply servers that can be used for an apply process. This apply parameter is relevant only if its value is less than the value of the txn_lcr_spill_threshold apply parameter. When the value of txn_lcr_spill_threshold is lower than the value of eager_size, transactions spill to disk before eager apply begins. **Note:** This parameter is intended for XStream. Do not set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations.
enable_xstream_table_stats	Y orN	Y	When this parameter is set to Y, statistics about the operations of applied transactions are collected and made available in the V$XSTREAM_TABLE_STATS view. When this parameter is set to N, no statistics are collected. **Note:** This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Streams replication environment.
excludetag	Comma-delimited list of Oracle Streams tags	NULL	Controls whether the capture process for an outbound server captures DML changes that are tagged with one of the specified Oracle Streams tags. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Streams replication environment. **See Also:** "Usage Notes" on page 34-53 for the DBMS_CAPTURE_ADM.SET_PARAMETER procedure for more information about this parameter

Table 23–22 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
excludetrans	Comma-delimited list of transaction names	NULL	Controls whether the capture process for an outbound server captures DML changes in the specified transaction names. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Streams replication environment. **See Also:** "Usage Notes" on page 34-53 for the DBMS_CAPTURE_ADM.SET_PARAMETER procedure for more information about this parameter
excludeuser	Comma-delimited list of user names	NULL	Controls whether the capture process for an outbound server captures DML changes made by the specified users. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. Specify an exact pattern match for each user name. The pattern match is case sensitive. For example, specify HR for the hr user. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Streams replication environment. **See Also:** "Usage Notes" on page 34-53 for the DBMS_CAPTURE_ADM.SET_PARAMETER procedure for more information about this parameter
excludeuserid	Comma-delimited list of user ID values	NULL	Controls whether the capture process for an outbound server captures data manipulation language (DML) changes made by the specified users. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. To view the user ID for a user, query the USER_ID column in the ALL_USERS data dictionary view. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Streams replication environment. **See Also:** "Usage Notes" on page 34-53 for the DBMS_CAPTURE_ADM.SET_PARAMETER procedure for more information about this parameter

Table 23–22 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
getapplops	Y or N	Y	If Y, then the capture process captures DML changes if the original user is not specified in the excludeuserid or excludeuser parameters and the transaction name is not specified in the excludetrans parameter. If N, then the capture process ignores DML changes if the original user is not specified in the excludeuserid or excludeuser parameters and the transaction name is not specified in the excludetrans parameter. In either case, the capture process captures a DML change only if it satisfies the capture process's rule sets. When N is set for both getapplops and getreplicates, no data is captured. **Note:** This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Streams replication environment. **See Also:** "Usage Notes" on page 34-53 for the DBMS_CAPTURE_ADM.SET_PARAMETER procedure for more information about this parameter
getreplicates	Y or N	N	If Y, then the capture process captures DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter. If N, then the capture process ignores DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter. In either case, the capture process captures a DML change only if it satisfies the capture process's rule sets. When N is set for both getapplops and getreplicates, no data is captured. **Note:** This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Streams replication environment. **See Also:** "Usage Notes" on page 34-53 for the DBMS_CAPTURE_ADM.SET_PARAMETER procedure for more information about this parameter

Table 23–22 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
grouptransops	A positive integer from 1 to 10000	250 for apply processes and XStream inbound servers	The minimum number of LCRs that can be grouped into a single transaction. The commit LCR for a transaction is not included in the LCR count for the transaction.
		10000 for XStream outbound servers	This parameter enables an apply component to group LCRs from multiple transactions into a single transaction. The apply component groups only LCRs that are part of committed transactions. If a transaction has more LCRs than the setting for this parameter, then the transaction is applied as a single transaction. The apply component does not split a transaction into separate transactions. This parameter only takes effect if the parallelism parameter setting is 1. The grouptransops parameter is ignored if the parallelism parameter setting is greater than 1. **Note:** This parameter is intended for XStream outbound servers and inbound servers. An Oracle Streams apply process ignores this parameter unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 23-71
handlecollisions	Y or N	N	This parameter controls whether the apply component tries to resolve duplicate-record and missing-record errors when applying changes during data loading. This parameter should be set to N for normal replication activity. It should be set to Y only when data is being loaded (instantiated) and replication is enabled. If Y, then does the equivalent of OVERWRITE for INSERT, UPDATE and DELETE operations that get ROW_EXISTS errors, and ignores UPDATE and DELETE operations that get ROW_MISSING errors. Specifically, the apply component performs the following actions when this parameter is set to Y: ▪ If the operation is an insert and the primary key or unique key exists, then the insert is converted to an update. ▪ If the operation is an update that does not modify the primary key or unique key columns, and the row does not exist, then the change is ignored. ▪ If the operation is an update that modifies the primary key or unique key columns, and the row does not exist, then the change is ignored. ▪ If the operation is an update that modifies the primary key or unique key columns, and the a row with the new key values already exists, then delete the row with the old key values and replace the row with the new key values. ▪ If the operation is a delete and the row does not exist, then the change is ignored. If N then it disables the above settings. **Note:** This parameter is intended for an XStream In environment with one or more inbound servers. Do not set this parameter in an Oracle Streams replication environment.

Table 23–22 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
ignore_transaction	A valid source transaction ID or NULL	NULL	Instructs the apply component to ignore the specified transaction from the source database, effective immediately. Use caution when setting this parameter because ignoring a transaction might lead to data divergence between the source database and destination database. To ignore multiple transactions, specify each transaction in a separate call to the SET_PARAMETER procedure. The DBA_APPLY_PARAMETERS view displays a comma-delimited list of all transactions to be ignored. To clear the list of ignored transactions, run the SET_PARAMETER procedure and specify NULL for the ignore_transaction parameter. If NULL, then the apply component ignores this parameter. **Note:** An apply component ignores this parameter for transactions that were not captured by a capture process. **See Also:** "Usage Notes" on page 23-71
maximum_scn	A valid SCN or INFINITE	INFINITE	The apply component is disabled before applying a transaction with a commit SCN greater than or equal to the value specified. If INFINITE, then the apply component runs regardless of the SCN value. **Note:** An apply component ignores this parameter for transactions that were not captured by a capture process. **See Also:** "Usage Notes" on page 23-71
max_parallelism	A positive integer	50	Limits the maximum number of apply servers that can be used for an apply component. When the apply parallelism parameter is set greater than one, the apply component adds apply servers when necessary to process transactions until it reaches the limit set by this parameter (max_parallelism). Transactions include both unassigned (eager) and assigned transactions. Apply servers that idle for more than 5 minutes are shut down until the configured parallelism is attained. Runtime statistics for servers that have been shut down are aggregated into apply server 0 so that accurate apply statistics for the entire apply process can be maintained. **Note:** This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations.

Table 23–22 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
max_sga_size	A positive integer	INFINITE	Controls the amount of system global area (SGA) memory allocated specifically to the apply component, in megabytes. The memory is allocated for the duration of the apply component's session and is released when the apply component becomes disabled. **Note:** The sum of system global area (SGA) memory allocated for all components on a database must be less than the value set for the STREAMS_POOL_SIZE initialization parameter. If NULL, then the apply component uses the original default value. A NULL value has the same effect as resetting the parameter to its default value. **Note:** This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 23-71
optimize_progress_table	Y or N	Y	This parameter determines if a table or the redo log tracks the apply transactions. The progress table tracks completed apply transactions. If Y, transactions are tracked in the redo log. If N, transactions are tracked in a table. If the database is not in archivelog mode, then the setting of Y is ignored. **Note:** This parameter is intended for XStream. Do not set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 23-71
optimize_self_updates	Y or N	Y	This parameter affects conflict resolution when an update in the source database sets a column to its existing value. When this parameter is set to Y, a conflict between the value in the LCR and the corresponding column in the target database is considered resolved. When this parameter is set to N, the conflict is processed.

Table 23–22 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
parallelism	A positive integer	4	The number of apply servers that can concurrently apply transactions. The reader server and the apply server process names are ASnn, where nn can include letters and numbers. The total number of ASnn processes is the value of the parallelism parameter plus one. For example, if parallelism is set to 4, then an apply component uses a total of five ASnn processes. In this case, there is one reader server and four apply servers. Setting the parallelism parameter to a number higher than the number of available operating system user processes can disable the apply component. Make sure the PROCESSES initialization parameter is set appropriately when you set the parallelism parameter. **Note:** When the value of this parameter is changed from 1 to a higher value for a running apply component, the apply component is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied. When the value of this parameter is greater than 1, and the parameter value is decreased or increased, the apply component does not restart. **See Also:** "Usage Notes" on page 23-71
parallelism_interval	0 or a positive integer	0	The parallelism interval is the interval in seconds at which the current workload activity is computed. The apply component calculates the mean throughput every 5 X parallelism_interval seconds. After each calculation, the apply component can increase or decrease the number of apply servers to try to improve throughput. If throughput is improved, then the apply component keeps the new number of apply servers. The parallelism interval is used only if the parallelism parameter is set to a value greater than one and the max_parallelism parameter value is greater than the parallelism parameter value. **Note:** This parameter is intended for an XStream In environment with one or more inbound servers. XStream outbound servers ignore this parameter. Do not set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 23-71

Table 23–22 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
preserve_encryption	Y or N	Y	Whether to preserve encryption for columns encrypted using Transparent Data Encryption. If Y, then columns in tables at the destination database must be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then an error is raised when the apply component tries to apply the row LCRs. If N, then columns in tables at the destination database do not need to be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then the apply component applies the changes in the row LCRs. **Note:** When the value of this parameter is changed for a running apply component, the apply component is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied. **See Also:** "Usage Notes" on page 23-71
rtrim_on_implicit_conversion	Y or N	Y	Whether to remove blank padding from the right end of a column when automatic datatype conversion is performed during apply. If Y, then blank padding is removed when a CHAR or NCHAR source column in a row LCR is converted to a VARCHAR2, NVARCHAR2, or CLOB column in a table. If N, then blank padding is preserved in the column. **See Also:** "Usage Notes" on page 23-71 and *Oracle Streams Concepts and Administration* for information about automatic datatype conversion during apply
startup_seconds	0, a positive integer, or INFINITE	0	The maximum number of seconds to wait for another instantiation of the same apply component to finish. If the other instantiation of the same apply component does not finish within this time, then the apply component does not start. If INFINITE, then an apply component does not start until another instantiation of the same apply component finishes. **See Also:** "Usage Notes" on page 23-71

Table 23–22 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
suppresstriggers	Y or N	Y	This parameter controls whether triggers fire when a change is made by the apply component. If Y, triggers do not fire for changes made by the apply component. If N, triggers fire for changes made by the apply component. If a trigger's firing property is set to always fire, then the trigger always fires for changes made by the apply component, regardless of the value of the suppresstriggers parameter. A trigger's firing property is set to always fire by running the the DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY procedure with the fire_once parameter set to FALSE. **Note:** This parameter is intended for an XStream In environment with one or more inbound servers. Do not set this parameter in an Oracle Streams replication environment. **See Also:** "Usage Notes" on page 23-71
time_limit	A positive integer or INFINITE	INFINITE	The apply component stops as soon as possible after the specified number of seconds since it started. If INFINITE, then the apply component continues to run until it is stopped explicitly. **See Also:** "Usage Notes" on page 23-71
trace_level	0 or a positive integer	0	Set this parameter only under the guidance of Oracle Support Services. **See Also:** "Usage Notes" on page 23-71
transaction_limit	A positive integer or INFINITE	INFINITE	The apply component stops after applying the specified number of transactions. If INFINITE, then the apply component continues to run regardless of the number of transactions applied. **See Also:** "Usage Notes" on page 23-71

Table 23–22 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
txn_age_spill_threshold	A positive integer or INFINITE	900	The apply component begins to spill messages from memory to hard disk for a particular transaction when the amount of time that any message in the transaction has been in memory exceeds the specified number. The parameter specifies the age in seconds. When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table. Message spilling occurs at the transaction level. For example, if this parameter is set to 900, and the reader server of an apply component detects that one message in a transaction has been in memory longer than 900 seconds, then all of the messages in the transaction spill from memory to hard disk. If INFINITE, then the apply component does not spill messages to the hard disk based on the age of the messages. Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply component. **See Also:** "Usage Notes" on page 23-71

Table 23–22 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
txn_lcr_spill_threshold	A positive integer or INFINITE	10000	The apply component begins to spill messages from memory to hard disk for a particular transaction when the number of messages in memory for the transaction exceeds the specified number. The number of messages in first chunk of messages spilled from memory equals the number specified for this parameter, and the number of messages spilled in future chunks is either 100 or the number specified for this parameter, whichever is less. If the reader server of an apply component has the specified number of messages in memory for a particular transaction, then when it detects the next message for this transaction, it spills the messages that are in memory to the hard disk. For example, if this parameter is set to 10000, and a transaction has 10,200 messages, then the reader server handles the transaction in the following way: 1. Reads the first 10,000 messages in the transaction into memory 2. Spills messages 1 - 10,000 to hard disk when it detects message 10,000 3. Reads the next 100 messages in the transaction into memory 4. Spills messages 10,001 - 10,100 to hard disk when it detects message 10,100 5. Reads the next 100 messages in the transaction into memory The apply component applies the first 10,100 messages from the hard disk and the last 100 messages from memory. When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table. Message spilling occurs at the transaction level. For example, if this parameter is set to 10000, and the reader server of an apply component is assembling two transactions, one with 7,500 messages and another with 8,000 messages, then it does not spill any messages. If INFINITE, then the apply component does not spill messages to the hard disk based on the number of messages in a transaction. Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply component. **See Also:** "Usage Notes" on page 23-71
write_alert_log	Y or N	Y	If Y, then the apply component writes a message to the alert log on exit. If N, then the apply component does not write a message to the alert log on exit. The message specifies the reason why the apply component stopped.

Usage Notes

The following usage notes apply to this procedure:

- Delays Are Possible Before New Parameter Settings Take Effect

Delays Are Possible Before New Parameter Settings Take Effect

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Parameters Interpreted as Positive Integers

For all parameters that are interpreted as positive integers, the maximum possible value is `4,294,967,295`. Where applicable, specify `INFINITE` for larger values.

Parameters with a System Change Number (SCN) Setting

For parameters that require an SCN setting, any valid SCN value can be specified.

The SET_PARAMETER Procedure and Streams

You can use the following parameters in Streams if you enable XStream performance optimizations for Oracle Streams using the procedure `DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS`:

- `apply_sequence_nextval`
- `compute_lcr_dep_on_arrival`
- `eager_size`
- `grouptransops`
- `max_parallelism`
- `max_sga_size`
- `optimize_progress_table`
- `parallelism_interval`

The SET_PARAMETER Procedure and XStream Outbound Servers

Outbound servers ignore the settings for the following apply parameters:

- `allow_duplicate_rows`
- `commit_serialization`
- `compare_key_only`
- `compute_lcr_dep_on_arrival`
- `disable_on_error`
- `eager_size`
- `enable_xstream_table_stats`
- `grouptransops`
- `handlecollisions`
- `optimize_self_updates`

- parallelism
- parallelism_interval
- preserve_encryption
- rtrim_on_implicit_conversion
- suppresstriggers

The commit_serialization parameter is always set to FULL for an outbound server, and the parallelism parameter is always set to 1 for an outbound server.

You can use the other apply parameters with outbound servers.

> **Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

The SET_PARAMETER Procedure and XStream Inbound Servers

Inbound servers ignore the settings for the following apply parameters:

- excludetag
- excludetrans
- excludeuser
- excludeuserid
- getapplops
- getreplicates
- ignore_transaction
- maximum_scn

You can use all of the other apply component parameters with inbound servers.

The default setting for the compare_key_only parameter for an inbound server is Y.

The default setting for the parallelism parameter for an inbound server is 4.

> **Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

SET_SCHEMA_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database. This procedure overwrites any existing instantiation SCN for the schema, and, if it sets the instantiation SCN for a table, it overwrites any existing instantiation SCN for the table.

This procedure gives you precise control over which DDL logical change records (LCRs) for a schema are ignored and which DDL LCRs are applied by an apply component.

Syntax

```
DBMS_APPLY_ADM.SET_SCHEMA_INSTANTIATION_SCN(
  source_schema_name    IN  VARCHAR2,
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  recursive             IN  BOOLEAN   DEFAULT FALSE,
  source_root_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 23–23 SET_SCHEMA_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_schema_name	The name of the source schema. For example, hr. When setting an instantiation SCN for schema, always specify the name of the schema at the source database, even if a rule-based transformation or apply handler is configured to change the schema name.
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source schema from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.

Table 23–23 (Cont.) SET_SCHEMA_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
recursive	If TRUE, then the procedure sets the instantiation SCN for the specified schema and all tables owned by the schema in the source database. This procedure selects the tables owned by the specified schema from the ALL_TABLES data dictionary view at the source database under the security context of the current user. If FALSE, then the procedure sets the instantiation SCN for specified schema, but does not set the instantiation SCN for any tables **Note:** If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.
source_root_name	The global name of the source root database. In a non-CDB, this parameter must be NULL. In a CDB, both source_database and source_root_name must be specified to identify a specific container.

Usage Notes

The following usage notes apply to this procedure:

- The SET_SCHEMA_INSTANTIATION_SCN Procedure and LCRs
- Instantiation SCNs and DDL LCRs
- The recursive Parameter
- The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Outbound Servers
- The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Inbound Servers
- The SET_SCHEMA_INSTANTIATION_SCN Procedure and CDBs

See Also:

- SET_GLOBAL_INSTANTIATION_SCN Procedure on page 23-50
- SET_TABLE_INSTANTIATION_SCN Procedure on page 23-77
- LCR$_DDL_RECORD Type on page 275-6 for more information about DDL LCRs
- *Oracle Streams Replication Administrator's Guide*

The SET_SCHEMA_INSTANTIATION_SCN Procedure and LCRs

Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

Instantiation SCNs and DDL LCRs

If the commit SCN of a DDL LCR for a database object in a schema from a source database is less than or equal to the instantiation SCN for that database object at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The schema instantiation SCN specified by this procedure is used on the following types of DDL LCRs:

- DDL LCRs with a `command_type` of `CREATE TABLE`
- DDL LCRs with a non-`NULL` `object_owner` specified and neither `base_table_owner` nor `base_table_name` specified.

For example, the schema instantiation SCN set by this procedure is used for a DDL LCR with a `command_type` of `CREATE TABLE` and `ALTER USER`.

The schema instantiation SCN specified by this procedure is not used for DDL LCRs with a `command_type` of `CREATE USER`. A global instantiation SCN is needed for such DDL LCRs.

The recursive Parameter

If the `recursive` parameter is set to `TRUE`, then this procedure sets the table instantiation SCN for each table at the source database owned by the schema. This procedure uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any tables.

The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

> **See Also:** *Oracle Database XStream Guide* for more information about outbound servers and instantiation SCNs

The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

The SET_SCHEMA_INSTANTIATION_SCN Procedure and CDBs

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.

SET_TABLE_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified table in the specified source database. This procedure overwrites any existing instantiation SCN for the particular table.

This procedure gives you precise control over which logical change records (LCRs) for a table are ignored and which LCRs are applied by an apply component.

Syntax

```
DBMS_APPLY_ADM.SET_TABLE_INSTANTIATION_SCN(
  source_object_name    IN  VARCHAR2,
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  source_root_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 23–24 SET_TABLE_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_object_name	The name of the source object specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. When setting an instantiation SCN for a database object, always specify the name of the schema and database object at the source database, even if a rule-based transformation or apply handler is configured to change the schema name or database object name.
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source table from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database. **Note:** This parameter must be NULL when the procedure is invoked from the root of a CDB.
source_root_name	The global name of the source root database. In a non-CDB, this parameter must be NULL. In a CDB, both source_database and source_root_name must be specified to identify a specific container.

Usage Notes

The following usage notes apply to this procedure:

- Instantiation SCNs and LCRs

- The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Outbound Servers
- The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Inbound Servers
- The SET_TABLE_INSTANTIATION_SCN Procedure and CDBs

Instantiation SCNs and LCRs

If the commit SCN of an LCR for a table from a source database is less than or equal to the instantiation SCN for that table at some destination database, then the apply component at the destination database disregards the LCR. Otherwise, the apply component applies the LCR.

The table instantiation SCN specified by this procedure is used on the following types of LCRs:

- Row LCRs for the table
- DDL LCRs that have a non-`NULL` `base_table_owner` and `base_table_name` specified, except for DDL LCRs with a `command_type` of `CREATE TABLE`

For example, the table instantiation SCN set by this procedure is used for DDL LCRs with a `command_type` of `ALTER TABLE` or `CREATE TRIGGER`.

Note: The instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

- SET_GLOBAL_INSTANTIATION_SCN Procedure on page 23-50
- SET_SCHEMA_INSTANTIATION_SCN Procedure on page 23-74
- LCR$_ROW_RECORD Type on page 275-15 for more information about row LCRs
- LCR$_DDL_RECORD Type on page 275-6 for more information about DDL LCRs
- *Oracle Streams Replication Administrator's Guide*

The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

See Also: *Oracle Database XStream Guide* for more information about outbound servers and instantiation SCNs

The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

The SET_TABLE_INSTANTIATION_SCN Procedure and CDBs

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.

SET_UPDATE_CONFLICT_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt update conflict handler for the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
   object_name          IN  VARCHAR2,
   method_name          IN  VARCHAR2,
   resolution_column    IN  VARCHAR2,
   column_list          IN  DBMS_UTILITY.NAME_ARRAY,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 23–25 SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
object_name	The schema and name of the table, specified as [*schema_name.*]*object_name*, for which an update conflict handler is being added, modified, or removed. For example, if an update conflict handler is being added for table employees owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.
method_name	Type of update conflict handler to create. You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained: ■ MAXIMUM: Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database. ■ MINIMUM: Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database. ■ OVERWRITE: Applies the column list from the source database, overwriting the column values at the destination database. ■ DISCARD: Retains the column list from the destination database, discarding the column list from the source database. If NULL, then the procedure removes any existing update conflict handler with the same object_name, resolution_column, and column_list. If non-NULL, then the procedure replaces any existing update conflict handler with the same object_name and resolution_column.
resolution_column	Name of the column used to uniquely identify an update conflict handler. For the MAXIMUM and MINIMUM prebuilt methods, the resolution column is also used to resolve the conflict. The resolution column must be one of the columns listed in the column_list parameter. NULL is not allowed for this parameter. For the OVERWRITE and DISCARD prebuilt methods, you can specify any column in the column list.

Table 23–25 (Cont.) SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
column_list	List of columns for which the conflict handler is called. The same column cannot be in more than one column list. If a conflict occurs for one or more of the columns in the list when an apply component tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list. **Note:** Prebuilt update conflict handlers do not support LOB, LONG, LONG RAW, user-defined type, and Oracle-suppled type columns. Therefore, you should not include these types of columns in the column_list parameter.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database. **Note:** Currently, conflict handlers are not supported when applying changes to a non-Oracle database.

Usage Notes

The following usage notes apply to this procedure:

- Modifying an Existing Update Conflict Handler
- Removing an Existing Update Conflict Handler
- Series of Actions for Conflicts
- Procedure DML Handlers for Conflicts
- A Column Can Be in Only One Column List
- Update Conflict Handlers and Non-Oracle Databases
- The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Outbound Servers
- The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Inbound Servers

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about prebuilt and custom update conflict handlers

Modifying an Existing Update Conflict Handler

If you want to modify an existing update conflict handler, then you specify the table and resolution column of an the existing update conflict handler. You can modify the prebuilt method or the column list.

Removing an Existing Update Conflict Handler

If you want to remove an existing update conflict handler, then specify NULL for the prebuilt method and specify the table, column list, and resolution column of the existing update conflict handler.

Series of Actions for Conflicts

If an update conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate update conflict handler to resolve the conflict

2. If no update conflict handler is specified or if the update conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply component, table, and operation to handle the error
3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue

> **See Also:** "Signature of a DML Handler Procedure or Error Handler Procedure" on page 23-43 for information about setting an error handler

Procedure DML Handlers for Conflicts

If you cannot use a prebuilt update conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the `SET_DML_HANDLER` procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

> **See Also:** SET_DML_HANDLER Procedure on page 23-41

A Column Can Be in Only One Column List

When a column is in a column list, and you try to add the same column to another column list, this procedure returns the following error:

```
ORA-00001: UNIQUE CONSTRAINT (SYS.APPLY$_CONF_HDLR_COLUMNS_UNQ1) VIOLATED
```

Update Conflict Handlers and Non-Oracle Databases

Setting an update conflict handler for an apply component that is applying to a non-Oracle database is not supported.

The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

Examples

The following is an example for setting an update conflict handler for the `employees` table in the `hr` schema:

```
DECLARE
  cols  DBMS_UTILITY.NAME_ARRAY;
BEGIN
  cols(1) := 'salary';
  cols(2) := 'commission_pct';
  DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name           =>  'hr.employees',
    method_name           =>  'MAXIMUM',
    resolution_column     =>  'salary',
    column_list           =>  cols);
END;
/
```

This example sets a conflict handler that is called if a conflict occurs for the `salary` or `commission_pct` column in the `hr.employees` table. If such a conflict occurs, then the `salary` column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the `job_id` column, then this conflict handler is not called.

SET_VALUE_DEPENDENCY Procedure

This procedure sets or removes a value dependency. A value dependency is a virtual dependency definition that defines a relationship between the columns of two or more tables.

An apply component uses the name of a value dependencies to detect dependencies between row logical change records (row LCRs) that contain the columns defined in the value dependency. Value dependencies can define virtual foreign key relationships between tables, but, unlike foreign key relationships, value dependencies can involve more than two database objects.

This procedure is overloaded. The `attribute_list` and `attribute_table` parameters are mutually exclusive.

See Also: *Oracle Streams Concepts and Administration*

Syntax

```
DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
   dependency_name IN VARCHAR2,
   object_name     IN VARCHAR2,
   attribute_list  IN VARCHAR2);

DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
   dependency_name IN VARCHAR2,
   object_name     IN VARCHAR2,
   attribute_table IN DBMS_UTILITY.NAME_ARRAY);
```

Parameters

Table 23–26 SET_VALUE_DEPENDENCY Procedure Parameters

Parameter	Description
`dependency_name`	The name of the value dependency. If a dependency with the specified name does not exist, then it is created. If a dependency with the specified name exists, then the specified object and attributes are added to the dependency. If `NULL`, an error is raised.
`object_name`	The name of the table, specified as `[`*`schema_name`*`.]`*`table_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. If `NULL` and the specified dependency exists, then the dependency is removed. If `NULL` and the specified dependency does not exist, then an error is raised. If `NULL`, then `attribute_list` and `attribute_table` also must be `NULL`.
`attribute_list`	A comma-delimited list of column names in the table. There must be no spaces between entries.
`attribute_table`	A PL/SQL associative array of type `DBMS_UTILITY.NAME_ARRAY` that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be `NULL` terminated.

Usage Notes

The following usage notes apply to this procedure:

- The SET_VALUE_DEPENDENCY Procedure and XStream Outbound Servers
- The SET_VALUE_DEPENDENCY Procedure and XStream Inbound Servers

The SET_VALUE_DEPENDENCY Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_VALUE_DEPENDENCY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

START_APPLY Procedure

This procedure directs the apply component to start applying messages.

Syntax

```
DBMS_APPLY_ADM.START_APPLY(
   apply_name  IN  VARCHAR2);
```

Parameter

Table 23–27 START_APPLY Procedure Parameter

Parameter	Description
apply_name	The apply component name. A NULL setting is not allowed. Do not specify an owner.

Usage Notes

The following usage notes apply to this procedure:

- Apply Component Status
- The START_APPLY Procedure and XStream Outbound Servers
- The START_APPLY Procedure and XStream Inbound Servers

Apply Component Status

The apply component status is persistently recorded. Hence, if the status is ENABLED, then the apply component is started upon database instance startup. An apply component (a*nnn*) is an Oracle background process. The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the start status of an apply component.

The START_APPLY Procedure and XStream Outbound Servers

This procedure functions the same way for apply processes and outbound servers.

The START_APPLY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

STOP_APPLY Procedure

This procedure stops the apply component from applying messages and rolls back any unfinished transactions being applied.

Syntax

```
DBMS_APPLY_ADM.STOP_APPLY(
   apply_name  IN  VARCHAR2,
   force       IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 23–28 STOP_APPLY Procedure Parameters

Parameter	Description
apply_name	The apply component name. A NULL setting is not allowed. Do not specify an owner.
force	If TRUE, then the procedure stops the apply component as soon as possible. If FALSE, then the procedure stops the apply component after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply component depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply component parameter. See "Usage Notes" for more information.

Usage Notes

The following usage notes apply to this procedure:

- Apply Component Status
- Queue Subprograms Have No Effect on Apply Component Status
- The STOP_APPLY force Parameter and the commit_serialization Apply Parameter
- The STOP_APPLY Procedure and XStream Outbound Servers
- The STOP_APPLY Procedure and XStream Inbound Servers

Apply Component Status

The apply component status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the apply component is not started upon database instance startup.

Queue Subprograms Have No Effect on Apply Component Status

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the STOP status of an apply component.

The STOP_APPLY force Parameter and the commit_serialization Apply Parameter

The following table describes apply component behavior for each setting of the force parameter in the STOP_APPLY procedure and the commit_serialization apply component parameter. In all cases, the apply component rolls back any unfinished transactions when it stops.

force	commit_serialization	Apply Component Behavior
TRUE	FULL	The apply component stops immediately and does not apply any unfinished transactions.
TRUE	DEPENDENT_ TRANSACTIONS	When the apply component stops, some transactions that have been applied locally might have committed at the source database at a later point in time than some transactions that have not been applied locally.
FALSE	FULL	The apply component stops after applying the next uncommitted transaction in the commit order, if any such transaction is in progress.
FALSE	DEPENDENT_ TRANSACTIONS	Before stopping, the apply component applies all of the transactions that have a commit time that is earlier than the applied transaction with the most recent commit time.

For example, assume that the commit_serialization apply component parameter is set to DEPENDENT_TRANSACTIONS and there are three transactions: transaction 1 has the earliest commit time, transaction 2 is committed after transaction 1, and transaction 3 has the latest commit time. Also assume that an apply component has applied transaction 1 and transaction 3 and is in the process of applying transaction 2 when the STOP_APPLY procedure is run. Given this scenario, if the force parameter is set to TRUE, then transaction 2 is not applied, and the apply component stops (transaction 2 is rolled back). If, however, the force parameter is set to FALSE, then transaction 2 is applied before the apply component stops.

A different scenario would result if the commit_serialization apply component parameter is set to FULL. For example, assume that the commit_serialization apply component parameter is set to FULL and there are three transactions: transaction A has the earliest commit time, transaction B is committed after transaction A, and transaction C has the latest commit time. In this case, the apply component has applied transaction A and is in the process of applying transactions B and C when the STOP_APPLY procedure is run. Given this scenario, if the force parameter is set to TRUE, then transactions B and C are not applied, and the apply component stops (transactions B and C are rolled back). If, however, the force parameter is set to FALSE, then transaction B is applied before the apply component stops, and transaction C is rolled back.

> **See Also:** SET_PARAMETER Procedure on page 23-56 for more information about the commit_serialization apply component parameter

The STOP_APPLY Procedure and XStream Outbound Servers

This procedure functions the same way for apply processes and outbound servers.

The STOP_APPLY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

24

DBMS_AQ

The DBMS_AQ package provides an interface to Oracle Streams Advanced Queuing (AQ).

See Also:

- *Oracle Database Advanced Queuing User's Guide*
- Oracle Database Advanced Queuing (AQ) Types for information about TYPEs to use with DBMS_AQ.

This chapter contains the following topics:

Using DBMS_AQ

This section contains the following topics.

Security Model

Initially, only SYS and SYSTEM have execution privilege for the procedures in DBMS_AQ and DBMS_AQADM.

Queue Security

To enqueue or dequeue, users need EXECUTE rights on DBMS_AQ and either ENQUEUE or DEQUEUE privileges on target queues, or ENQUEUE_ANY/DEQUEUE_ANY system privileges. Users who have been granted EXECUTE rights to DBMS_AQ and DBMS_AQADM are able to create, manage, and use queues in their own schemas. The MANAGE_ANY AQ system privilege is used to create and manage queues in other schemas.

As a database user, you do not need any explicit object-level or system-level privileges to enqueue or dequeue to queues in your own schema other than the EXECUTE right on DBMS_AQ.

> **See Also:** *Oracle Database Advanced Queuing User's Guide* for more information on queue privileges and access control.

OCI Applications and Queue Access

For an Oracle Call Interface (OCI) application to access a queue, the session user must be granted either the object privilege of the queue he intends to access or the ENQUEUE ANY QUEUE or DEQUEUE ANY QUEUE system privileges. The EXECUTE right of DBMS_AQ is not checked against the session user's rights.

Security Required for Propagation

Propagation jobs are owned by SYS, but the propagation occurs in the security context of the queue table owner. Previously propagation jobs were owned by the user scheduling propagation, and propagation occurred in the security context of the user setting up the propagation schedule. The queue table owner must be granted EXECUTE privileges on the DBMS_AQADM package. Otherwise, the Oracle Database snapshot processes do not propagate and generate trace files with the error identifier SYS.DBMS_AQADM not defined. Private database links owned by the queue table owner can be used for propagation. The username specified in the connection string must have EXECUTE access on the DBMS_AQ and DBMS_AQADM packages on the remote database.

> **See Also:**
>
> - Chapter 25, "DBMS_AQADM."
> - *Oracle Database Advanced Queuing User's Guide* for more information on security required for propagation.

Constants

The DBMS_AQ package uses the constants shown in Table 24–1.

When using enumerated constants such as BROWSE, LOCKED, or REMOVE, the PL/SQL constants must be specified with the scope of the packages defining it. All types associated with the operational interfaces have to be prepended with DBMS_AQ. For example: DBMS_AQ.BROWSE.

> **Note:** The sequence_deviation attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if message_grouping parameter of DBMS_AQADM subprograms is set to TRANSACTIONAL. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

Table 24–1 Enumerated Constants

Parameter	Options	Type	Description
VISIBILITY	IMMEDIATE		
.	ON_COMMIT		
DEQUEUE_MODE	BROWSE		
.	LOCKED		
.	REMOVE

Data Structures

Table 24–2 DBMS_AQ Data Structures

Data Structures	Description
Object Name on page 24-6	Names database objects
Type Name on page 24-6	Defines queue types
Oracle Database Advanced Queuing PL/SQL Callback on page 24-7	Specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification

Object Name

The `object_name` data structure names database objects. It applies to queues, queue tables, agent names, and object types.

Syntax

```
object_name := VARCHAR2;
object_name := [schema_name.]name;
```

Usage Notes

Names for objects are specified by an optional schema name and a name. If the schema name is not specified, the current schema is assumed. The name must follow object name guidelines in *Oracle Database SQL Language Reference* with regard to reserved characters. Schema names, agent names, and object type names can be up to 30 bytes long. Queue names and queue table names can be up to 24 bytes long.

Type Name

The `type_name` data structure defines queue types.

Syntax

```
type_name := VARCHAR2;
type_name := object_type | "RAW";
```

Attributes

Table 24–3 Type Name Attributes

Attribute	Description
object_type	Maximum number of attributes in the object type is limited to 900.

Table 24–3 (Cont.) Type Name Attributes

Attribute	Description
"RAW"	To store payload of type RAW, Oracle Database Advanced Queuing creates a queue table with a LOB column as the payload repository. The theoretical maximum size of the message payload is the maximum amount of data that can be stored in a LOB column. However, the maximum size of the payload is determined by which programmatic environment you use to access Oracle Database Advanced Queuing. For PL/SQL, Java and precompilers the limit is 32K; for the OCI the limit is 4G. Because the PL/SQL enqueue and dequeue interfaces accept RAW buffers as the payload parameters you will be limited to 32K bytes. In OCI, the maximum size of your RAW data will be limited to the maximum amount of contiguous memory (as an OCIRaw is simply an array of bytes) that the OCI Object Cache can allocate. Typically, this will be at least 32K bytes and much larger in many cases. Because LOB columns are used for storing RAW payload, the Oracle Database Advanced Queuing administrator can choose the LOB tablespace and configure the LOB storage by constructing a LOB storage string in the storage_clause parameter during queue table creation time.

Oracle Database Advanced Queuing PL/SQL Callback

The plsqlcallback data structure specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification.

Syntax

If a notification message is expected for a RAW payload enqueue, then the PL/SQL callback must have the following signature:

```
procedure plsqlcallback(
  context  IN  RAW,
  reginfo  IN  SYS.AQ$_REG_INFO,
  descr    IN  SYS.AQ$_DESCRIPTOR,
  payload  IN  RAW,
  payloadl IN  NUMBER);
```

Attributes

Table 24–4 Oracle Database Advanced Queuing PL/SQL Callback Attributes

Attribute	Description
context	Specifies the context for the callback function that was passed by dbms_aq.register. See AQ$_REG_INFO Type on page 271-14.
reginfo	See AQ$_REG_INFO Type on page 271-14.
descr	See AQ$_DESCRIPTOR Type on page 271-7
payload	If a notification message is expected for a raw payload enqueue then this contains the raw payload that was enqueued into a non persistent queue. In case of a persistent queue with raw payload this parameter will be null.
payloadl	Specifies the length of payload. If payload is null, payload1 = 0.

If the notification message is expected for an ADT payload enqueue, the PL/SQL callback must have the following signature:

```
procedure plsqlcallback(
  context  IN RAW,
```

```
reginfo  IN SYS.AQ$_REG_INFO,
descr    IN SYS.AQ$_DESCRIPTOR,
payload  IN VARCHAR2,
payloadl IN NUMBER);
```

Operational Notes

DBMS_AQ and DBMS_AQADM Java Classes

Java interfaces are available for `DBMS_AQ` and `DBMS_AQADM`. The Java interfaces are provided in the `$ORACLE_HOME/rdbms/jlib/aqapi.jar`. Users are required to have `EXECUTE` privileges on the `DBMS_AQIN` package to use these interfaces.

Summary of DBMS_AQ Subprograms

Table 24–5 DBMS_AQ Package Subprograms

Subprograms	Description
BIND_AGENT Procedure on page 24-11	Creates an entry for an Oracle Database Advanced Queuing agent in the LDAP directory
DEQUEUE Procedure on page 24-12	Dequeues a message from the specified queue
DEQUEUE_ARRAY Function on page 24-15	Dequeues an array of messages from the specified queue
ENQUEUE Procedure on page 24-17	Adds a message to the specified queue
ENQUEUE_ARRAY Function on page 24-19	Adds an array of messages to the specified queue
LISTEN Procedures on page 24-20	Listen to one or more queues on behalf of a list of agents
POST Procedure on page 24-22	Posts to a anonymous subscription which allows all clients who are registered for the subscription to get notifications
REGISTER Procedure on page 24-23	Registers for message notifications
UNBIND_AGENT Procedure on page 24-24	Removes an entry for an Oracle Database Advanced Queuing agent from the LDAP directory
UNREGISTER Procedure on page 24-25	Unregisters a subscription which turns off notification

Note: `DBMS_AQ` does not have a purity level defined; therefore, you cannot call any procedure in this package from other procedures that have `RNDS`, `WNDS`, `RNPS` or `WNPS` constraints defined.

BIND_AGENT Procedure

This procedure creates an entry for an Oracle Database Advanced Queuing agent in the LDAP server.

Syntax

```
DBMS_AQ.BIND_AGENT(
   agent        IN SYS.AQ$_AGENT,
   certificate  IN VARCHAR2 default NULL);
```

Parameters

Table 24–6 BIND_AGENT Procedure Parameters

Parameter	Description
`agent`	Agent that is to be registered in LDAP server.
`certificate`	Location (LDAP distinguished name) of the "organizationalperson" entry in LDAP whose digital certificate (attribute `usercertificate`) is to be used for this agent. Example: "cn=OE, cn=ACME, cn=com" is a distinguished name for a OrganizationalPerson OE whose certificate will be used with the specified agent.

Usage Notes

In the LDAP server, digital certificates are stored as an attribute (`usercertificate`) of the `OrganizationalPerson` entity. The distinguished name for this `OrganizationalPerson` must be specified when binding the agent.

DEQUEUE Procedure

This procedure dequeues a message from the specified queue.

Syntax

```
DBMS_AQ.DEQUEUE (
   queue_name           IN      VARCHAR2,
   dequeue_options      IN      dequeue_options_t,
   message_properties   OUT     message_properties_t,
   payload              OUT     "<ADT_1>"
   msgid                OUT     RAW);
```

Parameters

Table 24–7 DEQUEUE Procedure Parameters

Parameter	Description
`queue_name`	Specifies the name of the queue.
`dequeue_options`	See DEQUEUE_OPTIONS_T Type on page 271-19.
`message_properties`	See MESSAGE_PROPERTIES_T Type on page 271-26.
`payload`	Not interpreted by Oracle Database Advanced Queuing. The payload must be specified according to the specification in the associated queue table. For the definition of *`type_name`* refer to Type Name on page 24-6.
`msgid`	System generated identification of the message.

Usage Notes

The search criteria for messages to be dequeued is determined by the following parameters in `dequeue_options`:

- `consumer_name`
- `msgid`

  `Msgid` uniquely identifies the message to be dequeued. Only messages in the `READY` state are dequeued unless `msgid` is specified.

- `correlation`

  Correlation identifiers are application-defined identifiers that are not interpreted by Oracle Database Advanced Queuing.

- `deq_condition`

  Dequeue condition is an expression based on the message properties, the message data properties and PL/SQL functions. A `deq_condition` is specified as a Boolean expression using syntax similar to the `WHERE` clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Message properties include `priority`, `corrid` and other columns in the queue table.

  To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with `tab.user_data` as a qualifier to indicate the specific column of the queue table that stores the payload.

Example: `tab.user_data.orderstatus='EXPRESS'`

The dequeue order is determined by the values specified at the time the queue table is created unless overridden by the `msgid` and correlation ID in `dequeue_options`.

The database-consistent read mechanism is applicable for queue operations. For example, a `BROWSE` call may not see a message that is enqueued after the beginning of the browsing transaction.

The default `NAVIGATION` parameter during dequeue is `NEXT_MESSAGE`. This means that subsequent dequeues will retrieve the messages from the queue based on the snapshot obtained in the first dequeue. In particular, a message that is enqueued after the first dequeue command will be processed only after processing all the remaining messages in the queue. This is usually sufficient when all the messages have already been enqueued into the queue, or when the queue does not have a priority-based ordering. However, applications must use the `FIRST_MESSAGE` navigation option when the first message in the queue needs to be processed by every dequeue command. This usually becomes necessary when a higher priority message arrives in the queue while messages already-enqueued are being processed.

Note: It may be more efficient to use the `FIRST_MESSAGE` navigation option when messages are concurrently enqueued. If the `FIRST_MESSAGE` option is not specified, Oracle Database Advanced Queuing continually generates the snapshot as of the first dequeue command, leading to poor performance. If the `FIRST_MESSAGE` option is specified, then Oracle Database Advanced Queuing uses a new snapshot for every dequeue command.

Messages enqueued in the same transaction into a queue that has been enabled for message grouping will form a group. If only one message is enqueued in the transaction, then this will effectively form a group of one message. There is no upper limit to the number of messages that can be grouped in a single transaction.

In queues that have not been enabled for message grouping, a dequeue in `LOCKED` or `REMOVE` mode locks only a single message. By contrast, a dequeue operation that seeks to dequeue a message that is part of a group will lock the entire group. This is useful when all the messages in a group need to be processed as an atomic unit.

When all the messages in a group have been dequeued, the dequeue returns an error indicating that all messages in the group have been processed. The application can then use the `NEXT_TRANSACTION` to start dequeuing messages from the next available group. In the event that no groups are available, the dequeue will time out after the specified `WAIT` period.

Using Secure Queues

For secure queues, you must specify `consumer_name` in the `dequeue_options` parameter. See DEQUEUE_OPTIONS_T Type on page 271-19 for more information about `consumer_name`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Database Advanced Queuing agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See CREATE_AQ_AGENT Procedure on page 25-24.
- You must map the Oracle Database Advanced Queuing agent to a database user with dequeue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See ENABLE_DB_ACCESS Procedure on page 25-39.

See Also: *Oracle Streams Concepts and Administration* for information about secure queues

DEQUEUE_ARRAY Function

This function dequeues an array of messages and returns them in the form of an array of payloads, an array of message properties and an array of message IDs. This function returns the number of messages successfully dequeued.

Syntax

```
DBMS_AQ.DEQUEUE_ARRAY (
   queue_name                IN   VARCHAR2,
   dequeue_options           IN   dequeue_options_t,
   array_size                IN   pls_integer,
   message_properties_array  OUT  message_properties_array_t,
   payload_array             OUT  "<COLLECTION_1>",
   msgid_array               OUT  msgid_array_t,
   error_array               OUT  error_array_t)
RETURN pls_integer;
```

Parameters

Table 24–8 DEQUEUE_ARRAY Function Parameters

Parameter	Description
queue_name	The queue name from which messages are dequeued (same as single-row dequeue).
dequeue_options	The set of options which will be applied to all messages in the array (same as single-row dequeue).
array_size	The number of elements to dequeue.
message_properties_array	A record containing an array corresponding to each message property. Each payload element has a corresponding set of message properties. See MESSAGE_PROPERTIES_ARRAY_T Type on page 271-30.
payload_array	An array of dequeued payload data. "<COLLECTION_1>" can be an associative array, varray or nested table in its PL/SQL representation.
msgid_array	An array of message IDs of the dequeued messages. See MSGID_ARRAY_T Type on page 271-31.
error_array	Currently not implemented

Usage Notes

A nonzero wait time, as specified in dequeue_options, is recognized only when there are no messages in the queue. If the queue contains messages that are eligible for dequeue, then the DEQUEUE_ARRAY function will dequeue up to array_size messages and return immediately.

Dequeue by message_id is not supported. See DEQUEUE Procedure on page 24-12 for more information on the navigation parameter. Existing NAVIGATION modes are supported. In addition, two new NAVIGATION modes are supported for queues enabled for message grouping:

- FIRST_MESSAGE_MULTI_GROUP
- NEXT_MESSAGE_MULTI_GROUP

See Also: ENQUEUE_OPTIONS_T Type on page 271-22

For transaction grouped queues and ONE_GROUP navigation, messages are dequeued from a single transaction group only, subject to the array_size limit. In MULTI_GROUP navigation, messages are dequeued across multiple transaction groups, still subject to the array_size limit. ORA-25235 is returned to indicate the end of a transaction group.

DEQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting array_size to one message.

ENQUEUE Procedure

This procedure adds a message to the specified queue.

Syntax

```
DBMS_AQ.ENQUEUE (
   queue_name           IN      VARCHAR2,
   enqueue_options      IN      enqueue_options_t,
   message_properties   IN      message_properties_t,
   payload              IN       "<ADT_1>",
   msgid                OUT     RAW);
```

Parameters

Table 24–9 ENQUEUE Procedure Parameters

Parameter	Description
queue_name	Specifies the name of the queue to which this message should be enqueued. The queue cannot be an exception queue.
enqueue_options	See ENQUEUE_OPTIONS_T Type on page 271-22.
message_properties	See MESSAGE_PROPERTIES_T Type on page 271-26.
payload	Not interpreted by Oracle Database Advanced Queuing. The payload must be specified according to the specification in the associated queue table. NULL is an acceptable parameter. For the definition of *type_name* refer to Type Name on page 24-6.
msgid	System generated identification of the message. This is a globally unique identifier that can be used to identify the message at dequeue time.

Usage Notes

The sequence_deviation parameter in enqueue_options can be used to change the order of processing between two messages. The identity of the other message, if any, is specified by the enqueue_options parameter relative_msgid. The relationship is identified by the sequence_deviation parameter.

Specifying sequence_deviation for a message introduces some restrictions for the delay and priority values that can be specified for this message. The delay of this message must be less than or equal to the delay of the message before which this message is to be enqueued. The priority of this message must be greater than or equal to the priority of the message before which this message is to be enqueued.

> **Note:** The sequence_deviation attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if message_grouping parameter of DBMS_AQADM subprograms is set to TRANSACTIONAL. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

If a message is enqueued to a multiconsumer queue with no recipient, and if the queue has no subscribers (or rule-based subscribers that match this message), then Oracle error ORA_24033 is raised. This is a warning that the message will be discarded because there are no recipients or subscribers to whom it can be delivered.

Using Secure Queues

For secure queues, you must specify the `sender_id` in the `messages_properties` parameter. See MESSAGE_PROPERTIES_T Type on page 271-26 for more information about `sender_id`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Database Advanced Queuing agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See CREATE_AQ_AGENT Procedure on page 25-24.
- You must map `sender_id` to a database user with enqueue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See ENABLE_DB_ACCESS Procedure on page 25-39.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

ENQUEUE_ARRAY Function

This function enqueues an array of payloads using a corresponding array of message properties. The output will be an array of message IDs of the enqueued messages.

Syntax

```
DBMS_AQ.ENQUEUE_ARRAY (
   queue_name                IN   VARCHAR2,
   enqueue_options           IN   enqueue_options_t,
   array_size                IN   pls_integer,
   message_properties_array  IN   message_properties_array_t,
   payload_array             IN   "<COLLECTION_1>",
   msgid_array               OUT  msgid_array_t,
   error_array               OUT  error_array_t)
RETURN pls_integer;
```

Parameters

Table 24–10 ENQUEUE_ARRAY Function Parameters

Parameter	Description
queue_name	The queue name in which messages are enqueued (same as single-row enqueue).
enqueue_options	See ENQUEUE_OPTIONS_T Type on page 271-22.
array_size	The number of elements to enqueue.
message_properties_array	A record containing an array corresponding to each message property. For each property, the user must allocate array_size elements. See MESSAGE_PROPERTIES_ARRAY_T Type on page 271-30.
payload_array	An array of payload data. "<COLLECTION_1>" can be an associative array, VARRAY, or nested table in its PL/SQL representation.
msgid_array	An array of message IDs for the enqueued messages. If an error occurs for a particular message, then its corresponding message ID is null. See MSGID_ARRAY_T Type on page 271-31.
error_array	Currently not implemented

Usage Notes

ENQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting array_size to one message.

LISTEN Procedures

This procedure listens on one or more queues on behalf of a list of agents. The address field of the agent indicates the queue the agent wants to monitor. Only local queues are supported as addresses. Protocol is reserved for future use.

Syntax

```
DBMS_AQ.LISTEN (
   agent_list            IN    AQ$_AGENT_LIST_T,
   wait                  IN    BINARY_INTEGER DEFAULT DBMS_AQ.FOREVER,
   agent                 OUT   SYS.AQ$_AGENT);

DBMS_AQ.LISTEN (
   agent_list             IN   AQ$_AGENT_LIST_T,
   wait                   IN   BINARY_INTEGER DEFAULT FOREVER,
   listen_delivery_mode   IN   PLS_INTEGER DEFAULT DBMS_AQ.PERSISTENT,
   agent                  OUT  SYS.AQ$_AGENT,
   message_delivery_mode  OUT  PLS_INTEGER);

TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
```

Parameters

Table 24–11 LISTEN Procedure Parameters

Parameter	Description
agent_list	List of agents to listen for
wait	Time out for the listen call in seconds. By default, the call will block forever.
listen_delivery_mode	The caller specifies whether it is interested in persistent, buffered messages or both types of messages, specifying a delivery mode of DBMS_AQ.PERSISTENT or DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT_OR_BUFFERED
agent	Agent with a message available for consumption
message_delivery_mode	Returns the message type along with the queue and consumer for which there is a message

Usage Notes

If agent-address is a multiconsumer queue, then agent-name is mandatory. For single-consumer queues, agent-name must not be specified.

This procedure takes a list of agents as an argument. You specify the queue to be monitored in the address field of each agent listed. You also must specify the name of the agent when monitoring multiconsumer queues. For single-consumer queues, an agent name must not be specified. Only local queues are supported as addresses. Protocol is reserved for future use.

This is a blocking call that returns when there is a message ready for consumption for an agent in the list. If there are messages for more than one agent, only the first agent listed is returned. If there are no messages found when the wait time expires, an error is raised.

A successful return from the LISTEN call is only an indication that there is a message for one of the listed agents in one the specified queues. The interested agent must still dequeue the relevant message.

Note: You cannot call LISTEN on nonpersistent queues.

POST Procedure

This procedure posts to a list of anonymous subscriptions that allows all clients who are registered for the subscriptions to get notifications.

Syntax

```
DBMS_AQ.POST (
  post_list       IN  SYS.AQ$_POST_INFO_LIST,
  post_count      IN  NUMBER);
```

Parameters

Table 24–12 POST Procedure Parameters

Parameter	Description
post_list	Specifies the list of anonymous subscriptions to which you want to post. It is a list of AQ$_POST_INFO_LIST Type.
post_count	Specifies the number of entries in the post_list.

Usage Notes

This procedure is used to post to anonymous subscriptions which allows all clients who are registered for the subscriptions to get notifications. Several subscriptions can be posted to at one time.

REGISTER Procedure

This procedure registers an e-mail address, user-defined PL/SQL procedure, or HTTP URL for message notification.

Syntax

```
DBMS_AQ.REGISTER (
   reg_list     IN  SYS.AQ$_REG_INFO_LIST,
   count        IN  NUMBER);
```

Parameters

Table 24–13 REGISTER Procedure Parameters

Parameter	Description
reg_list	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.
count	Specifies the number of entries in the reg_list.

Usage Notes

- This procedure is used to register for notifications. You can specify an e-mail address to which message notifications are sent, register a procedure to be invoked on a notification, or register an HTTP URL to which the notification is posted. Interest in several subscriptions can be registered at one time.
- The procedure can also be used to register for grouping notifications using five grouping attributes:
  - Class – grouping criterion (currently only TIME criterion is supported)
  - Value – the value of the grouping criterion (currently only time in seconds for criterion TIME)
  - Type – summary or last, also contains count of notifications received in group (for AQ namespace only, not for DBCHANGE namespace)
  - Repeat count – how many times to perform grouping (Default is FOREVER)
  - Start time – when to start grouping (Default is current time)
- If you register for e-mail notifications, you should set the host name and port name for the SMTP server that will be used by the database to send e-mail notifications. If required, you should set the send-from e-mail address, which is set by the database as the sent from field. You need a Java-enabled database to use this feature.
- If you register for HTTP notifications, you may want to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

See Also: Chapter 26, "DBMS_AQELM" for more information on e-mail and HTTP notifications

UNBIND_AGENT Procedure

This procedure removes the entry for an Oracle Database Advanced Queuing agent from the LDAP server.

Syntax

```
DBMS_AQ.UNBIND_AGENT(
   agent     IN SYS.AQ$_AGENT);
```

Parameters

Table 24–14 BIND_AGENT Procedure Parameters

Parameter	Description
agent	Agent that is to be removed from the LDAP server

UNREGISTER Procedure

This procedure unregisters a subscription which turns off notifications.

Syntax

```
DBMS_AQ.UNREGISTER (
   reg_list     IN  SYS.AQ$_REG_INFO_LIST,
   reg_count    IN  NUMBER);
```

Parameters

Table 24–15 UNREGISTER Procedure Parameters

Parameter	Description
`reg_list`	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.
`reg_count`	Specifies the number of entries in the `reg_list`.

Usage Notes

This procedure is used to unregister a subscription which turns off notifications. Several subscriptions can be unregistered from at one time.

25

DBMS_AQADM

The DBMS_AQADM package provides procedures to manage Oracle Database Advanced Queuing (AQ) configuration and administration information.

See Also:

- *Oracle Database Advanced Queuing User's Guide*
- Chapter 271, "Oracle Database Advanced Queuing (AQ) Types" for information about the TYPEs to use with DBMS_AQADM

This chapter contains the following topics:

Using DBMS_AQADM

This section contains the following topics.

Security Model

Initially, only SYS and SYSTEM have execution privilege for the procedures in DBMS_AQADM and DBMS_AQ. Users who have been granted EXECUTE rights to DBMS_AQ and DBMS_AQADM are able to create, manage, and use queues in their own schemas. The MANAGE_ANY AQ system privilege is used to create and manage queues in other schemas and can be granted and revoked through DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE and DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE respectively.

User Roles

The database administrator has the option of granting the system privileges ENQUEUE_ANY and DEQUEUE_ANY, exercising DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE and DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE directly to a database user, if you want the user to have this level of control.

The application developer gives rights to a queue by granting and revoking privileges at the object level by exercising DBMS_AQADM.GRANT_QUEUE_PRIVILEGE and DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE.

See Also:
- Chapter 24, "DBMS_AQ."
- *Oracle Database Advanced Queuing User's Guide* for more information on queue privileges and access control.

Security Required for Propagation

Propagation jobs are owned by SYS, but the propagation occurs in the security context of the queue table owner. Previously propagation jobs were owned by the user scheduling propagation, and propagation occurred in the security context of the user setting up the propagation schedule. The queue table owner must be granted EXECUTE privileges on the DBMS_AQADM package. Otherwise, the Oracle Database snapshot processes do not propagate and generate trace files with the error identifier SYS.DBMS_AQADM not defined. Private database links owned by the queue table owner can be used for propagation. The username specified in the connection string must have EXECUTE access on the DBMS_AQ and DBMS_AQADM packages on the remote database.

See Also: *Oracle Database Advanced Queuing User's Guide* for more information on security required for propagation.

Queue Table Migration

The MIGRATE_QUEUE_TABLE procedure requires that the EXECUTE privilege on DBMS_AQADM be granted to the queue table owner, who is probably an ordinary queue user. If you do not want ordinary queue users to be able to create and drop queues and queue tables, add and delete subscribers, and so forth, then you must revoke the EXECUTE privilege as soon as the migration is done.

See Also:
- "MIGRATE_QUEUE_TABLE Procedure" on page 25-47.
- *Oracle Database Advanced Queuing User's Guide* for more information on granting Oracle Database Advanced Queuing system privileges.

Constants

When using enumerated constants, such as INFINITE, TRANSACTIONAL, or NORMAL_QUEUE, the symbol must be specified with the scope of the packages defining it. All types associated with the administrative interfaces must be prepended with DBMS_AQADM. For example: DBMS_AQADM.NORMAL_QUEUE.

Table 25–1 Enumerated Types in the Administrative Interface

Parameter	Options
retention	0, 1, 2...INFINITE
message_grouping	TRANSACTIONAL, NONE
queue_type	NORMAL_QUEUE, EXCEPTION_QUEUE, NON_PERSISTENT_QUEUE

See Also: For more information on the Java classes and data structures used in both DBMS_AQ and DBMS_AQADM, see the DBMS_AQ package.

Subprogram Groups

This DBMS_AQADM package is made up of the following subprogram groups:

Queue Table Subprograms

Table 25–2 Queue Table Subprograms

Subprograms	Description
ALTER_QUEUE_TABLE Procedure on page 25-22	Alters the existing properties of a queue table
CREATE_QUEUE_TABLE Procedure on page 25-30	Creates a queue table for messages of a predefined type
DROP_QUEUE_TABLE Procedure on page 25-38	Drops an existing queue table
ENABLE_JMS_TYPES Procedure on page 25-40	A precondition for the enqueue of JMS types and XML types
MIGRATE_QUEUE_TABLE Procedure on page 25-47	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table
PURGE_QUEUE_TABLE Procedure on page 25-48	Purges messages from queue tables

Privilege Subprograms

Table 25–3 Privilege Subprograms

Subprograms	Description
GRANT_QUEUE_PRIVILEGE Procedure on page 25-45	Grants privileges on a queue to users and roles
GRANT_SYSTEM_ PRIVILEGE Procedure on page 25-46	Grants Oracle Database Advanced Queuing system privileges to users and roles
REVOKE_QUEUE_ PRIVILEGE Procedure on page 25-52	Revokes privileges on a queue from users and roles
REVOKE_SYSTEM_ PRIVILEGE Procedure on page 25-53	Revokes Oracle Database Advanced Queuing system privileges from users and roles

Queue Subprograms

Table 25–4 Queue Subprograms

Subprograms	Description
ALTER_QUEUE Procedure on page 25-21	Alters existing properties of a queue
CREATE_NP_QUEUE Procedure on page 25-25	Creates a nonpersistent `RAW` queue
CREATE_QUEUE Procedure on page 25-26	Creates a queue in the specified queue table
CREATE_SHARDED_QUEUE Procedure on page 25-28	Creates a queue and its queue table for a sharded queue all together.
DROP_SHARDED_QUEUE Procedure on page 25-29	Drops an existing sharded queue from the database queuing system
DROP_QUEUE Procedure on page 25-37	Drops an existing queue
QUEUE_SUBSCRIBERS Function on page 25-50	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`
START_QUEUE Procedure on page 25-59	Enables the specified queue for enqueuing or dequeuing
STOP_QUEUE Procedure on page 25-60	Disables enqueuing or dequeuing on the specified queue

Subscriber Subprograms

Table 25–5 Subscriber Subprograms

Subprograms	Description
ADD_SUBSCRIBER Procedure on page 25-18	Adds a default subscriber to a queue
ALTER_SUBSCRIBER Procedure on page 25-23	Alters existing properties of a subscriber to a specified queue
REMOVE_SUBSCRIBER Procedure on page 25-51	Removes a default subscriber from a queue

Notification Subprograms

Table 25–6 Notification Subprograms

Subprograms	Description
GET_WATERMARK Procedure on page 25-42	Retrieves the value of watermark set by the SET_WATERMARK Procedure
GET_MAX_STREAMS_POOL Procedure on page 25-43	Retrieves the value of Oracle Database Advanced Queuing maximum streams pool memory limit
GET_MIN_STREAMS_POOL Procedure on page 25-44	Retrieves the value of Oracle Database Advanced Queuing minimum streams pool memory limit
SET_WATERMARK Procedure on page 25-56	Used for Oracle Database Advanced Queuing notification to specify and limit memory use
SET_MAX_STREAMS_POOL Procedure on page 25-57	Used for Oracle Database Advanced Queuing to specify and limit maximum streams pool memory use
SET_MIN_STREAMS_POOL Procedure on page 25-58	used for Oracle Database Advanced Queuing to specify and limit minimum streams pool memory use

Propagation Subprograms

Table 25–7 Propagation Subprograms

Subprograms	Description
ALTER_PROPAGATION_SCHEDULE Procedure on page 25-20	Alters parameters for a propagation schedule
DISABLE_PROPAGATION_SCHEDULE Procedure on page 25-35	Disables a propagation schedule
ENABLE_PROPAGATION_SCHEDULE Procedure on page 25-41	Enables a previously disabled propagation schedule
SCHEDULE_PROPAGATION Procedure on page 25-54	Schedules propagation of messages from a queue to a destination identified by a specific database link
UNSCHEDULE_PROPAGATION Procedure on page 25-61	Unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link
VERIFY_QUEUE_TYPES Procedure on page 25-62	Verifies that the source and destination queues have identical types

Oracle Database Advanced Queuing Agent Subprograms

Table 25–8 Oracle Streams AQ Agent Subprograms

Subprograms	Description
ALTER_AQ_AGENT Procedure on page 25-19	Alters an agent registered for Oracle Database Advanced Queuing Internet access, and an Oracle Database Advanced Queuing agent that accesses secure queues
CREATE_AQ_AGENT Procedure on page 25-24	Registers an agent for Oracle Database Advanced Queuing Internet access using HTTP/SMTP protocols, and creates an Oracle Database Advanced Queuing agent to access secure queues
DISABLE_DB_ACCESS Procedure on page 25-34	Revokes the privileges of a specific database user from an Oracle Database Advanced Queuing Internet agent
DROP_AQ_AGENT Procedure on page 25-36	Drops an agent that was previously registered for Oracle Database Advanced Queuing Internet access
ENABLE_DB_ACCESS Procedure on page 25-39	Grants an Oracle Database Advanced Queuing Internet agent the privileges of a specific database user

Alias Subprograms

Table 25–9 Alias Subprograms

Subprograms	Description
ADD_ALIAS_TO_LDAP Procedure on page 25-17	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
DEL_ALIAS_FROM_LDAP Procedure on page 25-33	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP

Summary of DBMS_AQADM Subprograms

Table 25–10 DBMS_AQADM Package Subprograms

Subprograms	Description
ADD_ALIAS_TO_LDAP Procedure on page 25-17	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
ADD_SUBSCRIBER Procedure on page 25-18	Adds a default subscriber to a queue
ALTER_AQ_AGENT Procedure on page 25-19	Alters an agent registered for Oracle Database Advanced Queuing Internet access, and an Oracle Database Advanced Queuing agent that accesses secure queues
ALTER_PROPAGATION_ SCHEDULE Procedure on page 25-20	Alters parameters for a propagation schedule
ALTER_QUEUE Procedure on page 25-21	Alters existing properties of a queue
ALTER_QUEUE_TABLE Procedure on page 25-22	Alters the existing properties of a queue table
ALTER_SUBSCRIBER Procedure on page 25-23	Alters existing properties of a subscriber to a specified queue
CREATE_AQ_AGENT Procedure on page 25-24	Registers an agent for Oracle Database Advanced Queuing Internet access using HTTP/SMTP protocols, and creates an Oracle Database Advanced Queuing agent to access secure queues
CREATE_NP_QUEUE Procedure on page 25-25	Creates a nonpersistent `RAW` queue
CREATE_QUEUE Procedure on page 25-26	Creates a queue in the specified queue table
CREATE_SHARDED_QUEUE Procedure on page 25-28	Creates a queue and its queue table for a sharded queue all together.
CREATE_QUEUE_TABLE Procedure on page 25-30	Creates a queue table for messages of a predefined type
DROP_SHARDED_QUEUE Procedure on page 25-29	Drops an existing sharded queue from the database queuing system
DEL_ALIAS_FROM_LDAP Procedure on page 25-33	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP
DISABLE_DB_ACCESS Procedure on page 25-34	Revokes the privileges of a specific database user from an Oracle Database Advanced Queuing Internet agent
DISABLE_PROPAGATION_ SCHEDULE Procedure on page 25-35	Disables a propagation schedule
DROP_AQ_AGENT Procedure on page 25-36	Drops an agent that was previously registered for Oracle Database Advanced Queuing Internet access
DROP_QUEUE Procedure on page 25-37	Drops an existing queue
DROP_QUEUE_TABLE Procedure on page 25-38	Drops an existing queue table
ENABLE_DB_ACCESS Procedure on page 25-39	Grants an Oracle Database Advanced Queuing Internet agent the privileges of a specific database user

Table 25–10 (Cont.) DBMS_AQADM Package Subprograms

Subprograms	Description
ENABLE_JMS_TYPES Procedure on page 25-40	A precondition for the enqueue of JMS types and XML types
ENABLE_PROPAGATION_SCHEDULE Procedure on page 25-41	Enables a previously disabled propagation schedule
GET_WATERMARK Procedure on page 25-42	Retrieves the value of watermark set by the `SET_WATERMARK` Procedure
GET_MAX_STREAMS_POOL Procedure on page 25-43	Retrieves the value of Oracle Database Advanced Queuing maximum streams pool memory limit
GET_MIN_STREAMS_POOL Procedure on page 25-44	Retrieves the value of Oracle Database Advanced Queuing minimum streams pool memory limit
GRANT_QUEUE_PRIVILEGE Procedure on page 25-45	Grants privileges on a queue to users and roles
GRANT_SYSTEM_PRIVILEGE Procedure on page 25-46	Grants Oracle Database Advanced Queuing system privileges to users and roles
MIGRATE_QUEUE_TABLE Procedure on page 25-47	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table
PURGE_QUEUE_TABLE Procedure on page 25-48	Purges messages from queue tables
QUEUE_SUBSCRIBERS Function on page 25-50	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`
REMOVE_SUBSCRIBER Procedure on page 25-51	Removes a default subscriber from a queue
REVOKE_QUEUE_PRIVILEGE Procedure on page 25-52	Revokes privileges on a queue from users and roles
REVOKE_SYSTEM_PRIVILEGE Procedure on page 25-53	Revokes Oracle Database Advanced Queuing system privileges from users and roles
SCHEDULE_PROPAGATION Procedure on page 25-54	Schedules propagation of messages from a queue to a destination identified by a specific database link
SET_WATERMARK Procedure on page 25-56	Used for Oracle Database Advanced Queuing notification to specify and limit memory use
SET_MAX_STREAMS_POOL Procedure on page 25-57	Used for Oracle Database Advanced Queuing to specify and limit maximum streams pool memory use
SET_MIN_STREAMS_POOL Procedure on page 25-58	used for Oracle Database Advanced Queuing to specify and limit minimum streams pool memory use
START_QUEUE Procedure on page 25-59	Enables the specified queue for enqueuing or dequeuing
STOP_QUEUE Procedure on page 25-60	Disables enqueuing or dequeuing on the specified queue
UNSCHEDULE_PROPAGATION Procedure on page 25-61	Unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link

Table 25–10 (Cont.) DBMS_AQADM Package Subprograms

Subprograms	Description
VERIFY_QUEUE_TYPES Procedure on page 25-62	Verifies that the source and destination queues have identical types

ADD_ALIAS_TO_LDAP Procedure

This procedure creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP. The alias will be placed directly under the database server's distinguished name in LDAP hierarchy.

Syntax

```
DBMS_AQADM.ADD_ALIAS_TO_LDAP(
   alias          IN VARCHAR2,
   obj_location   IN VARCHAR2);
```

Parameters

Table 25–11 ADD_ALIAS_TO_LDAP Procedure Parameters

Parameter	Description
`alias`	Name of the alias. Example: `west_shipping`.
`obj_location`	The distinguished name of the object (queue, agent or connection factory) to which `alias` refers.

Usage Notes

This method can be used to create aliases for queues, agents, and JMS ConnectionFactory objects. These object must exist before the alias is created. These aliases can be used for JNDI lookup in JMS and Oracle Database Advanced Queuing Internet access.

ADD_SUBSCRIBER Procedure

This procedure adds a default subscriber to a queue.

Syntax

```
DBMS_AQADM.ADD_SUBSCRIBER (
   queue_name      IN    VARCHAR2,
   subscriber      IN    sys.aq$_agent,
   rule            IN    VARCHAR2 DEFAULT NULL,
   transformation  IN    VARCHAR2 DEFAULT NULL
   queue_to_queue  IN    BOOLEAN DEFAULT FALSE,
   delivery_mode   IN    PLS_INTEGER DEFAULT DBMS_AQADM.PERSISTENT);
```

Parameters

Table 25–12 ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent on whose behalf the subscription is being defined.
rule	A conditional expression based on the message properties, the message data properties and PL/SQL functions. A rule is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Currently supported message properties are priority and corrid. To specify rules on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The rule parameter cannot exceed 4000 characters.
transformation	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.
queue_to_queue	If TRUE, propagation is from queue-to-queue.
delivery_mode	The administrator may specify one of DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED, or DBMS_AQADM.PERSISTENT_OR_BUFFERED for the delivery mode of the messages the subscriber is interested in. This parameter will not be modifiable by ALTER_SUBSCRIBER.

Usage Notes

A program can enqueue messages to a specific list of recipients or to the default list of subscribers. This operation only succeeds on queues that allow multiple consumers. This operation takes effect immediately, and the containing transaction is committed. Enqueue requests that are executed after the completion of this call will reflect the new behavior.

Any string within the rule must be quoted:

```
rule   => 'PRIORITY <= 3 AND CORRID =  ''FROM JAPAN'''
```

Note that these are all single quotation marks.

ALTER_AQ_AGENT Procedure

This procedure alters an agent registered for Oracle Database Advanced Queuing Internet access. It is also used to alter an Oracle Database Advanced Queuing agent that accesses secure queues.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

Syntax

```
DBMS_AQADM.ALTER_AQ_AGENT (
  agent_name                IN VARCHAR2,
  certificate_location      IN VARCHAR2 DEFAULT NULL,
  enable_http               IN BOOLEAN DEFAULT FALSE,
  enable_smtp               IN BOOLEAN DEFAULT FALSE,
  enable_anyp               IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 25–13 ALTER_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Database Advanced Queuing Internet agent.
certification_location	Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Database Advanced Queuing through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
enable_http	TRUE means the agent can access Oracle Database Advanced Queuing through HTTP. FALSE means the agent cannot access Oracle Database Advanced Queuing through HTTP.
enable_smtp	TRUE means the agent can access Oracle Database Advanced Queuing through SMTP (e-mail). FALSE means the agent cannot access Oracle Database Advanced Queuing through SMTP.
enable_anyp	TRUE means the agent can access Oracle Database Advanced Queuing through any protocol (HTTP or SMTP).

ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters parameters for a propagation schedule.

Syntax

```
DBMS_AQADM.ALTER_PROPAGATION_SCHEDULE (
   queue_name           IN    VARCHAR2,
   destination          IN    VARCHAR2 DEFAULT NULL,
   duration             IN    NUMBER   DEFAULT NULL,
   next_time            IN    VARCHAR2 DEFAULT NULL,
   latency              IN    NUMBER   DEFAULT 60,
   destination_queue    IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–14 ALTER_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.
latency	Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. The default value is 60. Caution: if latency is not specified for this call, then latency will over-write any existing value with the default value. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It will be at least 60 seconds before the queue will be checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue will not be checked for 10 minutes and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination and as soon as a message is enqueued it will be propagated.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

ALTER_QUEUE Procedure

This procedure alters existing properties of a queue. The parameters max_retries, retention_time, and retry_delay are not supported for nonpersistent queues.

Syntax

```
DBMS_AQADM.ALTER_QUEUE (
   queue_name        IN    VARCHAR2,
   max_retries       IN    NUMBER   DEFAULT NULL,
   retry_delay       IN    NUMBER   DEFAULT NULL,
   retention_time    IN    NUMBER   DEFAULT NULL,
   auto_commit       IN    BOOLEAN  DEFAULT TRUE,
   comment           IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–15 ALTER_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be altered
max_retries	Limits the number of times a dequeue with REMOVE mode can be attempted on a message. The maximum value of max_retries is 2**31 -1. A message is moved to an exception queue if RETRY_COUNT is greater than MAX_RETRIES. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. Note that max_retries is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retry_delay	Delay time in seconds before this message is scheduled for processing again after an application rollback. The default is NULL, which means that the value will not be altered. Note that retry_delay is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retention_time	Retention time in seconds for which a message is retained in the queue table after being dequeued. The default is NULL, which means that the value will not be altered.
auto_commit	TRUE causes the current transaction, if any, to commit before the ALTER_QUEUE operation is carried out. The ALTER_QUEUE operation become persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.
comment	User-specified description of the queue. This user comment is added to the queue catalog. The default value is NULL, which means that the value will not be changed.

ALTER_QUEUE_TABLE Procedure

This procedure alters the existing properties of a queue table.

Syntax

```
DBMS_AQADM.ALTER_QUEUE_TABLE (
   queue_table          IN   VARCHAR2,
   comment              IN   VARCHAR2       DEFAULT NULL,
   primary_instance     IN   BINARY_INTEGER DEFAULT NULL,
   secondary_instance   IN   BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 25–16 ALTER_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be created.
comment	Modifies the user-specified description of the queue table. This user comment is added to the queue catalog. The default value is NULL which means that the value will not be changed.
primary_instance	This is the primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table will be done in this instance. The default value is NULL, which means that the current value will not be changed.
secondary_instance	The queue table fails over to the secondary instance if the primary instance is not available. The default value is NULL, which means that the current value will not be changed.

ALTER_SUBSCRIBER Procedure

This procedure alters existing properties of a subscriber to a specified queue. Only the rule can be altered.

Syntax

```
DBMS_AQADM.ALTER_SUBSCRIBER (
   queue_name     IN    VARCHAR2,
   subscriber     IN    sys.aq$_agent,
   rule           IN    VARCHAR2
   transformation IN    VARCHAR2);
```

Parameters

Table 25–17 ALTER_SUBSCRIBER Procedure Parameters

Parameter	Description
`queue_name`	Name of the queue.
`subscriber`	Agent on whose behalf the subscription is being altered. See "AQ$_ AGENT Type" on page 271-5.
`rule`	A conditional expression based on the message properties, the message data properties and PL/SQL functions. The rule parameter cannot exceed 4000 characters. To eliminate the rule, set the rule parameter to `NULL`.
`transformation`	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.

Usage Notes

This procedure alters both the rule and the transformation for the subscriber. If you want to retain the existing value for either of them, you must specify its old value. The current values for rule and transformation for a subscriber can be obtained from the *schema*.AQ$*queue_table*_R and *schema*.AQ$*queue_table*_S views.

CREATE_AQ_AGENT Procedure

This procedure registers an agent for Oracle Database Advanced Queuing Internet access using HTTP/SMTP protocols. It is also used to create an Oracle Database Advanced Queuing agent to access secure queues.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

Syntax

```
DBMS_AQADM.CREATE_AQ_AGENT (
  agent_name                IN VARCHAR2,
  certificate_location      IN VARCHAR2 DEFAULT NULL,
  enable_http               IN BOOLEAN DEFAULT FALSE,
  enable_smtp               IN BOOLEAN DEFAULT FALSE,
  enable_anyp               IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 25–18 CREATE_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Database Advanced Queuing Internet agent.
certification_location	Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Database Advanced Queuing through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
enable_http	TRUE means the agent can access Oracle Database Advanced Queuing through HTTP. FALSE means the agent cannot access Oracle Database Advanced Queuing through HTTP.
enable_smtp	TRUE means the agent can access Oracle Database Advanced Queuing through SMTP (e-mail). FALSE means the agent cannot access Oracle Database Advanced Queuing through SMTP.
enable_anyp	TRUE means the agent can access Oracle Database Advanced Queuing through any protocol (HTTP or SMTP).

Usage Notes

The SYS.AQ$INTERNET_USERS view has a list of all Oracle Database Advanced Queuing Internet agents.

CREATE_NP_QUEUE Procedure

> **Note:** nonpersistent queues are deprecated as of Release 10gR2. Oracle recommends using buffered messaging.

This procedure creates a nonpersistent `RAW` queue.

Syntax

```
DBMS_AQADM.CREATE_NP_QUEUE (
   queue_name              IN        VARCHAR2,
   multiple_consumers      IN        BOOLEAN  DEFAULT FALSE,
   comment                 IN        VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–19 CREATE_NP_QUEUE Procedure Parameters

Parameter	Description
`queue_name`	Name of the nonpersistent queue that is to be created. The name must be unique within a schema and must follow object name guidelines in *Oracle Database SQL Language Reference.*
`multiple_consumers`	`FALSE` means queues created in the table can only have one consumer for each message. This is the default. `TRUE` means queues created in the table can have multiple consumers for each message. Note that this parameter is distinguished at the queue level, because a nonpersistent queue does not inherit this characteristic from any user-created queue table.
`comment`	User-specified description of the queue. This user comment is added to the queue catalog.

Usage Notes

The queue may be either single-consumer or multiconsumer queue. All queue names must be unique within a schema. The queues are created in a 8.1-compatible or higher system-created queue table (`AQ$_MEM_SC` or `AQ$_MEM_MC`) in the same schema as that specified by the queue name.

If the queue name does not specify a schema name, the queue is created in the login user's schema. After a queue is created with `CREATE_NP_QUEUE`, it can be enabled by calling `START_QUEUE`. By default, the queue is created with both enqueue and dequeue disabled.

You cannot dequeue from a nonpersistent queue. The only way to retrieve a message from a nonpersistent queue is by using the OCI notification mechanism. You cannot invoke the `LISTEN` call on a nonpersistent queue.

CREATE_QUEUE Procedure

This procedure creates a queue in the specified queue table.

Syntax

```
DBMS_AQADM.CREATE_QUEUE (
   queue_name          IN       VARCHAR2,
   queue_table         IN       VARCHAR2,
   queue_type          IN       BINARY_INTEGER DEFAULT NORMAL_QUEUE,
   max_retries         IN       NUMBER         DEFAULT NULL,
   retry_delay         IN       NUMBER         DEFAULT 0,
   retention_time      IN       NUMBER         DEFAULT 0,
   dependency_tracking IN       BOOLEAN        DEFAULT FALSE,
   comment             IN       VARCHAR2       DEFAULT NULL,
   auto_commit         IN       BOOLEAN        DEFAULT TRUE);
```

Parameters

Table 25–20 CREATE_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be created. The name must be unique within a schema and must follow object name guidelines in *Oracle Database SQL Language Reference* with regard to reserved characters.
queue_table	Name of the queue table that will contain the queue.
queue_type	Specifies whether the queue being created is an exception queue or a normal queue. NORMAL_QUEUE means the queue is a normal queue. This is the default. EXCEPTION_QUEUE means it is an exception queue. Only the dequeue operation is allowed on the exception queue.
max_retries	Limits the number of times a dequeue with the REMOVE mode can be attempted on a message. The maximum value of max_retries is 2**31 -1. A message is moved to an exception queue if RETRY_COUNT is greater than MAX_RETRIES. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. Note that max_retries is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retry_delay	Delay time, in seconds, before this message is scheduled for processing again after an application rollback. The default is 0, which means the message can be retried as soon as possible. This parameter has no effect if max_retries is set to 0. Note that retry_delay is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retention_time	Number of seconds for which a message is retained in the queue table after being dequeued from the queue. INFINITE means the message is retained forever. NUMBER is the number of seconds for which to retain the messages. The default is 0, no retention.

Table 25–20 (Cont.) CREATE_QUEUE Procedure Parameters

Parameter	Description
dependency_tracking	Reserved for future use. FALSE is the default. TRUE is not permitted in this release.
comment	User-specified description of the queue. This user comment is added to the queue catalog.
auto_commit	TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE operation is carried out. The CREATE_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

All queue names must be unique within a schema. After a queue is created with CREATE_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

CREATE_SHARDED_QUEUE Procedure

CREATE_SHARDED_QUEUE is a new API in 12*c* Release 1 (12.1) to create a queue and its queue table as appropriate for a JMS sharded queue. This API cannot be used to create unsharded queues. JMS sharded queues must be created using this single integrated API that will automatically set AQ properties as needed for JMS.

JMS Sharded queues may be either a single consumer or a multi-consumer queue.

Syntax

```
PROCEDURE CREATE_SHARDED_QUEUE (
    queue_name              IN VARCHAR2,
    storage_clause          IN VARCHAR2       DEFAULT NULL,
    multiple_consumers      IN BOOLEAN        DEFAULT FALSE,
    max_retries             IN NUMBER         DEFAULT NULL,
    comment                 IN VARCHAR2       DEFAULT NULL);
```

Parameters

Table 25–21 CREATE_SHARDED_QUEUE Procedure Parameters

Parameter	Description
queue_name	This required parameter specifies the name of the new queue.
storage_clause	The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage_clause argument.The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLESPACE, LOB, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See *Oracle Database SQL Language Reference* for the usage of these parameters.
multiple_consumers	FALSE means queues can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.
max_retries	This optional parameter limits the number of times that a dequeue can reattempted on a message after a failure. The maximum value of max_retries is 2**31 -1. After the retry limit has been exceeded, the message will be purged from the queue. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.
comment	This optional parameter is a user-specified description of the queue table. This user comment is added to the queue catalog.

DROP_SHARDED_QUEUE Procedure

This procedure drops an existing sharded queue from the database queuing system. You must stop the queue before calling DROP_SHARDED_QUEUE. User must stop the queue explicitly if force is set to FALSE before calling DROP_SHARDED_QUEUE. If force is set to TRUE then queue will be stopped internally and then dropped.

Syntax

```
DBMS_AQADM.DROP_SHARDED_QUEUE(
       queue_name IN VARCHAR2,
       force      IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 25–22 CREATE_SHARDED_QUEUE Procedure Parameters

Parameter	Description
queue_name	This required parameter specifies the name of the sharded queue.
force	The sharded queue is dropped even if the queue is not stopped.

CREATE_QUEUE_TABLE Procedure

This procedure creates a queue table for messages of a predefined type.

Syntax

```
DBMS_AQADM.CREATE_QUEUE_TABLE (
   queue_table          IN      VARCHAR2,
   queue_payload_type   IN      VARCHAR2,
   storage_clause       IN      VARCHAR2        DEFAULT NULL,
   sort_list            IN      VARCHAR2        DEFAULT NULL,
   multiple_consumers   IN      BOOLEAN         DEFAULT FALSE,
   message_grouping     IN      BINARY_INTEGER  DEFAULT NONE,
   comment              IN      VARCHAR2        DEFAULT NULL,
   auto_commit          IN      BOOLEAN         DEFAULT TRUE,
   primary_instance     IN      BINARY_INTEGER  DEFAULT 0,
   secondary_instance   IN      BINARY_INTEGER  DEFAULT 0,
   compatible           IN      VARCHAR2        DEFAULT NULL,
   secure               IN      BOOLEAN         DEFAULT FALSE);
```

Parameters

Table 25–23 CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be created
queue_payload_type	Type of the user data stored. See Type Name on page 24-6 for valid values for this parameter.
storage_clause	Storage parameter. The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage_clause argument.The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLESPACE, LOB, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See *Oracle Database SQL Language Reference* for the usage of these parameters.

Table 25–23 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
sort_list	The columns to be used as the sort key in ascending order. This parameter has the following format: '*sort_column_1*,*sort_column_2*' The allowed column names are priority, enq_time, and commit_time.If both columns are specified, then *sort_column_1* defines the most significant order. After a queue table is created with a specific ordering mechanism, all queues in the queue table inherit the same defaults. The order of a queue table cannot be altered after the queue table has been created. If no sort list is specified, then all the queues in this queue table are sorted by the enqueue time in ascending order. This order is equivalent to FIFO order. Even with the default ordering defined, a dequeuer is allowed to choose a message to dequeue by specifying its msgid or correlation. msgid, correlation, and sequence_deviation take precedence over the default dequeueing order, if they are specified. When commit_time is specified for the sort_list parameter the resulting queue table uses commit-time ordering. See "Commit-Time Queues" in *Oracle Streams Concepts and Administration* for more information about commit-time ordering. See also "Priority and Ordering of Messages" in *Oracle Database Advanced Queuing User's Guide* for information about message ordering in Oracle Database Advanced Queuing.
multiple_consumers	FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.
message_grouping	Message grouping behavior for queues created in the table. NONE means each message is treated individually. TRANSACTIONAL means messages enqueued as part of one transaction are considered part of the same group and can be dequeued as a group of related messages.
comment	User-specified description of the queue table. This user comment is added to the queue catalog.
auto_commit	TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE_TABLE operation is carried out. The CREATE_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Note: This parameter has been deprecated.
primary_instance	The primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table are done in this instance. The default value for primary instance is 0, which means queue monitor scheduling and propagation will be done in any available instance.

Table 25–23 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
secondary_instance	The queue table fails over to the secondary instance if the primary instance is not available. The default value is 0, which means that the queue table will fail over to any available instance.
compatible	The lowest database version with which the queue is compatible. Currently the possible values are either 8.0, 8.1, or 10.0. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0.
secure	This parameter must be set to TRUE if you want to use the queue table for secure queues. Secure queues are queues for which AQ agents must be associated explicitly with one or more database users who can perform queue operations, such as enqueue and dequeue. The owner of a secure queue can perform all queue operations on the queue, but other users cannot perform queue operations on a secure queue, unless they are configured as secure queue users.

Usage Notes

The sort keys for dequeue ordering, if any, must be defined at table creation time. The following objects are created at this time:

- aq$_*queue_table_name*_e, a default exception queue associated with the queue table
- aq$*queue_table_name*, a read-only view, which is used by Oracle Database Advanced Queuing applications for querying queue data
- aq$_*queue_table_name*_t, an index (or an index organized table (IOT) in the case of multiple consumer queues) for the queue monitor operations
- aq$_*queue_table_name*_i, an index (or an index organized table in the case of multiple consumer queues) for dequeue operations

For 8.1-compatible or higher queue tables, the following index-organized tables are created:

- aq$_*queue_table_name*_s, a table for storing information about the subscribers
- aq$_*queue_table_name*_r, a table for storing information about rules on subscriptions

aq$_*queue_table_name*_h, an index-organized table for storing the dequeue history data

CLOB, BLOB, and BFILE are valid attributes for Oracle Database Advanced Queuing object type payloads. However, only CLOB and BLOB can be propagated using Oracle Database Advanced Queuing propagation in Oracle8*i* release 8.1.5 or later. See the *Oracle Database Advanced Queuing User's Guide* for more information.

The default value of the compatible parameter depends on the database compatibility mode in the init.ora. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0

You can specify and modify the primary_instance and secondary_instance only in 8.1-compatible or higher mode. You cannot specify a secondary instance unless there is a primary instance.

DEL_ALIAS_FROM_LDAP Procedure

This procedure drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP.

Syntax

```
DBMS_AQ.DEL_ALIAS_FROM_LDAP(
   alias IN VARCHAR2);
```

Parameters

Table 25–24 DEL_ALIAS_FROM_LDAP Procedure Parameters

Parameter	Description
alias	The alias to be removed.

DISABLE_DB_ACCESS Procedure

This procedure revokes the privileges of a specific database user from an Oracle Database Advanced Queuing Internet agent.

Syntax

```
DBMS_AQADM.DISABLE_DB_ACCESS (
  agent_name                IN VARCHAR2,
  db_username               IN VARCHAR2)
```

Parameters

Table 25–25 DISABLE_DB_ACCESS Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Database Advanced Queuing Internet agent.
db_username	Specifies the database user whose privileges are to be revoked from the Oracle Database Advanced Queuing Internet agent.

Usage Notes

The Oracle Database Advanced Queuing Internet agent should have been previously granted those privileges using the ENABLE_DB_ACCESS Procedure.

DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Syntax

```
DBMS_AQADM.DISABLE_PROPAGATION_SCHEDULE (
   queue_name            IN   VARCHAR2,
   destination           IN   VARCHAR2 DEFAULT NULL,
   destination_queue  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–26 DISABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

DROP_AQ_AGENT Procedure

This procedure drops an agent that was previously registered for Oracle Database Advanced Queuing Internet access.

Syntax

```
DBMS_AQADM.DROP_AQ_AGENT (
  agent_name                IN VARCHAR2)
```

Parameters

Table 25–27 DROP_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Database Advanced Queuing Internet agent

DROP_QUEUE Procedure

This procedure drops an existing queue.

Syntax

```
DBMS_AQADM.DROP_QUEUE (
   queue_name        IN    VARCHAR2,
   auto_commit       IN    BOOLEAN DEFAULT TRUE);
```

Parameters

Table 25–28 DROP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be dropped.
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE operation is carried out. The DROP_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

DROP_QUEUE is not allowed unless STOP_QUEUE has been called to disable the queue for both enqueuing and dequeuing. All the queue data is deleted as part of the drop operation.

DROP_QUEUE_TABLE Procedure

This procedure drops an existing queue table.

Syntax

```
DBMS_AQADM.DROP_QUEUE_TABLE (
   queue_table       IN    VARCHAR2,
   force             IN    BOOLEAN DEFAULT FALSE,
   auto_commit       IN    BOOLEAN DEFAULT TRUE);
```

Parameters

Table 25–29 DROP_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be dropped.
force	FALSE means the operation does not succeed if there are any queues in the table. This is the default. TRUE means all queues in the table are stopped and dropped automatically.
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE_TABLE operation is carried out. The DROP_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

All the queues in a queue table must be stopped and dropped before the queue table can be dropped. You must do this explicitly unless the force option is used, in which case this is done automatically.

ENABLE_DB_ACCESS Procedure

This procedure grants an Oracle Database Advanced Queuing Internet agent the privileges of a specific database user.

Syntax

```
DBMS_AQADM.ENABLE_DB_ACCESS (
  agent_name                IN VARCHAR2,
  db_username               IN VARCHAR2)
```

Parameters

Table 25–30 ENABLE_DB_ACCESS Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Database Advanced Queuing Internet agent.
db_username	Specified the database user whose privileges are to be granted to the Oracle Database Advanced Queuing Internet agent.

Usage Notes

The Oracle Database Advanced Queuing Internet agent should have been previously created using the CREATE_AQ_AGENT Procedure.

For secure queues, the sender and receiver agent of the message must be mapped to the database user performing the enqueue or dequeue operation.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

The SYS.AQ$INTERNET_USERS view has a list of all Oracle Database Advanced Queuing Internet agents and the names of the database users whose privileges are granted to them.

ENABLE_JMS_TYPES Procedure

Enqueue of JMS types and XML types does not work with Oracle Streams `Sys.Anydata` queues unless you call this procedure after `DBMS_STREAMS_ADM.SET_UP_QUEUE`. Enabling an Oracle Streams queue for these types may affect import/export of the queue table.

Syntax

```
DBMS_AQADM.ENABLE_JMS_TYPES (
   queue_table   IN   VARCHAR2);
```

Parameters

Table 25–31 ENABLE_JMS_TYPES Procedure Parameters

Parameter	Description
`queue_table`	Specifies name of the queue table to be enabled for JMS and XML types.

ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a previously disabled propagation schedule.

Syntax

```
DBMS_AQADM.ENABLE_PROPAGATION_SCHEDULE (
   queue_name          IN   VARCHAR2,
   destination         IN   VARCHAR2 DEFAULT NULL,
   destination_queue   IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 25–32 ENABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_ queue	Name of the target queue to which messages are to be propagated in the form of a dblink

GET_WATERMARK Procedure

This procedure retrieves the value of watermark set by `SET_WATERMARK`.

Syntax

```
DBMS_AQADM.GET_WATERMARK (
   wmvalue     IN      NUMBER);
```

Parameters

Table 25–33 GET_WATERMARK Procedure Parameter

Parameter	Description
`wmvalue`	Watermark value in megabytes.

GET_MAX_STREAMS_POOL Procedure

This procedure retrieves the value of Oracle Database Advanced Queuing maximum streams pool memory limit.

Syntax

```
DBMS_AQADM.GET_MAX_STREAMS_POOL (
   value     OUT      NUMBER);
```

Parameters

Table 25–34 GET_MAX_STREAMS_POOL Procedure Parameter

Parameter	Description
value	Value in megabytes.

GET_MIN_STREAMS_POOL Procedure

This procedure retrieves the value of Oracle Database Advanced Queuing minimum streams pool memory limit.

Syntax

```
DBMS_AQADM.GET_MIN_STREAMS_POOL (
   value     OUT      NUMBER);
```

Parameters

Table 25–35 GET_MIN_STREAMS_POOL Procedure Parameter

Parameter	Description
value	Value in megabytes.

GRANT_QUEUE_PRIVILEGE Procedure

This procedure grants privileges on a queue to users and roles. The privileges are ENQUEUE or DEQUEUE. Initially, only the queue table owner can use this procedure to grant privileges on the queues.

Syntax

```
DBMS_AQADM.GRANT_QUEUE_PRIVILEGE (
   privilege        IN    VARCHAR2,
   queue_name       IN    VARCHAR2,
   grantee          IN    VARCHAR2,
   grant_option     IN    BOOLEAN := FALSE);
```

Parameters

Table 25–36 GRANT_QUEUE_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Database Advanced Queuing queue privilege to grant. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.
queue_name	Name of the queue.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.
grant_option	Specifies if the access privilege is granted with the GRANT option or not. If the privilege is granted with the GRANT option, then the grantee is allowed to use this procedure to grant the access privilege to other users or roles, regardless of the ownership of the queue table. The default is FALSE.

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants Oracle Database Advanced Queuing system privileges to users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. Initially, only SYS and SYSTEM can use this procedure successfully.

Syntax

```
DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE (
   privilege         IN    VARCHAR2,
   grantee           IN    VARCHAR2,
   admin_option      IN    BOOLEAN := FALSE);
```

Parameters

Table 25–37 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Database Advanced Queuing system privilege to grant. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. ENQUEUE_ANY means users granted this privilege are allowed to enqueue messages to any queues in the database. DEQUEUE_ANY means users granted this privilege are allowed to dequeue messages from any queues in the database. MANAGE_ANY means users granted this privilege are allowed to run DBMS_AQADM calls on any schemas in the database.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.
admin_option	Specifies if the system privilege is granted with the ADMIN option or not. If the privilege is granted with the ADMIN option, then the grantee is allowed to use this procedure to grant the system privilege to other users or roles. The default is FALSE.

MIGRATE_QUEUE_TABLE Procedure

This procedure upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table.

Syntax

```
DBMS_AQADM.MIGRATE_QUEUE_TABLE (
   queue_table    IN   VARCHAR2,
   compatible     IN   VARCHAR2);
```

Parameters

Table 25–38 MIGRATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
`queue_table`	Specifies name of the queue table to be migrated.
`compatible`	Set this to `8.1` to upgrade an 8.0-compatible queue table, or set this to `8.0` to downgrade an 8.1-compatible queue table.

PURGE_QUEUE_TABLE Procedure

This procedure purges messages from queue tables. You can perform various purge operations on both single-consumer and multiconsumer queue tables for persistent and buffered messages.

Syntax

```
DBMS_AQADM.PURGE_QUEUE_TABLE(
   queue_table        IN   VARCHAR2,
   purge_condition    IN   VARCHAR2,
   purge_options      IN   aq$_purge_options_t);
```

where type aq$_purge_options_t is described in Chapter 271, "Oracle Database Advanced Queuing (AQ) Types".

Parameters

Table 25–39 PURGE_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Specifies the name of the queue table to be purged.
purge_condition	Specifies the purge condition to use when purging the queue table. The purge condition must be in the format of a SQL WHERE clause, and it is case-sensitive. The condition is based on the columns of aq$queue_table_name view. When specifying the purge_condition, qualify the column names in aq$queue_table_name view with qtview. To purge all queues in a queue table, set purge_condition to either NULL (a bare null word, no quotes) or'' (two single quotes).
purge_options	Type aq$_purge_options_t contains a block parameter and a delivery_mode parameter. ■ If block is TRUE, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueuers and dequeuers to block while the queue table is purged. The purge call always succeeds if block is TRUE. The default for block is FALSE. This will not block enqueuers and dequeuers, but it can cause the purge to fail with an error during high concurrency times. ■ delivery_mode is used to specify whether DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED or DBMS_AQADM.PERSISTENT_OR_BUFFERED types of messages are to be purged. You cannot implement arbitrary purge conditions if buffered messages have to be purged.

Usage Notes

- You an purge selected messages from the queue table by specifying a purge_condition. Table 25–39 describes these parameters. Messages can be enqueued to and dequeued from the queue table while the queue table is being purged.

- A trace file is generated in the `udump` destination when you run this procedure. It details what the procedure is doing.
- This procedure commits batches of messages in autonomous transactions. Several such autonomous transactions may get executed as a part of one `purge_queue_table` call depending on the number of messages in the queue table.

QUEUE_SUBSCRIBERS Function

This function returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`. Each element of the collection is of type `sys.aq$_agent`. This functionality is provided for 8.1-compatible queues by the `AQ$`*`queue_table_name`*`_S` view.

Syntax

```
DBMS_AQADM.QUEUE_SUBSCRIBERS (
   queue_name         IN         VARCHAR2);
RETURN aq$_subscriber_list_t IS
```

Parameters

Table 25–40 QUEUE_SUBSCRIBERS Function Parameters

Parameter	Description
`queue_name`	Specifies the queue whose subscribers are to be printed.

REMOVE_SUBSCRIBER Procedure

This procedure removes a default subscriber from a queue. This operation takes effect immediately, and the containing transaction is committed. All references to the subscriber in existing messages are removed as part of the operation.

Syntax

```
DBMS_AQADM.REMOVE_SUBSCRIBER (
   queue_name          IN          VARCHAR2,
   subscriber          IN          sys.aq$_agent);
```

Parameters

Table 25–41 REMOVE_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent who is being removed. See AQ$_AGENT Type on page 271-5.

REVOKE_QUEUE_PRIVILEGE Procedure

This procedure revokes privileges on a queue from users and roles. The privileges are ENQUEUE or DEQUEUE.

Syntax

```
DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE (
   privilege         IN      VARCHAR2,
   queue_name        IN      VARCHAR2,
   grantee           IN      VARCHAR2);
```

Parameters

Table 25–42 REVOKE_QUEUE_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Database Advanced Queuing queue privilege to revoke. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.
queue_name	Name of the queue.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role. If the privilege has been propagated by the grantee through the GRANT option, then the propagated privilege is also revoked.

Usage Notes

To revoke a privilege, the revoker must be the original grantor of the privilege. The privileges propagated through the GRANT option are revoked if the grantor's privileges are revoked.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes Oracle Database Advanced Queuing system privileges from users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.

Syntax

```
DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE (
   privilege         IN   VARCHAR2,
   grantee           IN   VARCHAR2);
```

Parameters

Table 25–43 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Database Advanced Queuing system privilege to revoke. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.

SCHEDULE_PROPAGATION Procedure

This procedure schedules propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```
DBMS_AQADM.SCHEDULE_PROPAGATION (
   queue_name          IN    VARCHAR2,
   destination         IN    VARCHAR2 DEFAULT NULL,
   start_time          IN    DATE     DEFAULT SYSDATE,
   duration            IN    NUMBER   DEFAULT NULL,
   next_time           IN    VARCHAR2 DEFAULT NULL,
   latency             IN    NUMBER   DEFAULT 60,
   destination_queue   IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–44 SCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
start_time	Initial start time for the propagation window for messages from the source queue to the destination.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.
latency	Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It is at least 60 seconds before the queue is checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue is not checked for 10 minutes, and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination. As soon as a message is enqueued, it is propagated.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

Usage Notes

Messages may also be propagated to other queues in the same database by specifying a NULL destination. If a message has multiple recipients at the same destination in

either the same or different queues, the message is propagated to all of them at the same time.

SET_WATERMARK Procedure

This procedure is used for Oracle Database Advanced Queuing notification to specify and limit memory use.

Syntax

```
DBMS_AQADM.SET_WATERMARK (
   wmvalue     IN      NUMBER);
```

Parameters

Table 25–45 SET_WATERMARK Procedure Parameter

Parameter	Description
wmvalue	Watermark value in megabytes.

SET_MAX_STREAMS_POOL Procedure

This procedure is used for Oracle Database Advanced Queuing to specify and limit maximum streams pool memory use.

Syntax

```
DBMS_AQADM.SET_MAX_STREAMS_POOL (
   value     IN      NUMBER);
```

Parameters

Table 25–46 SET_MAX_STREAMS_POOL Procedure Parameter

Parameter	Description
value	Value in megabytes.

SET_MIN_STREAMS_POOL Procedure

This procedure is used for Oracle Database AQ to specify and limit minimum streams pool memory use.

Syntax

```
DBMS_AQADM.SET_MIN_STREAMS_POOL (
   value     IN      NUMBER);
```

Parameters

Table 25–47 SET_MIN_STREAMS_POOL Procedure Parameter

Parameter	Description
value	Value in megabytes.

START_QUEUE Procedure

This procedure enables the specified queue for enqueuing or dequeuing.

Syntax

```
DBMS_AQADM.START_QUEUE (
   queue_name       IN     VARCHAR2,
   enqueue          IN     BOOLEAN DEFAULT TRUE,
   dequeue          IN     BOOLEAN DEFAULT TRUE);
```

Parameters

Table 25–48 START_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue to be enabled
enqueue	Specifies whether ENQUEUE should be enabled on this queue. TRUE means enable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be enabled on this queue. TRUE means enable DEQUEUE. This is the default. FALSE means do not alter the current setting.

Usage Notes

After creating a queue, the administrator must use START_QUEUE to enable the queue. The default is to enable it for both ENQUEUE and DEQUEUE. Only dequeue operations are allowed on an exception queue. This operation takes effect when the call completes and does not have any transactional characteristics.

STOP_QUEUE Procedure

This procedure disables enqueuing or dequeuing on the specified queue.

Syntax

```
DBMS_AQADM.STOP_QUEUE (
   queue_name      IN   VARCHAR2,
   enqueue         IN   BOOLEAN DEFAULT TRUE,
   dequeue         IN   BOOLEAN DEFAULT TRUE,
   wait            IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 25–49 STOP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue to be disabled
enqueue	Specifies whether ENQUEUE should be disabled on this queue. TRUE means disable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be disabled on this queue. TRUE means disable DEQUEUE. This is the default. FALSE means do not alter the current setting.
wait	Specifies whether to wait for the completion of outstanding transactions. TRUE means wait if there are any outstanding transactions. In this state no new transactions are allowed to enqueue to or dequeue from this queue. FALSE means return immediately either with a success or an error.

Usage Notes

By default, this call disables both ENQUEUE and DEQUEUE. A queue cannot be stopped if there are outstanding transactions against the queue. This operation takes effect when the call completes and does not have any transactional characteristics.

UNSCHEDULE_PROPAGATION Procedure

This procedure unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```
DBMS_AQADM.UNSCHEDULE_PROPAGATION (
   queue_name         IN  VARCHAR2,
   destination        IN  VARCHAR2 DEFAULT NULL
   destination_queue  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–50 UNSCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_ queue	Name of the target queue to which messages are to be propagated in the form of a dblink

VERIFY_QUEUE_TYPES Procedure

This procedure verifies that the source and destination queues have identical types. The result of the verification is stored in the table `sys.aq$_message_types`, overwriting all previous output of this command.

Syntax

```
DBMS_AQADM.VERIFY_QUEUE_TYPES (
   src_queue_name    IN    VARCHAR2,
   dest_queue_name   IN    VARCHAR2,
   destination       IN    VARCHAR2 DEFAULT NULL,
   rc                OUT   BINARY_INTEGER);
```

Parameters

Table 25–51 VERIFY_QUEUE_TYPES Procedure Parameters

Parameter	Description
`src_queue_name`	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
`dest_queue_name`	Name of the destination queue where messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
`destination`	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is `NULL`, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
`rc`	Return code for the result of the procedure. If there is no error, and if the source and destination queue types match, then the result is 1. If they do not match, then the result is 0. If an Oracle error is encountered, then it is returned in `rc`.

26

DBMS_AQELM

The DBMS_AQELM package provides subprograms to manage the configuration of Oracle Streams Advanced Queuing (AQ) asynchronous notification by e-mail and HTTP.

> **See Also:** *Oracle Database Advanced Queuing User's Guide* for detailed information about DBMS_AQELM

This chapter contains the following topic:

Using DBMS_AQELM

This section contains the following topic:

- Security Model

Security Model

You need the administrator role `AQ_ADMINISTRATOR_ROLE` to run all procedures in `DBMS_AQELM`.

Summary of DBMS_AQELM Subprograms

Table 26–1 DBMS_ALERT Package Subprograms

Subprogram	Description
SET_MAILHOST Procedure on page 26-5	Sets the host name for the SMTP server that the database will uses send out e-mail notifications
SET_MAILPORT Procedure on page 26-6	Sets the port number for the SMTP server
SET_SENDFROM Procedure on page 26-7	Sets the sent-from e-mail address

SET_MAILHOST Procedure

This procedure sets the host name for the SMTP server. The database uses this SMTP server host name to send out e-mail notifications.

Syntax

```
DBMS_AQELM.SET_MAILHOST (
   mailhost  IN  VARCHAR2);
```

Parameters

Table 26–2 SET_MAILHOST Procedure Parameters

Parameter	Description
mailhost	SMTP server host name.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package needs to set the host name before registering for e-mail notifications.

SET_MAILPORT Procedure

This procedure sets the port number for the SMTP server.

Syntax

```
DBMS_AQELM.SET_MAILPORT (
   mailport  IN NUMBER);
```

Parameters

Table 26–3 SET_MAILPORT Procedure Parameters

Parameter	Description
mailport	SMTP server port number.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on DBMS_AQELM package needs to set the port number before registering for e-mail notifications. The database uses this SMTP server port number to send out e-mail notifications. If not set, the SMTP mailport defaults to 25

SET_SENDFROM Procedure

This procedure sets the sent-from e-mail address. This e-mail address is used in the sent-from field in all the e-mail notifications sent out by the database to the registered e-mail addresses.

Syntax

```
DBMS_AQELM.SET_SENDFROM (
   sendfrom  IN  VARCHAR2);
```

Parameters

Table 26–4 SET_SENDFROM Procedure Parameters

Parameter	Description
sendfrom	The sent-from e-mail address.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package should set the sent-from address before registering for e-mail notifications

27

DBMS_AQIN

The DBMS_AQIN package plays a part in providing secure access to the Oracle JMS interfaces.

> **See Also:** *Oracle Database Advanced Queuing User's Guide* for detailed information about DBMS_AQIN

This chapter contains the following topic:

Using DBMS_AQIN

This section contains the following topic.

- Security Model

Security Model

While you should not call any subprograms in the DBMS_AQIN package directly, you must have the EXECUTE privilege on the DBMS_AQIN and DBMS_AQJMS packages to use the Oracle JMS interfaces. Use the following syntax to accomplish this with regard to the DBMS_AQIN package:

```
GRANT EXECUTE ON DBMS_AQIN to user;
```

You must have EXECUTE privilege on the DBMS_AQIN and DBMS_AQJMS packages to use the Oracle JMS interfaces. You can also acquire these rights through the AQ_USER_ROLE or the AQ_ADMINSTRATOR_ROLE.

> **See Also:** *Oracle Database Advanced Queuing User's Guide* for more information on accessing standard and Oracle JMS applications.

28

DBMS_ASSERT

The DBMS_ASSERT package provides an interface to validate properties of the input value.

> **See Also:** *Oracle Database PL/SQL Language Reference* for more information about "Avoiding SQL Injection in PL/SQL"

This chapter contains the following topics:

Using DBMS_ASSERT

Operational Notes

If the condition which determines the property asserted in a function is not met then a value error is raised. Otherwise the input value is returned through the return value. Most functions return the value unchanged, however, several functions modify the value.

Summary of DBMS_ASSERT Subprograms

Table 28–1 DBMS_APPLICATION_INFO Package Subprograms

Subprogram	Description
ENQUOTE_LITERAL Function on page 28-5	Enquotes a string literal
ENQUOTE_NAME Function on page 28-6	Encloses a name in double quotes
NOOP Functions on page 28-7	Returns the value without any checking
QUALIFIED_SQL_NAME Function on page 28-8	Verifies that the input string is a qualified SQL name
SCHEMA_NAME Function on page 28-9	Verifies that the input string is an existing schema name
SIMPLE_SQL_NAME Function on page 28-10	Verifies that the input string is a simple SQL name
SQL_OBJECT_NAME Function on page 28-11	Verifies that the input parameter string is a qualified SQL identifier of an existing SQL object

ENQUOTE_LITERAL Function

This function adds leading and trailing single quotes to a string literal.

Syntax

```
DBMS_ASSERT.ENQUOTE_LITERAL (
   str            VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 28–2 ENQUOTE_LITERAL Function Parameters

Parameter	Description
str	String to enquote

Usage Notes

- Verify that all single quotes except leading and trailing characters are paired with adjacent single quotes.
- No additional quotes are added if the name was already in quotes.

ENQUOTE_NAME Function

This function encloses the provided string within quotation marks. However, additional quotation marks are not added if the string is already in quotation marks. The quoted string is then checked to see if it is a valid identifier.

For more information on Database object names and qualifiers, see Oracle Database SQL Language Reference Guide.

Syntax

```
DBMS_ASSERT.ENQUOTE_NAME (
   str            VARCHAR2,
   capitalize     BOOLEAN DEFAULT TRUE)
RETURN VARCHAR2;
```

Parameters

Table 28–3 ENQUOTE_NAME Function Parameters

Parameter	Description
`str`	String to enquote
`capitalize`	If `TRUE` or defaulted, alphabetic characters of `str` which was not in quotes are translated to upper case

Usage Notes

- No additional quotes are added if the name was already in quotes.
- Verify that all other double quotes in the string are adjacent pairs of double quotes.

NOOP Functions

This function returns the value without any checking.

Syntax

```
DBMS_ASSERT.NOOP (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;

DBMS_ASSERT.NOOP (
   str      CLOB CHARACTER SET ANY_CS)
 RETURN     CLOB CHARACTER SET str%CHARSET;
```

Parameters

Table 28–4 NOOP Function Parameters

Parameter	Description
str	Input value

QUALIFIED_SQL_NAME Function

This function verifies that the input string is a qualified SQL name.

Syntax

```
DBMS_ASSERT.QUALIFIED_SQL_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 28–5 QUALIFIED_SQL_NAME Function Parameters

Parameter	Description
str	Input value

Exceptions

ORA44004: string is not a qualified SQL name

Usage Notes

A qualified SQL name <qualified name> can be expressed by the following grammar:

```
<local qualified name> ::= <simple name> {'.' <simple name>}
<database link name> ::= <local qualified name> ['@' <connection string>]
<connection string> ::= <simple name>
<qualified name> ::= <local qualified name> ['@' <database link name>]
```

SCHEMA_NAME Function

This function verifies that the input string is an existing schema name.

Syntax

```
DBMS_ASSERT.SCHEMA_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 28–6 SCHEMA_NAME Function Parameters

Parameter	Description
str	Input value

Exceptions

ORA44001: Invalid schema name

Usage Notes

By definition, a schema name need not be just a simple SQL name. For example, "FIRST LAST" is a valid schema name. As a consequence, care must be taken to quote the output of schema name before concatenating it with SQL text.

SIMPLE_SQL_NAME Function

This function verifies that the input string is a simple SQL name.

Syntax

```
DBMS_ASSERT.SIMPLE_SQL_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 28–7 SIMPLE_SQL_NAME Function Parameters

Parameter	Description
str	Input value

Exceptions

ORA44003: string is not a simple SQL name

Usage Notes

- The input value must be meet the following conditions:
  - The name must begin with an alphabetic character. It may contain alphanumeric characters as well as the characters _, $, and # in the second and subsequent character positions.
  - Quoted SQL names are also allowed.
  - Quoted names must be enclosed in double quotes.
  - Quoted names allow any characters between the quotes.
  - Quotes inside the name are represented by two quote characters in a row, for example, "a name with "" inside" is a valid quoted name.
  - The input parameter may have any number of leading and/or trailing white space characters.
- The length of the name is not checked.

SQL_OBJECT_NAME Function

This function verifies that the input parameter string is a qualified SQL identifier of an existing SQL object.

Syntax

```
DBMS_ASSERT.SQL_OBJECT_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 28–8 SQL_OBJECT_NAME Function Parameters

Parameter	Description
str	Input value

Exceptions

ORA44002: Invalid object name

Usage Notes

The use of synonyms requires that the base object exists.

29

DBMS_AUDIT_MGMT

The DBMS_AUDIT_MGMT package provides subprograms to manage audit trail records. These subprograms enable audit administrators to manage the audit trail. In a mixed-mode environment, these audit trails comprise the database, operating system (OS), and XML audit trails. In a unified auditing environment, this comprises the unified audit trail.

See Also:

- *Oracle Database Security Guide* regarding verifying security access with auditing
- *Oracle Database Upgrade Guide* regarding migrating to unified auditing

This chapter contains the following topics:

Using DBMS_AUDIT_MGMT

This section contains topics which relate to using the `DBMS_AUDIT_MGMT` package. The following topics are included:

Overview

Database auditing helps meet your database security and compliance requirements. In a mixed mode environment, audit records are written to database tables, operating system (OS) files, or XML files depending on the AUDIT_TRAIL initialization parameter setting. If you have upgraded to unified auditing, then the audit records are written to the unified audit trail.

In a mixed mode environment, when AUDIT_TRAIL is set to DB, database records are written to the AUD$ table. In a unified auditing environment, audit records are written to a read-only table in the AUDSYS schema. The contents of this table are available from the UNIFIED_AUDIT_TRAIL data dictionary view.When AUDIT_TRAIL is set to OS, audit records are written to operating system files. When AUDIT_TRAIL is set to XML, audit records are written to operating system files in XML format.

With Unified Auditing facility, all audit records are written to the unified audit trail in a uniform format and are made available through the UNIFIED_AUDIT_TRAIL views.

It is important to manage your audit records properly in order to ensure efficient performance and disk space management. The DBMS_AUDIT_MGMT subprograms enable you to efficiently manage your audit trail records.

If you have not yet migrated to unified auditing, the DBMS_AUDIT_MGMT package provides a subprogram that allows you to move the database audit trail tables out of the SYSTEM tablespace. This improves overall database performance by reducing the load on the SYSTEM tablespace. It also enables you to dedicate an optimized tablespace for audit records.

For a mixed mode environment, the DBMS_AUDIT_MGMT subprograms also enable you to manage your operating system and XML audit files. You can define properties like the maximum size and age of an audit file. This enables you to keep the file sizes of OS and XML audit files in check.

The DBMS_AUDIT_MGMT subprograms enable you to perform cleanup operations on all audit trail types. Audit trails can be cleaned based on the last archive timestamp value. The last archive timestamp represents the timestamp of the most recent audit record that was securely archived.

The DBMS_AUDIT_MGMT package provides a subprogram that enables audit administrators to set the last archive timestamp for archived audit records. This subprogram can also be used by external archival systems to set the last archive timestamp.

The DBMS_AUDIT_MGMT subprograms also enable you to configure jobs that periodically delete audit trail records. The frequency with which these jobs should run can be controlled by the audit administrator.

> **See Also:** *Oracle Database Security Guide* for a detailed description of unified auditing

Security Model

All DBMS_AUDIT_MGMT subprograms require the user to have EXECUTE privilege over the DBMS_AUDIT_MGMT package. The SYSDBA and AUDIT_ADMIN roles have EXECUTE privileges on the package by default.

Oracle strongly recommends that only audit administrators should have the EXECUTE privilege on the DBMS_AUDIT_MGMT package and be granted the AUDIT_ADMIN role.

Executions of the DBMS_AUDIT_MGMT subprograms are always audited.

Constants

The DBMS_AUDIT_MGMT package defines several constants that can be used for specifying parameter values.

The DBMS_AUDIT_MGMT package includes the constants shown in the following tables:

- DBMS_AUDIT_MGMT Constants - Audit Trail Types
- DBMS_AUDIT_MGMT Constants - Audit Trail Properties
- DBMS_AUDIT_MGMT Constants - Purge Job Status

Audit trails can be classified based on whether audit records are written to database tables, operating system files, or XML files. Table 29–1 lists the audit trail type constants.

Table 29–1 DBMS_AUDIT_MGMT Constants - Audit Trail Types

Constant	Type	Description
AUDIT_TRAIL_ALL	PLS_INTEGER	All audit trail types. This includes the standard database audit trail (SYS.AUD$, SYS.FGA_LOG$ and unified audit trail tables), operating system (OS) audit trail, and XML audit trail.
AUDIT_TRAIL_AUD_STD	PLS_INTEGER	Standard database audit records in the SYS.AUD$ table
AUDIT_TRAIL_DB_STD	PLS_INTEGER	Both standard audit (SYS.AUD$) and FGA audit(SYS.FGA_LOG$) records
AUDIT_TRAIL_FGA_STD	PLS_INTEGER	Standard database fine-grained auditing (FGA) records in the SYS.FGA_LOG$ table
AUDIT_TRAIL_FILES	PLS_INTEGER	Both operating system (OS) and XML audit trails
AUDIT_TRAIL_OS	PLS_INTEGER	Operating system audit trail. This refers to the audit records stored in operating system files.
AUDIT_TRAIL_UNIFIED	PLS_INTEGER	Unified audit trail. In unified auditing, all audit records are written to the unified audit trail and are made available through the unified audit trail views, such as UNIFIED_AUDIT_TRAIL.
AUDIT_TRAIL_XML	PLS_INTEGER	XML audit trail. This refers to the audit records stored in XML files.

Audit trail properties determine the audit configuration settings. Table 29–2 lists the constants related to audit trail properties.

Table 29–2 DBMS_AUDIT_MGMT Constants - Audit Trail Properties

Constant	Type	Description
AUDIT_TRAIL_WRITE_MODE	PLS_INTEGER	A value of AUDIT_TRAIL_IMMEDIATE_WRITE indicates that the audit record must be immediately persisted and not to be queued. By contrast, AUDIT_TRAIL_QUEUED_WRITE indicates that the audit record can be queued and persisting can be done according the database's flushing strategy. See Also *Oracle Database Security Guide*

Table 29–2 (Cont.) DBMS_AUDIT_MGMT Constants - Audit Trail Properties

Constant	Type	Description
CLEAN_UP_INTERVAL	PLS_INTEGER	Interval, in hours, after which the cleanup procedure is called to clear audit records in the specified audit trail
DB_DELETE_BATCH_SIZE	PLS_INTEGER	Specifies the batch size to be used for deleting audit records in database audit tables. The audit records are deleted in batches of size equal to DB_DELETE_BATCH_SIZE.
FILE_DELETE_BATCH_SIZE	PLS_INTEGER	Specifies the batch size to be used for deleting audit files in the audit directory. The audit files are deleted in batches of size equal to FILE_DELETE_BATCH_SIZE.
OS_FILE_MAX_AGE	PLS_INTEGER	Specifies the maximum number of days for which an operating system (OS) or XML audit file can be kept open before a new audit file gets created
OS_FILE_MAX_SIZE	PLS_INTEGER	Specifies the maximum size, in kilobytes (KB), to which an operating system (OS) or XML audit file can grow before a new file is opened

The audit trail purge job cleans the audit trail. Table 29–3 lists the constants related to purge job status values.

Table 29–3 DBMS_AUDIT_MGMT Constants - Purge Job Status

Constant	Type	Description
PURGE_JOB_DISABLE	PLS_INTEGER	Disables a purge job
PURGE_JOB_ENABLE	PLS_INTEGER	Enables a purge job

Views

The views listed in Table 29–4 are used to display DBMS_AUDIT_MGMT configuration and cleanup events.

Table 29–4 Views used by DBMS_AUDIT_MGMT

View	Description
DBA_AUDIT_MGMT_CLEAN_EVENTS	Displays the cleanup event history
DBA_AUDIT_MGMT_CLEANUP_JOBS	Displays the currently configured audit trail purge jobs
DBA_AUDIT_MGMT_CONFIG_PARAMS	Displays the currently configured audit trail properties
DBA_AUDIT_MGMT_LAST_ARCH_TS	Displays the last archive timestamps set for the audit trails

See Also: *Oracle Database Reference* for more information on these views

Subprogram Groups

The DBMS_AUDIT_MGMT package subprograms can be grouped into the following categories:

- Audit Trail Management Subprograms
- Audit Trail Cleanup Subprograms

Audit Trail Management Subprograms

Audit trail management subprograms enable you to manage audit trail properties.

Table 29–5 Audit Trail Management Subprograms

Subprogram	Description
CLEAR_AUDIT_TRAIL_PROPERTY Procedure on page 29-14	Clears the value for the audit trail property that you specify
FLUSH_UNIFIED_AUDIT_TRAIL Procedure on page 29-23	Writes the unified audit trail records in the SGA queue to disk
GET_ AUDIT_TRAIL_PROPERTY_VALUE Function on page 29-25	Returns the property value set by the SET_ AUDIT_TRAIL_PROPERTY Procedure
GET_LAST_ARCHIVE_TIMESTAMP Function on page 29-26	Returns the timestamp set by the SET_LAST_ ARCHIVE_TIMESTAMP Procedure in that database instance
LOAD_UNIFIED_AUDIT_FILES Procedure on page 29-30	Loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace
SET_AUDIT_TRAIL_LOCATION Procedure on page 29-31	Moves the audit trail tables from their current tablespace to a user-specified tablespace
SET_AUDIT_TRAIL_PROPERTY Procedure on page 29-33	Sets an audit trail property for the audit trail type that you specify
SET_LAST_ARCHIVE_TIMESTAMP Procedure on page 29-36	Sets a timestamp indicating when the audit records or files were last archived

The Summary of DBMS_AUDIT_MGMT Subprograms contains a complete listing of all subprograms in the package.

Audit Trail Cleanup Subprograms

Audit trail cleanup subprograms help you perform cleanup related operations on the audit trail records.

Table 29–6 Audit Trail Cleanup Subprograms

Subprogram	Description
CLEAN_AUDIT_TRAIL Procedure on page 29-12	Deletes audit trail records or files that have been archived
CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure on page 29-16	Clears the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure
CREATE_PURGE_JOB Procedure on page 29-18	Creates a purge job for periodically deleting the audit trail records or files
DEINIT_CLEANUP Procedure on page 29-20	Undoes the setup and initialization performed by the INIT_CLEANUP Procedure
DROP_OLD_UNIFIED_AUDIT_TABLES Procedure on page 29-21	Drops old unified audit tables following the cloning of a pluggable database (PDB)
DROP_PURGE_JOB Procedure on page 29-22	Drops the purge job created using the CREATE_PURGE_JOB Procedure
INIT_CLEANUP Procedure on page 29-27	Sets up the audit management infrastructure and sets a default cleanup interval for audit trail records or files
IS_CLEANUP_INITIALIZED Function on page 29-29	Checks to see if the INIT_CLEANUP Procedure has been run for an audit trail type
SET_PURGE_JOB_INTERVAL Procedure on page 29-38	Sets the interval at which the CLEAN_AUDIT_TRAIL Procedure is called for the purge job that you specify
SET_PURGE_JOB_STATUS Procedure on page 29-39	Enables or disables the purge job that you specify

The Summary of DBMS_AUDIT_MGMT Subprograms contains a complete listing of all subprograms in the package.

Summary of DBMS_AUDIT_MGMT Subprograms

Table 29–7 DBMS_AUDIT_MGMT Package Subprograms

Subprogram	Description
CLEAN_AUDIT_TRAIL Procedure on page 29-12	Deletes audit trail records that have been archived
CLEAR_AUDIT_TRAIL_PROPERTY Procedure on page 29-14	Clears the value for the audit trail property that you specify
CLEAR_LAST_ARCHIVE_ TIMESTAMP Procedure on page 29-16	Clears the timestamp set by the SET_LAST_ ARCHIVE_TIMESTAMP Procedure
CREATE_PURGE_JOB Procedure on page 29-18	Creates a purge job for periodically deleting the audit trail records
DEINIT_CLEANUP Procedure on page 29-20	Undoes the setup and initialization performed by the INIT_CLEANUP Procedure
DROP_OLD_UNIFIED_AUDIT_ TABLES Procedure on page 29-21	Drops old unified audit tables following the cloning of a pluggable database (PDB)
DROP_PURGE_JOB Procedure on page 29-22	Drops the purge job created using the CREATE_ PURGE_JOB Procedure
FLUSH_UNIFIED_AUDIT_TRAIL Procedure on page 29-23	Writes the unified audit trail records in the SGA queue to disk
GET_AUDIT_COMMIT_DELAY Function on page 29-24	Returns the audit commit delay time as the number of seconds. This is the maximum time that it takes to `COMMIT` an audit record to the database audit trail.
GET_ AUDIT_TRAIL_PROPERTY_ VALUE Function on page 29-25	Returns the property value set by the SET_AUDIT_ TRAIL_PROPERTY Procedure
GET_LAST_ARCHIVE_TIMESTAMP Function on page 29-26	Returns the timestamp set by the SET_LAST_ ARCHIVE_TIMESTAMP Procedure in that database instance
INIT_CLEANUP Procedure on page 29-27	Sets up the audit management infrastructure and sets a default cleanup interval for audit trail records
IS_CLEANUP_INITIALIZED Function on page 29-29	Checks to see if the INIT_CLEANUP Procedure has been run for an audit trail type
LOAD_UNIFIED_AUDIT_FILES Procedure on page 29-30	Loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace
SET_AUDIT_TRAIL_LOCATION Procedure on page 29-31	Moves the audit trail tables from their current tablespace to a user-specified tablespace
SET_AUDIT_TRAIL_PROPERTY Procedure on page 29-33	Sets the audit trail properties for the audit trail type that you specify
SET_LAST_ARCHIVE_TIMESTAMP Procedure on page 29-36	Sets a timestamp indicating when the audit records were last archived
SET_PURGE_JOB_INTERVAL Procedure on page 29-38	Sets the interval at which the CLEAN_AUDIT_TRAIL Procedure is called for the purge job that you specify
SET_PURGE_JOB_STATUS Procedure on page 29-39	Enables or disables the purge job that you specify

CLEAN_AUDIT_TRAIL Procedure

This procedure deletes audit trail records. The `CLEAN_AUDIT_TRAIL` procedure is usually called after the SET_LAST_ARCHIVE_TIMESTAMP Procedure has been used to set the last archived timestamp for the audit records.

Syntax

```
DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
   audit_trail_type         IN PLS_INTEGER,
   use_last_arch_timestamp  IN BOOLEAN DEFAULT TRUE,
   container                IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
   database_id              IN NUMBER DEFAULT NULL,
   container_guid           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 29–8 CLEAN_AUDIT_TRAIL Procedure Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for which the cleanup operation needs to be performed. Audit trail types are listed in Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5.
`use_last_arch_timestamp`	Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted. A value of `TRUE` indicates that only audit records created before the last archive timestamp should be deleted. A value of `FALSE` indicates that all audit records should be deleted. The default value is `TRUE`. Oracle recommends using this value, as this helps guard against inadvertent deletion of records.
`container`	Values: `CONTAINER_CURRENT` for the connected pluggable database (PDB) or `CONTAINER_ALL` for all pluggable databases (PDBs). When `CONTAINER` is set to `CONTAINER_ALL`, this purges the audit trail in all the PDBs, otherwise it only purges from the connected PDB.
`database_id`	Database ID (DBID) of the `SYS.AUD$` and `SYS.FGA$` audit records to cleanup; does not apply to unified audit records
`container_guid`	Container GUID of the audit records to cleanup; applies to unified audit records

Usage Notes

The following usage notes apply:

- When cleaning up operating system (OS) or XML audit files, only files in the current audit directory, specified by the `AUDIT_FILE_DEST` parameter, are cleaned up.
- For Windows platforms, no cleanup is performed when the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS`. This is because operating system (OS) audit records on Windows are written to the Windows Event Viewer.

- For Unix platforms, no cleanup is performed for cases where the operating system (OS) audit records are written to the syslog. When the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS`, it removes only the `*.aud` files under the directory specified by the `AUDIT_FILE_DEST` initialization parameter.

  See Also: "AUDIT_SYSLOG_LEVEL" in the *Oracle Database Reference*

- When the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_XML`, this procedure only removes XML audit files (`*.xml`) from the current audit directory.

  Oracle database maintains a book-keeping file (`adx_$ORACLE_SID.txt`) for the XML audit files. This file is not removed by the cleanup procedure.

Examples

The following example calls the `CLEAN_AUDIT_TRAIL` procedure to clean up the operating system (OS) audit trail records that were updated before the last archive timestamp.

```
BEGIN
DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
   audit_trail_type         =>  DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
   use_last_arch_timestamp  =>  TRUE);
END;
```

CLEAR_AUDIT_TRAIL_PROPERTY Procedure

This procedure clears the value for the audit trail property that is specified. Audit trail properties are set using the SET_AUDIT_TRAIL_PROPERTY Procedure.

The CLEAR_AUDIT_TRAIL_PROPERTY procedure can optionally reset the property value to it's default value through the use_default_values parameter.

Syntax

```
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY(
   audit_trail_type        IN PLS_INTEGER,
   audit_trail_property    IN PLS_INTEGER,
   use_default_values      IN BOOLEAN DEFAULT FALSE) ;
```

Parameters

Table 29–9 CLEAR_AUDIT_TRAIL_PROPERTY Procedure Parameters

Parameter	Description
audit_trail_type	The audit trail type for which the property needs to be cleared. Audit trail types are listed in Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5
audit_trail_property	The audit trail property whose value needs to be cleared. You cannot clear the value for the CLEANUP_INTERVAL property. Audit trail properties are listed in Table 29–2, " DBMS_AUDIT_MGMT Constants - Audit Trail Properties"
use_default_values	Specifies whether the default value of the audit_trail_property should be used in place of the cleared value. A value of TRUE causes the default value of the parameter to be used. A value of FALSE causes the audit_trail_property to have no value. The default value for this parameter is FALSE.

Usage Notes

The following usage notes apply:

- You can use this procedure to clear the value for an audit trail property that you do not wish to use. For example, if you do not want a restriction on the operating system audit file size, then you can use this procedure to reset the OS_FILE_MAX_SIZE property.

  You can also use this procedure to reset an audit trail property to it's default value. You need to set use_default_values to TRUE when invoking the procedure.

- The DB_DELETE_BATCH_SIZE property needs to be individually cleared for the AUDIT_TRAIL_AUD_STD and AUDIT_TRAIL_FGA_STD audit trail types. You cannot clear this property collectively using the AUDIT_TRAIL_DB_STD and AUDIT_TRAIL_ALL audit trail types.

- If you clear the value of the DB_DELETE_BATCH_SIZE property with use_default_value set to FALSE, the default value of DB_DELETE_BATCH_SIZE is still assumed. This is because audit records are always deleted in batches.

- The FILE_DELETE_BATCH_SIZE property needs to be individually cleared for the AUDIT_TRAIL_OS and AUDIT_TRAIL_XML audit trail types. You cannot clear this

property collectively using the AUDIT_TRAIL_FILES and AUDIT_TRAIL_ALL audit trail types.

- If you clear the value of the FILE_DELETE_BATCH_SIZE property with use_default_value set to FALSE, the default value of FILE_DELETE_BATCH_SIZE is still assumed. This is because audit files are always deleted in batches.
- You cannot clear the value for the CLEANUP_INTERVAL property.
- You cannot clear the value for the AUDIT_TRAIL_WRITE_MODE property.

Examples

The following example calls the CLEAR_AUDIT_TRAIL_PROPERTY procedure to clear the value for the audit trail property, OS_FILE_MAX_SIZE. The procedure uses a value of FALSE for the USE_DEFAULT_VALUES parameter. This means that there will be no maximum size threshold for operating system (OS) audit files.

```
BEGIN
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY(
   AUDIT_TRAIL_TYPE        =>  DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
   AUDIT_TRAIL_PROPERTY    =>  DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
   USE_DEFAULT_VALUES      =>  FALSE );
END;
```

CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure

This procedure clears the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure.

Syntax

```
DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP(
   audit_trail_type         IN PLS_INTEGER,
   rac_instance_number      IN PLS_INTEGER DEFAULT NULL,
   container                IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
   database_id              IN NUMBER DEFAULT NULL,
   container_guid           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 29–10 CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure Parameters

Parameter	Description
audit_trail_type	The audit trail type for which the timestamp needs to be cleared. Audit trail types are listed in Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5.
rac_instance_number	The instance number for the Oracle Real Application Clusters (Oracle RAC) instance. The default value is NULL. The rac_instance_number is not relevant for single instance databases. You can find the instance number by issuing the SHOW PARAMETER INSTANCE_NUMBER command in SQL*Plus.
container	Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this clears the last archive timestamp from all the PDBs, otherwise it clears from only the connected PDB.
database_id	Database ID (DBID) of the audit records to cleanup
container_guid	Container GUID of the audit records to cleanup

Usage Notes

The following usage notes apply:

- The timestamp for only one audit_trail_type can be cleared at a time.
- The following are invalid audit_trail_type values for this procedure and cannot be used:
  - AUDIT_TRAIL_ALL
  - AUDIT_TRAIL_DB_STD
  - AUDIT_TRAIL_FILES

Examples

The following example calls the CLEAR_LAST_ARCHIVE_TIMESTAMP procedure to clear the timestamp value for the operating system (OS) audit trail type.

```
BEGIN
DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP(
   audit_trail_type     =>  DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
```

```
   rac_instance_number  =>  1);
END;
```

CREATE_PURGE_JOB Procedure

This procedure creates a purge job for periodically deleting the audit trail records.

This procedure carries out the cleanup operation at intervals specified by the user. It calls the CLEAN_AUDIT_TRAIL Procedure to perform the cleanup operation.

The SET_PURGE_JOB_INTERVAL Procedure is used to modify the frequency of the purge job.

The SET_PURGE_JOB_STATUS Procedure is used to enable or disable the purge job.

The DROP_PURGE_JOB Procedure is used to drop a purge job created with the `CREATE_PURGE_JOB` procedure.

Syntax

```
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB(
   audit_trail_type            IN PLS_INTEGER,
   audit_trail_purge_interval  IN PLS_INTEGER,
   audit_trail_purge_name      IN VARCHAR2,
   use_last_arch_timestamp     IN BOOLEAN DEFAULT TRUE,
   container                   IN PLS_INTEGER DEFAULT CONTAINER_CURRENT) ;
```

Parameters

Table 29–11 CREATE_PURGE_JOB Procedure Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for which the purge job needs to be created. Audit trail types are listed in Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5.
`audit_trail_purge_interval`	The interval, in hours, at which the clean up procedure is called. A lower value means that the cleanup is performed more often.
`audit_trail_purge_name`	A name to identify the purge job.
`use_last_arch_timestamp`	Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted. A value of `TRUE` indicates that only audit records created before the last archive timestamp should be deleted. A value of `FALSE` indicates that all audit records should be deleted. The default value is `TRUE`.
`container`	Values: `CONTAINER_CURRENT` for the connected pluggable database (PDB) or `CONTAINER_ALL` for all pluggable databases (PDBs). When `CONTAINER` is set to `CONTAINER_ALL`, it creates one job in the Root PDB and the invocation of this job will invoke cleanup in all the PDBs.

Usage Notes

Use this procedure to schedule the CLEAN_AUDIT_TRAIL Procedure for your audit trail records.

Examples

The following example calls the CREATE_PURGE_JOB procedure to create a cleanup job called CLEANUP, for all audit trail types. It sets the audit_trail_purge_interval parameter to 100. This means that the cleanup job is invoked every 100 hours. It also sets the use_last_arch_timestamp parameter value to TRUE. This means that all audit records older than the last archive timestamp are deleted.

```
BEGIN
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB(
  audit_trail_type             =>  DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
  audit_trail_purge_interval   =>  100 /* hours */,
  audit_trail_purge_name       =>  'CLEANUP',
  use_last_arch_timestamp      =>  TRUE);
END;
```

DEINIT_CLEANUP Procedure

This procedure undoes the setup and initialization performed by the INIT_CLEANUP Procedure. The DEINIT_CLEANUP procedure clears the value of the default_cleanup_interval parameter. However, when used for audit tables, it does not move the audit trail tables back to their original tablespace.

Syntax

```
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
   audit_trail_type  IN PLS_INTEGER,
   container         IN PLS_INTEGER DEFAULT CONTAINER_CURRENT);
```

Parameters

Table 29–12 DEINIT_CLEANUP Procedure Parameters

Parameter	Description
audit_trail_type	The audit trail type for which the procedure needs to be called. Audit trail types are listed in Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5
container	Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this de-initializes the audit trail from cleanup in all the pluggable databases, otherwise it de-initializes the audit trail from cleanup in the connected PDB only.

Usage Notes

You cannot invoke this procedure for AUDIT_TRAIL_UNIFIED. Doing so it will raise ORA-46250 : Invalid value for argument 'AUDIT_TRAIL_TYPE'

Examples

The following example clears the default_cleanup_interval parameter setting for the standard database audit trail:

```
BEGIN
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
  AUDIT_TRAIL_TYPE  => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD);
END;
```

DROP_OLD_UNIFIED_AUDIT_TABLES Procedure

This procedure drops old unified audit tables following the cloning of a pluggable database (PDB).

Syntax

```
DBMS_AUDIT_MGMT.DROP_OLD_UNIFIED_AUDIT_TABLES(
   container_guid    IN VARCHAR2) ;
```

Parameters

Table 29–13 DROP_OLD_UNIFIED_AUDIT_TABLES Procedure Parameters

Parameter	Description
container_guid	Container GUID of the old unified audit tables

Usage Notes

When a pluggable database gets cloned, the unified audit tables get newly created in the new pluggable database. To drop the old unified audit tables, use the DROP_OLD_UNIFIED_AUDIT_TABLES by specifying the old GUID of the PDB from which the clone was created. You can query the historical GUIDs from the DBA_PDB_HISTORY view for the given PDB.

Examples

```
BEGIN
    DBMS_AUDIT_MGMT.DROP_OLD_UNIFIED_AUDIT_TABLES (
      container_guid => 'E4721865A9321CB5E043EFA9E80A2D77');
END;
```

DROP_PURGE_JOB Procedure

This procedure drops the purge job created using the CREATE_PURGE_JOB Procedure. The name of the purge job is passed as an argument.

Syntax

```
DBMS_AUDIT_MGMT.DROP_PURGE_JOB(
   audit_trail_purge_name    IN VARCHAR2) ;
```

Parameters

Table 29–14 DROP_PURGE_JOB Procedure Parameters

Parameter	Description
audit_trail_purge_name	The name of the purge job which is being deleted. This is the purge job name that you specified with the CREATE_PURGE_JOB Procedure.

Examples

The following example calls the DROP_PURGE_JOB procedure to drop the purge job called CLEANUP.

```
BEGIN
DBMS_AUDIT_MGMT.DROP_PURGE_JOB(
  AUDIT_TRAIL_PURGE_NAME  => 'CLEANUP');
END;
```

FLUSH_UNIFIED_AUDIT_TRAIL Procedure

This procedure writes the unified audit trail records in the SGA queue to disk.

Syntax

```
DBMS_AUDIT_MGMT.FLUSH_UNIFIED_AUDIT_TRAIL (
   flush_type      IN BINARY_INTEGER   DEFAULT FLUSH_CURRENT_INSTANCE,
   container       IN BINARY_INTEGER   DEFAULT CONTAINER_CURRENT);
```

Parameters

Table 29–15 FLUSH_UNIFIED_AUDIT_TRAIL Procedure Parameters

Parameter	Description
`flush_type`	Takes one of the following two arguments: ■ `FLUSH_CURRENT_INSTANCE` - Flushes the audit records from SGA queues in that particular RAC instance ■ `FLUSH_ALL_INSTANCES` - Flushes the audit records from SGA queues in all the RAC instances
`container`	The containers where the SGA queues should be flushed. It takes one of the following two arguments: ■ `CONTAINER_CURRENT` - Flushes the audit records from SGA queues in that particular PDB ■ `CONTAINER_ALL` - Flushes the audit records from SGA queues in all the active PDBs.

GET_AUDIT_COMMIT_DELAY Function

This function returns the audit commit delay time as the number of seconds. audit commit delay time is the maximum time that it takes to `COMMIT` an audit record to the database audit trail. If it takes more time to COMMIT an audit record than defined by the audit commit delay time, then a copy of the audit record is written to the operating system (OS) audit trail.

The audit commit delay time value is useful when determining the last archive timestamp for database audit records.

Syntax

```
DBMS_AUDIT_MGMT.GET_AUDIT_COMMIT_DELAY
  RETURN NUMBER;
```

GET_ AUDIT_TRAIL_PROPERTY_VALUE Function

This procedure returns the property value set by the SET_AUDIT_TRAIL_PROPERTY Procedure.

Syntax

```
DBMS_AUDIT_MGMT.GET_LAST_ARCHIVE_TIMESTAMP(
   audit_trail_type         IN PLS_INTEGER,
   audit_trail_property     IN PLS_INTEGER)
 RETURN NUMBER;
```

Parameters

Table 29–16 GET_ AUDIT_TRAIL_PROPERTY_VALUE Function Parameters

Parameter	Description
audit_trail_type	The audit trail type for the timestamp to be retrieved. Audit trail types are listed in Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5.
audit_trail_property	The audit trail property that is being queried. Audit trail properties are listed in Table 29–2, " DBMS_AUDIT_MGMT Constants - Audit Trail Properties" on page 29-5.

Return Values

If the property value is cached in SGA memory, this function will return the value set by the SET_AUDIT_TRAIL_PROPERTY Procedure. Else it will return NULL.

Examples

The following example prints the property value of OS_FILE_MAX_AGE set by the SET_AUDIT_TRAIL_PROPERTY Procedure.

```
SET_AUDIT_TRAIL_PROPERTY.
SET SERVEROUTPUT ON
DECLARE
 OS_MAX_AGE_VAL NUMBER;
BEGIN
 OS_MAX_AGE_VAL := DBMS_AUDIT_MGMT.GET_AUDIT_TRAIL_PROPERTY_VALUE(
      audit_trail_type          => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
      audit_trail_property      => DBMS_AUDIT_MGMT. OS_FILE_MAX_AGE);
 IF OS_MAX_AGE_VAL is not NULL THEN
  DBMS_OUTPUT.PUT_LINE('The Maximum Age configured for OS Audit files is: ' ||
                       OS_MAX_AGE_VAL);
 END IF;
END;
```

GET_LAST_ARCHIVE_TIMESTAMP Function

This procedure returns the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure in that database instance.

Syntax

```
DBMS_AUDIT_MGMT.GET_LAST_ARCHIVE_TIMESTAMP(
   audit_trail_type     IN PLS_INTEGER)
 RETURN TIMESTAMP;
```

Parameters

Table 29–17 GET_LAST_ARCHIVE_TIMESTAMP Function Parameters

Parameter	Description
audit_trail_type	The audit trail type for the timestamp to be retrieved. Audit trail types are listed in Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5.

Return Values

In a database that is opened for READ WRITE, since there will no timestamp stored in SGA memory, this function will return NULL. But in a database that is opened for READ ONLY, if a timestamp is set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure, the timestamp will be returned. Else it will return NULL.

Usage Notes

This function will return NULL on a database that is opened READ WRITE. Use DBA_AUDIT_MGMT_LAST_ARCH_TS view to check the timestamp set in such a case.

Examples

The following example prints the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure on a READ ONLY database.

```
SET SERVEROUTPUT ON
DECLARE
 LAT_TS TIMESTAMP;
BEGIN
 LAT_TS := DBMS_AUDIT_MGMT.GET_LAST_ARCHIVE_TIMESTAMP(
      audit_trail_type          => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS);
 IF LAT_TS is not NULL THEN
  DBMS_OUTPUT.PUT_LINE('The Last Archive Timestamp is: ' || to_char(LAT_TS));
 END IF;
END;
```

INIT_CLEANUP Procedure

This procedure sets up the audit management infrastructure and a default cleanup interval for the audit trail records. If the audit trail tables are in the SYSTEM tablespace, then the procedure moves them to the SYSAUX tablespace. If you are using unified auditing, you do not need to run this procedure because the unified audit trail tables are in the SYSAUX tablespace by default. If you are not using unified auditing, refer to *Oracle Database Upgrade Guide* for documentation which references an environment without unified auditing.

Moving the audit trail tables out of the SYSTEM tablespace enhances overall database performance. The INIT_CLEANUP procedure moves the audit trail tables to the SYSAUX tablespace. If the SET_AUDIT_TRAIL_LOCATION Procedure has already moved the audit tables elsewhere, then no tables are moved.

The SET_AUDIT_TRAIL_LOCATION Procedure enables you to specify an alternate target tablespace for the database audit tables.

The INIT_CLEANUP procedure is currently not relevant for the AUDIT_TRAIL_OS, AUDIT_TRAIL_XML, and AUDIT_TRAIL_FILES audit trail types. No preliminary set up is required for these audit trail types.

> **See Also:** Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5 for a list of all audit trail types

This procedure also sets a default cleanup interval for the audit trail records.

Syntax

```
DBMS_AUDIT_MGMT.INIT_CLEANUP(
   audit_trail_type          IN PLS_INTEGER,
   default_cleanup_interval  IN PLS_INTEGER
   container                 IN PLS_INTEGER DEFAULT CONTAINER_CURRENT);
```

Parameters

Table 29–18 INIT_CLEANUP Procedure Parameters

Parameter	Description
audit_trail_type	The audit trail type for which the clean up operation needs to be initialized. Audit trail types are listed in Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5 except AUDIT_TRAIL_UNIFIED
default_cleanup_interval	The default time interval, in hours, after which the cleanup procedure should be called. The minimum value is 1 and the maximum is 999.
container	Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this initializes the audit trails for clean up in all the pluggable databases, otherwise this initializes the audit trail in the connected PDB only.

Usage Notes

The following usage notes apply:

- This procedure may involve data movement across tablespaces. This can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.
- You should ensure that the SYSAUX tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the SYSAUX tablespace for frequent write operations.
- You can change the default_cleanup_interval later using the SET_AUDIT_TRAIL_PROPERTY Procedure.
- If you do not wish to move the audit trail tables to the SYSAUX tablespace, then you should use the DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION procedure to move the audit trail tables to another tablespace before calling the INIT_CLEANUP procedure.
- Invoking this procedure with AUDIT_TRAIL_UNIFIED results in ORA-46250. It requires no initializations for cleanup since it is cleanup-ready by default.

See Also: "SET_AUDIT_TRAIL_LOCATION Procedure" on page 29-31

Examples

The following example calls the INIT_CLEANUP procedure to set a default_cleanup_interval of 12 hours for all audit trail types:

```
BEGIN
DBMS_AUDIT_MGMT.INIT_CLEANUP(
              audit_trail_type   => DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
      default_cleanup_interval   => 12 /* hours */);
END;
```

See Also: Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5 for a list of all audit trail types

IS_CLEANUP_INITIALIZED Function

This function checks to see if the INIT_CLEANUP Procedure has been run for an audit trail type. The IS_CLEANUP_INITIALIZED function returns TRUE if the procedure has already been run for the audit trail type. It returns FALSE if the procedure has not been run for the audit trail type.

This function is currently not relevant for the AUDIT_TRAIL_OS, AUDIT_TRAIL_XML, and AUDIT_TRAIL_FILES audit trail types. The function always returns TRUE for these audit trail types. No preliminary set up is required for these audit trail types.

> **See Also:** Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5 for a list of all audit trail types

Syntax

```
DBMS_AUDIT_MGMT.IS_CLEANUP_INITIALIZED(
   audit_trail_type  IN PLS_INTEGER
   container         IN PLS_INTEGER DEFAULT CONTAINER_CURRENT)
 RETURN BOOLEAN;
```

Parameters

Table 29–19 IS_CLEANUP_INITIALIZED Function Parameters

Parameter	Description
audit_trail_type	The audit trail type for which the function needs to be called. Note that this does not apply to AUDIT_TRAIL_UNIFIED. Audit trail types are listed in Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5
container	Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). ▪ When CONTAINER is set to CONTAINER_ALL, this function returns the initialization status of all the pluggable databases. The function returns FALSE even if one of the PDBs is not initialized. ▪ When CONTAINER is set to CONTAINER_CURRENT, this returns the initialization status of the connected PDB.

Examples

The following example checks to see if the standard database audit trail type has been initialized for cleanup operation. If the audit trail type has not been initialized, then it calls the INIT_CLEANUP Procedure to initialize the audit trail type.

```
BEGIN
 IF
   NOT DBMS_AUDIT_MGMT.IS_CLEANUP_INITIALIZED(DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD)
 THEN
   DBMS_AUDIT_MGMT.INIT_CLEANUP(
      audit_trail_type          => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
      default_cleanup_interval  => 12 /* hours */);
 END IF;
END;
```

LOAD_UNIFIED_AUDIT_FILES Procedure

This procedure loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace.

> **See Also:** *Oracle Database Security Guide* for information about moving the OS audit trail records into the unified audit trail

Syntax

```
DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES (
   container       IN BINARY_INTEGER);
```

Parameters

Table 29–20 LOAD_UNIFIED_AUDIT_FILES Procedure Parameters

Parameter	Description
container	Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). ■ CONTAINER_CURRENT - loads the unified audit files from $ORACLE_BASE/audit/$ORACLE_SID OS directory to the tables in only current PDB ■ CONTAINER_ALL - loads the unified audit files from $ORACLE_BASE/audit/$ORACLE_SID OS directory to the tables in the respective PDBs, but for all the active PDBs

SET_AUDIT_TRAIL_LOCATION Procedure

This procedure moves the audit trail tables from their current tablespace to a user-specified tablespace.

The `SET_AUDIT_TRAIL_LOCATION` procedure is not relevant for the `AUDIT_TRAIL_OS`, `AUDIT_TRAIL_XML`, and `AUDIT_TRAIL_FILES` audit trail types. The `AUDIT_FILE_DEST` initialization parameter is the only way you can specify the destination directory for these audit trail types.

See Also:

- Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5 for a list of all audit trail types
- "AUDIT_FILE_DEST" in the *Oracle Database Reference*

Syntax

```
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
   audit_trail_type            IN PLS_INTEGER,
   audit_trail_location_value  IN VARCHAR2) ;
```

Parameters

Table 29–21 SET_AUDIT_TRAIL_LOCATION Procedure Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for which the audit trail location needs to be set. Audit trail types are listed in Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5
`audit_trail_location_value`	Target location or tablespace for the audit trail records

Usage Notes

The following usage notes apply:

- This procedure involves data movement across tablespaces. This can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.
- You should ensure that the target tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the target tablespace for frequent write operations.
- This procedure is valid for the following `audit_trail_type` values only:
  - `AUDIT_TRAIL_AUD_STD`
  - `AUDIT_TRAIL_FGA_STD`
  - `AUDIT_TRAIL_DB_STD`
- You optionally can specify an encrypted tablespace for the audit trail location.

When AUDIT_TRAIL_TYPE is AUDIT_TRAIL_UNIFIED, this procedure sets the tablespace for newer audit records in the unified audit trail but does not move the older audit records. Thus, it is not resource intensive for unified audit trail.

Examples

The following example moves the database audit trail tables, AUD$ and FGA_LOG$, from the current tablespace to a user-created tablespace called RECORDS:

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
       audit_trail_type            => DBMS_AUDIT_MGMT.AUDIT_TRAIL_DB_STD,
       audit_trail_location_value  =>  'RECORDS');
END;
```

SET_AUDIT_TRAIL_PROPERTY Procedure

This procedure sets an audit trail property for the audit trail type that is specified.

The procedure sets the properties OS_FILE_MAX_SIZE, OS_FILE_MAX_AGE, and FILE_DELETE_BATCH_SIZE for operating system (OS) and XML audit trail types. The OS_FILE_MAX_SIZE and OS_FILE_MAX_AGE properties determine the maximum size and age of an audit trail file before a new audit trail file gets created. The FILE_DELETE_BATCH_SIZE property specifies the number of audit trail files that are deleted in one batch.

The procedure sets the properties DB_DELETE_BATCH_SIZE and CLEANUP_INTERVAL for the database audit trail type. DB_DELETE_BATCH_SIZE specifies the batch size in which records get deleted from audit trail tables. This ensures that if a cleanup operation gets interrupted midway, the process does not need to start afresh the next time it is invoked. This is because all batches before the last processed batch are already committed.

The CLEANUP_INTERVAL specifies the frequency, in hours, with which the cleanup procedure is called.

Syntax

```
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
   audit_trail_type            IN PLS_INTEGER,
   audit_trail_property        IN PLS_INTEGER,
   audit_trail_property_value  IN PLS_INTEGER) ;
```

Parameters

Table 29–22 SET_AUDIT_TRAIL_PROPERTY Procedure Parameters

Parameter	Description
audit_trail_type	The audit trail type for which the property needs to be set. Audit trail types are listed in Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5
audit_trail_property	The audit trail property that is being set. Audit trail properties are listed in Table 29–2, " DBMS_AUDIT_MGMT Constants - Audit Trail Properties"

Table 29–22 (Cont.) SET_AUDIT_TRAIL_PROPERTY Procedure Parameters

Parameter	Description
audit_trail_property_value	The value of the property specified using audit_trail_property. The following are valid values for audit trail properties: ■ OS_FILE_MAX_SIZE can have a minimum value of 1 and maximum value of 2000000. The default value is 10000. OS_FILE_MAX_SIZE is measured in kilobytes (KB). ■ OS_FILE_MAX_AGE can have a minimum value of 1 and a maximum value of 497. The default value is 5. OS_FILE_MAX_AGE is measured in days. ■ DB_DELETE_BATCH_SIZE can have a minimum value of 100 and a maximum value of 1000000. The default value is 10000. DB_DELETE_BATCH_SIZE is measured as the number of audit records that are deleted in one batch. ■ FILE_DELETE_BATCH_SIZE can have a minimum value of 100 and a maximum value of 1000000. The default value is 1000. FILE_DELETE_BATCH_SIZE is measured as the number of audit files that are deleted in one batch. ■ CLEANUP_INTERVAL can have a minimum value of 1 and a maximum value of 999. The default value is set using the INIT_CLEANUP Procedure. CLEANUP_INTERVAL is measured in hours.

Usage Notes

The following usage notes apply:

- The audit trail properties for which you do not explicitly set values use their default values.
- If you have set both the OS_FILE_MAX_SIZE and OS_FILE_MAX_AGE properties for an operating system (OS) or XML audit trail type, then a new audit trail file gets created depending on which of these two limits is reached first.

  For example, let us take a scenario where OS_FILE_MAX_SIZE is 10000 and OS_FILE_MAX_AGE is 5. If the operating system audit file is already more than 5 days old and has a size of 9000 KB, then a new audit file is opened. This is because one of the limits has been reached.
- The DB_DELETE_BATCH_SIZE property needs to be individually set for the AUDIT_TRAIL_AUD_STD and AUDIT_TRAIL_FGA_STD audit trail types. You cannot set this property collectively using the AUDIT_TRAIL_DB_STD and AUDIT_TRAIL_ALL audit trail types.
- The DB_DELETE_BATCH_SIZE property enables you to control the number of audit records that are deleted in one batch. Setting a large value for this parameter requires increased allocation for the undo log space.
- The FILE_DELETE_BATCH_SIZE property needs to be individually set for the AUDIT_TRAIL_OS and AUDIT_TRAIL_XML audit trail types. You cannot set this property collectively using the AUDIT_TRAIL_FILES and AUDIT_TRAIL_ALL audit trail types.
- The FILE_DELETE_BATCH_SIZE property enables you to control the number of audit files that are deleted in one batch. Setting a very large value may engage the GEN0 background process for a long time.

- In Oracle Database Standard Edition, you can only associate the tablespace for unified auditing once. You should perform this association before you generate any audit records for the unified audit trail. The default tablespace is SYSAUX. After you have associated the tablespace, you cannot modify it on the Standard Edition because the partitioning feature is not supported in the Standard Edition.

Examples

The following example calls the SET_AUDIT_TRAIL_PROPERTY procedure to set the OS_FILE_MAX_SIZE property for the operating system (OS) audit trail. It sets this property value to 102400. This means that a new audit file gets created every time the current audit file size reaches 100 MB.

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
       audit_trail_type            => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
       audit_trail_property        =>  DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
       audit_trail_property_value  =>  102400 /* 100MB*/ );
END;
```

The following example calls the SET_AUDIT_TRAIL_PROPERTY procedure to set the OS_FILE_MAX_AGE property for the operating system (OS) audit trail. It sets this property value to 5. This means that a new audit file gets created every sixth day.

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
       audit_trail_type            => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
       audit_trail_property        =>  DBMS_AUDIT_MGMT.OS_FILE_MAX_AGE,
       audit_trail_property_value  =>  5 /* days */);
END;
```

The following example calls the SET_AUDIT_TRAIL_PROPERTY procedure to set the DB_DELETE_BATCH_SIZE property for the AUDIT_TRAIL_AUD_STD audit trail. It sets this property value to 100000. This means that during a cleanup operation, audit records are deleted from the SYS.AUD$ table in batches of size 100000.

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
       audit_trail_type              => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
       audit_trail_property          => DBMS_AUDIT_MGMT.DB_DELETE_BATCH_SIZE,
       audit_trail_property_value    => 100000 /* delete batch size */);
END;
```

SET_LAST_ARCHIVE_TIMESTAMP Procedure

This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records. The CLEAN_AUDIT_TRAIL Procedure uses this timestamp to decide on the audit records to be deleted.

Syntax

```
DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(
   audit_trail_type         IN PLS_INTEGER,
   last_archive_time        IN TIMESTAMP,
   rac_instance_number      IN PLS_INTEGER DEFAULT NULL,
   container                IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
   database_id              IN NUMBER DEFAULT NULL,
   container_guid           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 29–23 SET_LAST_ARCHIVE_TIMESTAMP Procedure Parameters

Parameter	Description
audit_trail_type	The audit trail type for which the timestamp needs to be set. Audit trail types are listed in Table 29–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5.
last_archive_time	The TIMESTAMP value based on which the audit records or files should be deleted. This indicates the last time when the audit records or files were archived.
rac_instance_number	The instance number for the Oracle Real Application Clusters (Oracle RAC) instance.The default value is NULL. The rac_instance_number is not relevant for the database audit trail type, as the database audit trail tables are shared by all Oracle RAC instances. The rac_instance_number is also not relevant for a single-instance database.
container	Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this sets the value for last archive timestamp in all the pluggable databases, otherwise it sets the value in the connected PDB only.
database_id	Database ID (DBID) of the audit records to cleanup
container_guid	Container GUID of the audit records to cleanup

Usage Notes

The following usage notes apply:

- The last_archive_time must be specified in Coordinated Universal Time (UTC) when the audit trail types are AUDIT_TRAIL_AUD_STD, AUDIT_TRAIL_FGA_STD, or AUDIT_TRAIL_UNIFIED. This is because the database audit trails store the timestamps in UTC. UTC is also known as Greenwich Mean Time (GMT).
- The last_archive_time must be specified as the local time zone time when the audit trail types are AUDIT_TRAIL_OS or AUDIT_TRAIL_XML. The time zone must be the time zone of the machine where the OS or XML audit files were created. This is because the operating system audit files are cleaned based on the audit file's Last

Modification Timestamp property. The Last Modification Timestamp property value is stored in the local time zone of the machine.

- The following `audit_trail_type` values for valid for this procedure:
  - `AUDIT_TRAIL_AUD_STD`
  - `AUDIT_TRAIL_FGA_STD`
  - `AUDIT_TRAIL_OS`
  - `AUDIT_TRAIL_XML`
- When using an Oracle Real Application Clusters (Oracle RAC) database, Oracle recommends that you use the Network Time Protocol (NTP) to synchronize individual Oracle RAC nodes.

Examples

The following example calls the `SET_LAST_ARCHIVE_TIMESTAMP` procedure to set the last archive timestamp for the operating system (OS) audit trail type on Oracle RAC instance 1. It uses the `TO_TIMESTAMP` function to convert a character string into a timestamp value.

A subsequent call to the CLEAN_AUDIT_TRAIL Procedure, with `use_last_arch_timestamp` set to `TRUE`, will delete all those OS audit files from the current `AUDIT_FILE_DEST` directory that were modified before 10-Sep-2012 14:10:10.0.

```
BEGIN
DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(
   audit_trail_type     => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
   last_archive_time    => TO_
TIMESTAMP('12-SEP-0714:10:10.0','DD-MON-RRHH24:MI:SS.FF'),
   rac_instance_number  => 1);
END;
```

SET_PURGE_JOB_INTERVAL Procedure

This procedure sets the interval at which the CLEAN_AUDIT_TRAIL Procedure is called for the purge job specified. The purge job must have already been created using the CREATE_PURGE_JOB Procedure.

Syntax

```
DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(
   audit_trail_purge_name      IN VARCHAR2,
   audit_trail_interval_value  IN PLS_INTEGER) ;
```

Parameters

Table 29–24 SET_PURGE_JOB_INTERVAL Procedure Parameters

Parameter	Description
audit_trail_purge_name	The name of the purge job for which the interval is being set. This is the purge job name that you specified with the CREATE_PURGE_JOB Procedure.
audit_trail_interval_value	The interval, in hours, at which the clean up procedure should be called. This value modifies the audit_trail_purge_interval parameter set using the CREATE_PURGE_JOB Procedure

Usage Notes

Use this procedure to modify the audit_trail_purge_interval parameter set using the CREATE_PURGE_JOB Procedure.

Examples

The following example calls the SET_PURGE_JOB_INTERVAL procedure to change the frequency at which the purge job called CLEANUP is invoked. The new interval is set to 24 hours.

```
BEGIN
DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(
  AUDIT_TRAIL_PURGE_NAME       => 'CLEANUP',
  AUDIT_TRAIL_INTERVAL_VALUE   => 24 );
END;
```

SET_PURGE_JOB_STATUS Procedure

This procedure enables or disables the specified purge job. The purge job must have already been created using the CREATE_PURGE_JOB Procedure.

Syntax

```
DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(
   audit_trail_purge_name    IN VARCHAR2,
   audit_trail_status_value  IN PLS_INTEGER) ;
```

Parameters

Table 29–25 SET_PURGE_JOB_STATUS Procedure Parameters

Parameter	Description
audit_trail_purge_name	The name of the purge job for which the status is being set. This is the purge job name that you specified with the CREATE_PURGE_JOB Procedure.
audit_trail_status_value	One of the values specified in DBMS_AUDIT_MGMT Constants - Purge Job Status. The value PURGE_JOB_ENABLE enables the specified purge job. The value PURGE_JOB_DISABLE disables the specified purge job.

Examples

The following example calls the SET_PURGE_JOB_STATUS procedure to enable the CLEANUP purge job.

```
BEGIN
DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(
  audit_trail_purge_name      => 'CLEANUP',
  audit_trail_status_value    => DBMS_AUDIT_MGMT.PURGE_JOB_ENABLE);
END;
```

DBMS_AUTO_SQLTUNE

The DBMS_AUTO_SQLTUNE package is the interface for managing the Automatic SQL Tuning task. Unlike DBMS_SQLTUNE, the DBMS_AUTO_SQLTUNE package requires the DBA role.

The chapter contains the following topics:

Using DBMS_AUTO_SQLTUNE

Overview

The DBMS_AUTO_SQLTUNE package is the interface to SQL Tuning Advisor (DBMS_SQLTUNE) when run within the Autotask framework. The database creates the automated system task SYS_AUTO_SQL_TUNING_TASK as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs the SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

The automated task tests any SQL profiles it finds by executing both the old and new query plans. Automatic SQL Tuning differs from manual SQL tuning in one important way. If automatic implementation of SQL profiles is enabled (the default is disabled), then the database implements any SQL profiles that promise a great performance benefit. The implementation occurs at tuning time so that the database can immediately benefit from the new plan. You can enable or disable automatic implementation by using the SET_AUTO_TUNING_TASK_PARAMETER API to set the ACCEPT_SQL_PROFILES parameter.

In each maintenance window, the automated tuning task stores its results as a new execution. Each execution result has the same task name but a different execution name. Query the DBA_ADVISOR_EXECUTIONS view for information about task executions. Use the REPORT_AUTO_TUNING_TASK Function to view reports that span multiple executions.

Security Model

This package is available to users with the DBA role. For other users, you must grant the EXECUTE privilege on the package explicitly. Note that the EXECUTE_AUTO_TUNING_TASK procedure is an exception: only SYS can invoke it.

Users can call APIs in this package to control how the automatic tuning task behaves when it runs, such as enabling automatic SQL profile creation and configuring the total and per-SQL time limits under which the task runs. Because these settings affect the overall performance of the database, it may not be appropriate for all users with the ADVISOR privilege to have access to this package.

Summary of DBMS_AUTO_SQLTUNE Subprograms

Table 30–1 DBMS_AUTO_SQLTUNE Package Subprograms

Subprogram	Description
EXECUTE_AUTO_TUNING_TASK Function & Procedure on page 30-6	Executes the Automatic SQL Tuning task immediately (`SYS` only)
REPORT_AUTO_TUNING_TASK Function on page 30-7	Displays a text report of the automatic tuning task's history
SET_AUTO_TUNING_TASK_PARAMETER Procedures on page 30-9	Changes a task parameter value for the daily automatic runs

EXECUTE_AUTO_TUNING_TASK Function & Procedure

This function and procedure executes the Automatic SQL Tuning task (SYS_AUTO_SQL_TUNING_TASK). Both the function and the procedure run in the context of a new task execution. The difference is that the function returns that new execution name. Note that only SYS can invoke this subprogram.

Syntax

```
DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN dbms_advisor.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL)
 RETURN VARCHAR2;

DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN dbms_advisor.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL);
```

Parameters

Table 30–2 EXECUTE_TUNING_TASK Function & Procedure Parameters

Parameter	Description
execution_name	A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.
execution_params	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the SET_AUTO_TUNING_TASK_PARAMETER Procedures).
execution_desc	A 256-length string describing the execution

Usage Notes

A tuning task can be executed multiple times without having to reset it.

Examples

```
EXEC DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(:exec_name);
```

REPORT_AUTO_TUNING_TASK Function

This procedure displays the results of an Automatic SQL Tuning task.

Syntax

```
DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(
   begin_exec      IN   VARCHAR2   := NULL,
   end_exec        IN   VARCHAR2   := NULL,
   type            IN   VARCHAR2   := 'TEXT',
   level           IN   VARCHAR2   := 'TYPICAL',
   section         IN   VARCHAR2   := ALL,
   object_id       IN   NUMBER     := NULL,
   result_limit    IN   NUMBER     := NULL)
RETURN CLOB;
```

Parameters

Table 30–3 REPORT_TUNING_TASK Function Parameters

Parameter	Description
begin_exec	Name of the beginning task execution to use. If NULL, the report is generated for the most recent task execution.
end_exec	Name of the ending task execution to use. If NULL, the report is generated for the most recent task execution.
type	Type of the report to produce. Possible values are TEXT which produces a text report.
level	Level of detail in the report: ■ BASIC: simple version of the report. Just show info about the actions taken by the advisor. ■ TYPICAL: show information about every statement analyzed, including requests not implemented. ■ ALL: highly detailed report level, also provides annotations about statements skipped over.
section	Section of the report to include: ■ SUMMARY: summary information ■ FINDINGS: tuning findings ■ PLAN: explain plans ■ INFORMATION: general information ■ ERROR: statements with errors ■ ALL: all sections
object_id	Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.
result_limit	Maximum number of SQL statements to show in the report

Return Values

A CLOB containing the desired report.

Examples

```
-- Get the whole report for the most recent execution
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK
FROM   DUAL;

-- Show the summary for a range of executions
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:begin_exec, :end_exec, 'TEXT',
       'TYPICAL', 'SUMMARY')
FROM   DUAL;

-- Show the findings for the statement of interest
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:exec, :exec, 'TEXT',
       'TYPICAL', 'FINDINGS', 5)
FROM   DUAL;
```

SET_AUTO_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER` as used for the reserved auto tuning task, `SYS_AUTO_SQL_TUNING_TASK`.

Syntax

```
DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
   parameter    IN  VARCHAR2,
   value        IN  VARCHAR2);

DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
   parameter    IN  VARCHAR2,
   value        IN  NUMBER);
```

Parameters

Table 30–4 SET_AUTO_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
parameter	Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2: ■ MODE: tuning scope (comprehensive, limited) ■ USERNAME: username under which the statement is parsed ■ DAYS_TO_EXPIRE: number of days until the task is deleted ■ EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions is deleted (without deleting the task) ■ DEFAULT_EXECUTION_TYPE: the task defaults to this type of execution when none is specified by the EXECUTE_AUTO_TUNING_TASK Function & Procedure. ■ TIME_LIMIT: global time out (seconds) ■ LOCAL_TIME_LIMIT: per-statement time out (seconds) ■ TEST_EXECUTE: FULL/AUTO/OFF. * FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set) * AUTO - test-execute for an automatically-chosen time proportional to the tuning time * OFF - do not test-execute ■ BASIC_FILTER: basic filter for SQL tuning set ■ OBJECT_FILTER: object filter for SQL tuning set ■ PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) ■ RANK_MEASURE1: first ranking measure for SQL tuning set ■ RANK_MEASURE2: second possible ranking measure for SQL tuning set ■ RANK_MEASURE3: third possible ranking measure for SQL tuning set ■ RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER ■ SQL_LIMIT: maximum number of SQL statements to tune ■ SQL_PERCENTAGE: percentage filter of SQL tuning set statements The following parameters are supported for the automatic tuning task only: ■ ACCEPT_SQL_PROFILES: TRUE/FALSE: whether the task should accept SQL profiles automatically ■ MAX_AUTO_SQL_PROFILES: maximum number of automatic SQL profiles allowed on the system, in sum ■ MAX_SQL_PROFILES_PER_EXEC: maximum number of SQL profiles that can be automatically implemented per execution of the task.
value	New value of the specified parameter

31

DBMS_AUTO_REPORT

The DBMS_AUTO_REPORT package provides an interface to view SQL Monitoring and Real-time Automatic Database Diagnostic Monitor (ADDM) data that has been captured into Automatic Workload Repository (AWR). It also provides subprograms to control the behavior of how these data are captured to AWR.

> **See Also:** *Oracle Database SQL Tuning Guide* for more information about reporting database operations

This chapter contains the following topics:

Using DBMS_AUTO_REPORT

Overview

This package provides an interface to view SQL Monitoring and Real-time ADDM data that has been captured into AWR. It also provides subprograms to control the behavior of how these data are captured to AWR.Captured data are stored in AWR and exposed via 2 views: `DBA_HIST_REPORTS` and `DBA_HIST_REPORTS_DETAILS`.

Security Model

This package is available to PUBLIC and performs its own security checking.

Summary of DBMS_AUTO_REPORT Subprograms

Table 31–1 DBMS_AUTO_REPORT Package Subprograms

Subprogram	Description
FINISH_REPORT_CAPTURE Procedure on page 31-6	Ends the complete capture of SQL monitor data that was started with the START_REPORT_CAPTURE Procedure.
REPORT_REPOSITORY_DETAIL Function on page 31-7	Obtains the stored report for a given report ID
REPORT_REPOSITORY_DETAIL_XML Function on page 31-8	Obtains the stored XML report for a given report ID
REPORT_REPOSITORY_LIST_XML Function on page 31-9	Obtains an XML report of the list of SQL Monitor and Real-time ADDM data captured in AWR
START_REPORT_CAPTURE Procedure on page 31-11	Captures SQL monitor data of any newly monitored SQLs every minute since the last run of the capture cycle, and stores it in AWR.

FINISH_REPORT_CAPTURE Procedure

This procedure ends the complete capture of SQL monitor data that was started with the START_REPORT_CAPTURE Procedure. This subprogram runs a last capture cycle immediately to capture any new data and then ends the per-minute complete capture.

After calling this subprogram, capture of data continues every minute except that it is not captured for all active SQLs but only for those deemed important, namely the top 5 SQLs (by elapsed time, or elapsed time*DOP in case of PQ) whose monitoring has completed.

Syntax

```
DBMS_AUTO_REPORT.FINISH_REPORT_CAPTURE;
```

REPORT_REPOSITORY_DETAIL Function

This procedure obtains the stored report for a given report ID in the specified format such as XML or HTML.

Syntax

```
DBMS_AUTO_REPORT.REPORT_REPOSITORY_DETAIL (
   rid              IN NUMBER    DEFAULT NULL,
   type             IN VARCHAR2  DEFAULT 'XML',
   base_path        IN VARCHAR2  DEFAULT NULL)
 RETURNS CLOB
```

Parameters

Table 31–2 REPORT_REPOSITORY_DETAIL Function Parameters

Parameter	Description
`rid`	ID of the stored report which returned by the function
`type`	Desired format of the report. Values can be `'XML'`, `'TEXT'`, `'HTML'`, `'EM'` or `'ACTIVE'`. The last two options generate a report in the same format called active HTML. Default value is `'XML'`.
`base_path`	Unused/Non-operative

Return Values

The persisted report for the given record ID

REPORT_REPOSITORY_DETAIL_XML Function

This procedure obtains the stored XML report for a given report ID.

Syntax

```
DBMS_AUTO_REPORT.REPORT_REPOSITORY_DETAIL_XML (
   rid              IN NUMBER    DEFAULT NULL,
   base_path        IN VARCHAR2  DEFAULT NULL)
 RETURNS XMLTYPE
```

Parameters

Table 31–3 REPORT_REPOSITORY_DETAIL_XML Function Parameters

Parameter	Description
rid	ID of the stored report which returned by the function
base_path	Unused/Non-operative

Return Values

The persisted XML report for the given record ID

REPORT_REPOSITORY_LIST_XML Function

This procedure obtains an XML report of the list of SQL Monitor and Real-time ADDM data captured in AWR. The input parameters can be used to select and restrict which captured data will be included in the list report. All parameters are optional.

Syntax

```
DBMS_AUTO_REPORT.REPORT_REPOSITORY_LIST_XML (
    active_since              IN DATE     DEFAULT NULL,
    active_upto               IN DATE     DEFAULT NULL,
    snapshot_id               IN NUMBER   DEFAULT NULL,
    dbid                      IN NUMBER   DEFAULT NULL,
    inst_id                   IN NUMBER   DEFAULT NULL,
    con_dbid                  IN NUMBER   DEFAULT NULL,
    session_id                IN NUMBER   DEFAULT NULL,
    session_serial            IN NUMBER   DEFAULT NULL,
    component_name            IN VARCHAR2 DEFAULT NULL,
    key1                      IN VARCHAR2 DEFAULT NULL,
    key2                      IN VARCHAR2 DEFAULT NULL,
    key3                      IN VARCHAR2 DEFAULT NULL,
    report_level              IN VARCHAR2 DEFAULT 'TYPICAL',
    base_path                 IN VARCHAR2 DEFAULT NULL)
RETURNS XMLTYPE
```

Parameters

Table 31–4 REPORT_REPOSITORY_LIST_XML Function Parameters

Parameter	Description
active_since	Start of a time range used to select data. When a time range is specified, only those data are included in the list that were active during the time range. When no value is specified the time range is chosen as the last 24 hours ending at the current system time.
active_upto	Same as active_since except that it is the end of the time range
snapshot_id	If a value is specified, only those data captured during the specified snapshot ID are included in the list report. If no value is specified, no filtering is performed on snapshot ID.
dbid	If a value is specified, only those data captured for the specified database ID are included in the list report. If no value is specified, no filtering is performed on database ID
inst_id	If a value is specified, only those data captured on the specified instance number are included in the list report. If no value is specified, no filtering is performed on the instance ID.
con_dbid	If a value is specified, only those data captured on the specified container DBID are included in the list report. If no value is specified, no filtering is performed on the container DBID.
session_id	If a value is specified, only those data captured for the specified session ID are included in the list report. If no value is specified, no filtering is performed on session ID.
session_serial	If a value is specified, only those data captured for the specified session are included in the list report. If no value is specified, no filtering is performed on session serial number. This parameter should be used in conjunction with the session_id parameter.

Table 31–4 (Cont.) REPORT_REPOSITORY_LIST_XML Function Parameters

Parameter	Description
component_name	Can be 'sqlmonitor' for SQL Monitor data or 'rtaddm' for Real-time ADDM data. If a value is specified then data pertaining only to the specified component will be included in the list report. If no value is specified, no filtering is performed.
key1	Key value relevant to a component. For SQL Monitor, key1 is the SQL ID of the captured SQL statement. If a value is specified, only those data having specified value for key1 are included, else no filtering is performed on key1.
key2	Key value relevant to a component. For SQL Monitor, key2 is the SQL execution ID of the captured SQL statement. If a value is specified, only those data having specified value for key2 are included, else no filtering is performed on key2.
key3	Key value relevant to a component. For SQL Monitor, key3 is the SQL execution start time of the captured SQL statement. If a value is specified, then only those data having specified value for key3 are included, else no filtering is performed on key3.
report_level	Currently only 'TYPICAL' is used
base_path	Unused/Non-operative

START_REPORT_CAPTURE Procedure

This procedure captures SQL monitor data of any newly monitored SQLs every minute since the last run of the capture cycle, and stores it in AWR. Every capture cycle attempts to capture data for SQLs that are not currently executing or queued. This is a complete capture since data of all newly monitored SQLs is captured. It continues to run every minute until it is explicitly ended with the FINISH_REPORT_CAPTURE Procedure. In the case of a RAC system, the capture will start on each node of the cluster.

Syntax

```
DBMS_AUTO_REPORT.START_REPORT_CAPTURE;
```

32

DBMS_AUTO_TASK_ADMIN

The DBMS_AUTO_TASK_ADMIN package provides an interface to AUTOTASK functionality. It is used by the DBA as well as Enterprise Manager to access the AUTOTASK controls. Enterprise Manager also uses the AUTOTASK Advisor.

> **See Also:** *Oracle Database Administrator's Guide* for more information about "Configuring Automated Maintenance Task"

This chapter contains the following sections:

Using DBMS_AUTO_TASK_ADMIN

Deprecated Subprograms

Note: Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- OVERRIDE_PRIORITY Procedures

Security Model

DBMS_AUTO_TASK_ADMIN is a definer's rights package, and EXECUTE is automatically granted to DBA, IMP_FULL_DATABASE and DATAPUMP_IMP_FULL_DATABASE.

Constants

The DBMS_AUTO_TASK_ADMIN package uses the constants shown in Table 32–1:

Table 32–1 DBMS_AUTO_TASK_ADMIN Constants

Name	Type	Value	Description
PRIORITY_MEDIUM	VARCHAR2	'MEDIUM'	Task with this priority should be executed as time permits
PRIORITY_HIGH	VARCHAR2	'HIGH'	Task with this priority should be executed within the current Maintenance Window
PRIORITY_URGENT	VARCHAR2	'URGENT'	Task with this priority is to be executed at the earliest opportunity

Summary of DBMS_AUTO_TASK_ADMIN Subprograms

Table 32–2 DBMS_XMLSTORE Package Subprograms

Method	Description
DISABLE Procedures on page 32-7	Prevents AUTOTASK from executing any requests from a specified client or operation.
ENABLE Procedures on page 32-8	Allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control
GET_CLIENT_ ATTRIBUTES Procedure on page 32-9	Returns values of select client attributes
GET_P1_RESOURCES Procedure on page 32-10	Returns percent of resources allocated to each AUTOTASK High Priority Consumer Groups
OVERRIDE_PRIORITY Procedures on page 32-11	Manually overrides task priority.
SET_CLIENT_SERVICE Procedure on page 32-12	Associates an AUTOTASK Client with a specified Service
SET_P1_RESOURCES Procedure on page 32-13	Sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients

DISABLE Procedures

This procedure prevents AUTOTASK from executing any requests from a specified client or operation.

Syntax

Disables all AUTOTASK functionality.

```
DBMS_AUTO_TASK_ADMIN.DISABLE;
```

Disables all tasks for the client or operation.

```
DBMS_AUTO_TASK_ADMIN.DISABLE (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   window_name       IN    VARCHAR2);
```

Parameters

Table 32–3 DISABLE Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
operation	Name of the operation as specified in DBA_AUTOTASK_OPERATION View
window_name	Optional name of the window in which client is to be disabled

Usage Notes

- If operation and window_name are both NULL, the client is disabled.
- If operation is not NULL, window_name is ignored and the operation is disabled
- If operation is NULL and window_name is not NULL, the client is disabled in the specified window.

ENABLE Procedures

This procedure allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control. Specifying the DEFERRED option postpones the effect of the call until the start of the next maintenance window. If IMMEDIATE option is specified the effect of this call is immediate – as long as there is a currently open maintenance window.

Syntax

Re-enabling AUTOTASK. This version enables the specified client. Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE;
```

Re-enabling a client or operation.Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   window_name       IN    VARCHAR2);
```

Parameters

Table 32–4 ENABLE Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
operation	Name of the operation as specified in DBA_AUTOTASK_OPERATION View
window_name	Optional name of the window in which client is to be enabled

Usage Notes

- If operation and window_name are both NULL, the client is enabled.
- If operation is not NULL, window_name is ignored and the specified operation is enabled
- If operation is NULL and window_name is not NULL, the client is enabled in the specified window.

GET_CLIENT_ATTRIBUTES Procedure

This procedure returns values of select client attributes.

Syntax

```
DBMS_AUTO_TASK_ADMIN.GET_CLIENT_ATTRIBUTES(
   client_name        IN    VARCHAR2,   service_name       OUT   VARCHAR2,
window_group       OUT   VARCHAR2);
```

Parameters

Table 32–5 GET_CLIENT_ATTRIBUTES Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
service_name	Service name for client, may be NULL
window_group	Name of the window group in which the client is active

GET_P1_RESOURCES Procedure

This procedure returns percent of resources allocated to each AUTOTASK High Priority Consumer Group.

Syntax

```
DBMS_AUTO_TASK_ADMIN.GET_P1_RESOURCES(
   stats_group_pct     OUT   NUMBER,
   seg_group_pct       OUT   NUMBER,
   tune_group_pct      OUT   NUMBER,
   health_group_pct    OUT   NUMBER);
```

Parameters

Table 32–6 GET_P1_RESOURCES Procedure Parameters

Parameter	Description
stats_group_pct	%resources for Statistics Gathering
seq_group_pct	%resources for Space Management
tune_group_pct	%resources for SQL Tuning
health_group_pct	%resources for Health Checks

Usage Notes

Values will add up to 100%.

OVERRIDE_PRIORITY Procedures

> **Note:** This subprogram is deprecated and becomes nonoperative with Oracle Database 12*c*.

This procedure is used to manually override task priority. This can be done at the client, operation or individual task level. This priority assignment is honored during the next maintenance window in which the named client is active. Specifically, setting the priority to `URGENT` causes a high priority job to be generated at the start of the maintenance window. Setting `priority` to `CLEAR` removes the override.

Syntax

Override Priority for a Client.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
   client_name       IN    VARCHAR2,
   priority          IN    VARCHAR2);
```

Override Priority for an Operation.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   priority          IN    VARCHAR2);
```

Override Priority for a Task.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   task_target_type  IN    VARCHAR2,
   task_target_name  IN    VARCHAR2,
   priority          IN    VARCHAR2);
```

Parameters

Table 32–7 OVERRIDE_PRIORITY Procedure Parameters

Parameter	Description
`client_name`	Name of the client, as found in `DBA_AUTOTASK_CLIENT` View
`priority`	`URGENT`, `HIGH`, `MEDIUM` or `LOW`
`operation`	Name of the operation as specified in `DBA_AUTOTASK_OPERATION` View
`task_target_type`	Type of target to be affected, as found in V$`AUTOTASK_TARGET_TYPE` View
`task_target_name`	Name of the specific target to be affected

SET_CLIENT_SERVICE Procedure

This procedure associates an AUTOTASK Client with a specified Service.

Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_CLIENT_SERVICE(
   client_name        IN    VARCHAR2,
   service_name       IN   VARCHAR2);
```

Parameters

Table 32–8 SET_CLIENT_SERVICE Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
service_name	Service name for client, may be NULL

Usage Notes

All work performed on behalf of the Client takes place only on instances where the service is enabled.

SET_P1_RESOURCES Procedure

This procedure sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients.

Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_P1_RESOURCES(
   stats_group_pct     OUT   NUMBER,
   seg_group_pct       OUT   NUMBER,
   tune_group_pct      OUT   NUMBER,
   health_group_pct    OUT   NUMBER);
```

Parameters

Table 32–9 SET_P1_RESOURCES Procedure Parameters

Parameter	Description
stats_group_pct	%resources for Statistics Gathering
seq_group_pct	%resources for Space Management
tune_group_pct	%resources for SQL Tuning
health_group_pct	%resources for Health Checks

Usage Notes

Values must be integers in the range 0 to 100, and must add up to 100 (percent), otherwise, an exception is raised.

33

DBMS_AW_STATS

DBMS_AW_STATS contains subprograms for managing optimizer statistics for cubes and dimensions. Generating the statistics does not have a significant performance cost.

> **See Also:** *Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topic:

- Using DBMS_AW_STATS
- Summary of DBMS_AW_STATS Subprograms

Using DBMS_AW_STATS

Cubes and dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Optimizer statistics are used to create execution plans for queries that join two cube views or join a cube view to a table or a view of a table. They are also used for query rewrite to cube materialized views. You need to generate the statistics only for these types of queries.

Queries against a single cube do not use optimizer statistics. These queries are automatically optimized within the analytic workspace.

Summary of DBMS_AW_STATS Subprograms

Table 33–1 DBMS_AW_STATS Package Subprograms

Subprogram	Description
ANALYZE Procedure on page 33-4	Generates optimizer statistics on cubes and cube dimensions.
CLEAR Procedure on page 33-7	Clears optimizer statistics from cubes and cube dimensions.

ANALYZE Procedure

This procedure generates optimizer statistics on a cube or a cube dimension. These statistics are used to generate some execution plans, as described in "Using DBMS_AW_STATS" on page 33-2.

For a cube, the statistics are for all of the measures and calculated measures associated with the cube. These statistics include:

- The average length of data values
- The length of the largest data value
- The minimum value
- The number of distinct values
- The number of null values

For a dimension, the statistics are for the dimension and its attributes, levels, and hierarchies. These statistics include:

- The average length of a value
- The length of the largest value
- The minimum value
- The maximum value

Syntax

```
DBMS_AW_STATS.ANALYZE
     (inname       IN VARCHAR2);
```

Parameters

Table 33–2 ANALYZE Procedure Parameters

Parameter	Description
inname	The qualified name of a cube or a dimension. For a cube, the format of a qualified name is *owner.cube_name*. For a dimension, the format is *owner.dimension_name*.

Usage Notes

Always analyze the dimensions first, then the cube.

After analyzing a dimension, analyze all cubes that use that dimension.

Example

This sample script generates optimizer statistics on UNITS_CUBE and its dimensions.

```
BEGIN
     DBMS_AW_STATS.ANALYZE('time');
     DBMS_AW_STATS.ANALYZE('customer');
     DBMS_AW_STATS.ANALYZE('product');
     DBMS_AW_STATS.ANALYZE('channel');
     DBMS_AW_STATS.ANALYZE('units_cube');
END;
/
```

The following statements create and display an execution plan for a`SELECT` statement that joins columns from `UNITS_CUBE_VIEW`, `CUSTOMER_PRIMARY_VIEW`, and the `ACCOUNTS` table:

```
EXPLAIN PLAN FOR SELECT
     cu.long_description customer,
     a.city city,
     a.zip_pc zip,
     cu.level_name "LEVEL",
     round(f.sales) sales
/* From dimension views and cube view */
FROM time_calendar_view t,
     product_primary_view p,
     customer_view cu,
     channel_view ch,
     units_cube_view f,
     account a
/* Create level filters instead of GROUP BY */
WHERE t.long_description = '2004'
    AND p.level_name ='TOTAL'
    AND cu.customer_account_id like 'COMP%'
    AND ch.level_name = 'TOTAL'
/* Join dimension views to cube view */
    AND t.dim_key = f.TIME
    AND p.dim_key = f.product
    AND cu.dim_key = f.customer
    AND ch.dim_key = f.channel
    AND a.account_id = cu.customer_account_id
ORDER BY zip;
```

```
SQL>  SELECT plan_table_output FROM TABLE(dbms_xplan.display());

Predicate Information (identified by operation id):
---------------------------------------------------

   2 - access("A"."ACCOUNT_ID"=SYS_OP_ATG(VALUE(KOKBF$),39,40,2))
   8 - filter(SYS_OP_ATG(VALUE(KOKBF$),16,17,2)='2004' AND
              SYS_OP_ATG(VALUE(KOKBF$),39,40,2) LIKE 'COMP%' AND
              SYS_OP_ATG(VALUE(KOKBF$),47,48,2)='TOTAL' AND
              SYS_OP_ATG(VALUE(KOKBF$),25,26,2)='TOTAL')
```

```
   9 - filter("A"."ACCOUNT_ID" LIKE 'COMP%')

Note
-----
   - dynamic statistics used for this statement

30 rows selected.
```

CLEAR Procedure

Clears the statistics generated by the ANALYZE Procedure.

Syntax

```
DBMS_AW_STATS.CLEAR (
          inname        IN  VARCHAR2;
```

Parameters

Table 33–3 CLEAR Procedure Parameters

Parameter	Description
inname	The qualified name of a cube or a dimension. For a cube, the format of a qualified name is *owner.cube_name*. For a dimension, the format is *owner.dimension_name*.

Examples

The following scripts clears the statistics from UNITS_CUBE and its dimensions.

```
BEGIN
     DBMS_AW_STATS.clear('units_cube');
     DBMS_AW_STATS.clear('time');
     DBMS_AW_STATS.clear('customer');
     DBMS_AW_STATS.clear('product');
     DBMS_AW_STATS.clear('channel');
END;
/
```

34

DBMS_CAPTURE_ADM

The DBMS_CAPTURE_ADM package, one of a set of Oracle Streams packages, provides subprograms for starting, stopping, and configuring a capture process. The source of the captured changes is the redo logs, and the repository for the captured changes is a queue.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and capture processes

This chapter contains the following topics:

Using DBMS_CAPTURE_ADM

This section contains topics which relate to using the `DBMS_CAPTURE_ADM` package.

Overview

This package provides interfaces to start, stop, and configure a capture process or a synchronous capture. This package includes subprograms for preparing database objects for instantiation.

Capture processes can be used in an XStream configuration in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

> **See Also:** *Oracle Database Concepts* for more information about CDBs and PDBs

Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the `DBMS_CAPTURE_ADM` package is used to manage an Oracle Streams configuration, it requires that the user is granted the privileges of an Oracle Streams administrator.

When the `DBMS_CAPTURE_ADM` package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.

Note:

- The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as setting a capture user. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.
- Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

See Also:

- *Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator
- *Oracle Database XStream Guide* for information about configuring an XStream administrator

Summary of DBMS_CAPTURE_ADM Subprograms

Table 34–1 DBMS_CAPTURE_ADM Package Subprograms

Subprogram	Description
ABORT_GLOBAL_INSTANTIATION Procedure on page 34-7	Reverses the effects of running the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures
ABORT_SCHEMA_INSTANTIATION Procedure on page 34-8	Reverses the effects of running the PREPARE_SCHEMA_INSTANTIATION and PREPARE_TABLE_INSTANTIATION procedures
ABORT_SYNC_INSTANTIATION Procedure on page 34-9	Reverses the effects of running the PREPARE_SYNC_INSTANTIATION procedure
ABORT_TABLE_INSTANTIATION Procedure on page 34-10	Reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure
ALTER_CAPTURE Procedure on page 34-11	Alters a capture process
ALTER_SYNC_CAPTURE Procedure on page 34-16	Alters a synchronous capture
BUILD Procedure on page 34-18	Extracts the data dictionary of the current database to the redo logs and automatically specifies database supplemental logging for all primary key and unique key columns
CREATE_CAPTURE Procedure on page 34-19	Creates a capture process
CREATE_SYNC_CAPTURE Procedure on page 34-29	Creates a synchronous capture
DROP_CAPTURE Procedure on page 34-31	Drops a capture process
INCLUDE_EXTRA_ATTRIBUTE Procedure on page 34-33	Includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture
PREPARE_GLOBAL_INSTANTIATION Procedure on page 34-35	Performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables
PREPARE_SCHEMA_INSTANTIATION Procedure on page 34-37	Performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables
PREPARE_SYNC_INSTANTIATION Function on page 34-39	Performs the synchronization necessary for instantiating one or more tables at another database and returns the prepare SCN
PREPARE_TABLE_INSTANTIATION Procedure on page 34-40	Performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table
SET_PARAMETER Procedure on page 34-42	Sets a capture process parameter to the specified value

Table 34–1 (Cont.) DBMS_CAPTURE_ADM Package Subprograms

Subprogram	Description
START_CAPTURE Procedure on page 34-57	Starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue
STOP_CAPTURE Procedure on page 34-58	Stops the capture process from mining redo logs

Note: All subprograms commit unless specified otherwise.

ABORT_GLOBAL_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the database, schema, and table instantiations
- Removes any supplemental logging enabled by the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures

Syntax

```
DBMS_CAPTURE_ADM.ABORT_GLOBAL_INSTANTIATION(
   container    IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameter

Table 34–2 ABORT_SCHEMA_INSTANTIATION Procedure Parameter

Parameter	Description
container	Either CURRENT, ALL, or *pdb_name*. If CURRENT is specified, then this procedure removes supplemental logging for the current container. If ALL is specified, then this procedure removes supplemental logging for all of the containers in the current CDB. If *pdb_name* is specified, then this procedure removes supplemental logging for the specified PDB. ALL and *pdb_name* are valid only when you invoke the procedure from the root.

ABORT_SCHEMA_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_SCHEMA_INSTANTIATION procedure. It also reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure on tables in the specified schema.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to schema instantiations and table instantiations of tables in the schema
- Removes any supplemental logging enabled by the PREPARE_SCHEMA_INSTANTIATION procedure
- Removes any supplemental logging enabled by the PREPARE_TABLE_INSTANTIATION procedure for tables in the specified schema

Syntax

```
DBMS_CAPTURE_ADM.ABORT_SCHEMA_INSTANTIATION(
   schema_name  IN  VARCHAR2,
   container    IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameter

Table 34–3 ABORT_SCHEMA_INSTANTIATION Procedure Parameter

Parameter	Description
schema_name	The name of the schema for which to abort the effects of preparing instantiation
container	Either CURRENT, ALL, or *pdb_name*. If CURRENT is specified, then this procedure removes supplemental logging for the current container. If ALL is specified, then this procedure removes supplemental logging for all of the containers in the current CDB. If *pdb_name* is specified, then this procedure removes supplemental logging for the specified PDB. ALL and *pdb_name* are valid only when you invoke the procedure from the root.

ABORT_SYNC_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_SYNC_INSTANTIATION procedure. Specifically, this procedure removes data dictionary information related to the table instantiation.

This procedure is overloaded. The table_names parameter is VARCHAR2 datatype in one version and DBMS_UTILITY.UNCL_ARRAY datatype in the other version.

Syntax

```
DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
   table_names IN  VARCHAR2);

DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
   table_names IN  DBMS_UTILITY.UNCL_ARRAY);
```

Parameters

Table 34–4 ABORT_SYNC_INSTANTIATION Procedure Parameter

Parameter	Description
table_names	When the table_names parameter is VARCHAR2 datatype, a comma-delimited list of the tables for which to abort the effects of preparing instantiation. There must be no spaces between entries. When the table_names parameter is DBMS_UTILITY.UNCL_ARRAY datatype, specify a PL/SQL associative array of this type that contains the names of the tables for which to abort the effects of preparing instantiation. The first table name is at position 1, the second at position 2, and so on. The table does not need to be NULL terminated. In either version of the procedure, specify the name of each table in the form [*schema_name*.]*table_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.

ABORT_TABLE_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the table instantiation
- Removes any supplemental logging enabled by the PREPARE_TABLE_INSTANTIATION procedure

Syntax

```
DBMS_CAPTURE_ADM.ABORT_TABLE_INSTANTIATION(
   table_name  IN  VARCHAR2);
   container   IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameter

Table 34–5 ABORT_TABLE_INSTANTIATION Procedure Parameter

Parameter	Description
table_name	The name of the table for which to abort the effects of preparing instantiation, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
container	Either CURRENT, ALL, or *pdb_name*. If CURRENT is specified, then this procedure removes supplemental logging for the current container. If ALL is specified, then this procedure removes supplemental logging for all of the containers in the current CDB. If *pdb_name* is specified, then this procedure removes supplemental logging for the specified PDB. ALL and *pdb_name* are valid only when you invoke the procedure from the root.

ALTER_CAPTURE Procedure

This procedure alters a capture process.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about altering a capture process

Syntax

```
DBMS_CAPTURE_ADM.ALTER_CAPTURE(
   capture_name               IN  VARCHAR2,
   rule_set_name              IN  VARCHAR2   DEFAULT NULL,
   remove_rule_set            IN  BOOLEAN    DEFAULT FALSE,
   start_scn                  IN  NUMBER     DEFAULT NULL,
   use_database_link          IN  BOOLEAN    DEFAULT NULL,
   first_scn                  IN  NUMBER     DEFAULT NULL,
   negative_rule_set_name     IN  VARCHAR2   DEFAULT NULL,
   remove_negative_rule_set   IN  BOOLEAN    DEFAULT FALSE,
   capture_user               IN  VARCHAR2   DEFAULT NULL,
   checkpoint_retention_time  IN  NUMBER     DEFAULT NULL,
   start_time                 IN  TIMESTAMP  DEFAULT NULL);
```

Parameters

Table 34–6 ALTER_CAPTURE Procedure Parameters

Parameter	Description
`capture_name`	The name of the capture process being altered. You must specify an existing capture process name. Do not specify an owner.
`rule_set_name`	The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes. To change the positive rule set for the capture process, specify an existing rule set in the form `[`*`schema_name`*`.]`*`rule_set_name`*. For example, to specify a positive rule set in the `hr` schema named `job_capture_rules`, enter `hr.job_capture_rules`. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package. If you specify `NULL` and the `remove_rule_set` parameter is set to `FALSE`, then the procedure retains any existing positive rule set. If you specify `NULL` and the `remove_rule_set` parameter is set to `TRUE`, then the procedure removes any existing positive rule set. **See Also:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a capture process

Table 34–6 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
remove_rule_set	If TRUE, then the procedure removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified capture process. If the rule_set_name parameter is non-NULL, then ensure that this parameter is set to FALSE.
start_scn	A valid SCN for the database from which the capture process starts capturing changes. The SCN value must be greater than or equal to the first SCN for the capture process. Also, the capture process must be stopped before resetting its start SCN. An error is returned if an invalid SCN is specified or if the capture process is enabled.
use_database_link	If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify TRUE. In this case, a database link with the same name as the global name of the source database must exist at the downstream database. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify FALSE. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects. If NULL, then the current value of this parameter for the capture process is not changed.

Table 34–6 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
first_scn	The lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements: ■ It must be greater than the current first SCN for the capture process. ■ It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero. ■ It must be less than or equal to the required checkpoint SCN for the capture process. An error is returned if the specified SCN does not meet the first three requirements. See "Usage Notes" on page 34-15 for information about determining an SCN value that meets all of these conditions. When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN. See BUILD Procedure on page 34-18 for more information about a LogMiner data dictionary. If the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN.
negative_rule_set_name	The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes. To change the negative rule set for the capture process, specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.

Table 34–6 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
remove_negative_rule_set	If TRUE, then the procedure removes the negative rule set for the specified capture process. If you remove a negative rule set for a capture process, and the capture process does not have a positive rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you remove a negative rule set for a capture process, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified capture process. If the negative_rule_set_name parameter is non-NULL, then ensure that this parameter is set to FALSE.
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the capture user is not changed. To change the capture user, the user who invokes the ALTER_CAPTURE procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue. In addition, ensure that the capture user has the following privileges: ■ EXECUTE privilege on the rule sets used by the capture process ■ EXECUTE privilege on all rule-based transformation functions used in the rule set These privileges can be granted directly to the capture user, or they can be granted through roles. In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles. The capture process is stopped and restarted automatically when you change the value of this parameter. **Note:** If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.

Table 34–6 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
checkpoint_retention_time	Either the number of days that a capture process retains checkpoints before purging them automatically, or DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically. If NULL, then the checkpoint retention time is not changed. If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours. When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file. **See Also:** *Oracle Streams Concepts and Administration* for more information about checkpoint retention time
start_time	A valid time from which the capture process starts capturing changes. The capture process must be stopped before resetting its start time. An error is returned if an invalid time is specified or if the capture process is enabled. The start_scn and start_time parameters are mutually exclusive.

Usage Notes

If you want to alter the first SCN for a capture process, then the value specified must meet the conditions in the description for the first_scn parameter.

Examples

The following query determines the current first SCN, applied SCN, and required checkpoint SCN for each capture process in a database:

```
SELECT CAPTURE_NAME, FIRST_SCN, APPLIED_SCN, REQUIRED_CHECKPOINT_SCN
   FROM DBA_CAPTURE;
```

ALTER_SYNC_CAPTURE Procedure

This procedure alters a synchronous capture.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about altering a capture process

Syntax

```
DBMS_CAPTURE_ADM.ALTER_SYNC_CAPTURE(
   capture_name   IN  VARCHAR2,
   rule_set_name  IN  VARCHAR2  DEFAULT NULL,
   capture_user   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 34–7 ALTER_SYNC_CAPTURE Procedure Parameters

Parameter	Description
capture_name	The name of the synchronous capture being altered. You must specify an existing synchronous capture name. Do not specify an owner.
rule_set_name	The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes. To change the rule set for the synchronous capture, specify an existing rule set in the form *[schema_name.]rule_set_name*. For example, to specify a positive rule set in the strmadmin schema named sync_cap_rules, enter strmadmin.sync_cap_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You must specify a rule set that was created using the DBMS_STREAMS_ADM package. If NULL, then the rule set is not changed. **See Also:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a synchronous capture
capture_user	The user in whose security domain a synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the capture user is not changed. To change the capture user, the user who invokes the ALTER_SYNC_CAPTURE procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the synchronous capture and configures the user as a secure queue user of the queue. In addition, ensure that capture user has the following privileges: ■ EXECUTE privilege on the rule sets used by the synchronous capture ■ EXECUTE privilege on all rule-based transformation functions used in the rule set These privileges can be granted directly to the capture user, or they can be granted through roles. In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. They cannot be granted through roles.

Usage Notes

If the capture user for a synchronous capture is dropped using `DROP USER . . . CASCADE`, then the synchronous capture is also dropped automatically.

BUILD Procedure

This procedure extracts the data dictionary of the current database to the redo log and automatically specifies database supplemental logging by running the following SQL statement:

```
ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;
```

This procedure is overloaded. One version of this procedure contains the `OUT` parameter `first_scn`, and the other does not.

Syntax

```
DBMS_CAPTURE_ADM.BUILD(
   first_scn OUT NUMBER);

DBMS_CAPTURE_ADM.BUILD;
```

Parameters

Table 34–8 BUILD Procedure Parameter

Parameter	Description
`first_scn`	Contains the lowest SCN value corresponding to the data dictionary extracted to the redo log that can be specified as a first SCN for a capture process

Usage Notes

The following usage notes apply to this procedure:

- You can run this procedure multiple times at a source database.
- If you plan to capture changes originating at a source database with a capture process, then this procedure must be executed at the source database at least once. When the capture process is started, either at a local source database or at a downstream database, the capture process uses the extracted information in the redo log to create a LogMiner data dictionary.
- A LogMiner data dictionary is a separate data dictionary used by a capture process to determine the details of a change that it is capturing. The LogMiner data dictionary is necessary because the primary data dictionary of the source database might not be synchronized with the redo data being scanned by a capture process.
- After executing this procedure, you can query the `FIRST_CHANGE#` column of the `V$ARCHIVED_LOG` dynamic performance view where the `DICTIONARY_BEGIN` column is `YES` to determine the lowest SCN value for the database that can be specified as a first SCN for a capture process. The first SCN for a capture process is the lowest SCN in the redo log from which the capture process can capture changes.You can specify the first SCN for a capture process when you run the `CREATE_CAPTURE` or `ALTER_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.
- In a CDB, the `BUILD` procedure must be executed from the root.

CREATE_CAPTURE Procedure

This procedure creates a capture process.

See Also:

- *Oracle Streams Replication Administrator's Guide* for more information about creating a capture process
- Chapter 139, "DBMS_RULE_ADM" for more information about rules and rule sets

Syntax

```
DBMS_CAPTURE_ADM.CREATE_CAPTURE(
   queue_name                 IN  VARCHAR2,
   capture_name               IN  VARCHAR2,
   rule_set_name              IN  VARCHAR2   DEFAULT NULL,
   start_scn                  IN  NUMBER     DEFAULT NULL,
   source_database            IN  VARCHAR2   DEFAULT NULL,
   use_database_link          IN  BOOLEAN    DEFAULT FALSE,
   first_scn                  IN  NUMBER     DEFAULT NULL,
   logfile_assignment         IN  VARCHAR2   DEFAULT 'implicit',
   negative_rule_set_name     IN  VARCHAR2   DEFAULT NULL,
   capture_user               IN  VARCHAR2   DEFAULT NULL,
   checkpoint_retention_time  IN  NUMBER     DEFAULT 60,
   start_time                 IN  TIMESTAMP  DEFAULT NULL,
   source_root_name           IN  VARCHAR2   DEFAULT NULL,
   capture_class              IN  VARCHAR2   DEFAULT 'Streams');
```

Parameters

Table 34–9 CREATE_CAPTURE Procedure Parameters

Parameter	Description
queue_name	The name of the queue into which the capture process enqueues changes. You must specify an existing queue in the form [*schema_name.*]*queue_name*. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. **Note:** The queue_name setting cannot be altered after the capture process is created.
capture_name	The name of the capture process being created. A NULL specification is not allowed. Do not specify an owner. **Note:** The capture_name setting cannot be altered after the capture process is created.

Table 34–9 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
rule_set_name	The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes. If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_capture_rules, enter hr.job_capture_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL, and no negative rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you specify NULL, and a negative rule set exists for the capture process, then the capture process captures all changes that are not discarded by the negative rule set. **See Also:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a capture process
start_scn	A valid SCN for the database from which the capture process starts capturing changes. An error is returned if an invalid SCN is specified. The start_scn and start_time parameters are mutually exclusive. **See Also:** "Usage Notes" on page 34-23 for more information setting the start_scn parameter
source_database	The global name of the source database. The source database is where the changes to be captured originated. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. If NULL, or if the specified name is the same as the global name of the current database, then local capture is assumed and only the default values for use_database_link and first_scn can be specified.

Table 34–9 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
use_database_link	If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. A database link with the same name as the global name of the source database must exist at the downstream database. The capture process uses the database link to prepare database objects for instantiation at the source database and run the DBMS_CAPTURE_ADM.BUILD procedure at the source database, if necessary. During the creation of a downstream capture process, if the first_scn parameter is set to NULL, then the use_database_link parameter must be set to TRUE. Otherwise, an error is returned. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. In this case, you must perform the following administrative tasks manually: ■ Run the DBMS_CAPTURE_ADM.BUILD procedure at the source database to extract the data dictionary at the source database to the redo log when a capture process is created. ■ Obtain the first SCN for the downstream capture process if the first SCN is not specified during capture process creation. The first SCN is needed to create and maintain a capture process. ■ Prepare source database objects for instantiation.
first_scn	The lowest SCN in the redo log from which a capture process can capture changes. A non-NULL value for this parameter is valid only if the DBMS_CAPTURE_ADM.BUILD procedure has been run at least once at the source database. You can query the FIRST_CHANGE# column of the V$ARCHIVED_LOG dynamic performance view where the DICTIONARY_BEGIN column is YES to determine whether the DBMS_CAPTURE_ADM.BUILD procedure has been run on a source database. Any of the values returned by such a query can be used as a first_scn value if the redo log containing that SCN value is still available. **See Also:** "Usage Notes" on page 34-23 for more information setting the first_scn parameter

Table 34–9 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
logfile_assignment	If implicit, which is the default, then the capture process at a downstream database scans all redo log files added by redo transport services or manually from the source database to the downstream database. If explicit, then a redo log file is scanned by a capture process at a downstream database only if the capture process name is specified in the FOR *logminer_session_name* clause. If explicit, then the redo log file must be added manually to the downstream database, and redo transport services cannot be used to add redo log files to the capture process being created. If you specify explicit for this parameter for a local capture process, then the local capture process cannot use the online redo log to find changes. In this case, the capture process must use the archived redo log. **See Also:** "Usage Notes" on page 34-23 for information about adding redo log files manually
negative_rule_set_name	The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes. If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no positive rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you specify NULL, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the user who runs the CREATE_CAPTURE procedure is used. **Note:** If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically. **See Also:** "Usage Notes" on page 34-23 for more information about this parameter.

Table 34–9 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
checkpoint_retention_time	Either specify the number of days that a capture process retains checkpoints before purging them automatically, or specify DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically. If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours. When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file. **See Also:** *Oracle Streams Concepts and Administration* for more information about checkpoint retention time
start_time	A valid time from which the capture process starts capturing changes. An error is returned if an invalid time is specified. The start_scn and start_time parameters are mutually exclusive. **See Also:** "Usage Notes" on page 34-23 for more information setting the start_time parameter
source_root_name	The global name of the root in the source CDB. If you specify NULL, or if the specified name is the same as the global name of the current root, then local capture is assumed. If not NULL, then remote capture is assumed and a condition is added to the generated rules to filter the LCRs based on the root in the source CDB. **Note:** In a downstream capture configuration, if the capture database is CDB and the source database is a non-CDB, then specify the same value for source_root_name and source_database. The source_root_name parameter does not need to be specified for local capture for either a CDB or a non-CDB.
capture_class	The valid values are 'Streams', 'XStream' or 'GoldenGate'. If NULL is specified, then 'Streams' is assumed. **Note:** The capture_class parameter cannot be set to 'Streams' or NULL when the capture database is a CDB.

Usage Notes

Consider the following usage notes when you run this procedure:

- DBA Role Requirement
- Capture User Requirements
- First SCN and Start SCN Settings
- Explicit Log File Assignment

DBA Role Requirement

If the user who invokes this procedure is different from the user specified in the `capture_user` parameter, then the invoking user must be granted the `DBA` role. If the user who invokes this procedure is the same as the user specified in the `capture_user` parameter, then the `DBA` role is not required for the invoking user. Only the `SYS` user can set the `capture_user` to `SYS`.

Capture User Requirements

The `capture_user` parameter specifies the user who captures changes that satisfy the capture process rule sets. This user must have the necessary privileges to capture changes. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue.

In addition, ensure that the capture user has the following privileges:

- `EXECUTE` privilege on the rule sets used by the capture process
- `EXECUTE` privilege on all rule-based transformation functions used in the positive rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted `EXECUTE` privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.

Note:

- A capture user does not require privileges on a database object to capture changes to the database object. The capture process can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.
- Creation of the first capture process in a database might take some time because the data dictionary is duplicated during this creation.

First SCN and Start SCN Settings

When you create a capture process using this procedure, you can specify the first SCN and start SCN for the capture process. A capture process scans the redo data from the first SCN or an existing capture process checkpoint forward, even if the start SCN is higher than the first SCN or the checkpoint SCN. In this case, the capture process does not capture any changes in the redo data before the start SCN. Oracle recommends that, at capture process creation time, the difference between the first SCN and start SCN be as small as possible to keep the amount of redo scanned by the capture process to a minimum.

Note: When you specify the `start_time` parameter instead of the `start_scn` parameter, the `start_time` corresponds with a specific SCN. In this case, the information in this section also applies to the SCN that corresponds with the specified `start_time`.

In some cases, the behavior of the capture process is different depending on the settings of these SCN values and on whether the capture process is local or downstream.

The following table describes capture process behavior for SCN value settings:

first_scn Setting	start_scn Setting	Capture Process Type	Description
Non-NULL	NULL	Local or Downstream	The new capture process is created at the local database with a new LogMiner session starting from the value specified for the first_scn parameter. The start SCN is set to the specified first SCN value automatically, and the new capture process does not capture changes that were made before this SCN. The BUILD procedure in the DBMS_CAPTURE_ADM package is not run automatically. This procedure must have been run at least once before on the source database, and the specified first SCN must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the BUILD procedure has not been run at least once on the source database, then an error is raised when the capture process is started. Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.
Non-NULL	Non-NULL	Local or Downstream	If the specified value for the start_scn parameter is greater than or equal to the specified value for the first_scn parameter, then the new capture process is created at the local database with a new LogMiner session starting from the specified first SCN. In this case, the new capture process does not capture changes that were made before the specified start SCN. If the specified value for the start_scn parameter is less than the specified value for the first_scn parameter, then an error is raised. The BUILD procedure in the DBMS_CAPTURE_ADM package is not run automatically. This procedure must have been called at least once before on the source database, and the specified first_scn must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the BUILD procedure has not been run at least once on the source database, then an error is raised. Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.

first_scn Setting	start_scn Setting	Capture Process Type	Description
NULL	Non-NULL	Local	The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true: ■ There is no existing capture process for the local source database, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the database. ■ There are existing capture processes, but none of the capture processes have taken a checkpoint yet, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the database. In either of these cases, the BUILD procedure in the DBMS_CAPTURE_ADM package is run during capture process creation. The new capture process uses the resulting build of the source data dictionary in the redo log to create a LogMiner data dictionary the first time it is started, and the first SCN corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the BUILD procedure waits until these transactions commit before completing. An in-flight transaction is one that is active during capture process creation or a data dictionary build. However, if there is at least one existing local capture process for the local source database that has taken a checkpoint, then the new capture process shares an existing LogMiner data dictionary with one or more of the existing capture processes. In this case, a capture process with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit. If there is no existing capture process for the local source database (or if no existing capture processes have taken a checkpoint yet), and the specified start SCN is less than the current SCN for the database, then an error is raised.

first_scn Setting	start_scn Setting	Capture Process Type	Description
NULL	Non-NULL	Downstream	When the CREATE_CAPTURE procedure creates a downstream capture process, the use_database_link parameter must be set to TRUE when the first_scn parameter is set to NULL. Otherwise, an error is raised. The database link is used to obtain the current SCN of the source database. The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true: ▪ There is no existing capture process that captures changes to the source database at the downstream database, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the source database. ▪ There are existing capture processes that capture changes to the source database at the downstream database, but none of the capture processes have taken a checkpoint yet, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the source database. In either of these cases, the BUILD procedure in the DBMS_CAPTURE_ADM package is run during capture process creation. The first time you start the new capture process, it uses the resulting build of the source data dictionary in the redo log files copied to the downstream database to create a LogMiner data dictionary. Here, the first SCN for the new capture process corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the BUILD procedure waits until these transactions commit before completing. However, if at least one existing capture process has taken a checkpoint and captures changes to the source database at the downstream database, then the new capture process shares an existing LogMiner data dictionary with one or more of these existing capture processes. In this case, one of these existing capture processes with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit. If there is no existing capture process that captures changes to the source database at the downstream database (or no existing capture process has taken a checkpoint), and the specified start_scn parameter value is less than the current SCN for the source database, then an error is raised.
NULL	NULL	Local or Downstream	The behavior is the same as setting the first_scn parameter to NULL and setting the start_scn parameter to the current SCN of the source database.

Note: When you create a capture process using the DBMS_STREAMS_ADM package, both the first SCN and the start SCN are set to NULL during capture process creation.

See Also: BUILD Procedure on page 34-18 for more information about the BUILD procedure and the LogMiner data dictionary

Explicit Log File Assignment

If you specify explicit for the logfile_assignment parameter, then you add a redo log file manually to a downstream database using the following statement:

```
ALTER DATABASE REGISTER LOGICAL LOGFILE
   file_name FOR capture_process;
```

Here, *file_name* is the name of the redo log file being added and *capture_process* is the name of the capture process that will use the redo log file at the downstream database. The *capture_process* is equivalent to the *logminer_session_name* and must be specified. The redo log file must be present at the site running the downstream database. You must transfer this file manually to the site running the downstream database using the DBMS_FILE_TRANSFER package, FTP, or some other transfer method.

> **See Also:** *Oracle Database SQL Language Reference* for more information about the ALTER DATABASE statement and *Oracle Data Guard Concepts and Administration* for more information registering redo log files

CREATE_SYNC_CAPTURE Procedure

This procedure creates a synchronous capture.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about creating a synchronous capture

Syntax

```
DBMS_CAPTURE_ADM.CREATE_SYNC_CAPTURE(
   queue_name     IN  VARCHAR2,
   capture_name   IN  VARCHAR2,
   rule_set_name  IN  VARCHAR2,
   capture_user   IN  VARCHAR2  DEFAULT NUL);
```

Parameters

Table 34–10 CREATE_SYNC_CAPTURE Procedure Parameters

Parameter	Description
queue_name	The name of the queue into which the synchronous capture enqueues changes. You must specify an existing queue in the form *[schema_name.]queue_name*. For example, to specify a queue in the strmadmin schema named streams_queue, enter strmadmin.streams_queue. If the schema is not specified, then the current user is the default. **Note:** The queue_name setting cannot be altered after the synchronous capture is created.
capture_name	The name of the synchronous capture being created. A NULL specification is not allowed. Do not specify an owner. **Note:** The capture_name setting cannot be altered after the synchronous capture is created.
rule_set_name	The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes. Specify an existing rule set in the form *[schema_name.]rule_set_name*. For example, to specify a positive rule set in the strmadmin schema named sync_cap_rules, enter strmadmin.sync_cap_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You must specify a rule set that was created using the DBMS_STREAMS_ADM package. If NULL, then an error is returned. **Note:** Synchronous capture rules must be added to the synchronous capture rule set using the ADD_TABLE_RULES or ADD_SUBSET_RULES procedure in the DBMS_STREAMS_ADM package. A synchronous capture ignores rules added to the rule set with other procedures. **See Also:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a synchronous capture

Table 34–10 (Cont.) CREATE_SYNC_CAPTURE Procedure Parameters

Parameter	Description
capture_user	The user in whose security domain the synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the user who runs the CREATE_SYNC_CAPTURE procedure is used. Only a user who is granted the DBA role can set a capture user. Only the SYS user can set the capture_user to SYS. **Note:** If the capture user for a synchronous capture is dropped using DROP USER . . . CASCADE, then the synchronous capture is also dropped automatically. **See Also:** "Usage Notes" on page 34-30 for more information about this parameter.

Usage Notes

When the CREATE_SYNC_CAPTURE procedure creates a synchronous capture, the procedure must obtain an exclusive lock on each table for which it will capture changes. The rules in the specified rule set for the synchronous capture determine these tables. If there are outstanding transactions on a table for which the synchronous capture will capture changes, then the procedure waits until it can obtain a lock.

The capture_user parameter specifies the user who captures changes that satisfy the synchronous capture rule set. This user must have the necessary privileges to capture changes.

In addition, ensure that the capture user has the following privileges:

- ENQUEUE privilege on the queue specified in the queue_name parameter
- EXECUTE privilege on the rule set used by the synchronous capture
- EXECUTE privilege on all rule-based transformation functions used in the rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. These privileges cannot be granted through roles.

Note: A capture user does not require privileges on a database object to capture changes to the database object. The synchronous capture can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a synchronous capture.

DROP_CAPTURE Procedure

This procedure drops a capture process.

Syntax

```
DBMS_CAPTURE_ADM.DROP_CAPTURE(
   capture_name           IN  VARCHAR2,
   drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 34–11 DROP_CAPTURE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process being dropped. Specify an existing capture process name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified capture process if these rule sets are not used by any other Oracle Streams client. Oracle Streams clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified capture process, and the rule sets retain their rules.

Usage Notes

The following usage notes apply to this procedure:

- The Capture Process Must Be Stopped Before It Is Dropped
- The DROP_CAPTURE Procedure and Rules-related Information

The Capture Process Must Be Stopped Before It Is Dropped

A capture process must be stopped before it can be dropped.

See Also: STOP_CAPTURE Procedure on page 34-58

The DROP_CAPTURE Procedure and Rules-related Information

When you use this procedure to drop a capture process, rules-related information for the capture process created by the DBMS_STREAMS_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the capture process.

The following are the data dictionary views for Oracle Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES

- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES
- ALL_STREAMS_RULES
- DBA_STREAMS_RULES

See Also: *Oracle Streams Concepts and Administration* for more information about Oracle Streams data dictionary views

INCLUDE_EXTRA_ATTRIBUTE Procedure

This procedure includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture.

Syntax

```
DBMS_CAPTURE_ADM.INCLUDE_EXTRA_ATTRIBUTE(
   capture_name    IN  VARCHAR2,
   attribute_name  IN  VARCHAR2,
   include         IN  BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 34–12 INCLUDE_EXTRA_ATTRIBUTE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process or synchronous capture. Specify an existing capture process name or synchronous capture name. Do not specify an owner.
attribute_name	The name of the attribute to be included in or excluded from LCRs captured by the capture process or synchronous capture. The following names are valid settings: ■ row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, or in row LCRs for index-organized tables. The type is VARCHAR2. ■ serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. ■ session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. ■ thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. ■ tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. ■ username The name of the user who performed the change captured in the LCR. The type is VARCHAR2.
include	If TRUE, then the specified attribute is included in LCRs captured by the capture process or synchronous capture. If FALSE, then the specified attribute is excluded from LCRs captured by the capture process or synchronous capture.

Usage Notes

Some information is not captured by a capture process or synchronous capture unless you use this procedure to specify that the information should be captured. If you want

to exclude an extra attribute that is being captured by a capture process or synchronous capture, then specify the attribute and specify `FALSE` for the `include` parameter.

PREPARE_GLOBAL_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables. This procedure prepares the tables in the database for instantiation when a capture process will be used to capture changes to the tables in the database.

This procedure records the lowest SCN of each object in the database for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the database for instantiation.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_GLOBAL_INSTANTIATION
   supplemental_logging  IN  VARCHAR2  DEFAULT 'KEYS',
   container             IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameter

Table 34–13 PREPARE_GLOBAL_INSTANTIATION Procedure Parameter

Parameter	Description
supplemental_logging	Either NONE, KEYS, or ALL. If NONE is specified, then this procedure does not enable supplemental logging for any columns in the tables in the database. This procedure does not remove existing supplemental logging specifications for these tables. If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the database and for any table added to the database in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying KEYS does not enable supplemental logging of bitmap join index columns. If ALL is specified, then this procedure enables supplemental logging for all columns in the tables in the database and for any table added to the database in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.
container	Either CURRENT, ALL, or *pdb_name*. If CURRENT is specified, then this procedure adds supplemental logging for the current container. If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB. If *pdb_name* is specified, then this procedure adds supplemental logging for the specified PDB. ALL and *pdb_name* are valid only when you invoke the procedure from the root.

Usage Notes

Run this procedure at the source database.

If you use a capture process to capture all of the changes to a database, then use this procedure to prepare the tables in the database for instantiation after the capture process has been configured.

PREPARE_SCHEMA_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables. This procedure prepares the tables in the schema for instantiation when a capture process will be used to capture changes to the tables in the schema.

This procedure records the lowest SCN of each object in the schema for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the schema for instantiation.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SCHEMA_INSTANTIATION(
   schema_name           IN  VARCHAR2,
   supplemental_logging  IN  VARCHAR2  DEFAULT 'KEYS',
   container             IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 34–14 PREPARE_SCHEMA_INSTANTIATION Procedure Parameters

Parameter	Description
schema_name	The name of the schema. For example, hr.
supplemental_logging	Either NONE, KEYS, or ALL. If NONE is specified, then this procedure does not enable supplemental logging for any columns in the tables in the schema. This procedure does not remove existing supplemental logging specifications for these tables. If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the schema and for any table added to this schema in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying KEYS does not enable supplemental logging of bitmap join index columns. If ALL is specified, then this procedure enables supplemental logging for all columns in the tables in the schema and for any table added to this schema in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.
container	Either CURRENT, ALL, or *pdb_name*. If CURRENT is specified, then this procedure adds supplemental logging for the current container. If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB. If *pdb_name* is specified, then this procedure adds supplemental logging for the specified PDB ALL and *pdb_name* are valid only when you invoke the procedure from the root.

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a schema, then use this procedure to prepare the tables in the schema for instantiation after the capture process has been configured.

PREPARE_SYNC_INSTANTIATION Function

This function performs the synchronization necessary for instantiating one or more tables at another database. This function returns the prepare system change number (SCN) for the table or tables being prepared for instantiation.

This function prepares one or more tables for instantiation when a synchronous capture will be used to capture changes to the tables.

This function records the lowest SCN of each table for instantiation (prepare SCN). SCNs after the lowest SCN for an object can be used for instantiating the object.

This function is overloaded. The `table_names` parameter is `VARCHAR2` datatype in one version and `DBMS_UTILITY.UNCL_ARRAY` datatype in the other version.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
   table_names  IN  VARCHAR2)
RETURN NUMBER;

DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
   table_names  IN  DBMS_UTILITY.UNCL_ARRAY)
RETURN NUMBER;
```

Parameters

Table 34–15 PREPARE_SYNC_INSTANTIATION Function Parameter

Parameter	Description
`table_names`	When the `table_names` parameter is `VARCHAR2` datatype, a comma-delimited list of the tables to prepare for instantiation. There must be no spaces between entries. When the `table_names` parameter is `DBMS_UTILITY.UNCL_ARRAY` datatype, specify a PL/SQL associative array of this type that contains the names of the tables to prepare for instantiation. The first table name is at position 1, the second at position 2, and so on. The table does not need to be `NULL` terminated. In either version of the function, specify the name of each table in the form `[`*`schema_name`*`.]`*`table_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.

PREPARE_TABLE_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table. This procedure prepares the table for instantiation when a capture process will be used to capture changes to the table.

This procedure records the lowest SCN of the table for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_TABLE_INSTANTIATION(
   table_name            IN  VARCHAR2,
   supplemental_logging  IN  VARCHAR2  DEFAULT 'KEYS',
   container             IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 34–16 PREPARE_TABLE_INSTANTIATION Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[schema_name.]object_name`. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`supplemental_logging`	Either `NONE`, `KEYS`, or `ALL`. If `NONE` is specified, then this procedure does not enable supplemental logging for any columns in the table. This procedure does not remove existing supplemental logging specifications for the table. If `KEYS` is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the table. The procedure places the key columns for the table in three separate log groups: the primary key columns in an unconditional log group, the unique key columns and bitmap index columns in a conditional log group, and the foreign key columns in a conditional log group. Specifying `KEYS` does not enable supplemental logging of bitmap join index columns. If `ALL` is specified, then this procedure enables supplemental logging for all columns in the table. The procedure places all of the columns for the table in an unconditional log group. Supplemental logging is not enabled for columns of the following types: LOB, `LONG`, `LONG RAW`, user-defined types, and Oracle-supplied types.

Table 34–16 (Cont.) PREPARE_TABLE_INSTANTIATION Procedure Parameters

Parameter	Description
container	Either CURRENT, ALL, or *pdb_name*. If CURRENT is specified, then this procedure adds supplemental logging for the current container. If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB. If *pdb_name* is specified, then this procedure adds supplemental logging for the specified PDB. ALL and *pdb_name* are valid only when you invoke the procedure from the root.

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a table, then use this procedure to prepare the table for instantiation after the capture process has been configured.

SET_PARAMETER Procedure

This procedure sets a capture process parameter to the specified value.

Syntax

```
DBMS_CAPTURE_ADM.SET_PARAMETER(
   capture_name  IN  VARCHAR2,
   parameter     IN  VARCHAR2,
   value         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 34–17 SET_PARAMETER Procedure Parameters

Parameter	Description
capture_name	The name of the capture process. Do not specify an owner.
parameter	The name of the parameter you are setting. See "Capture Process Parameters" on page 34-42 for a list of these parameters.
value	The value to which the parameter is set. If NULL, then the parameter is set to its default value.

Capture Process Parameters

The following table lists the parameters for the capture process.

Table 34–18 Capture Process Parameters

Parameter Name	Possible Values	Default	Description
capture_idkey_objects	Y or N	N	If Y, then the capture process captures ID key logical change records (LCRs). If N, then the capture process does not capture ID key LCRs. Capture processes do not fully support capturing changes to some data types from the redo log. ID key LCRs enable an XStream configuration to capture these changes and process them with an XStream client application. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 34-53 for more information about this parameter and *Oracle Database XStream Guide* for more information about ID key LCRs
capture_sequence_nextval	Y or N	N	If Y, then the capture process captures sequence LCRs for all of the sequences in the database, except for sequences in Oracle-supplied, administrative schemas such as SYS and SYSTEM. The capture process's rule sets can filter sequence LCRs in the same way that they filter row LCRs and DDL LCRs. If N, then the capture process does not capture sequence LCRs. An apply process or XStream inbound server can use sequence LCRs to ensure that the sequence values at a destination database use the appropriate values. For increasing sequences, the sequence values at the destination are equal to or greater than the sequence values at the source database. For decreasing sequences, the sequence values at the destination are less than or equal to the sequence values at the source database. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 34-53 for more information about this parameter and "SET_PARAMETER Procedure" on page 23-56 for information about the apply_sequence_nextval apply process parameter

Table 34–18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
disable_on_limit	Y or N	N	If Y, then the capture process is disabled because it reached a value specified by the time_limit parameter or message_limit parameter. If N, then the capture process is restarted immediately after stopping because it reached a limit. When a capture process is restarted, it starts to capture changes at the point where it last stopped. A restarted capture process gets a new session identifier, and the processes associated with the capture process also get new session identifiers. However, the capture process number (CP*nn*) remains the same.
downstream_real_time_mine	Y or N	Y for local capture processes N for downstream capture processes	If Y, then the capture process is a real-time downstream capture process. After setting this parameter to Y, switch the redo log file at the source database using the SQL statement ALTER SYSTEM ARCHIVE LOG CURRENT to begin real-time downstream capture. If this parameter is set to Y, then redo data from the source database must be sent to the standby redo log at the downstream database. See *Oracle Streams Replication Administrator's Guide* for information about creating a real-time downstream capture process. If N, then the capture process is an archived-log downstream capture process. An error is raised if an attempt is made to set this parameter for a local capture process.
excludetag	Comma-delimited list of Oracle Streams tags	NULL	Controls whether the capture process captures DML changes that are tagged with one of the specified Oracle Streams tags. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 34-53 for more information about this parameter

Table 34–18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
excludetrans	Comma-delimited list of transaction names	NULL	Controls whether the capture process captures DML changes in the specified transaction names. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 34-53 for more information about this parameter
excludeuser	Comma-delimited list of user names	NULL	Controls whether the capture process captures DML changes made by the specified users. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. Specify an exact pattern match for each user name. The pattern match is case sensitive. For example, specify HR for the hr user. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 34-53 for more information about this parameter
excludeuserid	Comma-delimited list of user ID values	NULL	Controls whether the capture process captures data manipulation language (DML) changes made by the specified users. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. To view the user ID for a user, query the USER_ID column in the ALL_USERS data dictionary view. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 34-53 for more information about this parameter

Table 34–18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
getapplops	Y or N	Y	If Y, then the capture process captures DML changes if the original user is not specified in the excludeuserid or excludeuser parameters and the transaction name is not specified in the excludetrans parameter. If N, then the capture process ignores DML changes if the original user is not specified in the excludeuserid or excludeuser parameters and the transaction name is not specified in the excludetrans parameter. In either case, the capture process captures a DML change only if it satisfies the capture process's rule sets. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 34-53 for more information about this parameter
getreplicates	Y or N	N	If Y, then the capture process captures DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter. If N, then the capture process ignores DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter. In either case, the capture process captures a DML change only if it satisfies the capture process's rule sets. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 34-53 for more information about this parameter

Table 34–18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
ignore_transaction	A valid transaction ID or NULL	NULL	Instructs the capture process to ignore the specified transaction from the source database, effective immediately. The capture process eliminates all subsequent LCRs for the transaction. If the specified transaction is committed successfully at the source database, the destination database will receive a ROLLBACK statement instead, and any LCRs from the transaction that were enqueued before the ignore transaction request are rolled backed at the destination database. If NULL, then the capture process ignores this parameter. Use caution when setting this parameter because ignoring a transaction might lead to data divergence between the source database and destination database. To ignore multiple transactions, specify each transaction in a separate call to the SET_PARAMETER procedure. The DBA_CAPTURE_PARAMETERS view displays a comma-delimited list of all transactions to be ignored. To clear the list of ignored transactions, run the SET_PARAMETER procedure and specify NULL for the ignore_transaction parameter.
ignore_unsupported_table	A fully qualified table name, *, or -	*	Controls the behavior of the capture process when it tries to capture changes to a specified table or to an unsupported table. A capture process tries to capture changes to an unsupported table when its rule sets instruct it to do so. If you do not want the capture process to try to capture changes to unsupported tables, then ensure that the capture process's rule sets exclude unsupported tables. When a table name is specified, the capture process does not capture changes to the specified table. The table name must be entered in the form *table_owner. table_name*. For example. hr.employees. To specify multiple tables, specify each table in a separate call to the SET_PARAMETER procedure. When * is specified and the capture process tries to capture a change to an unsupported table, the capture process ignores the change and continues to run. The change to the unsupported table is not captured, and the capture process records the unsupported table in the alert log. When - is specified and the capture process tries to capture a change to an unsupported table, the capture process aborts.

Table 34–18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
include_objects	A list of tables or schema names separated by commas	none	Directs capture to include changes from the specified tables or schemas. An LCR that is selected by include_objects is passed to the outbound server regardless of any further filtering that is specified. **Note:** This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 34-53 for more information about this parameter
inline_lob_optimization	Y or N	N	If Y, then LOBs that can be processed inline (such as small LOBs) are included in the LCR directly, rather than sending LOB chunk LCRs. If N, then each LOB column is sent as NULL followed by LOB chunk LCRs to update the LOB column. **Note:** This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 34-53 for more information about this parameter
maximum_scn	A valid SCN or INFINITE	INFINITE	The capture process is disabled before capturing a change record with an SCN greater than or equal to the value specified. If INFINITE, then the capture process runs regardless of the SCN value.

Table 34–18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
max_sga_size	A positive integer	INFINITE	Controls the amount of system global area (SGA) memory allocated specifically to the capture process, in megabytes. The capture process attempts to allocate memory up to this limit. A capture process uses Oracle LogMiner to scan for changes in the redo log. The memory is allocated for the duration of the capture process session and is released when the capture process becomes disabled. **Note:** The sum of system global area (SGA) memory allocated for all components on a database must be less than the value set for the STREAMS_POOL_SIZE initialization parameter. If NULL, then the capture component uses the original default value. A NULL value has the same effect as resetting the parameter to its default value. **Note:** This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 34-53 for more information about this parameter
merge_threshold	A negative integer, 0, a positive integer, or INFINITE	60	The amount of time, in seconds, between the message creation time of the original capture process and the message creation time of the cloned capture process. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then automatic merge begins by running the MERGE_STREAMS procedure. If the difference is greater than the value specified by this parameter, then automatic merge does not begin, and the value is recorded in the LAG column of the DBA_STREAMS_SPLIT_MERGE view. The CAPTURE_MESSAGE_CREATE_TIME is recorded in the V$STREAMS_CAPTURE view. This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes and the split_threshold parameter is set to a value other than INFINITE. If a negative value is specified, then automatic merge is disabled. If 0 (zero) is specified, then there must be no lag between the original capture process and the cloned capture process to begin the merge. If INFINITE is specified, then automatic merging starts immediately. **See Also:** *Oracle Streams Replication Administrator's Guide*
message_limit	A positive integer or INFINITE	INFINITE	The capture process stops after capturing the specified number of messages. If INFINITE, then the capture process continues to run regardless of the number of messages captured.

Table 34–18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
message_tracking_frequency	0 or a positive integer	2000000	The frequency at which messages captured by the capture process are tracked automatically. For example, if this parameter is set to the default value of 2000000, then every two-millionth message is tracked automatically. The tracking label used for automatic message tracking is *capture_process_name*:AUTOTRACK, where *capture_process_name* is the name of the capture process. Only the first 20 bytes of the capture process name are used; the rest is truncated if it exceeds 20 bytes. If 0 (zero), then no messages are tracked automatically. See *Oracle Streams Replication Administrator's Guide* for more information about message tracking.
parallelism	A positive integer	1	The number of preparer servers that can concurrently mine the redo log for the capture process. A capture process consists of one reader server, one or more preparer servers, and one builder server. The preparer servers concurrently format changes found in the redo log into logical change records (LCRs). Each reader server, preparer server, and builder server is a process, and the number of preparer servers equals the number specified for the parallelism capture process parameter. So, if parallelism is set to 5, then a capture process uses a total of seven processes: one reader server, five preparer servers, and one builder server. Setting the parallelism parameter to a number higher than the number of available parallel execution servers might disable the capture process. Ensure that the PROCESSES initialization parameter is set appropriately when you set the parallelism capture process parameter. **Note:** When you change the value of this parameter, the capture process is stopped and restarted automatically. **See Also:** *Oracle Streams Concepts and Administration* for more information about capture process components
skip_autofiltered_table_ddl	Y or N	Y	If Y, then the capture process does not capture data definition language (DDL) changes to tables that are automatically filtered by the capture process. If N, then the capture process can capture DDL changes to tables that are automatically filtered by the capture process if the DDL changes satisfy the capture process rule sets. The AUTO_FILTERED column in the DBA_STREAMS_UNSUPPORTED data dictionary view shows which tables are automatically filtered by capture processes.

Table 34–18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
split_threshold	0, a positive integer, or INFINITE	1800	The amount of time, in seconds, that a stream is broken before the stream is automatically split from other streams that flow from the capture process. When a stream is split, the capture process, queue, and propagation are cloned. In this case, a stream is a flow of logical change records (LCRs) that flows from a capture process to an apply. A stream is broken when LCRs captured by the capture process cannot reach the apply process. For example, a stream is broken when the relevant propagation or apply process is disabled. This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes. If 0 (zero), then automatic splitting starts immediately. If INFINITE, then automatic splitting is disabled. The stream is not split regardless of the amount of time that it is broken. This parameters is designed to be used with the merge_threshold parameter. You can monitor an automatic split and merge operation by querying the DBA_STREAMS_SPLIT_MERGE view. **See Also:** *Oracle Streams Replication Administrator's Guide*
startup_seconds	0, a positive integer, or INFINITE	0	The maximum number of seconds to wait for another instantiation of the same capture process to finish. If the other instantiation of the same capture process does not finish within this time, then the capture process does not start. This parameter is useful only if you are starting the capture process manually. If INFINITE, then the capture process does not start until another instantiation of the same capture process finishes.
time_limit	A positive integer or INFINITE	INFINITE	The capture process stops as soon as possible after the specified number of seconds since it started. If INFINITE, then the capture process continues to run until it is stopped explicitly.
trace_level	0 or a positive integer	0	Set this parameter only under the guidance of Oracle Support Services.

Table 34–18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
use_rac_service	Y or N	Y if Streams N if XStream	If Y, then the capture process is run in the owning instance of its queue. If N, then the client specifies where the capture process is to run. **Note:** This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations. **See Also:** "Usage Notes" on page 34-53 for more information about this parameter
write_alert_log	Y or N	Y	If Y, then the capture process writes a message to the alert log on exit. If N, then the capture process does not write a message to the alert log on exit. The message specifies the reason the capture process stopped.
xout_client_exists	Y or N	Y if the capture process sends LCRs to XStream outbound servers N if the capture process sends LCRs to Oracle Streams apply processes	Y indicates that the capture process sends LCRs to one or more XStream outbound servers. N indicates that the capture process sends LCRs to one or more Oracle Streams apply processes. A single capture process cannot send LCRs to both outbound servers and apply processes. In an XStream configuration where an outbound server runs on a different database than its capture process, set this parameter to Y to enable the capture process to send LCRs to the outbound server. **Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

Usage Notes

The following usage notes apply to the SET_PARAMETER procedure:

- Delays Are Possible Before New Parameter Settings Take Effect
- Parameters Interpreted as Positive Integers
- Parameters with a System Change Number (SCN) Setting
- Parameters that Require XStream Optimizations
- XStream or Oracle GoldenGate Integrated Capture Configurations

Delays Are Possible Before New Parameter Settings Take Effect

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Parameters Interpreted as Positive Integers

For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify INFINITE for larger values.

Parameters with a System Change Number (SCN) Setting

For parameters that require an SCN setting, any valid SCN value can be specified.

Parameters that Require XStream Optimizations

A capture process uses the following parameters only when the capture process is sending logical change records (LCRs) to an XStream outbound server or when XStream optimizations are enabled for Oracle Streams components:

- capture_idkey_objects
- capture_sequence_nextval
- excludetag
- excludetrans
- excludeuser
- excludeuserid
- getapplops
- getreplicates
- include_objects
- inline_lob_optimization
- max_sga_size
- use_rac_services

The DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure enables XStream optimizations for Oracle Streams. When XStream optimizations are not enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure, a capture process raises an error if one of these parameters is set to any value other than its default value.

When XStream optimizations are enabled for Oracle Streams and the capture_idkey_objects parameter is set to Y, a capture process can capture ID key LCRs. ID key LCRs do not contain all of the columns for a row change. Instead, they contain the rowid of the changed row, a group of key columns to identify the row in the table, and the data for the scalar columns of the table that are supported by capture processes. An apply process can apply these changes using the information available the ID key LCRs.

To determine the database objects for which a capture process will capture ID key LCRs, run the following query on the source database:

```
SELECT OWNER, OBJECT_NAME
  FROM DBA_XSTREAM_OUT_SUPPORT_MODE
  WHERE SUPPORT_MODE='ID KEY';
```

Note: Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

XStream or Oracle GoldenGate Integrated Capture Configurations

In an XStream or Oracle GoldenGate integrated capture configuration, the following parameters control which changes are captured by a capture process:

- capture_idkey_objects
- capture_sequence_nextval

- excludetag
- excludetrans
- excludeuser
- excludeuserid
- getapplops
- getreplicates
- include_objects
- inline_lob_optimization
- max_sga_size
- use_rac_services

You can set these parameters to avoid change cycling. Change cycling sends a change back to the database where it originated. Typically, change cycling should be avoided in a replication environment so that the same change is not made to a database more than once.

In an XStream or Oracle GoldenGate integrated capture configuration that performs bi-directional replication, a GoldenGate Replicat process runs on the source database for a capture process. Therefore, the changes made by the GoldenGate Replicat are recorded in the redo log.

If an integrated configuration performs bi-directional replication, then, to avoid change cycling, the capture process should not capture the changes made by the Oracle GoldenGate Replicat process. To accomplish this goal, use the default settings for the `getapplops` and `getreplicates` parameters and exclude changes made by the user running the Replicat process. To exclude these changes, specify this user in the `excludeuserid` or `excludeuser` parameter. Typically, the user running the Oracle GoldenGate Replicat process is the XStream administrator.

In some configurations, the goal might be to capture or exclude changes made by applications or by the Replicat process. For example, an intermediate database in a replication environment might capture all of the changes made to the database, including both application changes and Replicat process changes, and send these changes to a different destination database.

Table 34–19 describes the capture process behavior when at least one of the exclude parameters is non-`NULL`.

Table 34–19 Behavior When at Least One exclude Parameter Is Non-NULL

getapplops Setting	getreplicates Setting	Description
`Y`	`Y`	The capture process captures all DML changes.
`Y`	`N`	The capture process captures the DML changes made by the users that are not in the `excludeuserid` or `excludeuser` parameters. The capture process captures the DML changes that are not in the transactions in the `excludetrans` parameter. The capture process captures only the DML changes that do not have a tag that is in the `excludetags` parameter.

Table 34–19 (Cont.) Behavior When at Least One exclude Parameter Is Non-NULL

getapplops Setting	getreplicates Setting	Description
N	Y	The capture process captures only the DML changes made by the users that are in the excludeuserid or excludeuser parameters. The capture process captures only the DML changes that are in the transactions in the excludetrans parameter. The capture process captures only the DML changes that have a tag that is in the excludetags parameter.
N	N	The capture process does not capture any DML changes.

Table 34–19 describes the capture process behavior when all of the exclude parameters are set to NULL.

Table 34–20 Behavior When All exclude Parameters Are Set to NULL

getapplops Setting	getreplicates Setting	Description
Y	Y	The capture process captures all DML changes.
Y	N	The capture process captures all DML changes.
N	Y	The capture process does not capture any DML changes.
N	N	The capture process does not capture any DML changes.

See the documentation for the Oracle GoldenGate product for more information:

http://docs.oracle.com/cd/E15881_01/index.htm

Note: A capture process evaluates a change using these parameters before it evaluates a change using its rule sets. Therefore, a capture process can discard a change before the change is evaluated against the capture process's rule sets. Also, regardless of the settings for these parameters, a capture process captures a change only if the change satisfies the capture process's rule sets.

See Also: *Oracle Database XStream Guide*

START_CAPTURE Procedure

This procedure starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue.

The start status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup.

The capture process is a background Oracle process and is prefixed by c.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the start status of a capture process.

See Also: Chapter 159, "DBMS_STREAMS_ADM"

Syntax

```
DBMS_CAPTURE_ADM.START_CAPTURE(
   capture_name  IN  VARCHAR2);
```

Parameters

Table 34–21 START_CAPTURE Procedure Parameter

Parameter	Description
capture_name	The name of the capture process. Do not specify an owner. The capture process uses LogMiner to capture changes in the redo information. A NULL setting is not allowed.

Usage Notes

The capture process status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup. A capture process (*cnnn*) is an Oracle background process.

STOP_CAPTURE Procedure

This procedure stops the capture process from mining redo logs.

Syntax

```
DBMS_CAPTURE_ADM.STOP_CAPTURE(
   capture_name  IN  VARCHAR2,
   force         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 34–22 STOP_CAPTURE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process. A NULL setting is not allowed. Do not specify an owner.
force	If TRUE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then it aborts. If FALSE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then an ORA-26672 error is returned, and the capture process might continue to run.

Usage Notes

The following usage notes apply to this procedure:

- The capture process status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the capture process is not started upon database instance startup.
- A capture process is an Oracle background process with a name in the form CP*nn*, where *nn* can include letters and numbers.
- The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the stop status of a capture process.

35

DBMS_COMPARISON

The DBMS_COMPARISON package provides interfaces to compare and converge database objects at different databases.

This chapter contains the following topics:

See Also:

- *Oracle Streams Replication Administrator's Guide* for information about using the basic features of this package

Using DBMS_COMPARISON

This section contains topics which relate to using the `DBMS_COMPARISON` package.

Overview

The DBMS_COMPARISON package is an Oracle-supplied package that you can use to compare database objects at two databases. This package also enables you converge the database objects so that they are consistent at different databases. Typically, this package is used in environments that share a database object at multiple databases. When copies of the same database object exist at multiple databases, the database object is a **shared database object**. Several data dictionary views contain information about comparisons made with the DBMS_COMPARISON package.

Shared database objects might be maintained by data replication. For example, materialized views or Oracle Streams components might replicate the database objects and maintain them at multiple databases. A custom application might also maintain shared database objects. When a database object is shared, it can diverge at the databases that share it. You can use this package to identify differences in the shared database objects. After identifying the differences, you can optionally use this package to synchronize the shared database objects.

To compare a database object that is shared at two different databases, complete the following general steps:

1. Run the CREATE_COMPARISON Procedure in this package to create a **comparison**. The comparison identifies the database objects to compare and specifies parameters for the comparison.
2. Run the COMPARE Function in this package to compare the database object at the two databases and identify differences. This function returns TRUE when no differences are found and FALSE when differences are found. This function also populates data dictionary views with comparison results. Separate comparison results are generated for each execution of the COMPARE function.
3. If you want to examine the comparison results, query the following data dictionary views:
   - DBA_COMPARISON_SCAN
   - USER_COMPARISON_SCAN
   - DBA_COMPARISON_SCAN_VALUES
   - USER_COMPARISON_SCAN_VALUES
   - DBA_COMPARISON_ROW_DIF
   - USER_COMPARISON_ROW_DIF
4. If there are differences, and you want to synchronize the database objects at the two databases, then run the CONVERGE procedure in this package.

After you create a comparison with the CREATE_COMPARISON procedure in the DBMS_COMPARISON package, you can run the comparison at any time using the COMPARE function. Each time you run the COMPARE function, it records comparison results in the appropriate data dictionary views. Comparison results might be modified when subprograms in this package are invoked and the scans in the comparison results are specified. For example, comparison results might be modified when you run the RECHECK function.

The comparison results for a single execution of the COMPARE function can include one or more **scans**. A scan checks for differences in some or all of the rows in a shared database object at a single point in time. You can compare database objects multiple times, and a unique scan ID identifies each scan in the comparison results.

A **bucket** is a range of rows in a database object that is being compared. Buckets improve performance by splitting the database object into ranges and comparing the ranges independently. Every comparison divides the rows being compared into an appropriate number of buckets, and each bucket is compared by a scan.

Each time the `COMPARE` function splits a bucket into smaller buckets, it performs new scans of the smaller buckets. The scan that analyzes a larger bucket is the **parent scan** of each scan that analyzes the smaller buckets into which the larger bucket was split. The **root scan** in the comparison results is the highest level parent scan. The root scan does not have a parent.

You can recheck a scan using the `RECHECK` function, and you can converge a scan using the `CONVERGE` procedure. When you want to recheck or converge all of the rows comparison results, specify the root scan ID for the comparison results in the appropriate subprogram. When you want to recheck or converge a portion of the rows in comparison results, specify the scan ID of the scan that contains the differences.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about comparisons, including detailed information about scans, buckets, parent scans, and root scans

Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

Each subprogram in the DBMS_COMPARISON package has a comparison_name parameter. The current user must be the owner of the specified comparison to run a subprogram in the DBMS_COMPARISON package.

To run the COMPARE function, RECHECK function, or CONVERGE procedure, the following users must have the SELECT or READ privilege on each copy of the shared database object:

- The comparison owner at the local database
- When a database link is used, the user at the remote database to which the comparison owner connects through a database link

The CONVERGE procedure also requires additional privileges for one of these users at the database where it makes changes to the shared database object. The user must have INSERT, UPDATE, and DELETE privileges on the shared database object at this database.

In addition, when the CONVERGE procedure is run with either the local_converge_tag or remote_converge_tag parameter set to a non-NULL value, then the following additional requirements must be met:

- If the local table "wins," then the user at the remote database to which the invoker of the CONVERGE procedure connects through a database link must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.
- If the remote table "wins," then the invoker of the CONVERGE procedure at the local database must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.

Note: The database administrator (DBA) can assume control over some of the DBMS_COMPARISON functions and procedures owned by other users. This control applies to DROP_COMPARISON and PURGE_COMPARISON. This DBA override can be particularly useful in cleanup operations when comparisons created by another user need to be dropped

---

Constants

The DBMS_COMPARISON package defines several enumerated constants to use specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_COMPARISON.CMP_SCAN_MODE_FULL.

Table 35–1 lists the parameters and enumerated constants.

Table 35–1 DBMS_COMPARISON Parameters with Enumerated Constants

Parameter	Option	Type	Description
comparison_mode	■ CMP_COMPARE_MODE_OBJECT	VARCHAR2(30)	CMP_COMPARE_MODE_OBJECT is a database object. This constant can be specified as 'OBJECT'.
scan_mode	■ CMP_SCAN_MODE_FULL ■ CMP_SCAN_MODE_RANDOM ■ CMP_SCAN_MODE_CYCLIC ■ CMP_SCAN_MODE_CUSTOM	VARCHAR2(30)	CMP_SCAN_MODE_FULL indicates that the entire database object is compared. This constant can be specified as 'FULL'. CMP_SCAN_MODE_RANDOM indicates that a random portion of the database object is compared. This constant can be specified as 'RANDOM'. CMP_SCAN_MODE_CYCLIC indicates that a portion of the database object is compared when you perform a single comparison. When you compare the database object again, another portion of the database object is compared, starting where the last comparison ended. This constant can be specified as 'CYCLIC'. CMP_SCAN_MODE_CUSTOM indicates that the user who runs the subprogram specifies the range to compare in the database object. This constant can be specified as 'CUSTOM'.
converge_options	■ CMP_CONVERGE_LOCAL_WINS ■ CMP_CONVERGE_REMOTE_WINS	VARCHAR2(30)	CMP_CONVERGE_LOCAL_WINS indicates that the column values at the local database replace the column values at the remote database when these column values are different. This constant can be specified as 'LOCAL'. CMP_CONVERGE_REMOTE_WINS indicates that the column values at the remote database replace the column values at the local database when these column values are different. This constant can be specified as 'REMOTE'.

Table 35–1 (Cont.) DBMS_COMPARISON Parameters with Enumerated Constants

Parameter	Option	Type	Description
null_value	■ CMP_NULL_VALUE_DEF	VARCHAR2(100)	CMP_NULL_VALUE_DEF indicates that ORA$STREAMS$NV is substituted for NULL values in database objects during comparison. This constant can be specified as 'ORA$STREAMS$NV'.
max_num_buckets	■ CMP_MAX_NUM_BUCKETS	INTEGER	CMP_MAX_NUM_BUCKETS indicates that the maximum number of buckets is 1,000. This constant can be specified as 1000.
min_rows_in_bucket	■ CMP_MIN_ROWS_IN_BUCKET	INTEGER	CMP_MIN_ROWS_IN_BUCKET indicates that the minimum number of rows in a bucket is 10,000. This constant can be specified as 10000.

Views

The DBMS_COMPARISON package uses the following views:

- DBA_COMPARISON
- USER_COMPARISON
- DBA_COMPARISON_COLUMNS
- USER_COMPARISON_COLUMNS
- DBA_COMPARISON_SCAN
- USER_COMPARISON_SCAN
- DBA_COMPARISON_SCAN_VALUES
- USER_COMPARISON_SCAN_VALUES
- DBA_COMPARISON_ROW_DIF
- USER_COMPARISON_ROW_DIF

See Also: *Oracle Database Reference*

Operational Notes

This section contains the following operational notes for the DBMS_COMPARISON package:

- Oracle Database Release Requirements for the DBMS_COMPARISON Package
- Database Character Set Requirements for the DBMS_COMPARISON Package
- Database Object Requirements for the DBMS_COMPARISON Package
- Index Column Requirements for the DBMS_COMPARISON Package
- Datatype Requirements for the DBMS_COMPARISON Package
- Only Converge Rows That Are Not Being Updated

Oracle Database Release Requirements for the DBMS_COMPARISON Package

Meet the following Oracle Database release requirements when running the subprograms in the DBMS_COMPARISON package:

- The local database that runs the subprograms in the DBMS_COMPARISON package must be an Oracle Database 11*g* Release 1 (11.1) database.
- The remote database must be an Oracle Database 10*g* Release 1 (10.1) or later database. Oracle databases before this release and non-Oracle databases are not supported.

Database Character Set Requirements for the DBMS_COMPARISON Package

The database character sets must be the same for the databases that contain the database objects being compared.

> **See Also:** *Oracle Database Globalization Support Guide* for information about database character sets

Database Object Requirements for the DBMS_COMPARISON Package

The DBMS_COMPARISON package can compare the following types of database objects:

- Tables
- Single-table views
- Materialized views
- Synonyms for tables, single-table views, and materialized views

Database objects of different types can be compared and converged at different databases. For example, a table at one database and a materialized view at another database can be compared and converged with this package.

To run the subprograms in the DBMS_COMPARISON package, the specified database objects must have the same shape at each database. Specifically, the database objects must have the same number of columns at each database, and the datatypes of corresponding columns must match.

If a database object being compared contains columns that do not exist in the other database object, then you can compare the database objects by excluding the extra columns during comparison creation. Use the column_list parameter in the CREATE_COMPARISON procedure to list only the columns that exist in both database objects.

See Also: CREATE_COMPARISON Procedure on page 35-20

Index Column Requirements for the DBMS_COMPARISON Package

This section discusses number, timestamp, and interval columns. These include the following datatypes:

- Number columns are of the following datatypes: `NUMBER`, `FLOAT`, `BINARY_FLOAT`, and `BINARY_DOUBLE`.
- Timestamp columns are of the following datatypes: `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, and `TIMESTAMP WITH LOCAL TIME ZONE`
- Interval columns are of the following datatypes: `INTERVAL YEAR TO MONTH` and `INTERVAL DAY TO SECOND`.

For all scan modes to be supported by the `DBMS_COMPARISON` package, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, or `DATE` datatype column
- A composite index that only includes number, timestamp, interval, or `DATE` datatype columns. Each column in the composite index must either have a `NOT NULL` constraint or be part of the primary key.

For the scan modes `CMP_SCAN_MODE_FULL` and `CMP_SCAN_MODE_CUSTOM` to be supported, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, `DATE`, `VARCHAR2`, or `CHAR` datatype column
- A composite index that only includes number, timestamp, interval, `DATE`, `VARCHAR2`, or `CHAR` columns. Each column in the composite index must either have a `NOT NULL` constraint or be part of the primary key.

If the database objects do not have one of these types of indexes, then the `DBMS_COMPARISON` package does not support the database objects. For example, if the database objects only have a single index on an `NVARCHAR2` column, then the `DBMS_COMPARISON` package does not support them. Or, if the database objects have only one index, and it is a composite index that includes a `NUMBER` column and an `NCHAR` column, then the `DBMS_COMPARISON` package does not support them.

You can specify an index when you create a comparison using the `index_schema_name` and `index_name` parameters in the `CREATE_COMPARISON` procedure. If you specify an index, then make sure the columns in the index meet the requirements of the scan mode used for the comparison.

The index columns in a comparison must uniquely identify every row involved in a comparison. The following constraints satisfy this requirement:

- A primary key constraint
- A unique constraint on one or more non-`NULL` columns

If these constraints are not present on a table, then use the `index_schema_name` and `index_name` parameters in the `CREATE_COMPARISON` procedure to specify an index whose columns satisfy this requirement.

When a single index value identifies both a local row and a remote row, the two rows must be copies of the same row in the replicated tables. In addition, each pair of copies of the same row must always have the same index value.

The DBMS_COMPARISON package can use an index only if all of the columns in the index are included in the column_list parameter when the comparison is created with the CREATE_COMPARISON procedure.

After a comparison is created, you can determine the index column or columns for it by running the following query:

```
SELECT COLUMN_NAME, COLUMN_POSITION FROM DBA_COMPARISON_COLUMNS
  WHERE COMPARISON_NAME = 'COMPARE_CUSTOM' AND
        INDEX_COLUMN    = 'Y';
```

If there are multiple index columns, then the index column with 1 for the COLUMN_POSITION is the lead index column in the composite index.

See Also:

- "Constants" on page 35-6 for information about scan modes
- CREATE_COMPARISON Procedure on page 35-20 for information about specifying an index for a comparison

Datatype Requirements for the DBMS_COMPARISON Package

The DBMS_COMPARISON package can compare data in columns of the following datatypes:

- VARCHAR2
- NVARCHAR2
- NUMBER
- FLOAT
- DATE
- BINARY_FLOAT
- BINARY_DOUBLE
- TIMESTAMP
- TIMESTAMP WITH TIME ZONE
- TIMESTAMP WITH LOCAL TIME ZONE
- INTERVAL YEAR TO MONTH
- INTERVAL DAY TO SECOND
- RAW
- CHAR
- NCHAR

If a column with datatype TIMESTAMP WITH LOCAL TIME ZONE is compared, then the two databases must use the same time zone. Also, if a column with datatype NVARCHAR2 or NCHAR is compared, then the two databases must use the same national character set.

The DBMS_COMPARISON package cannot compare data in columns of the following datatypes:

- LONG
- LONG RAW
- ROWID

- UROWID
- CLOB
- NCLOB
- BLOB
- BFILE
- User-defined types (including object types, REFs, varrays, and nested tables)
- Oracle-supplied types (including any types, XML types, spatial types, and media types)

You can compare database objects that contain unsupported columns by excluding the unsupported columns during comparison creation. Use the column_list parameter in the CREATE_COMPARISON procedure to list only the supported columns in a shared database object.

See Also:

- CREATE_COMPARISON Procedure on page 35-20
- *Oracle Database SQL Language Reference* for more information about datatypes
- *Oracle Database Globalization Support Guide* for information about national character sets

Only Converge Rows That Are Not Being Updated

You should only converge rows that are not being updated on either database. For example, if the shared database object is updated by replication components, then only converge rows for which replication changes have been applied and make sure no new changes are in the process of being replicated for these rows. If you compare replicated database objects, then it is typically best to compare them during a time of little or no replication activity to identify persistent differences.

Attention: If a scan identifies that a row is different in the shared database object at two databases, and the row is modified after the scan, then it can result in unexpected data in the row after the CONVERGE procedure is run.

See Also: *Oracle Streams Replication Administrator's Guide* for information about the DBMS_COMPARISON package in an Oracle Streams replication environment

Data Structures

The DBMS_COMPARISON package defines a RECORD type.

RECORD Types

- COMPARISON_TYPE Record Type

COMPARISON_TYPE Record Type

Contains information returned by the `COMPARE` function or `CONVERGE` procedure in the `DBMS_COMPARISON` package.

> **Note:** The `COMPARE` function only returns a value for the `scan_id` field.

Syntax

```
TYPE COMPARISON_TYPE IS RECORD(
  scan_id            NUMBER,
  loc_rows_merged    NUMBER,
  rmt_rows_merged    NUMBER,
  loc_rows_deleted   NUMBER,
  rmt_rows_deleted   NUMBER);
```

Fields

Table 35–2 COMPARISON_TYPE Attributes

Field	Description
`scan_id`	The scan ID of the scan
`loc_rows_merged`	The number of rows in the local database object updated with information from the database object at the remote site
`rmt_rows_merged`	The number of rows in the database object updated at the remote site with information from the database object at the local site
`loc_rows_deleted`	The number of rows deleted from the local database object
`rmt_rows_deleted`	The number of rows deleted from the remote database object

Summary of DBMS_COMPARISON Subprograms

Table 35–3 DBMS_COMPARISON Package Subprograms

Subprogram	Description
COMPARE Function on page 35-16	Performs the specified comparison
CONVERGE Procedure on page 35-18	Executes data manipulation language (DML) changes to synchronize the portion of the database object that was compared in the specified scan
CREATE_COMPARISON Procedure on page 35-20	Creates a comparison
DROP_COMPARISON Procedure on page 35-24	Drops a comparison
PURGE_COMPARISON Procedure on page 35-25	Purges the comparison results, or a subset of the comparison results, for a comparison
RECHECK Function on page 35-26	Rechecks the differences in a specified scan for a comparison

COMPARE Function

This function performs the specified comparison.

Each time a comparison is performed, it results in at least one new scan, and each scan has a unique scan ID. You can define and name a comparison using the CREATE_COMPARISON procedure.

See Also:

- "Overview" on page 35-3
- CREATE_COMPARISON Procedure on page 35-20

Syntax

```
DBMS_COMPARISON.COMPARE(
   comparison_name  IN   VARCHAR2,
   scan_info        OUT  COMPARISON_TYPE,
   min_value        IN   VARCHAR2   DEFAULT NULL,
   max_value        IN   VARCHAR2   DEFAULT NULL,
   perform_row_dif  IN   BOOLEAN    DEFAULT FALSE)
RETURN BOOLEAN;
```

Parameters

Table 35–4 COMPARE Function Parameters

Parameter	Description
comparison_name	The name of the comparison.
scan_info	Information about the compare operation returned in the COMPARISON_TYPE datatype. See COMPARISON_TYPE Record Type on page 35-14.
min_value	When the scan mode for the comparison is set to CMP_SCAN_MODE_CUSTOM, specify the minimum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the DBA_COMPARISON_COLUMNS data dictionary view. For a composite index, specify a value for the column with column_position equal to 1 in the DBA_COMPARISON_COLUMNS view. See "Index Column Requirements for the DBMS_COMPARISON Package" on page 35-10. If the scan mode is set to a value other than CMP_SCAN_MODE_CUSTOM, then this parameter must be set to NULL. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then an error is raised. To determine the scan mode for the comparison, query the DBA_COMPARISON data dictionary view. See Constants on page 35-6 for information about scan modes.

Table 35–4 (Cont.) COMPARE Function Parameters

Parameter	Description
max_value	When the scan mode for the comparison is set to CMP_SCAN_MODE_CUSTOM, specify the maximum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the DBA_COMPARISON_COLUMNS data dictionary view. For a composite index, specify a value for the column with column_position equal to 1 in the DBA_COMPARISON_COLUMNS view. See "Index Column Requirements for the DBMS_COMPARISON Package" on page 35-10. If the scan mode is set to a value other than CMP_SCAN_MODE_CUSTOM, then this parameter must be set to NULL. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then an error is raised. To determine the scan mode for the comparison, query the DBA_COMPARISON data dictionary view. See Constants on page 35-6 for information about scan modes.
perform_row_dif	If TRUE, then compares each row individually in the database object being compared after reaching the smallest possible bucket for the comparison. If FALSE, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket. See "Overview" on page 35-3 for information about buckets.

Return Values

This function returns TRUE when no differences are found in the database objects being compared. This function returns FALSE when differences are found in the database objects being compared.

CONVERGE Procedure

This procedure executes data manipulation language (DML) changes to synchronize the portion of the database objects that was compared in the specified scan.

Syntax

```
DBMS_COMPARISON.CONVERGE(
   comparison_name      IN   VARCHAR2,
   scan_id              IN   NUMBER,
   scan_info            OUT  COMPARISON_TYPE,
   converge_options     IN   VARCHAR2  DEFAULT CMP_CONVERGE_LOCAL_WINS,
   perform_commit       IN   BOOLEAN   DEFAULT TRUE,
   local_converge_tag   IN   RAW       DEFAULT NULL,
   remote_converge_tag  IN   RAW       DEFAULT NULL);
```

Parameters

Table 35–5 CONVERGE Procedure Parameters

Parameter	Description
comparison_name	The name of the comparison.
scan_id	The identifier for the scan that contains the differences between the database objects being converged. See "Overview" on page 35-3 for more information about specifying a scan ID in this parameter.
scan_info	Information about the converge operation returned in the COMPARISON_TYPE datatype. See COMPARISON_TYPE Record Type on page 35-14.
converge_options	Either the CMP_CONVERGE_LOCAL_WINS constant or the CMP_CONVERGE_REMOTE_WINS constant. See "Constants" on page 35-6 for information about these constants.
perform_commit	If TRUE, then performs a COMMIT periodically while making the DML changes. The CONVERGE procedure might perform more than one COMMIT when this parameter is set to TRUE. If FALSE, then does not perform a COMMIT after making DML changes.
local_converge_tag	The Oracle Streams tag to set in the session on the local database before performing any changes to converge the data in the database objects being converged. If non-NULL, then this parameter setting takes precedence over the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison. If NULL, then this parameter is ignored, and the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison is used. See "Security Model" on page 35-5 for information about security requirement related to this parameter, and see the *Oracle Streams Replication Administrator's Guide* for more information about tags.

Table 35–5 (Cont.) CONVERGE Procedure Parameters

Parameter	Description
remote_converge_tag	The Oracle Streams tag to set in the session on the remote database before performing any changes to converge the data in the database objects being converged. If non-NULL, then this parameter setting takes precedence over the remote_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison. If NULL, then this parameter is ignored, and the remote_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison is used. See "Security Model" on page 35-5 for information about security requirement related to this parameter, and see the *Oracle Streams Replication Administrator's Guide* for more information about tags.

Usage Notes

If one of the database objects being converged is a read-only materialized view, then the converge_options parameter must be set to ensure that the read-only materialized view "wins" in the converge operation. The CONVERGE procedure raises an error if it tries to make changes to a read-only materialized view.

CREATE_COMPARISON Procedure

This procedure creates a comparison.

Syntax

```
DBMS_COMPARISON.CREATE_COMPARISON(
   comparison_name      IN  VARCHAR2,
   schema_name          IN  VARCHAR2,
   object_name          IN  VARCHAR2,
   dblink_name          IN  VARCHAR2,
   index_schema_name    IN  VARCHAR2  DEFAULT NULL,
   index_name           IN  VARCHAR2  DEFAULT NULL,
   remote_schema_name   IN  VARCHAR2  DEFAULT NULL,
   remote_object_name   IN  VARCHAR2  DEFAULT NULL,
   comparison_mode      IN  VARCHAR2  DEFAULT CMP_COMPARE_MODE_OBJECT,
   column_list          IN  VARCHAR2  DEFAULT '*',
   scan_mode            IN  VARCHAR2  DEFAULT CMP_SCAN_MODE_FULL,
   scan_percent         IN  NUMBER    DEFAULT NULL,
   null_value           IN  VARCHAR2  DEFAULT CMP_NULL_VALUE_DEF,
   local_converge_tag   IN  RAW       DEFAULT NULL,
   remote_converge_tag  IN  RAW       DEFAULT NULL,
   max_num_buckets      IN  NUMBER    DEFAULT CMP_MAX_NUM_BUCKETS,
   min_rows_in_bucket   IN  NUMBER    DEFAULT CMP_MIN_ROWS_IN_BUCKET);
```

Parameters

Table 35–6 CREATE_COMPARISON Procedure Parameters

Parameter	Description
comparison_name	The name of the comparison.
schema_name	The name of the schema that contains the local database object to compare.
object_name	The name of the local database object to compare.
dblink_name	Database link to the remote database. The specified database object in the remote database is compared with the database object in the local database. If NULL, then the comparison is configured to compare two database objects in the local database. In this case, parameters that specify the remote database object apply to the second database object in the comparison and to operations on the second database object. For example, specify the second database object in this procedure by using the remote_schema_name and remote_object_name parameters.
index_schema_name	The name of the schema that contains the index. If NULL, then the schema specified in the schema_name parameter is used.
index_name	The name of the index. If NULL, then the system determines the index columns for the comparison automatically. If the index_schema_name parameter is non-NULL, then the index_name parameter must also be non-NULL. Otherwise, an error is raised. **See Also:** "Usage Notes" on page 35-22 for more information about specifying an index

Table 35–6 (Cont.) CREATE_COMPARISON Procedure Parameters

Parameter	Description
remote_schema_name	The name of the schema that contains the database object at the remote database. Specify a non-NULL value if the schema names are different at the two databases. If NULL, then the schema specified in the schema_name parameter is used.
remote_object_name	The name of the database object at the remote database. Specify a non-NULL value if the database object names are different at the two databases. If NULL, then the database object specified in the object_name parameter is used.
comparison_mode	Specify the default value CMP_COMPARE_MODE_OBJECT. Additional modes might be added in future releases.
column_list	Specify '*' to include all of the columns in the database objects being compared. To compare a subset of columns in the database objects, specify a comma-delimited list of the columns to check. Any columns that are not in the list are ignored during a comparison and convergence. See "Usage Notes" on page 35-22 for information about columns that are required in the column_list parameter.
scan_mode	Either CMP_SCAN_MODE_FULL, CMP_SCAN_MODE_RANDOM, CMP_SCAN_MODE_CYCLIC, or CMP_SCAN_MODE_CUSTOM. If you specify CMP_SCAN_MODE_CUSTOM, then make sure you specify an index using the index_schema_name and index_name parameters. Specifying an index ensures that you can specify the correct min_value and max_value for the lead index column when you run the COMPARE or RECHECK function. See "Constants" on page 35-6 for information about these constants.
scan_percent	The percentage of the database object to scan for comparison when the scan_mode parameter is set to either CMP_SCAN_MODE_RANDOM or CMP_SCAN_MODE_CYCLIC. For these scan_mode settings, a non-NULL value that is greater than 0 (zero) and less than 100 is required. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_FULL, then the entire database object is scanned for comparison. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then the portion of the database object scanned for comparison is specified when the COMPARE function is run. If non-NULL and the scan_mode parameter is set to either CMP_SCAN_MODE_FULL or CMP_SCAN_MODE_CUSTOM, then the scan_percent parameter is ignored. **Note:** When the scan_percent parameter is non-NULL, and the lead index column for the comparison does not distribute the rows in the database object evenly, the portion of the database object that is compared might be smaller or larger than the specified scan_percent value. See "Index Column Requirements for the DBMS_COMPARISON Package" on page 35-10 for more information about the lead index column.

Table 35–6 (Cont.) CREATE_COMPARISON Procedure Parameters

Parameter	Description
null_value	The value to substitute for each NULL in the database objects being compared. Specify a value or use the CMP_NULL_VALUE_DEF constant. If a column being compared can contain NULLs, then the value specified for this parameter must be different than any non-NULL value in the column. Otherwise, if the value specified for this parameter can appear in the column, some row differences might not be found. See "Constants" on page 35-6 for information about this constant.
local_converge_tag	The Oracle Streams tag to set in the session on the local database before performing any changes to converge the data in the database objects being compared. If the local_converge_tag parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See CONVERGE Procedure on page 35-18 for more information. See the *Oracle Streams Replication Administrator's Guide* for more information about tags.
remote_converge_tag	The Oracle Streams tag to set in the session on the remote database before performing any changes to converge the data in the database objects being compared. If the remote_converge_tag parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See CONVERGE Procedure on page 35-18 for more information. See the *Oracle Streams Replication Administrator's Guide* for more information about tags.
max_num_buckets	Specify the maximum number of buckets to use. Specify a value or use the CMP_MAX_NUM_BUCKETS constant. See "Constants" on page 35-6 for information about this constant. See "Overview" on page 35-3 for information about buckets. **Note:** If an index column for a comparison is a VARCHAR2 or CHAR column, then the number of buckets might exceed the value specified for the max_num_buckets parameter.
min_rows_in_bucket	Specify the minimum number of rows in each bucket. Specify a value or use the CMP_MIN_ROWS_IN_BUCKET constant. See "Constants" on page 35-6 for information about this constant. See "Overview" on page 35-3 for information about buckets.

Usage Notes

This section contains usage notes for the CREATE_COMPARISON procedure.

Usage Notes for the index_schema_name and index_name Parameters

When you specify an index for a comparison with the index_schema_name and index_name parameters, the specified index determines the comparison's index columns and their ordering. The order of the columns in the index determines the index column ordering for the comparison. Therefore, the column in column position 1 in the index is the lead column for the comparison.

The index columns and their ordering affect the details of each SQL statement generated and executed for a comparison. For each SQL statement, the optimizer decides whether to use indexes. If the optimizer decides to use indexes, then the optimizer decides which particular indexes to use. An index specified in `column_list` parameter might or might not be used.

The columns in the specified index must meet the requirements described in "Index Column Requirements for the DBMS_COMPARISON Package" on page 35-10. If the index columns do not meet these requirements, then an error is raised.

> **Note:** If you do not specify an index when you create a comparison, then the `CREATE_COMPARISON` procedure selects either the primary key, if it exists, or an existing unique index. The procedure never selects a non-unique index. However, if you specify an index, then the `CREATE_COMPARISON` procedure does not check its uniqueness. Therefore, if you specify a non-unique index, and duplicate index keys exist, then the results might be incorrect when the `CONVERGE` procedure synchronizes data.

Usage Notes for the column_list Parameter

When the `column_list` parameter is set to a value other than `'*'`, the following columns are required in the `column_list` parameter:

- Any columns that are required to meet the index column requirements for the `DBMS_COMPARISON` package. If the `index_name` parameter is non-`NULL`, then the columns in the specified index must be in the column list. If the `index_name` parameter is `NULL`, then see "Index Column Requirements for the DBMS_COMPARISON Package" on page 35-10.
- If you plan to use the `CONVERGE` procedure to make changes to a database object based on the comparison, then any columns in this database object that have a `NOT NULL` constraint but no default value must be included in the column list. If these columns are not included, then the `CONVERGE` procedure returns an error. See CONVERGE Procedure on page 35-18.

DROP_COMPARISON Procedure

This procedure drops a comparison.

Syntax

```
DBMS_COMPARISON.DROP_COMPARISON(
   comparison_name  IN  VARCHAR2);
```

Parameters

Table 35–7 DROP_COMPARISON Procedure Parameters

Parameter	Description
comparison_name	The name of the comparison.

PURGE_COMPARISON Procedure

This procedure purges the comparison results, or a subset of the comparison results, for a comparison.

> **Note:** At least one of the following parameters must be set to `NULL`: `scan_id` or `purge_time`. If both the `scan_id` and `purge_time` parameters are `NULL`, then this procedure purges all comparison results for the comparison.

Syntax

```
DBMS_COMPARISON.PURGE_COMPARISON(
   comparison_name  IN  VARCHAR2,
   scan_id          IN  NUMBER     DEFAULT NULL,
   purge_time       IN  TIMESTAMP  DEFAULT NULL);
```

Parameters

Table 35–8 PURGE_COMPARISON Procedure Parameters

Parameter	Description
`comparison_name`	The name of the comparison.
`scan_id`	The scan ID of the scan for which results are purged. The scan ID must identify a root scan. If the scan ID does not identify a root scan, then an error is raised. When a root scan ID is specified, it is purged, and all direct and indirect child scans of the specified root scan are purged. If `NULL`, then no scan ID is considered when purging comparison results for the comparison. See "Overview" on page 35-3 for information about scans.
`purge_time`	The date before which results are purged. If `NULL`, then no date is considered when purging comparison results for the comparison.

RECHECK Function

This function rechecks the differences in a specified scan for a comparison.

This function performs one of the following actions:

- If the specified scan completed successfully the last time it ran, then this function checks the previously identified differences in the scan.
- If the specified scan completed partially, then this function continues to check the database object from the point where the previous scan ended.

Note: This function does not compare the shared database object for differences that were not recorded in the specified comparison scan. To check for those differences, run the `COMPARE` function.

See Also:

- *Oracle Streams Replication Administrator's Guide*
- COMPARE Function on page 35-16

Syntax

```
DBMS_COMPARISON.RECHECK(
   comparison_name  IN  VARCHAR2,
   scan_id          IN  NUMBER,
   perform_row_dif  IN  BOOLEAN  DEFAULT FALSE)
RETURN BOOLEAN;
```

Parameters

Table 35–9 RECHECK Function Parameters

Parameter	Description
`comparison_name`	The name of the comparison.
`scan_id`	The scan ID of the scan to recheck. See "Overview" on page 35-3 for more information about specifying a scan ID in this parameter.
`perform_row_dif`	If `TRUE`, then compares each row individually in the database objects being compared after reaching the smallest possible bucket for the comparison. If `FALSE`, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket. See "Overview" on page 35-3 for information about buckets.

Return Values

This function returns `TRUE` when no differences are found in the database objects being compared. This function returns `FALSE` when differences are found in the database objects being compared.

36

DBMS_COMPRESSION

The DBMS_COMPRESSION package provides an interface to facilitate choosing the correct compression level for an application.

- *Oracle Database SQL Language Reference*
- *Oracle Database Data Warehousing Guide*
- *Oracle Database VLDB and Partitioning Guide*
- *Oracle Database Reference*

This chapter contains the following topics:

Using DBMS_COMPRESSION

Overview

The DBMS_COMPRESSION package gathers compression-related information within a database environment. This includes tools for estimating compressibility of a table for both partitioned and non-partitioned tables, and gathering row-level compression information on previously compressed tables. This gives the user with adequate information to make compression-related decision.

Security Model

The DBMS_COMPRESSSION package is defined with AUTHID CURRENT USER, so it executes with the privileges of the current user.

Constants

The DBMS_COMPRESSION package uses the constants shown in Table 36–1, " DBMS_COMPRESSION Constants - Compression Types"e:

Table 36–1 DBMS_COMPRESSION Constants - Compression Types

Constant	Type	Value	Description
COMP_NOCOMPRESS	NUMBER	1	No compression
COMP_ADVANCED	NUMBER	2	Advanced compression level
COMP_QUERY_HIGH	NUMBER	4	High compression level for query operations
COMP_QUERY_LOW	NUMBER	8	Low compression level for query operations
COMP_ARCHIVE_HIGH	NUMBER	16	High compression level for archive operations
COMP_ARCHIVE_LOW	NUMBER	32	Low compression level for archive operations
COMP_BLOCK	NUMBER	64	Compressed row
COMP_LOB_HIGH	NUMBER	128	High compression level for LOB operations
COMP_LOB_MEDIUM	NUMBER	256	Medium compression level for LOB operations
COMP_LOB_LOW	NUMBER	512	Low compression level for LOB operations
COMP_INDEX_ADVANCED_HIGH	NUMBER	1024	High compression level for indexes
COMP_INDEX_ADVANCED_LOW	NUMBER	2048	Low compression level for indexes
COMP_RATIO_LOB_MINROWS	NUMBER	1000	Minimum required number of LOBs in the object for which LOB compression ratio is to be estimated
COMP_BASIC	NUMBER	4096	Basic compression level
COMP_RATIO_LOB_MAXROWS	NUMBER	5000	Maximum number of LOBs used to compute the LOB compression ratio
COMP_INMEMORY_NOCOMPRESS	NUMBER	8192	In-Memory with no compression
COMP_INMEMORY_DML	NUMBER	16384	In-Memory compression level for DML
COMP_INMEMORY_QUERY_LOW	NUMBER	32768	In-Memory compression level optimized for query performance
COMP_INMEMORY_QUERY_HIGH	NUMBER	65536	In-Memory compression level optimized on query performance as well as space saving
COMP_INMEMORY_CAPACITY_LOW	NUMBER	32768	In-Memory low compression level optimizing for capacity

Table 36–1 (Cont.) DBMS_COMPRESSION Constants - Compression Types

Constant	Type	Value	Description
COMP_INMEMORY_CAPACITY_HIGH	NUMBER	65536	In-Memory high compression level optimizing for capacity
COMP_RATIO_MINROWS	NUMBER	1000000	Minimum required number of rows in the object for which HCC ratio is to be estimated
COMP_RATIO_ALLROWS	NUMBER	-1	To indicate the use of all the rows in the object to estimate HCC ratio
OBJTYPE_TABLE	PLS_INTEGER	1	Identifies the object whose compression ratio is estimated as of type table
OBJTYPE_INDEX	PLS_INTEGER	2	Identifies the object whose compression ratio is estimated as of type index

Note: Hybrid columnar compression is a feature of certain Oracle storage systems. See *Oracle Database Concepts* for more information.

Data Structures

The DBMS_COMPRESSION package defines a RECORD type and a TABLE type.

RECORD TYPES

COMPREC Record Type

TABLE TYPES

COMPRECLIST Table Type

COMPREC Record Type

Record for calculating an individual index compression ratio on a table.

Syntax

```
TYPE COMPREC IS RECORD(
  ownname           varchar2(255),
  objname           varchar2(255),
  blkcnt_cmp        PLS_INTEGER,
  blkcnt_uncmp      PLS_INTEGER,
  row_cmp           PLS_INTEGER,
  row_uncmp         PLS_INTEGER,
  cmp_ratio         NUMBER,
  objtype           PLS_INTEGER);
```

Fields

Table 36–2 COMPREC Attributes

Field	Description
ownname	Schema of the object owner
objname	Name of the object
blkcnt_cmp	Number of blocks used by the compressed sample of the object
blkcnt_uncmp	Number of blocks used by the uncompressed sample of the object
row_cmp	Number of rows in a block in compressed sample of the object
row_uncmp	Number of rows in a block in uncompressed sample of the object
cmp_ratio	Compression ratio, blkcnt_uncmp divided by blkcnt_cmp
objtype	Type of the object

COMPRECLIST Table Type

A table type of COMPREC Record Type.

Syntax

```
TYPE compreclist IS TABLE OF comprec;
```

Summary of DBMS_COMPRESSION Subprograms

Table 36–3 DBMS_COMPRESSION Package Subprograms

Subprogram	Description
GET_COMPRESSION_RATIO Procedure on page 36-11	Analyzes the compression ratio of a table, and gives information about compressibility of a table
GET_COMPRESSION_TYPE Function on page 36-13	Returns the compression type for a specified row

GET_COMPRESSION_RATIO Procedure

This procedure analyzes the compression ratio of a table, and gives information about compressibility of a table. Various parameters can be provided by the user to selectively analyze different compression types.

Syntax

Get compression ratio for an object (table or index, default is table):

```
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
   scratchtbsname        IN     VARCHAR2,
   ownname               IN     VARCHAR2,
   objname               IN     VARCHAR2,
   subobjname            IN     VARCHAR2,
   comptype              IN     NUMBER,
   blkcnt_cmp            OUT    PLS_INTEGER,
   blkcnt_uncmp          OUT    PLS_INTEGER,
   row_cmp               OUT    PLS_INTEGER,
   row_uncmp             OUT    PLS_INTEGER,
   cmp_ratio             OUT    NUMBER,
   comptype_str          OUT    VARCHAR2,
   subset_numrows        IN     NUMBER  DEFAULT COMP_RATIO_MINROWS,
   objtype               IN     PLS_INTEGER DEFAULT OBJTYPE_TABLE);
```

Get compression ratio for LOBs:

```
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
   scratchtbsname        IN     VARCHAR2,
   tabowner              IN     VARCHAR2,
   tabname               IN     VARCHAR2,
   lobname               IN     VARCHAR2,
   partname              IN     VARCHAR2,
   comptype              IN     NUMBER,
   blkcnt_cmp            OUT    PLS_INTEGER,
   blkcnt_uncmp          OUT    PLS_INTEGER,
   lobcnt                OUT    PLS_INTEGER,
   cmp_ratio             OUT    NUMBER,
   comptype_str          OUT    VARCHAR2,
   subset_numrows        IN     number DEFAULT COMP_RATIO_LOB_MAXROWS);
```

Get compression ratio for all indexes on a table. The compression ratios are returned as a collection.

```
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
  scratchtbsname        IN     VARCHAR2,
  ownname               IN     VARCHAR2,
  tabname               IN     VARCHAR2,
  comptype              IN     NUMBER,
  index_cr              OUT    compRecList,
  comptype_str          OUT    VARCHAR2,
  subset_numrows        IN     NUMBER DEFAULT COMP_RATIO_INDEX_MINROWS);
```

Parameters

Table 36–4 GET_COMPRESSION_RATIO Procedure Parameters

Parameter	Description
scratchtbsname	Temporary scratch tablespace that can be used for analysis

Table 36–4 (Cont.) GET_COMPRESSION_RATIO Procedure Parameters

Parameter	Description
ownname / tabowner	Schema of the table to analyze
tabname	Name of the table to analyze
objname	Name of the object
subobjname	Name of the partition or sub-partition of the object
comptype	Compression types for which analysis should be performed
blkcnt_cmp	Number of blocks used by compressed sample of the table
blkcnt_uncmp	Number of blocks used by uncompressed sample of the table
row_cmp	Number of rows in a block in compressed sample of the table
row_uncmp	Number of rows in a block in uncompressed sample of the table
cmp_ratio	Compression ratio, blkcnt_uncmp divided by blkcnt_cmp
comptype_str	String describing the compression type
subset_numrows	Number of rows sampled to estimate compression ratio.
objtype	Type of the object. Should be a constant to indicate object types defined in this package.
lobname	Name of the LOB column
partname	In case of partitioned tables, the related partition name
lobcnt	Number of lobs actually sampled to estimate compression ratio
index_cr	List of indexes and their estimated compression ratios

Usage Notes

The procedure creates different tables in the scratch tablespace and runs analysis on these objects. It does not modify anything in the user-specified tables.

GET_COMPRESSION_TYPE Function

This function returns the compression type for a specified row. If the row is chained, the function returns the compression type of the head piece only, and does not examine the intermediate or the tail piece since head pieces can be differently compressed.

Syntax

```
DBMS_COMPRESSION.GET_COMPRESSION_TYPE (
   ownname      IN    VARCHAR2,
   tabname      IN    VARCHAR2,
   row_id       IN    ROWID,
   subobjname   IN    VARCHAR2 DEFAULT NULL))
  RETURN NUMBER;
```

Parameters

Table 36–5 GET_COMPRESSION_TYPE Function Parameters

Parameter	Description
ownname	Schema name of the table
tabname	Name of table
rowid	Rowid of the row
subobjname	Name of the table partition or subpartition

Return Values

Flag to indicate the compression type (see DBMS_COMPRESSION Constants - Compression Types).

37

DBMS_CONNECTION_POOL

The `DBMS_CONNECTION_POOL` package provides an interface to manage Database Resident Connection Pool.

> **See Also:** *Oracle Database Concepts* for more information on "Database Resident Connection Pooling"

This chapter contains the following topic:

- Summary of DBMS_CONNECTION_POOL Subprograms

Summary of DBMS_CONNECTION_POOL Subprograms

Table 37–1 DBMS_CONNECTION_POOL Package Subprograms

Subprogram	Description
ALTER_PARAM Procedure on page 37-3	Alters a specific configuration parameter as a standalone unit and does not affect other parameters
CONFIGURE_POOL Procedure on page 37-4	Configures the pool with advanced options
START_POOL Procedure on page 37-6	Starts the pool for operations. It is only after this call that the pool could be used by connection clients for creating sessions
STOP_POOL Procedure on page 37-7	Stops the pool and makes it unavailable for the registered connection clients
RESTORE_DEFAULTS Procedure on page 37-8	Restores the pool to default settings

ALTER_PARAM Procedure

This procedure alters a specific configuration parameter as a standalone unit and does not affect other parameters.

Syntax

```
DBMS_CONNECTION_POOL.ALTER_PARAM (
   pool_name     IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',   param_name
IN  VARCHAR2,   param_value   IN  VARCHAR2);
```

Parameters

Table 37–2 ALTER_PARAM Procedure Parameters

Parameter	Description
pool_name	Pool to be configured. Currently only the default pool name is supported.
param_name	Any parameter name from CONFIGURE_POOL
param_value	Parameter value for param_name.

Exceptions

Table 37–3 ALTER_PARAM Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56504	Invalid connection pool configuration parameter name
ORA-56505	Invalid connection pool configuration parameter value
ORA-56507	Connection pool alter configuration failed

Examples

```
DBMS_CONNECTION_POOL.ALTER_PARAM(
   'SYS_DEFAULT_CONNECTION_POOL', 'MAX_LIFETIME_SESSION', '120');
```

CONFIGURE_POOL Procedure

This procedure configures the pool with advanced options.

Syntax

```
DBMS_CONNECTION_POOL.CONFIGURE_POOL (
   pool_name                IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
   minsize                  IN NUMBER   DEFAULT 4,
   maxsize                  IN NUMBER   DEFAULT 40,
   incrsize                 IN NUMBER   DEFAULT 2,
   session_cached_cursors   IN NUMBER   DEFAULT 20,
   inactivity_timeout       IN NUMBER   DEFAULT 300,
   max_think_time           IN NUMBER   DEFAULT 120,
   max_use_session          IN NUMBER   DEFAULT 500000,
   max_lifetime_session     IN NUMBER   DEFAULT 86400,
   num_cbrok                IN NUMBER   DEFAULT 1,
   maxconn_cbrok            IN NUMBER   DEFAULT 40000);
```

Parameters

Table 37–4 CONFIGURE_POOL Procedure Parameters

Parameter	Description
pool_name	Pool to be configured. Currently only the default pool name is supported.
minsize	Minimum number of pooled servers in the pool
maxsize	Maximum allowed pooled servers in the pool
incrsize	Pool would increment by this number of pooled server when pooled server are unavailable at application request time
session_cached_cursors	Turn on SESSION_CACHED_CURSORS for all connections in the pool. This is an existing init.ora parameter
inactivity_timeout	TTL (Time to live) for an idle session in the pool. This parameter helps to shrink the pool when it is not used to its maximum capacity. If a connection remains in the pool idle for this time, it is killed.
max_think_time	Maximum time of inactivity by the client after getting a session from the pool. If the client does not issue a database call after grabbing a server from the pool, the client will be forced to relinquish control of the pooled server and will get an ORA-xxxxx error. The freed up server may or may not be returned to the pool.
max_use_session	Maximum number of times a connection can be taken and released to the pool
max_lifetime_session	TTL (Time to live) for a pooled session
num_cbrok	Number of brokers to be started at pool start
maxconn_brok	Maximum number of connections for each broker

Exceptions

Table 37–5 CONFIGURE_POOL Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56507	Connection pool alter configuration failed

Usage Notes

- All expressions of time are in seconds
- All of the parameters should be set based on statistical request patterns.
- minsize should be set keeping in mind that it puts a lower bound on server resource consumption. This is to prevent the timeout from dragging the pool too low, because of a brief period of inactivity.
- maxsize should be set keeping in mind that it puts an upper bound on concurrency and response-times and also server resource consumption.
- session_cached_cursors is typically set to the number of most frequently used statements. It occupies cursor resource on the server
- In doubt, do not set the increment and inactivity_timeout. The pool will have reasonable defaults.
- max_use_session and max_lifetime_session allow for software rejuvenation or defensive approaches to potential bugs, leaks, accumulations, and like problems, by getting brand new sessions once in a while.
- The connection pool reserves 5% of the pooled servers for authentication, and at least one pooled server is always reserved for authentication. When setting the maxsize parameter, ensure that there are enough pooled servers for both authentication and connections.

START_POOL Procedure

This procedure starts the pool for operations. It is only after this call that the pool could be used by connection classes for creating sessions.

Syntax

```
DBMS_CONNECTION_POOL.START_POOL (
   pool_name  IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 37–6 START_POOL Procedure Parameters

Parameter	Description
pool_name	Pool to be started. Currently only the default pool name is supported.

Exceptions

Table 37–7 START_POOL Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56501	Connection pool startup failed

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.

STOP_POOL Procedure

This procedure stops the pool and makes it unavailable for the registered connection classes.

Syntax

```
DBMS_CONNECTION_POOL.STOP_POOL (
   pool_name   IN   VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 37–8 STOP_POOL Procedure Parameters

Parameter	Description
pool_name	Pool to be stopped. Currently only the default pool name is supported.

Exceptions

Table 37–9 STOP_POOL Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56506	Connection pool shutdown failed

Usage Notes

This stops the pool and takes it offline. This does not destroy the persistent data (such as, the pool name and configuration parameters) associated with the pool.

RESTORE_DEFAULTS Procedure

This procedure restores the pool to default settings.

Syntax

```
DBMS_CONNECTION_POOL.RESTORE_DEFAULTS (
   pool_name   IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 37–10 RESTORE_DEFAULTS Procedure Parameters

Parameter	Description
pool_name	Pool to be restored. Currently only the default pool name is supported.

Exceptions

Table 37–11 RESTORE_DEFAULTS Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56507	Connection pool alter configuration failed

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.

38

DBMS_CQ_NOTIFICATION

The DBMS_CQ_NOTIFICATION package is part of the database change notification feature that provides the functionality to create registration on queries designated by a client application and so to receive notifications in response to DML or DDL changes on the objects associated with the queries. The notifications are published by the database when the DML or DDL transaction commits.

> **See Also:** *Oracle Database Development Guide* regarding implementing database change notification.

This chapter contains the following topics:

Using DBMS_CQ_NOTIFICATION

Overview

The DBMS_CQ_NOTIFICATION package provides PL/SQL based registration interfaces. A client can use this interface to create registrations on queries based on objects of interest and specify a PL/SQL callback handler to receive notifications. In case of object level registration, when a transaction changes any of the objects associated with the registered queries and |COMMIT|s, the PL/SQL callback, specified during registration for those objects, is invoked. The application can define client-specific processing inside the implementation of its PL/SQL callback handler.

The interface lets you define a registration block (using a mechanism similar to a BEGIN-END block). The recipient of notifications namely the name of the PL/SQL callback handler and a few other registration properties like time-outs can be specified during the BEGIN phase. Any queries executed subsequently (inside the registration block) are considered "interesting queries" and objects referenced by those queries during query execution are registered. The registration is completed by ENDing the registration block.The registration block lets you create new registrations or add objects to existing registrations.

When a registration is created through the PL/SQL interface, a unique registration ID is assigned to the registration by the RDBMS. The client application can use the registration ID to keep track of registrations created by it. When a notification is published by the RDBMS, the registration ID will be part of the notification.

Typical Applications

This functionality is useful for example to applications that cache query result sets on mostly read-only objects in the mid-tier to avoid network round trips to the database. Such an application can create a registration on the queries it is interested in caching. On changes to objects referenced inside those queries, the database publishes a notification when the underlying transaction commits. In response to the notification, the mid-tier application can refresh its cache by re-executing the query/queries.

Security Model

The DBMS_CQ_NOTIFICATION package requires that the user have the CHANGE NOTIFICATION system privilege in order to receive notifications, and be granted EXECUTE privilege on the DBMS_CQ_NOTIFICATION package.

In addition the user is required to have SELECT or READ privileges on all objects to be registered. Note that if the SELECT or READ privilege on an object was granted at the time of registration creation but lost subsequently (due to a revoke), then the registration will be purged and a notification to that effect will be published.

Constants

The DBMS_CQ_NOTIFICATION package uses the constants shown in Table 38–1. The constants are used as flag parameters either during registration or when received during the notification.

The DBMS_CQ_NOTIFICATION package has sets of constants:

- EVENT_STARTUP, EVENT_SHUTDOWN, EVENT_SHUTDOWN_ANY, EVENT_DEREG describe the type of the notification published by the database.
- INSERTOP, DELETEOP, UPDATEOP, ALTEROP, DROPOP and UNKNOWNOP describe the type of operation on a table (during a notification published by the database).
- QOS_RELIABLE, QOS_DEREG_NFY, QOS_ROWIDs describe registration Quality of Service properties that the client requires. These are specified during registration.

Table 38–1 DBMS_CQ_NOTIFICATION Constants

Name	Type	Value	Description
ALL_OPERATIONS	BINARY_INTEGER	0	Interested in being notified on all operations, specified as a parameter during registration
ALL_ROWS	BINARY_INTEGER	1	All rows within the table may have been potentially modified
EVENT_STARTUP	BINARY_INTEGER	1	Instance startup notification
EVENT_SHUTDOWN	BINARY_INTEGER	2	Instance shutdown notification
EVENT_SHUTDOWN_ANY	BINARY_INTEGER	3	Any instance shutdown when running Oracle Real Application Clusters (Oracle RAC)
EVENT_DEREG	BINARY_INTEGER	5	Registration has been removed
EVENT_OBJCHANGE	BINARY_INTEGER	6	Notification for object change
EVENT_QUERYCHANGE	BINARY_INTEGER	7	Notification for query result set change
INSERTOP	BINARY_INTEGER	2	Insert operation
UPDATEOP	BINARY_INTEGER	4	Update operation
DELETEOP	BINARY_INTEGER	8	Delete operation
ALTEROP	BINARY_INTEGER	16	Table altered
DROPOP	BINARY_INTEGER	32	Table dropped
UNKNOWNOP	BINARY_INTEGER	64	Unknown operation
QOS_RELIABLE	BINARY_INTEGER	1	Reliable or persistent notification. Also implies that the notifications will be inserted into the persistent storage atomically with the committing transaction that results in an object change.
QOS_DEREG_NFY	BINARY_INTEGER	2	Purge registration on first notification
QOS_ROWIDS	BINARY_INTEGER	4	Require rowids of modified rows
QOS_QUERY	BINARY_INTEGER	8	Register at query granularity
QOS_BEST_EFFORT	BINARY_INTEGER	16	Best effort evaluation

Table 38–1 (Cont.) DBMS_CQ_NOTIFICATION Constants

Name	Type	Value	Description
NTFN_GROUPING_CLASS_TIME	BINARY_INTEGER	1	Group notifications by time
NTFN_GROUPING_TYPE_SUMMARY	BINARY_INTEGER	1	Summary grouping of notifications
NTFN_GROUPING_TYPE_LAST	BINARY_INTEGER	2	Last notification in the group
NTFN_GROUPING_FOREVER	BINARY_INTEGER	-1	Repeat notifications forever

Operational Notes

With regard to object level registration:

- The notifications are published by the database when a transaction changes the registered objects and COMMITs.
- All objects referenced in the queries executed inside the registration block starting from the previous NEW_REG_START or ENABLE_REG to REG_END are considered interesting objects and added to the registration.

With regard to query result change registration:

- The notifications are published by the database when a transaction changes the result set of the registered query and COMMITs.

Troubleshooting

If you have created a registration and seem to not receive notifications when the underlying tables are changed, please check the following.

- Is the job_queue_processes parameter set to a nonzero value? This parameter needs to be configured to a nonzero value in order to receive PL/SQL notifications through the handler.
- Are the registrations being created as a non-SYS user?
- If you are attempting DML changes on the registered object, are you COMMITing the transaction? Please note that the notifications are transactional and will be generated when the transaction COMMITs.
- It maybe possible that there are run-time errors during the execution of the PL/SQL callback due to implementation errors. If so, they would be logged to the trace file of the JOBQ process that attempts to execute the procedure. The trace file would be usually named <ORACLE_SID>_j*_<PID>.trc. '

  For example, if the ORACLE_SID is 'dbs1' and the process is 12483, the trace file might be named 'dbs1_j000_12483.trc.

  Suppose a registration is created with 'chnf_callback as the notification handler and with registration_id 100. Let us suppose the user forgets to define the chnf_callback procedure. Then the JOBQ trace file might contain a message of the following form.

```
Runtime error during execution of PL/SQL cbk chnf_callback for reg CHNF100
   Error in PLSQL notification of msgid:
   Queue :
   Consumer Name :
   PLSQL function :chnf_callback
   Exception Occured, Error msg:
   ORA-00604: error occurred at recursive SQL level 2
   ORA-06550: line 1, column 7:
   PLS-00201: identifier 'CHNF_CALLBACK' must be declared
   ORA-06550: line 1, column 7:
   PL/SQL: Statement ignored
```

See Also: For more information about troubleshooting Database Change Notification, see *Oracle Database Development Guide*.

Examples

Object Change Registration Example

Suppose that a mid-tier application has a lot of queries on the HR.EMPLOYEES table. If the EMPLOYEES table is infrequently updated, it can obtain better performance by caching rows from the table because that would avoid a round-trip to the backend database server and server side execution latency. Let us assume that the application has implemented a mid-tier HTTP listener that listens for notifications and updates the mid-tier cache in response to a notification.

The DBMS_CQ_NOTIFICATION package can be utilized in this scenario to send notifications about changes to the table by means of the following steps:

1. Implement a mid-tier listener component of the cache management system (for example, using HTTP) that listens to notification messages sent from the database and refreshes the mid-tier cache in response to the notification.
2. Create a server side stored procedure to process notifications

```
CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;

Rem Enable job queue processes to receive notifications.
ALTER SYSTEM SET "job_queue_processes"=2;

CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid number, event_type number);

Rem create a table to record changes to registered tables
CREATE TABLE nftablechanges(regid number, table_name varchar2(100),
                            table_operation number);

Rem create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(regid number, table_name varchar2(100),
                          row_id varchar2(30));

Rem Create a PL/SQL callback handler to process notifications.
CREATE OR REPLACE PROCEDURE chnf_callback(ntfnds IN SYS.CHNF$_DESC) IS
   regid           NUMBER;
   tbname          VARCHAR2(60);
   event_type      NUMBER;
   numtables       NUMBER;
   operation_type  NUMBER;
   numrows         NUMBER;
   row_id          VARCHAR2(20);
 BEGIN
     regid      := ntfnds.registration_id;
     numtables  := ntfnds.numtables;
     event_type := ntfnds.event_type;

  INSERT INTO nfevents VALUES(regid, event_type);
  IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_OBJCHANGE) THEN
    FOR i IN 1..numtables LOOP
      tbname          := ntfnds.table_desc_array(i).table_name;
      operation_type  := ntfnds.table_desc_array(I). Opflags;
      INSERT INTO nftablechanges VALUES(regid, tbname, operation_type);
```

```
      /* Send the table name and operation_type to client side listener using
UTL_HTTP */
      /* If interested in the rowids, obtain them as follows */
      IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0) THEN
        numrows := ntfnds.table_desc_array(i).numrows;
      ELSE
        numrows :=0;   /* ROWID INFO NOT AVAILABLE */
      END IF;

      /* The body of the loop is not executed when numrows is ZERO */
      FOR j IN 1..numrows LOOP
          Row_id := ntfnds.table_desc_array(i).row_desc_array(j).row_id;
          INSERT INTO nfrowchanges VALUES(regid, tbname, Row_id);
        /* optionally Send out row_ids to client side listener using UTL_HTTP;
*/
      END LOOP;

    END LOOP;
  END IF;
  COMMIT;
END;
/
```

In Step 2 we can send as much information about the invalidation as the mid-tier application needs based on the information obtained from the notification descriptor.

Notes

a. In the above example, a registration was created on the `EMPLOYEES` table with '`chnf_callback`' as the PL/SQL handler for notifications. During registration, the client specified reliable notifications (`QOS_RELIABLE`) and rowid notifications (`QOS_ROWIDS`)

b. The handler accesses the table descriptor array from the notification descriptor only if the notification type is of `EVENT_OBJCHANGE`. In all other cases (e.g `EVENT_DEREG`, `EVENT_SHUTDOWN`), the table descriptor array should not be accessed.

c. The handler accesses the row descriptor array from the table notification descriptor only if the `ALL_ROWS` bit is not set in the table operation flag. If the `ALL_ROWS` bit is set in the table operation flag, then it means that all rows within the table may have been potentially modified. In addition to operations like `TRUNCATE` that affect all rows in the tables, this bit may also be set if individual rowids have been rolled up into a FULL table invalidation.

This can occur if too many rows were modified on a given table in a single transaction (more than 80) or the total shared memory consumption due to rowids on the RDBMS is determined too large (exceeds 1% of the dynamic shared pool size). In this case, the recipient must conservatively assume that the entire table has been invalidated and the callback/application must be able to handle this condition.

Also note that the implementation of the user defined callback is up to the developer. In the above example, the callback was used to record event details into database tables. The application can additionally send the notification details to a mid-tier `HTTP` listener of its cache management system (as in the example) using `UTL_HTTP`. The listener could then refresh its cache by querying from the back-end database.

3. Create a registrations on the tables that we wish to be notified about. We pass in the previously defined procedure name (`chnf_callback`) as the name of the server side PL/SQL procedure to be executed when a notification is generated.

```
Rem Create a REGISTRATION on the EMPLOYEES TABLE
DECLARE
  REGDS      SYS.CHNF$_REG_INFO;
  regid      NUMBER;
  mgr_id     NUMBER;
  dept_id    NUMBER;
  qosflags   NUMBER;
BEGIN
 qosflags := DBMS_CQ_NOTIFICATION.QOS_RELIABLE +
         DBMS_CQ_NOTIFICATION.QOS_ROWIDS;
REGDS := SYS.CHNF$_REG_INFO ('chnf_callback', qosflags, 0,0,0);
regid := DBMS_CQ_NOTIFICATION.NEW_REG_START (REGDS);
SELECT manager_id INTO mgr_id FROM EMPLOYEES WHERE employee_id = 200;
DBMS_CQ_NOTIFICATION.REG_END;
END;
/
```

Once the registration is created in Step 3 above, the server side PL/SQL procedure defined in Step 2 is executed in response to any `COMMIT`ted changes to the `HR.EMPLOYEES` table. As an example, let us assume that the following update is performed on the employees table.

```
UPDATE employees SET salary=salary*1.05 WHERE employee_id=203;COMMIT;
```

Once the notification is processed, you will find rows which might look like the following in the `nfevents`, `nftablechanges` and `nfrowchanges` tables.

```
SQL> SELECT * FROM nfevents;

     REGID     EVENT_TYPE
---------------------------
     20045          6

SQL> SELECT * FROM nftablechanges;

  REGID      TABLE_NAME         TABLE_OPERATION
-----------------------------------------
  20045      HR.EMPLOYEES            4

SQL> select * from nfrowchanges;

    REGID      TABLE_NAME          ROW_ID
-----------------------------------------------------
    20045     HR.EMPLOYEES    AAAKB/AABAAAJ8zAAF
```

Query Result Change Registration Example

1. Creating a Callback

```
CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;
CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid NUMBER, event_type NUMBER);

Rem Create a table to record notification queries
```

```
CREATE TABLE nfqueries (qid NUMBER, qop NUMBER);

Rem Create a table to record changes to registered tables
CREATE TABLE nftablechanges(
       qid               NUMBER,
       table_name        VARCHAR2(100),
       table_operation   NUMBER);

Rem Create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(
       qid               NUMBER,
       table_name        VARCHAR2(100),
       row_id            VARCHAR2(2000));

CREATE OR REPLACE PROCEDURE chnf_callback
  (ntfnds IN CQ_NOTIFICATION$_DESCRIPTOR)
IS
  regid           NUMBER;
  tbname          VARCHAR2(60);
  event_type      NUMBER;
  numtables       NUMBER;
  operation_type  NUMBER;
  numrows         NUMBER;
  row_id          VARCHAR2(2000);
  numqueries      NUMBER;
  qid NUMBER;
  qop NUMBER;

BEGIN
  regid := ntfnds.registration_id;
  event_type := ntfnds.event_type;
  INSERT INTO nfevents VALUES(regid, event_type);
  numqueries :=0;
  IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_QUERYCHANGE) THEN
      numqueries := ntfnds.query_desc_array.count;
      FOR i in 1..numqueries LOOP
         qid := ntfnds.QUERY_DESC_ARRAY(i).queryid;
         qop := ntfnds.QUERY_DESC_ARRAY(i).queryop;
         INSERT INTO nfqueries VALUES(qid, qop);
         numtables := 0;
         numtables := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array.count;
         FOR j IN 1..numtables LOOP
           tbname := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array(j).table_name;
           operation_type := ntfnds.QUERY_DESC_ARRAY(i).table_desc_
array(j).Opflags;
           INSERT INTO nftablechanges VALUES(qid, tbname, operation_type);
           IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0)
           THEN
             numrows := ntfnds.query_desc_array(i).table_desc_array(j).numrows;
           ELSE
             numrows :=0;   /* ROWID INFO NOT AVAILABLE */
           END IF;

            /* The body of the loop is not executed when numrows is ZERO */
            FOR k IN 1..numrows LOOP
               Row_id := ntfnds.query_desc_array(i).table_desc_array(j).row_
desc_array(k).row_id;
               INSERT INTO nfrowchanges VALUES(qid, tbname, Row_id);
```

```
           END LOOP;  /* loop over rows */
         END LOOP;     /* loop over tables */
       END LOOP;        /* loop over queries */
  END IF;
  COMMIT;
END;
/
```

2. Creates a query registration

```
DECLARE
  reginfo    cq_notification$_reg_info;
  mgr_id     NUMBER;
  dept_id    NUMBER;
  v_cursor   SYS_REFCURSOR;
  regid      NUMBER;
  qosflags   NUMBER;

BEGIN
  /* Register two queries for result-set-change notifications: */

  /* 1. Construct registration information.
        'chnf_callback' is name of notification handler.
        QOS_QUERY specifies result-set-change notifications. */

   qosflags := DBMS_CQ_NOTIFICATION.QOS_QUERY +
               DBMS_CQ_NOTIFICATION.QOS_ROWIDS;

   reginfo := cq_notification$_reg_info('chnf_callback', qosflags,0, 0, 0);

  /* 2. Create registration */

        regid := DBMS_CQ_NOTIFICATION.NEW_REG_START(reginfo);

        OPEN v_cursor FOR
           SELECT DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID, manager_id
           FROM HR.employees
           WHERE employee_id = 7902;
        CLOSE v_cursor;

       OPEN v_cursor for
        SELECT DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID, department_id
        FROM HR.departments
        WHERE department_name = 'IT';
       CLOSE v_cursor;

  DBMS_CQ_NOTIFICATION.REG_END;
END;
/
```

3. After creating the query registrations, the output from `USER_CQ_NOTIFICATION_QUERIES` would appear as follows.

```
SQL> SELECT queryid, regid, to_char(querytext)
     FROM user_cq_notification_queries;

   QUERYID      REGID
---------- ----------
TO_CHAR(QUERYTEXT)
--------------------------------------------------------------------------------
```

```
-
        22         41
 SELECT HR.DEPARTMENTS.DEPARTMENT_ID  FROM HR.DEPARTMENTS  WHERE
HR.DEPARTMENTS.
DEPARTMENT_NAME  = 'IT'

        21         41
 SELECT HR.EMPLOYEES.MANAGER_ID  FROM HR.EMPLOYEES  WHERE
HR.EMPLOYEES.EMPLOYEE_
ID  = 7902

Now, let us perform an UPDATE that changes the result of the query with queryid
22
by renaming the department with name 'IT' to FINANCE.

SQL>  update departments set department_name = 'FINANCE' where department_name
= 'IT';

1 row updated.

SQL> commit;

Commit complete.

Now we can query the notifications that we recorded in the callback.

SQL> select * from nfevents;

     REGID EVENT_TYPE
---------- ----------
        61          7

Event type 7 corresponds to EVENT_QUERYCHANGE

SQL> select * from nfqueries;

       QID        QOP
---------- ----------
        42          7

Event type 7 corresponds to EVENT_QUERYCHANGE

SQL> select * from nftablechanges;
SQL> select * from nftablechanges;

     REGID
----------
TABLE_NAME
--------------------------------------------------------------------------------
-
TABLE_OPERATION
---------------
        42
HR.DEPARTMENTS
              4

TABLE_OPERATION 4 corresponds to UPDATEOP
```

```
SQL> select * from nfrowchanges;
     REGID
----------
TABLE_NAME
--------------------------------------------------------------------------------
-
ROW_ID
--------------------------------------------------------------------------------
-
        61
HR.DEPARTMENTS
AAANkdAABAAALinAAF
```

Data Structures

The DBMS_CQ_NOTIFICATION package defines the following OBJECT types.

OBJECT Types

- CQ_NOTIFICATION$_DESCRIPTOR Object Type
- CQ_NOTIFICATION$_QUERY Object Type
- CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_TABLE Object Type
- CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_ROW Object Type
- CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_REG_INFO Object Type

CQ_NOTIFICATION$_DESCRIPTOR Object Type

This is the top level change notification descriptor type. It is a synonym for the SYS.CHNF$_DESC type.

Syntax

```
TYPE SYS.CHNF$_DESC IS OBJECT(
   registration_id    NUMBER,
   transaction_id     RAW(8),
   dbname             VARCHAR2(30),
   event_type         NUMBER,
   numtables          NUMBER,
   table_desc_array   CQ_NOTIFICATION$_TABLE_ARRAY,
   query_desc_array   CQ_NOTIFICATION$_QUERY_ARRAY);
```

Attributes

Table 38–2 CQ_NOTIFICATION$_DESCRIPTOR Object Type

Attribute	Description
registration_id	Registration ID returned during registration
transaction_id	Transaction ID. transaction_id of the transaction that made the change. Will be NULL unless the event_type is EVENT_OBJCHANGE or EVENT_QUERYCHANGE.
dbname	Name of database
event_type	Database event associated with the notification. Can be one of EVENT_OBJCHANGE (change to a registered object), EVENT_STARTUP, or EVENT_QUERYCHANGE, EVENT_SHUTDOWN or EVENT_DEREG (registration has been removed due to a timeout or other reason)
numtables	Number of modified tables. Will be NULL unless the event_type is EVENT_OBJCHANGE.
table_desc_array	Array of table descriptors. Will be NULL unless the event_type is EVENT_OBJCHANGE.
query_desc_array	Array of queries changed. This will be NULL unless event_type is EVENT_QUERYCHANGE

CQ_NOTIFICATION$_QUERY Object Type

The object type describes the changes to a query result caused by an event such as a transaction commit. An array of CQ_NOTIFICATION$_QUERY descriptors is embedded inside the top level notification descriptor (CQ_NOTIFICATION$_DESCRIPTOR) for events of type EVENT_QUERYCHANGE. The array corresponds to the SET of queryids which were invalidated as a result of the event.

This is a synonym for the base type SYS.CHNF$_QDESC.

Syntax

```
TYPE SYS.CHNF$_QDESC IS OBJECT (
  queryid            NUMBER,
  queryop            NUMBER,
  table_desc_array   CQ_NOTIFICATION$_TABLE_ARRAY);
```

Attributes

Table 38–3 TYPE SYS.CQ_NOTIFICATION$_QUERY Object Type

Attribute	Description
queryid	QueryId of the changed query
queryop	Operation describing change to the query
table_desc_array	Array of table changes which contributed to the query Result Set change

CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type

This type corresponds to an array of `CQ_NOTIFICATION$_QUERY` objects. It is a synonym for the `SYS.CHNF$_QUERY_ARRAY` type.

Syntax

```
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_
TABLE;
```

CQ_NOTIFICATION$_TABLE Object Type

This descriptor type describes a change to a table and is embedded inside the top level change notification descriptor type for events of type EVENT_OBJCHANGE For query result set changes (event type will be set to EVENT_QUERYCHANGE), the array of table descriptors is embedded inside each query change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF$_TDESC.

Syntax

```
TYPE SYS.CHNF$_TDESC IS OBJECT (
  opflags            NUMBER,
  table_name         VARCHAR2(2*M_IDEN+1),
  numrows            NUMBER,
  row_desc_array     CQ_NOTIFICATION$_ROW_ARRAY)
```

Attributes

Table 38–4 TYPE SYS.CQ_NOTIFICATION$_TABLE Object Type

Attribute	Description
opflags	Table level operation flags. This is a flag field (bit-vector) that describes the operations that occurred on the table. It can be an OR of the following bit fields - INSERTOP, UPDATEOP, DELETEOP, DROPOP, ALTEROP, ALL_ROWS. If the ALL_ROWS (0x1) bit is set it means that either the entire table is modified (for example, DELETE * FROM t) or row level granularity of information is not requested or not available in the notification and the receiver has to conservatively assume that the entire table has been invalidated.
table_name	Name of modified table
numrows	Number of modified rows within the table. numrows will be NULL and hence should not be accessed if the ALL_ROWS bit is set in the table change descriptor.
row_desc_array	Array of row descriptors. This field will be NULL if the ALL_ROWS bit is set in opflags.

CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type

This type corresponds to an array of `CQ_NOTIFICATION$_TABLE` objects. It is a synonym for the `SYS.CHNF$_TDESC_ARRAY` type.

Syntax

```
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_
TABLE;
```

CQ_NOTIFICATION$_ROW Object Type

An array of CQ_NOTIFICATION$_ROW is embedded inside a CQ_NOTIFICATION$_TABLE (table change descriptor) if the QOS_ROWIDS option was chosen at the time of registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF$_RDESC.

Syntax

```
TYPE SYS.CHNF$_RDESC IS OBJECT (
  opflags            NUMBER,
  row_id             VARCAHR2 (2000));
```

Attributes

Table 38–5 TYPE SYS.CQ_NOTIFICATION$_ROW Object Type

Attribute	Description
opflags	Row level operation flags. The flag field (bit vector) describes the operations in the row (could be INSERTOP, UPDATEOP or DELETEOP).
row_id	The rowid of the modified row

CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type

This object type corresponds to an array of `CQ_NOTIFICATION$_ROW` objects and is embedded inside the `CQ_NOTIFICATION$_TABLE` if `QOS_ROWIDS` was specified during registration and the `ALL_ROWS` bit is not set in the `opflags` field of the table change descriptor.

This type is a synonym for the `SYS.CHNF$_RDESC_ARRAY` type.

Syntax

```
TYPE CQ_NOTIFICATION$_ROW_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_ROW;
```

CQ_NOTIFICATION$_REG_INFO Object Type

The object type describes the attributes associated with creating a new registration. It is a synonym for the type `previously named SYS.CHNF$_REG_INFO`.

Syntax

```
TYPE SYS.CHNF$_REG_INFO IS OBJECT (
  callback                        VARCHAR2(20),
  quosflags                       NUMBER,
  timeout                         NUMBER,
  operations_filter               NUMBER,
  transaction_lag                 NUMBER,
  ntfn_grouping_class             NUMBER,
  ntfn_grouping_value             NUMBER,
  ntfn_grouping_type              NUMBER,
  ntfn_grouping_start_time        TIMESTAMP WITH TIME ZONE,
  ntfn_grouping_repeat_count      NUMBER);
```

Attributes

Table 38–6 TYPE CQ_NOTIFICATION$_REG_INFO Object Type

Attribute	Description
`callback`	Name of the server side PL/SQL procedure to be executed on a notification. Prototype is `<call_backname>(ntfnds IN SYS.chnf$_desc)`
`qosflags`	Quality of service flags. Can be set to an `OR` of the following values: ■ `QOS_RELIABLE` (`0x1`): Notifications are reliable (persistent) and survive instance death. This means that on an instance death in an Oracle RAC cluster, surviving instances will be able to deliver any queued invalidations. Similarly, pending invalidations can be delivered on instance restart, in a single instance configuration. The disadvantage is that there is a CPU cost/ latency involved in inserting the invalidation message to a persistent store. If this parameter is false, then server side CPU and latency are minimized, because invalidations are buffered into an in memory queue but the client could lose invalidation messages on an instance shutdown. ■ `QOS_DEREG_NFY` (`0x2`): The registration will be expunged on the first notification ■ `QOS_ROWIDS` (`0x4`): The notification needs to include information about the rowids that were modified ■ `QOS_QUERY (0x8)`: specifies query result change notification as opposed to object change notification ■ `QOS_BEST_EFFORt (0x16)`: can register simplified versions of queries and minimizes evaluation with some false positives.

Table 38–6 (Cont.) TYPE CQ_NOTIFICATION$_REG_INFO Object Type

Attribute	Description
timeout	If set to a nonzero value, specifies the time in seconds after which the registration is automatically expunged by the database. If zero / NULL, the registration lives until explicitly deregistered. Note that the timeout option can be combined with the purge on notification (QOS_DEREG_NFY) option as well.
operations_filter	if nonzero, specifies a filter to be selectively notified on certain operations. These flags can be used to filter based on specific operation types: ■ 0: Notify on all operations (DBMS_CQ_NOTIFICATION.ALL_OPERATIONS) ■ 0x2: Notify on every INSERT (DBMS_CQ_NOTIFICATION.INSERTOP) ■ 0x4: Notify on every UPDATE (DBMS_CQ_NOTIFICATION.UPDATEOP) ■ 0x8: Notify on every DELETE (DBMS_CQ_NOTIFICATION.DELETEOP) A combination of operations can be specified by using a bitwise OR. Caution: This parameter will be honored for object level registrations but ignored for query result change registrations. To implement notification flow control in 11g, the applications can use the "GROUPING notification" option.
transaction_lag	Lag between consecutive notifications in units of transactions. Can be used to specify the number of transactions/database changes, by which the client is willing to lag behind the database. If 0, it means that the client needs to receive an invalidation message as soon as it is generated. **Caution**: This parameter will be honored for object level registrations but ignored for query result change notification registrations.
ntfn_grouping_class	When grouping notifications, the class based on which the group is derived. Currently, the only allowed value is DBMS_CQ_NOTIFICATION.NTFN_GROUPING_CLASS_TIME by which notifications are grouped by time.
ntfn_grouping_value	The grouping value. This describes the time interval that defines the group in seconds. For example, if this were set to 900, it would mean that notifications that were generated in each 15 minute interval would be grouped together.
ntfn_grouping_type	The type of grouping desired. It can be one of two allowed values ■ DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_SUMMARY - all notifications in the group are summarized into a single notification ■ DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_LAST - only the last notification in the group is published and the earlier ones discarded
ntfn_grouping_start_time	When to start generating notifications. If specified as NULL, it defaults to the current system generated time.

Table 38–6 (Cont.) TYPE CQ_NOTIFICATION$_REG_INFO Object Type

Attribute	Description
ntfn_grouping_repeat_count	How many times the notification should be repeated. Set this to DBMS_CQ_NOTIFICATION.NTFN_GROUPING_FOREVER to receive notifications for the life time of the registration. Set to a nonzero value if only a certain number of notifications are desired for the life time of the registration.

Usage Notes

- The type declaration incorporates three other alternative constructors. In the first case all other parameters default to their default values.

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback                      VARCHAR2(20),
  quosflags                     NUMBER,
  timeout                       NUMBER);
```

  The second option applies to the type constructor defined in a previous release, and which is retained for backward compatibility:

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback                      VARCHAR2(20),
  quosflags                     NUMBER,
  timeout                       NUMBER,
  operations_filter             NUMBER,
  transaction_lag               NUMBER);
```

  The third definition contains all the members of the type except transaction_lag which is being deprecated:

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback                      VARCHAR2(20),
  quosflags                     NUMBER,
  timeout                       NUMBER,
  operations_filter             NUMBER,
  ntfn_grouping_class           NUMBER,
  ntfn_grouping_value           NUMBER,
  ntfn_grouping_type            NUMBER,
  ntfn_grouping_start_time      TIMESTAMP WITH TIME ZONE,
  ntfn_grouping_repeat_count    NUMBER);
```

- In response to a database change, the server side PL/SQL procedure specified by "callback" is executed. The PL/SQL procedure name has to be specified in the format schema_name.procedure_name. The procedure must have the following signature:

```
PROCEDURE <procedure_name>(ntfnds IN SYS.chnf$_desc)
```

  CHNF$_DESC describes the change notification descriptor.

- The init.ora parameter job_queue_processes must be set to a nonzero value to receive PL/SQL notifications, because the specified procedure is executed inside a job queue process when a notification is generated.

Summary of DBMS_CQ_NOTIFICATION Subprograms

Table 38–7 DBMS_CQ_NOTIFICATION Package Subprograms

Subprogram	Description
CQ_NOTIFICATION_QUERYID Function on page 38-27	Returns the queryid of the most recent query that was attempted to be registered in a registration block
DEREGISTER Procedure on page 38-28	De-subscribes the client with the supplied registration identifier (ID)
ENABLE_REG Procedure on page 38-29	Begins a registration block using an existing registration identifier (ID)
NEW_REG_START Function on page 38-30	Begins a new registration block
REG_END Procedure on page 38-31	Ends the registration boundary
SET_ROWID_THRESHOLD Procedure on page 38-32	Configures the maximum number of rows of a table published in a change notification if the rows of the table are modified in a transaction

CQ_NOTIFICATION_QUERYID Function

This function returns the queryid of the most recent query that was attempted to be registered in a registration block.

Syntax

```
DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID
 RETURN NUMBER;
```

Return Values

Returns the queryid of the most recently registered query.

DEREGISTER Procedure

This procedure desubscribes the client with the specified registration identifier (ID).

Syntax

```
DBMS_CQ_NOTIFICATION.DEREGISTER (
  regid IN NUMBER);
```

Parameters

Table 38–8 DEREGISTER Procedure Parameters

Parameter	Description
regid	Client registration ID

Usage Notes

Only the user that created the registration (or the SYS user) will be able to desubscribe the registration.

ENABLE_REG Procedure

This procedure adds objects to an existing registration identifier (ID). It is similar to the interface for creating a new registration, except that it takes an existing `regid` to which to add objects.Subsequent execution of queries causes the objects referenced in the queries to be added to the specified `regid`, and the registration is completed on invoking the REG_END Procedure.

Syntax

```
DBMS_CQ_NOTIFICATION.ENABLE_REG (
  regid IN NUMBER);
```

Parameters

Table 38–9 ENABLE_REG Procedure Parameters

Parameter	Description
`regid`	Client registration ID

Usage Notes

Only the user that created the registration will be able to add further objects to the registration.

NEW_REG_START Function

This procedure begins a new registration block. Any objects referenced by queries executed within the registration block are considered interesting objects and added to the registration. The registration block ends upon calling the `REG_END` procedure.

Syntax

```
DBMS_CQ_NOTIFICATION.NEW_REG_START (
  regds IN sys.chnf$_reg_info)
 RETURN NUMBER;
```

Parameters

Table 38–10 NEW_REG_START Function Parameters

Parameter	Description
`sys.chnf$_reg_info`	Registration descriptor describing the notification handler and other properties of the registration

Return Values

The procedure returns a registration-id which is a unique integer assigned by the database to this registration. The registration-id will be echoed back in every notification received for this registration.

Usage Notes

- The only operations permitted inside a registration block are queries (the ones the user wishes to register). DML and DDL operations are not permitted.
- The registration block is a session property and implicitly terminates upon exiting the session. While the registration block is a session property, the registration itself is a persistent database entity. Once created, the registration survives until explicitly deregistered by the client application or timed-out or removed by the database for some other reason (such as loss of privileges).
- The user must have the `CHANGE NOTIFICATION` system privilege and `SELECT` or `READ` privileges on any objects to be registered.
- The `SYS` user will not be permitted to create new registrations.
- Nesting of registration block is not permitted.

REG_END Procedure

This procedure marks the end of the registration block. No newly executed queries are tracked.

Syntax

```
DBMS_CQ_NOTIFICATION.REG_END;
```

SET_ROWID_THRESHOLD Procedure

This procedure configures the maximum number of rows of a table published in a change notification if the rows of the table are modified in a transaction.

Syntax

```
DBMS_CQ_NOTIFICATION.SET_ROWID_THRESHOLD (
  tbname     IN  VARCHAR2,
  threshold  IN  NUMBER);
```

Parameters

Table 38–11 SET_ROWID_THRESHOLD Procedure Parameters

Parameter	Description
`tbname`	Table name qualified by the schema name in the form `schemaname.tablename`
`threshold`	Maximum number of modified rows of the table to be published in the change notification

Usage Notes

- The table needs to be registered for change notification either at object change granularity or at query result set granularity.
- The threshold set by means of this subprogram applies to that instance only and does not persist across instance startup/shutdown.

39

DBMS_CREDENTIAL

The DBMS_CREDENTIAL package provides an interface for authenticating and impersonating EXTPROC callout functions, as well as external jobs, remote jobs and file watchers from the SCHEDULER.

See Also:

- *Oracle Database Administrator's Guide* regarding Specifying Job Credentials
- *Oracle Database Security Guide* regarding Guidelines for Securing External Processes

This chapter contains the following topics:

Using DBMS_CREDENTIAL

Overview

Credentials are database objects that hold a username/password pair for authenticating and impersonating `EXTPROC` callout functions, as well as remote jobs, external jobs and file watchers from the `SCHEDULER`. They are created using the CREATE_CREDENTIAL Procedure. The procedure also allows you to specify the Windows domain for remote external jobs executed against a Windows server.

Security Model

Every Oracle credential has a unique credential name and we can associate a credential through its unique credential name with EXTPROC by means of a PL/SQL alias library.

In order to associate a credential with a PL/SQL alias library and external procedure, you must have the CREATE AND/OR REPLACE LIBRARY privilege or CREATE AND/OR REPLACE FUNCTION / PROCEDURE privilege and read permission of the DLL or shared object that the alias library to be associated with so that you can create and/or replace function or procedure to make use of the alias library.

Once authenticated, EXTPROC must act on behalf of the client based on client's identity defined in the supplied user credential. If not authenticated, EXTPROC must return an error message.

In order to create or alter a credential, you must have the CREATE CREDENTIAL privilege. If you are attempting to create or alter a credential in a schema other than your own, you must have the CREATE ANY CREDENTIAL privilege.

Operational Notes

As the existing CREATE OR REPLACE LIBRARY statement and CREATE OR REPLACE FUNCTION/PROCEDURE do not support a CREDENTIAL clause, this model requires syntax and semantic changes in CREATE OR REPLACE LIBRARY and CREATE OR REPLACE FUNCTION/PROCEDURE statement.

For example:

```
CREATE OR REPLACE LIBRARY test
  AS '$ORACLE_HOME/bin/test.so' CREDENTIAL ricky_cred;
CREATE OR REPLACE FUNCTION ftest1
  (x VARCHAR2, y BINARY_INTEGER)
RETURN BINARY_INTEGER
AS LANGUAGE C
LIBRARY test
NAME "negative"
PARAMETERS(x STRING, y INT);
```

The credential name defined in the CREDENTIAL clause is a name of a database object. Therefore, do not enclose the credential name with single or double quotes.

An example of a credential being used on an external job:

```
BEGIN
   DBMS_SCHEDULER.CREATE_JOB(
   job_name            => 'example_job',
   job_type            => 'EXECUTABLE',
   job_action          => '/bin/ls',
   credential_name     => 'ricky_cred');
END;
/
```

Summary of DBMS_CREDENTIAL Subprograms

Table 39–1 DBMS_CREDENTIAL Package Subprograms

Subprogram	Description
CREATE_CREDENTIAL Procedure on page 39-7	Creates a stored username/password pair in a database object called an Oracle credential
DISABLE_CREDENTIAL Procedure on page 39-9	Disables an Oracle credential
DROP_CREDENTIAL Procedure on page 39-10	Drops an Oracle credential
ENABLE_CREDENTIAL Procedure on page 39-11	Enables an Oracle credential
UPDATE_CREDENTIAL Procedure on page 39-12	Updates an existing Oracle credential

CREATE_CREDENTIAL Procedure

This procedure creates a stored username/password pair in a database object called an Oracle credential.

Syntax

```
DBMS_CREDENTIAL.CREATE_CREDENTIAL (
   credential_name   IN  VARCHAR2,
   username          IN  VARCHAR2,
   password          IN  VARCHAR2,
   database_role     IN  VARCHAR2 DEFAULT NULL
   windows_domain    IN  VARCHAR2 DEFAULT NULL,
   comments          IN  VARCHAR2 DEFAULT NULL,
   enabled           IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 39–2 CREATE_CREDENTIAL Procedure Parameters

Parameter	Description
credential_name	Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotes.
username	User name to login to the operating system or remote database to run a job if this credential is chosen. This cannot be set to NULL.
password	Password to login to the remote operating system to run a job if this credential is chosen. It is case sensitive.
database_role	Whether a database job using this credential should attempt to log in with administrative privileges. Values: SYSDBA, SYSDG, SYSADMIN or SYSBACKUP.
windows_domain	For a Windows remote executable target, this is the domain that the specified user belongs to. The domain will be converted to uppercase automatically.
comments	A text string that can be used to describe the credential to the user. The Scheduler does not use this field.
enabled	Determines whether the credential is enabled or not

Usage Notes

- Credentials reside in a particular schema and can be created by any user with the CREATE CREDENTIAL or CREATE ANY CREDENTIAL system privilege. To create a credential in a schema other than your own, you must have the CREATE CREDENTIAL or CREATE ANY CREDENTIAL privilege.
- The user name is case sensitive. It cannot contain double quotes or spaces.
- Attempting to create a credential with an existing credential name returns an error. To alter an existing credential, users must drop the existing credential first using the DROP_CREDENTIAL Procedure.
- Attempting to drop an existing credential, which is already referenced by alias libraries, returns an error. To drop an existing credential without any checking, users must set the force parameter of DROP_CREDENTIAL Procedure to TRUE.

- You may also alter a credential, by means of the UPDATE_CREDENTIAL Procedure.

Examples

Create a Basic Credential

```
CONN scott
Enter password: password

BEGIN
-- Basic credential.
   DBMS_CREDENTIAL.CREATE_CREDENTIAL(
      credential_name  =>  'TIM_HALL_CREDENTIAL',
      username         =>  'tim_hall',
      password         =>  'password');
END
```

Create a Windows Credential

```
CONN scott
Enter password: password

-- Credential including Windows domain
BEGIN
  DBMS_CREDENTIAL.CREATE_CREDENTIAL(
     credential_name   =>  'TIM_HALL_WIN_CREDENTIAL',
     username          =>  'tim_hall',
     password          =>  'password',
     windows_domain    =>  'localdomain');
END
```

Display Information about Credentials

Information about credentials is displayed using the `[DBA|ALL|USER] _CREDENTIALS` views.

```
COLUMN credential_name FORMAT A25
COLUMN username FORMAT A20
COLUMN windows_domain FORMAT A20
SELECT credential_name,
       username,
       windows_domain
FROM   user_credentials
ORDER BY credential_name;

CREDENTIAL_NAME           USERNAME             WINDOWS_DOMAIN
------------------------- -------------------- --------------------
TIM_HALL_CREDENTIAL       tim_hall
TIM_HALL_WIN_CREDENTIAL   tim_hall             LOCALDOMAIN
2 rows selected.

SQL>
```

DISABLE_CREDENTIAL Procedure

This procedure disables an Oracle credential.

Syntax

```
DBMS_CREDENTIAL.DISABLE_CREDENTIAL (
   credential_name   IN  VARCHAR2,
   force             IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 39–3 DISABLE_CREDENTIAL Procedure Parameters

Parameter	Description
credential_name	Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotes.
force	If FALSE, the credential is not disabled provided it has no dependency on any existing scheduler job or PL/SQL library. An error is returned if the dependency is observed.If TRUE, the credential is disabled whether or not there is any scheduler job or PL/SQL library referencing it.

Usage Notes

- Credentials reside in a particular schema and can be disabled by any user with the CREATE CREDENTIAL or CREATE ANY CREDENTIAL system privilege. To disable a credential in a schema other than your own, you must have the CREATE ANY CREDENTIAL privilege.
- A credential for an OS user can be viewed as an entry point into an operating system as a particular user. Allowing a credential to be disabled lets an administrator (or credential owner) to quickly, easily and reversibly disallow all logins from the database to the OS as a particular user of external jobs, database jobs, file transfers, external procedures, and file watching. To enable an existing disabled credential, you need to use the ENABLE_CREDENTIAL Procedure.
- A library can become invalid if the properties of the credential – windows domain, username, password, its enable/disable bit – are changed.

DROP_CREDENTIAL Procedure

This procedure drops an Oracle credential.

Syntax

```
DBMS_CREDENTIAL.DROP_CREDENTIAL (
   credential_name   IN  VARCHAR2,
   force             IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 39–4 DROP_CREDENTIAL Procedure Parameters

Parameter	Description
`credential_name`	Name of the credential. It can optionally be prefixed with a schema. This cannot be set to `NULL`.
`force`	If set to `FALSE`, the credential must not be referenced by any `EXTPROC` alias library or an error is raised. If set to `TRUE`, the credential is dropped whether or not there are extproc alias libraries referencing it. `EXTPROC` alias libraries that reference the dropped credential become invalid.

Usage Notes

Only the owner of a credential or a user with the `CREATE ANY CREDENTIAL` system privilege may drop the credential.

Examples

```
EXEC DBMS_CREDENTIAL.DROP_CREDENTIAL('TIM_HALL_CREDENTIAL', FALSE);
EXEC DBMS_CREDENTIAL.DROP_CREDENTIAL('TIM_HALL_WIN_CREDENTIAL', FALSE);
```

ENABLE_CREDENTIAL Procedure

This procedure enables an Oracle credential.

Syntax

```
DBMS_CREDENTIAL.ENABLE_CREDENTIAL (
   credential_name   IN  VARCHAR2);
```

Parameters

Table 39–5 ENABLE_CREDENTIAL Procedure Parameters

Parameter	Description
credential_name	Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotes.

Usage Notes

- Credentials reside in a particular schema and can be disabled by any user with the CREATE CREDENTIAL OR CREATE ANY CREDENTIAL system privilege. To disable a credential in a schema other than your own, you must have the CREATE CREDENTIAL OR CREATE ANY CREDENTIAL privilege.
- A credential for an OS user can be viewed as an entry point into an operating system as a particular user. Allowing a credential to be disabled would allow an administrator (or credential owner) to quickly, easily and reversibly disallow all logins from the database to the OS as a particular user (external jobs, file transfers, external procedures, file watching). To disable an existing credential, you need to use the DISABLE_CREDENTIAL Procedure.
- A library can become invalid if the properties of the credential – windows domain, username, password, its enable/disable bit – are changed.

UPDATE_CREDENTIAL Procedure

This procedure updates an existing Oracle credential.

Syntax

```
DBMS_CREDENTIAL.UPDATE_CREDENTIAL (
   credential_name   IN   VARCHAR2,
   attribute         IN   VARCHAR2,
   value             IN   VARCHAR2);
```

Parameters

Table 39–6 UPDATE_CREDENTIAL Procedure Parameters

Parameter	Description
credential_name	Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotation marks.
attribute	Name of attribute to update: USERNAME, PASSWORD, WINDOWS_DOMAIN, DATABASE_ROLE or COMMENTS
value	New value for the selected attribute

Usage Notes

- Credentials reside in a particular schema and can be created by any user with the CREATE CREDENTIAL or CREATE ANY CREDENTIAL system privilege. To create a credential in a schema other than your own, you must have the CREATE ANY CREDENTIAL privilege.
- The user name is case sensitive. It cannot contain double quotes or spaces.
- EXTPROC alias libraries that reference the updated credential will become invalid. A library becomes invalid if the properties of the credential – windows domain, username, password, its enable/disable bit – are changed.

Examples

Update a Basic Credential

```
CONN scott
Enter password: password

BEGIN
-- Basic credential.
   DBMS_CREDENTIAL.UPDATE_CREDENTIAL (
      credential_name  =>  'TIM_HALL_CREDENTIAL',
      attribute        =>  'password',
      value            =>  'password2');

   DBMS_CREDENTIAL.UPDATE_CREDENTIAL (
      credential_name  =>  'TIM_HALL_CREDENTIAL',
      attribute        =>  'username',
      value            => 'tim_hall');
END;
```

Update a Windows Credential

```
CONN scott
Enter password: password

-- Credential including Windows domain
BEGIN
  DBMS_CREDENTIAL.UPDATE_CREDENTIAL(
     credential_name   =>  'TIM_HALL_WIN_CREDENTIAL',
     username          =>  'tim_hall',
     password          =>  'password',
     windows_domain    =>  'localdomain');
END
```

Display Information about Credentials

Information about credentials is displayed using the [DBA|ALL|USER] _CREDENTIALS views.

```
COLUMN credential_name FORMAT A25
COLUMN username FORMAT A20
COLUMN windows_domain FORMAT A20
SELECT credential_name,
       username,
       windows_domain
FROM   all_credentials
ORDER BY credential_name;

CREDENTIAL_NAME           USERNAME             WINDOWS_DOMAIN
------------------------- -------------------- --------------------
TIM_HALL_CREDENTIAL       tim_hall
TIM_HALL_WIN_CREDENTIAL   tim_hall             LOCALDOMAIN
2 rows selected.

SQL>
```

DBMS_CRYPTO

DBMS_CRYPTO provides an interface to encrypt and decrypt stored data, and can be used in conjunction with PL/SQL programs running network communications. It provides support for several industry-standard encryption and hashing algorithms, including the Advanced Encryption Standard (AES) encryption algorithm. AES has been approved by the National Institute of Standards and Technology (NIST) to replace the Data Encryption Standard (DES).

> **See Also:** *Oracle Database Security Guide* for further information about using this package and about encrypting data in general.

This chapter contains the following topics:

Using the DBMS_CRYPTO Subprograms

Overview

DBMS_CRYPTO contains basic cryptographic functions and procedures. To use this package correctly and securely, a general level of security expertise is assumed.

The DBMS_CRYPTO package enables encryption and decryption for common Oracle datatypes, including RAW and large objects (LOBs), such as images and sound. Specifically, it supports BLOBs and CLOBs. In addition, it provides Globalization Support for encrypting data across different database character sets.

The following cryptographic algorithms are supported:

- Data Encryption Standard (DES), Triple DES (3DES, 2-key and 3-key)
- Advanced Encryption Standard (AES)
- MD5, MD4, SHA-1, and SHA-2 cryptographic hashes
- MD5, SHA-1, and SHA-2 Message Authentication Code (MAC)

Block cipher modifiers are also provided with DBMS_CRYPTO. You can choose from several padding options, including PKCS (Public Key Cryptographic Standard) #5, and from four block cipher chaining modes, including Cipher Block Chaining (CBC).

Table 40–1 summarizes the DBMS_CRYPTO package features.

Table 40–1 DBMS_CRYPTO Features

Package Feature	DBMS_CRYPTO
Cryptographic algorithms	DES, 3DES, AES, RC4, 3DES_2KEY
Padding forms	PKCS5, zeroes
Block cipher chaining modes	CBC, CFB, ECB, OFB
Cryptographic hash algorithms	MD5, SHA-1, SHA-2 (SHA-256, SHA-384, SHA-512), MD4
Keyed hash (MAC) algorithms	HMAC_MD5, HMAC_SH1, HMAC_SH256, HMAC_SH384, HMAC_SH512
Cryptographic pseudo-random number generator	RAW, NUMBER, BINARY_INTEGER
Database types	RAW, CLOB, BLOB

The DBMS_CRYPTO package replaces DBMS_OBFUSCATION_TOOLKIT, providing greater ease of use and support for a range of algorithms to accommodate new and existing systems. Specifically, 3DES_2KEY and MD4 are provided for backward compatibility. It is not recommended that you use these algorithms because they do not provide the same level of security as provided by 3DES, AES, MD5, SHA-1, or SHA-2.

Security Model

Oracle Database installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed.

Datatypes

Parameters for the DBMS_CRYPTO subprograms use these datatypes:

Table 40–2 DBMS_CRYPTO Datatypes

Type	Description
BLOB	A source or destination binary LOB
CLOB	A source or destination character LOB (excluding NCLOB)
PLS_INTEGER	Specifies a cryptographic algorithm type (used with BLOB, CLOB, and RAW datatypes)
RAW	A source or destination RAW buffer

Algorithms

The following cryptographic algorithms, modifiers, and cipher suites are predefined in this package.

Table 40–3 DBMS_CRYPTO Cryptographic Hash Functions

Name	Description
HASH_MD4	Produces a 128-bit hash, or message digest of the input message
HASH_MD5	Also produces a 128-bit hash, but is more complex than MD4
HASH_SH1	Secure Hash Algorithm (SHA-1). Produces a 160-bit hash.
HASH_SH256	SHA-2, produces a 256-bit hash.
HASH_SH384	SHA-2, produces a 384-bit hash.
HASH_SH512	SHA-2, produces a 512-bit hash.

Table 40–4 DBMS_CRYPTO MAC (Message Authentication Code) Functions

Name	Description
HMAC_MD5[1]	Same as MD5 hash function, except it requires a secret key to verify the hash value.
HMAC_SH1[1]	Same as SHA hash function, except it requires a secret key to verify the hash value.
HMAC_SH256	Same as SHA-2 256-bit hash function, except it requires a secret key to verify the hash value.
HMAC_SH384	Same as SHA-2 384-bit hash function, except it requires a secret key to verify the hash value.
HMAC_SH512	Same as SHA-2 512-bit hash function, except it requires a secret key to verify the hash value.

[1] Complies with IETF RFC 2104 standard

Table 40–5 DBMS_CRYPTO Encryption Algorithms

Name	Description
ENCRYPT_DES	Data Encryption Standard. Block cipher. Uses key length of 56 bits.
ENCRYPT_3DES_2KEY	Data Encryption Standard. Block cipher. Operates on a block 3 times with 2 keys. Effective key length of 112 bits.
ENCRYPT_3DES	Data Encryption Standard. Block cipher. Operates on a block 3 times.
ENCRYPT_AES128	Advanced Encryption Standard. Block cipher. Uses 128-bit key size.
ENCRYPT_AES192	Advanced Encryption Standard. Block cipher. Uses 192-bit key size.
ENCRYPT_AES256	Advanced Encryption Standard. Block cipher. Uses 256-bit key size.
ENCRYPT_RC4	Stream cipher. Uses a secret, randomly generated key unique to each session.

Table 40–6 DBMS_CRYPTO Block Cipher Suites

Name	Description
DES_CBC_PKCS5	ENCRYPT_DES[1] + CHAIN_CBC[2]+ PAD_PKCS5[3]
DES3_CBC_PKCS5	ENCRYPT_3DES[1] + CHAIN_CBC[2] + PAD_PKCS5[3]

[1] See Table 40–5, " DBMS_CRYPTO Encryption Algorithms"
[2] See Table 40–7, " DBMS_CRYPTO Block Cipher Chaining Modifiers"
[3] See Table 40–8, " DBMS_CRYPTO Block Cipher Padding Modifiers"

Table 40–7 DBMS_CRYPTO Block Cipher Chaining Modifiers

Name	Description
CHAIN_ECB	Electronic Codebook. Encrypts each plaintext block independently.
CHAIN_CBC	Cipher Block Chaining. Plaintext is XORed with the previous ciphertext block before it is encrypted.
CHAIN_CFB	Cipher-Feedback. Enables encrypting units of data smaller than the block size.
CHAIN_OFB	Output-Feedback. Enables running a block cipher as a synchronous stream cipher. Similar to CFB, except that *n* bits of the previous output block are moved into the right-most positions of the data queue waiting to be encrypted.

Table 40–8 DBMS_CRYPTO Block Cipher Padding Modifiers

Name	Description
PAD_PKCS5	Provides padding which complies with the PKCS #5: Password-Based Cryptography Standard
PAD_NONE	Provides option to specify no padding. Caller must ensure that blocksize is correct, else the package returns an error.
PAD_ZERO	Provides padding consisting of zeroes

Restrictions

The VARCHAR2 datatype is not directly supported by DBMS_CRYPTO. Before you can perform cryptographic operations on data of the type VARCHAR2, you must convert it to the uniform database character set AL32UTF8, and then convert it to the RAW datatype. After performing these conversions, you can then encrypt it with the DBMS_CRYPTO package.

> **See Also:** "Conversion Rules" on page 40-11 for information about converting datatypes.

Exceptions

Table 40–9 lists exceptions that have been defined for DBMS_CRYPTO.

Table 40–9 DBMS_CRYPTO Exceptions

Exception	Code	Description
CipherSuiteInvalid	28827	The specified cipher suite is not defined.
CipherSuiteNull	28829	No value has been specified for the cipher suite to be used.
KeyNull	28239	The encryption key has not been specified or contains a NULL value.
KeyBadSize	28234	DES keys: Specified key size is too short. DES keys must be at least 8 bytes (64 bits). AES keys: Specified key size is not supported. AES keys must be 128, 192, or 256 bits in length.
DoubleEncryption	28233	Source data was previously encrypted.

Operational Notes

When to Use Encrypt and Decrypt Procedures or Functions

This package includes both `ENCRYPT` and `DECRYPT` procedures and functions. The procedures are used to encrypt or decrypt `LOB` datatypes (overloaded for `CLOB` and `BLOB` datatypes). In contrast, the `ENCRYPT` and `DECRYPT` functions are used to encrypt and decrypt `RAW` datatypes. Data of type `VARCHAR2` must be converted to `RAW` before you can use `DBMS_CRYPTO` functions to encrypt it.

When to Use Hash or Message Authentication Code (MAC) Functions

This package includes two different types of one-way hash functions: the `HASH` function and the `MAC` function. Hash functions operate on an arbitrary-length input message, and return a fixed-length hash value. One-way hash functions work in one direction only. It is easy to compute a hash value from an input message, but it is extremely difficult to generate an input message that hashes to a particular value. Note that hash values should be at least 128 bits in length to be considered secure.

You can use hash values to verify whether data has been altered. For example, before storing data, the user runs `DBMS_CRYPTO.HASH` against the stored data to create a hash value. On returning the stored data, the user can again run the hash function against it, using the same algorithm. If the second hash value is identical to the first one, then the data has not been altered. Hash values are similar to "file fingerprints" and are used to ensure data integrity.

The `HASH` function included with `DBMS_CRYPTO`, is a one-way hash function that you can use to generate a hash value from either `RAW` or `LOB` data. The `MAC` function is also a one-way hash function, but with the addition of a secret key. It works the same way as the `DBMS_CRYPTO.HASH` function, except only someone with the key can verify the hash value.

MACs can be used to authenticate files between users. They can also be used by a single user to determine if her files have been altered, perhaps by a virus. A user could compute the MAC of his files and store that value in a table. If the user did not use a MAC function, then the virus could compute the new hash value after infection and replace the table entry. A virus cannot do that with a MAC because the virus does not know the key.

About Generating and Storing Encryption Keys

The `DBMS_CRYPTO` package can generate random material for encryption keys, but it does not provide a mechanism for maintaining them. Application developers must take care to ensure that the encryption keys used with this package are securely generated and stored. Also note that the encryption and decryption operations performed by `DBMS_CRYPTO` occur on the server, not on the client. Consequently, if the key is sent over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire.

Although DBMS_CRYPTO cannot generate keys on its own, it does provide tools you can use to aid in key generation. For example, you can use the RANDOMBYTES function to generate random material for keys.

When generating encryption keys for DES, it is important to remember that some numbers are considered weak and semiweak keys. Keys are considered weak or semiweak when the pattern of the algorithm combines with the pattern of the initial key value to produce ciphertext that is more susceptible to cryptanalysis. To avoid this, filter out the known weak DES keys. Lists of the known weak and semiweak DES keys are available on several public Internet sites.

See Also:

- *Oracle Database Advanced Security Guide* for information about configuring network encryption and SSL.
- "RANDOMBYTES Function" on page 40-20

Conversion Rules

- To convert VARCHAR2 to RAW, use the UTL_I18N.STRING_TO_RAW function to perform the following steps:

  1. Convert VARCHAR2 in the current database character set to VARCHAR2 in the AL32UTF8 database character.
  2. Convert VARCHAR2 in the AL32UTF8 database character set to RAW.

  Syntax example:

  ```
  UTL_I18N.STRING_TO_RAW (string, 'AL32UTF8');
  ```

- To convert RAW to VARCHAR2, use the UTL_I18N.RAW_TO_CHAR function to perform the following steps:

  1. Convert RAW to VARCHAR2 in the AL32UTF8 database character set.
  2. Convert VARCHAR2 in the AL32UTF8 database character set to VARCHAR2 in the database character set you wish to use.

  Syntax example:

  ```
  UTL_I18N.RAW_TO_CHAR (data, 'AL32UTF8');
  ```

  See Also: Chapter 253, "UTL_I18N" for information about using the UTL_I18N PL/SQL package.

- If you want to store encrypted data of the RAW datatype in a VARCHAR2 database column, then use RAWTOHEX or UTL_ENCODE.BASE64_ENCODE to make it suitable for VARCHAR2 storage. These functions expand data size by 2 and 4/3, respectively.

Examples

The following listing shows PL/SQL block encrypting and decrypting pre-defined 'input_string' using 256-bit AES algorithm with Cipher Block Chaining and PKCS#5 compliant padding.

```
DECLARE
   input_string       VARCHAR2 (200) :=  'Secret Message';
   output_string      VARCHAR2 (200);
   encrypted_raw      RAW (2000);             -- stores encrypted binary text
   decrypted_raw      RAW (2000);             -- stores decrypted binary text
   num_key_bytes      NUMBER := 256/8;        -- key length 256 bits (32 bytes)
   key_bytes_raw      RAW (32);               -- stores 256-bit encryption key
   encryption_type    PLS_INTEGER :=          -- total encryption type
                         DBMS_CRYPTO.ENCRYPT_AES256
                       + DBMS_CRYPTO.CHAIN_CBC
                       + DBMS_CRYPTO.PAD_PKCS5;
   iv_raw             RAW (16);

BEGIN
   DBMS_OUTPUT.PUT_LINE ( 'Original string: ' || input_string);
   key_bytes_raw := DBMS_CRYPTO.RANDOMBYTES (num_key_bytes);
   iv_raw        := DBMS_CRYPTO.RANDOMBYTES (16);
   encrypted_raw := DBMS_CRYPTO.ENCRYPT
      (
         src => UTL_I18N.STRING_TO_RAW (input_string,  'AL32UTF8'),
         typ => encryption_type,
         key => key_bytes_raw,
         iv  => iv_raw
      );
    -- The encrypted value "encrypted_raw" can be used here

   decrypted_raw := DBMS_CRYPTO.DECRYPT
      (
         src => encrypted_raw,
         typ => encryption_type,
         key => key_bytes_raw,
         iv  => iv_raw
      );
   output_string := UTL_I18N.RAW_TO_CHAR (decrypted_raw, 'AL32UTF8');

   DBMS_OUTPUT.PUT_LINE ('Decrypted string: ' || output_string);

END;
```

Summary of DBMS_CRYPTO Subprograms

Table 40–10 DBMS_CRYPTO Package Subprograms

Subprogram	Description
DECRYPT Function on page 40-14	Decrypts `RAW` data using a stream or block cipher with a user supplied key and optional IV (initialization vector)
DECRYPT Procedures on page 40-15	Decrypts `LOB` data using a stream or block cipher with a user supplied key and optional IV
ENCRYPT Function on page 40-16	Encrypts `RAW` data using a stream or block cipher with a user supplied key and optional IV
ENCRYPT Procedures on page 40-17	Encrypts `LOB` data using a stream or block cipher with a user supplied key and optional IV
HASH Function on page 40-18	Applies one of the supported cryptographic hash algorithms (MD4, MD5, SHA-1, or SHA-2) to data
MAC Function on page 40-19	Applies Message Authentication Code algorithms (MD5, SHA-1, or SHA-2) to data to provide keyed message protection
RANDOMBYTES Function on page 40-20	Returns a `RAW` value containing a cryptographically secure pseudo-random sequence of bytes, and can be used to generate random material for encryption keys
RANDOMINTEGER Function on page 40-21	Returns a random `BINARY_INTEGER`
RANDOMNUMBER Function on page 40-22	Returns a random 128-bit integer of the `NUMBER` datatype

DECRYPT Function

This function decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT(
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW,
   iv  IN RAW DEFAULT NULL)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 40–11 DECRYPT Function Parameters

Parameter Name	Description
src	RAW data to be decrypted.
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

- To retrieve original plaintext data, DECRYPT must be called with the same cipher, modifiers, key, and IV that was used to encrypt the data originally.

  See Also: "Usage Notes" for the ENCRYPT function on page 40-16 for additional information about the ciphers and modifiers available with this package.

- If VARCHAR2 data is converted to RAW before encryption, then it must be converted back to the appropriate database character set by using the UTL_I18N package.

  See Also: "Conversion Rules" on page 40-11 for a discussion of the VARCHAR2 to RAW conversion process.

DECRYPT Procedures

These procedures decrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT(
   dst IN OUT NOCOPY BLOB,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);

DBMS_CRYPT.DECRYPT(
   dst IN OUT NOCOPY CLOB         CHARACTER SET ANY_CS,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 40–12 DECRYPT Procedure Parameters

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is all zeroes.

ENCRYPT Function

This function encrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT(
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW,
   iv  IN RAW          DEFAULT NULL)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 40–13 ENCRYPT Function Parameters

Parameter Name	Description
src	RAW data to be encrypted.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

- Block ciphers may be modified with chaining and padding type modifiers. The chaining and padding type modifiers are added to the block cipher to produce a cipher suite. Cipher Block Chaining (CBC) is the most commonly used chaining type, and PKCS #5 is the recommended padding type. See Table 40–7 and Table 40–8 on page 40-7 for block cipher chaining and padding modifier constants that have been defined for this package.
- To improve readability, you can define your own package-level constants to represent the cipher suites you use for encryption and decryption. For example, the following example defines a cipher suite that uses DES, cipher block chaining mode, and no padding:

  ```
  DES_CBC_NONE CONSTANT PLS_INTEGER := DBMS_CRYPTO.ENCRYPT_DES
                                     + DBMS_CRYPTO.CHAIN_CBC
                                     + DBMS_CRYPTO.PAD_NONE;
  ```

  See Table 40–6 on page 40-7 for the block cipher suites already defined as constants for this package.
- To encrypt VARCHAR2 data, it should first be converted to the AL32UTF8 character set.

  See Also: "Conversion Rules" on page 40-11 for a discussion of the conversion process.

- Stream ciphers, such as RC4, are not recommended for stored data encryption.

ENCRYPT Procedures

These procedures encrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT(
   dst IN OUT NOCOPY BLOB,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);

DBMS_CRYPTO.ENCRYPT(
   dst IN OUT NOCOPY BLOB,
   src IN            CLOB         CHARACTER SET ANY_CS,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 40–14 ENCRYPT Procedure Parameters

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

See "Conversion Rules" on page 40-11 for usage notes about using the ENCRYPT procedure.

HASH Function

A one-way hash function takes a variable-length input string, the data, and converts it to a fixed-length (generally smaller) output string called a *hash value*. The hash value serves as a unique identifier (like a fingerprint) of the input data. You can use the hash value to verify whether data has been changed or not.

Note that a one-way hash function is a hash function that works in one direction. It is easy to compute a hash value from the input data, but it is hard to generate data that hashes to a particular value. Consequently, one-way hash functions work well to ensure data integrity. Refer to "When to Use Hash or Message Authentication Code (MAC) Functions" on page 40-10 for more information about using one-way hash functions.

This function applies to data one of the supported cryptographic hash algorithms listed in Table 40–3 on page 40-6.

Syntax

```
DBMS_CRYPTO.Hash (
   src IN RAW,
   typ IN PLS_INTEGER)
 RETURN RAW;

DBMS_CRYPTO.Hash (
   src IN BLOB,
   typ IN PLS_INTEGER)
 RETURN RAW;

DBMS_CRYPTO.Hash (
   src IN CLOB CHARACTER SET ANY_CS,
   typ IN PLS_INTEGER)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(hash,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 40–15 HASH Function Parameters

Parameter Name	Description
src	The source data to be hashed.
typ	The hash algorithm to be used.

Usage Note

Oracle recommends that you use the SHA-1 (Secure Hash Algorithm) or SHA-2 because it is more resistant to brute-force attacks than MD4 or MD5. If you must use a Message Digest algorithm, then MD5 provides greater security than MD4.

MAC Function

A Message Authentication Code, or MAC, is a key-dependent one-way hash function. MACs have the same properties as the one-way hash function described in "HASH Function" on page 40-18, but they also include a key. Only someone with the identical key can verify the hash. Also refer to "When to Use Hash or Message Authentication Code (MAC) Functions" on page 40-10 for more information about using MACs.

This function applies MAC algorithms to data to provide keyed message protection. See Table 40–4 on page 40-6 for a list of MAC algorithms that have been defined for this package.

Syntax

```
DBMS_CRYPTO.MAC (
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW)
 RETURN RAW;

DBMS_CRYPTO.MAC (
   src IN BLOB,
   typ IN PLS_INTEGER
   key IN RAW)
 RETURN RAW;

DBMS_CRYPTO.MAC (
   src IN CLOB CHARACTER SET ANY_CS,
   typ IN PLS_INTEGER
   key IN RAW)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(mac,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 40–16 MAC Function Parameters

Parameter Name	Description
src	Source data to which MAC algorithms are to be applied.
typ	MAC algorithm to be used.
key	Key to be used for MAC algorithm.

RANDOMBYTES Function

This function returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, which can be used to generate random material for encryption keys. The RANDOMBYTES function is based on the RSA X9.31 PRNG (Pseudo-Random Number Generator).

Syntax

```
DBMS_CRYPTO.RANDOMBYTES (
   number_bytes IN POSITIVE)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(randombytes,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 40–17 RANDOMBYTES Function Parameter

Parameter Name	Description
number_bytes	The number of pseudo-random bytes to be generated.

Usage Note

The number_bytes value should not exceed the maximum length of a RAW variable.

RANDOMINTEGER Function

This function returns an integer in the complete range available for the Oracle `BINARY_INTEGER` datatype.

Syntax

```
DBMS_CRYPTO.RANDOMINTEGER
 RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references(randominteger,WNDS,RNDS,WNPS,RNPS);
```

RANDOMNUMBER Function

This function returns an integer in the Oracle `NUMBER` datatype in the range of [0..2**128-1].

Syntax

```
DBMS_CRYPTO.RANDOMNUMBER
 RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(randomnumber,WNDS,RNDS,WNPS,RNPS);
```

41

DBMS_CSX_ADMIN

The DBMS_CSX_ADMIN package provides an interface to customize the setup when transporting a tablespace containing binary XML data.

The chapter contains the following topics:

Using DBMS_CSX_ADMIN

Overview

This package can be used by DBAs to customize the setup when transporting a tablespace containing binary XML data. The use of the package is not required in order for a transportable tablespace job to run.

By default, all binary XML tables will use the default token table set, which will be replicated during transport on the target database. To avoid the cost of transporting a potentially large token table set, the DBA may opt for registering a new set of token tables for a given tablespace. The package provides routines for token table set registration and lookup.

Security Model

Owned by XDB, the DBMS_CSX_ADMIN package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB or DBA. Subprograms in this package are executed using the privileges of the current user.

Constants

The DBMS_CSX_ADMIN package uses the constants shown in Table 41–1:

Table 41–1 DBMS_CSX_ADMIN Constants

Name	Type	Value	Description
DEFAULT_LEVEL	BINARY_INTEGER	0	Default token table
TAB_LEVEL	BINARY_INTEGER	1	Token table set associated with tables, not tablespaces
TBS_LEVEL	BINARY_INTEGER	2	Token table set associated with a tablespace
NO_CREATE	BINARY_INTEGER	0	Token tables already exist, associate them with the given table/tablespace
NO_INDEXES	BINARY_INTEGER	1	Do not create indexes on the new set of token tables
WITH_INDEXES	BINARY_INTEGER	2	Create indexes on the token tables
DEFAULT_TOKS	BINARY_INTEGER	0	Prepopulate the token tables with default token mappings
NO_DEFAULT_TOKS	BINARY_INTEGER	1	Do not prepopulate the token tables with default token mappings

Summary of DBMS_CSX_ADMIN

Table 41–2 DBMS_CSX_ADMIN Package Subprograms

Subprogram	Description
GETTOKENTABLEINFO Procedure & Function on page 41-7	Returns the GUID of the token table set where token mappings for this table
GETTOKENTABLEINFOBYTABLESPACE Procedure on page 41-8	Returns the GUID and the token table names for this tablespace
NAMESPACEIDTABLE Function on page 41-9	Returns default namespace-ID token table
PATHIDTABLE Function on page 41-10	Returns the default path-ID token table
QNAMEIDTABLE Function on page 41-11	Returns the default qname-ID token table.

GETTOKENTABLEINFO Procedure & Function

Given the table name and the owner, the first overload of the procedure returns the globally unique identifier (GUID) of the token table set where token mappings for this table can be found. The procedure returns also the names of the token tables, and whether the token table set is the default one.

Given the object number of a table, the second overload of the procedure returns the GUID of the token table set used by the table, and whether this is the default token table set.

Syntax

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFO  (
   ownername      IN   VARCHAR2,
   tablename      IN   VARCHAR2,
   guid           OUT  RAW,
   qnametable     OUT  VARCHAR2,
   nmspctable     OUT  VARCHAR2,
   level          OUT  NUMBER,
   tabno          OUT  NUMBER);

DBMS_CSX_ADMIN.GETTOKENTABLEINFO  (
   tabno          IN   NUMBER,
   guid           OUT  RAW);
 RETURN BOOLEAN;
```

Parameters

Table 41–3 GETTOKENTABLEINFO Procedure & Function Parameters

Parameter	Description
ownername	Owner of the table
tablename	Name of the table
guid	GUID of the token table set used by the given table
qnametable	Name of the qname-ID table in the new set
nmspctable	Name of the namespace-ID table in the new set
level	DEFAULT_LEVEL if default token table set, TBS_LEVEL if same token table set is used by all tables in the same tablespace as the given table, TAB_LEVEL otherwise
tabno	Table object number

GETTOKENTABLEINFOBYTABLESPACE Procedure

Given a tablespace number, this procedure returns the GUID and the token table names for this tablespace.

Syntax

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFOBYTABLESPACE  (
   tsname          IN   VARCHAR2,
   tablespaceno    IN   NUMBER,
   guid            OUT  RAW,
   qnametable      OUT  VARCHAR2,
   nmspctable      OUT  VARCHAR2,
   isdefault       OUT  BOOLEAN,
   containTokTab   OUT  BOOLEAN);
```

Parameters

Table 41–4 GETTOKENTABLEINFOBYTABLESPACE Procedure Parameters

Parameter	Description
`tsname`	Tablespace name
`tablespaceno`	Tablespace number
`guid`	GUID of the token table set associated with this tablespace (if any)
`qnametable`	Name of the qname-ID table
`nmspctable`	Name of the namespace-ID table
`isdefault`	`TRUE` if the token table is the default one
`containTokTab`	`TRUE` if the tablespace contains its own token table set

NAMESPACEIDTABLE Function

This procedure returns default namespace-ID token table.

Syntax

```
DBMS_CSX_ADMIN.NAMESPACEIDTABLE
  RETURN VARCHAR2;
```

PATHIDTABLE Function

This procedure returns the default path-ID token table. This is used for granting permissions on the default path-ID token table for a user before executing `EXPLAIN PLAN` for a query on an XML table with an XML index.

Syntax

```
DBMS_CSX_ADMIN.PATHIDTABLE
  RETURN VARCHAR2;
```

QNAMEIDTABLE Function

This procedure returns the default qname-ID token table.

Syntax

```
DBMS_CSX_ADMIN.QNAMEIDTABLE
  RETURN VARCHAR2;
```

42

DBMS_CUBE

DBMS_CUBE contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying.

> **See Also:** *Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topics:

Using DBMS_CUBE

Cubes and cube dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Cubes can be enabled as cube materialized views for automatic refresh of the cubes and dimensions, and for query rewrite. Several `DBMS_CUBE` subprograms support the creation and maintenance of cube materialized views as a replacement for relational materialized views. These subprograms are discussed in "Using SQL Aggregation Management" on page 42-4.

The metadata for cubes and dimensions is defined in XML documents, called *templates*, which you can derive from relational materialized views using the `CREATE_CUBE` or `DERIVE_FROM_MVIEW` functions. Using a graphical tool named Analytic Workspace Manager, you can enhance the cube with analytic content or create the metadata for new cubes and cube dimensions from scratch.

Several other `DBMS_CUBE` subprograms provide a SQL alternative to Analytic Workspace Manager for creating an analytic workspace from an XML template and for refreshing the data stored in cubes and dimensions. The `IMPORT_XML` procedure creates an analytic workspace with its cubes and cube dimensions from an XML template. The `BUILD` procedure loads data into the cubes and dimensions from their data sources and performs whatever processing steps are needed to prepare the data for querying.

Security Model

The following roles and system privileges are required to use this package:

To create dimensional objects in the user's own schema:

- `OLAP_USER` role
- `CREATE SESSION` privilege

To create dimensional objects in different schemas:

- `OLAP_DBA` role
- `CREATE SESSION` privilege

To create cube materialized views in the user's own schema:

- `CREATE MATERIALIZED VIEW` privilege
- `CREATE DIMENSION` privilege
- `ADVISOR` privilege

To create cube materialized views in different schemas:

- `CREATE ANY MATERIALIZED VIEW` privilege
- `CREATE ANY DIMENSION` privilege
- `ADVISOR` privilege

If the source tables are in a different schema, then the owner of the dimensional objects needs `SELECT` object privileges on those tables.

Using SQL Aggregation Management

SQL Aggregation Management is a group of PL/SQL subprograms in DBMS_CUBE that supports the rapid deployment of cube materialized views from existing relational materialized views. Cube materialized views are cubes that have been enhanced to use the automatic refresh and query rewrite features of Oracle Database. A single cube materialized view can replace many of the relational materialized views of summaries on a fact table, providing uniform response time to all summary data.

Cube materialized views bring the fast update and fast query capabilities of the OLAP option to applications that query summaries of detail relational tables. The summary data is generated and stored in a cube, and query rewrite automatically redirects queries to the cube materialized views. Applications experience excellent querying performance.

In the process of creating the cube materialized views, DBMS_CUBE also creates a fully functional analytic workspace including a cube and the cube dimensions. The cube stores the data for a cube materialized view instead of the table that stores the data for a relational materialized view. A cube can also support a wide range of analytic functions that enhance the database with information-rich content.

Cube materialized views are registered in the data dictionary along with all other materialized views. A CB$ prefix identifies a cube materialized view.

The DBMS_CUBE subprograms also support life-cycle management of cube materialized views.

> **See Also:** *Oracle OLAP User's Guide* for more information about cube materialized views and enhanced OLAP analytics.

Subprograms in SQL Aggregation Management

These subprograms are included in SQL Aggregation Management:

- CREATE_MVIEW Function
- DERIVE_FROM_MVIEW Function
- DROP_MVIEW Procedure
- REFRESH_MVIEW Procedure

Requirements for the Relational Materialized View

SQL Aggregation Management uses an existing relational materialized view to derive all the information needed to generate a cube materialized view. The relational materialized view determines the detail level of data that is stored in the cube materialized view. The related relational dimension objects determine the scope of the aggregates, from the lowest level specified in the GROUP BY clause of the materialized view subquery, to the highest level of the dimension hierarchy.

The relational materialized view must conform to these requirements:

- Explicit `GROUP BY` clause for one or more columns.
- No expressions in the select list or `GROUP BY` clause.
- At least one of these numeric aggregation methods: `SUM`, `MIN`, `MAX`, or `AVG`.
- No outer joins.
- Summary keys with at least one simple column associated with a relational dimension.

  or

  Summary keys with at least one simple column and no hierarchies or levels.
- Numeric datatype of any type for the fact columns. All facts are converted to `NUMBER`.
- Eligible for rewrite. `REWRITE_CAPABILITY` should be `GENERAL`; it cannot be `NONE`. Refer to the `ALL_MVIEWS` entry in the *Oracle Database Reference*.
- Cannot use the `DISTINCT` or `UNIQUE` keywords with an aggregate function in the defining query. For example, `AVG(DISTINCT units)` causes an error in `STRICT` mode and is ignored in `LOOSE` mode.

You can choose between two modes when rendering the cube materialized view, `LOOSE` and `STRICT`. In `STRICT` mode, any deviation from the requirements raises an exception and prevents the materialized view from being created. In `LOOSE` mode (the default), some deviations are allowed, but they affect the content of the materialized view. These elements in the relational materialized view generate warning messages:

- Complex expressions in the defining query are ignored and do not appear in the cube materialized view.
- The `AVG` function is changed to `SUM` and `COUNT`.
- The `COUNT` function without a `SUM`, `MIN`, `MAX`, or `AVG` function is ignored.
- The `STDDEV` and `VARIANCE` functions are ignored.

You can also choose how conditions in the `WHERE` clause are filtered. When filtering is turned off, the conditions are ignored. When turned on, valid conditions are rendered in the cube materialized view, but asymmetric conditions among dimension levels raise an exception.

Permissions for Managing and Querying Cube Materialized Views

To create cube materialized views, you must have these privileges:

- `CREATE [ANY] MATERIALIZED VIEW` privilege
- `CREATE [ANY] DIMENSION` privilege
- `ADVISOR` privilege

To access cube materialized views from another schema using query rewrite, you must have these privileges:

- `GLOBAL QUERY REWRITE` privilege
- `SELECT` or `READ` privilege on the relational source tables
- `SELECT` or `READ` privilege on the analytic workspace (`AW$`*`name`*) that supports the cube materialized view
- `SELECT` or `READ` privilege on the cube
- `SELECT` or `READ` privilege on the dimensions of the cube

Note that you need `SELECT` or `READ` privileges on the database objects that *support* the cube materialized views, but not on the cube materialized views.

Example of SQL Aggregation Management

All examples for the SQL Aggregate Management subprograms use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: CAL_MONTH_SALES_MV and FWEEK_PSCAT_SALES_MV.

About Relational Materialized View CAL_MONTH_SALES_MV

This example uses CAL_MONTH_SALES_MV as the basis for creating a cube materialized view. The following query was used to create CAL_MONTH_SALES_MV. CAL_MONTH_SALES_MV summarizes the daily sales data stored in the SALES table by month.

```
SELECT query FROM user_mviews
     WHERE mview_name='CAL_MONTH_SALES_MV';

QUERY
-------------------------------------------
SELECT   t.calendar_month_desc
  ,        sum(s.amount_sold) AS dollars
  FROM     sales s
  ,        times t
  WHERE    s.time_id = t.time_id
  GROUP BY t.calendar_month_desc
```

DBMS_CUBE uses relational dimensions to derive levels and hierarchies for the cube materialized view. The SH schema has relational dimensions for most dimension tables in the schema, as shown by the following query.

```
SELECT dimension_name FROM user_dimensions;

DIMENSION_NAME
-----------------------------------
CUSTOMERS_DIM
PRODUCTS_DIM
TIMES_DIM
CHANNELS_DIM
PROMOTIONS_DIM
```

Creating the Cube Materialized View

This PL/SQL script uses the CREATE_MVIEW function to create a cube materialized view from CAL_MONTH_SALES_MV. CREATE_MVIEW sets the optional BUILD parameter to refresh the cube materialized view immediately.

```
SET serverout ON format wrapped

DECLARE
     salesaw  varchar2(30);

BEGIN
     salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH_SALES_MV',
                'build=immediate');
END;
/
```

These messages confirm that the script created and refreshed CB$CAL_MONTH_SALES successfully:

```
Completed refresh of cube mview "SH"."CB$CAL_MONTH_SALES" at 20130212 08:42:58.0
03.
```

```
Created cube organized materialized view "CB$CAL_MONTH_SALES" for rewrite at 200
130212 08:42:58.004.
```

The following query lists the materialized views in the SH schema:

```
SELECT mview_name FROM user_mviews;

MVIEW_NAME
------------------------------
CB$CAL_MONTH_SALES
CB$TIMES_DIM_D1_CAL_ROLLUP
CAL_MONTH_SALES_MV
FWEEK_PSCAT_SALES_MV
```

Two new materialized views are registered in the data dictionary:

- CB$CAL_MONTH_SALES: Cube materialized view
- CB$TIMES_DIM_D1_CAL_ROLLUP: Cube dimension materialized view for the TIME_DIM Calendar Rollup hierarchy

Cube dimension materialized views support refresh of the cube materialized view. You do not directly administer dimension materialized views.

Disabling the Relational Materialized Views

After creating a cube materialized view, disable query rewrite on all relational materialized views for the facts now supported by the cube materialized view. You can drop them when you are sure that you created the cube materialized view with the optimal parameters.

```
ALTER MATERIALIZED VIEW cal_month_sales_mv DISABLE QUERY REWRITE;

Materialized view altered.
```

You can also use the DISABLEQRW parameter in the CREATE_MVIEW function, which disables query rewrite on the source materialized view as described in Table 42–7.

Creating Execution Plans for Cube Materialized Views

You can create execution plans for cube materialized views the same as for relational materialized views. The following command generates an execution plan for a query against the SALES table, which contains data at the day level. The answer set requires data summarized by quarter. Query rewrite would not use the original relational materialized view for this query, because its data is summarized by month. However, query rewrite can use the new cube materialized view for summary data for months, quarters, years, and all years.

```
EXPLAIN PLAN FOR SELECT
           t.calendar_quarter_desc,
           sum(s.amount_sold) AS dollars
  FROM     sales s,
           times t
  WHERE    s.time_id = t.time_id
  AND      t.calendar_quarter_desc LIKE '2001%'
  GROUP BY t.calendar_quarter_desc
  ORDER BY t.calendar_quarter_desc;
```

The query returns these results:

```
CALENDAR_QUARTER_DESC    DOLLARS
-------------------- ----------
```

```
2001-01              6547097.44
2001-02              6922468.39
2001-03              7195998.63
2001-04              7470897.52
```

The execution plan shows that query rewrite returned the summary data from the cube materialized view, CB$CAL_MONTH_SALES, instead of recalculating it from the SALES table.

```
SELECT plan_table_output FROM TABLE(dbms_xplan.display());

PLAN_TABLE_OUTPUT
-------------------------------------------------------------------------------------------------------------------
Plan hash value: 2999729407

-------------------------------------------------------------------------------------------------------
| Id  | Operation                       | Name               | Rows  | Bytes | Cost (%CPU)| Time     |
-------------------------------------------------------------------------------------------------------
|   0 | SELECT STATEMENT                |                    |     1 |    30 |     3  (34)| 00:00:01 |
|   1 |  SORT GROUP BY                  |                    |     1 |    30 |     3  (34)| 00:00:01 |
|*  2 |   MAT_VIEW REWRITE CUBE ACCESS | CB$CAL_MONTH_SALES |     1 |    30 |     2   (0)| 00:00:01 |
-------------------------------------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------

   2 - filter("CB$CAL_MONTH_SALES"."D1_CALENDAR_QUARTER_DESC" LIKE '2001%' AND
              "CB$CAL_MONTH_SALES"."SYS_GID"=63)

15 rows selected.
```

Maintaining Cube Materialized Views

You can create a cube materialized view that refreshes automatically. However, you can force a refresh at any time using the REFRESH_MVIEW Procedure:

```
BEGIN
     dbms_cube.refresh_mview('SH', 'CB$CAL_MONTH_SALES');
END;
/

Completed refresh of cube mview "SH"."CB$CAL_MONTH_SALES" at 20130212
14:30:59.534.
```

If you want to drop a cube materialized view, use the DROP_MVIEW Procedure so that all supporting database objects (analytic workspace, cube, cube dimensions, and so forth) are also dropped:

```
BEGIN
     dbms_cube.drop_mview('SH', 'CB$CAL_MONTH_SALES');
END;
/

Dropped cube organized materialized view "SH"."CAL_MONTH_SALES" including
container analytic workspace "SH"."CAL_MONTH_SALES_AW" at 20130212 13:38:47.878.
```

New Database Objects

The CREATE_MVIEW function creates several first class database objects in addition to the cube materialized views. You can explore these objects through the data dictionary by querying views such as ALL_CUBES and ALL_CUBE_DIMENSIONS.

This example created the following supporting objects:

- Analytic workspace CAL_MONTH_SALES_AW (AW$CAL_MONTH_SALES_AW table)
- Cube CAL_MONTH_SALES
- Cube dimension TIMES_DIM_D1
- Dimension hierarchy CAL_ROLLUP
- Dimension levels ALL_TIMES_DIM, YEAR, QUARTER, and MONTH
- Numerous attributes for levels in the CAL_ROLLUP hierarchy

Upgrading 10*g* Analytic Workspaces

Oracle OLAP metadata is the same in OLAP 11*g* and OLAP 12*c* so you do not need to upgrade an OLAP 11*g* analytic workspace to OLAP 12*c*. This topic describes upgrading an Oracle OLAP 10*g* analytic workspace to OLAP 12*c*.

You can upgrade an OLAP 10*g* analytic workspace to OLAP 12*c* by saving the OLAP 10*g* objects as an XML template and importing the XML into a different schema. The original analytic workspace remains accessible and unchanged by the upgrade process.

> **Tip:** Oracle recommends using Analytic Workspace Manager for performing upgrades. See the *Oracle OLAP User's Guide*.

> **See Also:** *Oracle Database Upgrade Guide* for information on upgrading Oracle Database.

These subprograms in `DBMS_CUBE` support the upgrade process:

- CREATE_EXPORT_OPTIONS Procedure
- CREATE_IMPORT_OPTIONS Procedure
- EXPORT_XML Procedure
- EXPORT_XML_TO_FILE Procedure
- IMPORT_XML Procedure
- INITIALIZE_CUBE_UPGRADE Procedure
- UPGRADE_AW Procedure

Prerequisites:

- The OLAP 10*g* analytic workspace can use OLAP standard form metadata.
- Customizations to the OLAP 10*g* analytic workspace may not be exported to the XML template. You must re-create them in OLAP 12*c*.
- The original relational source data must be available to load into the new analytic workspace. If the data is in a different schema or the table names are different, then you must remap the dimensional objects to the new relational sources after the upgrade.
- You can create the OLAP 12*c* analytic workspace in the same schema as the OLAP 10*g* analytic workspace. However, if you prefer to create it in a different schema, then create a new user with the following privileges:
  - `SELECT` or `READ` privileges on the OLAP 10*g* analytic workspace (`GRANT SELECT ON schema.AW$analytic_workspace`).
  - `SELECT` or `READ` privileges on all database tables and views that contain the source data for the OLAP 10*g* analytic workspace.
  - Appropriate privileges for an OLAP administrator.
  - Same default tablespace as the Oracle 10*g* user.

  See the *Oracle OLAP User's Guide*.

Correcting Naming Conflicts

The namespaces are different in OLAP 10*g* than those in OLAP 12*c*. For a successful upgrade, you must identify any 10*g* object names that are used multiple times under the 12*c* naming rules and provide unique names for them.

The following namespaces control the uniqueness of OLAP object names in Oracle 12*c*:

- **Schema**: The names of cubes, dimensions, and measure folders must be unique within a schema. They cannot conflict with the names of tables, views, indexes, relational dimensions, or any other first class objects. However, these OLAP 12*c* object names do not need to be distinct from 10*g* object names, because they are in different namespaces.
- **Cube**: The names of measures must be unique within a cube.
- **Dimension**: The names of hierarchies, levels, and attributes must be unique within a dimension. For example, a dimension cannot have a hierarchy named Customers and a level named Customers.

You can use an initialization table and a rename table to rename objects in the upgraded 12*c* analytic workspace.

Initialization Table

The `INITIALIZE_CUBE_UPGRADE` procedure identifies ambiguous names under the OLAP 12*c* naming rules. For example, a 10*g* dimension might have a hierarchy and a level with the same name. Because hierarchies and levels are in the same 12*c* namespace, the name is not unique in 12*c*; to a 12*c* client, the hierarchy and the level cannot be differentiated by name.

`INITIALIZE_CUBE_UPGRADE` creates and populates a table named `CUBE_UPGRADE_INFO` with unique names for these levels, hierarchies, and attributes. By using the unique names provided in the table, a 12*c* client can browse the OLAP 12*c* metadata. You cannot attach an OLAP 12*c* client to the analytic workspace or perform an upgrade without a `CUBE_UPGRADE_INFO` table, if the 10*g* metadata contains ambiguous names.

You can edit `CUBE_UPGRADE_INFO` to change the default unique names to names of your choosing. You can also add rows to change the names of any other objects. When using an 12*c* client, you see the new object names. When using an 10*g* client, you see the original names. However, the `INITIALIZE_CUBE_UPGRADE` procedure overwrites this table, so you may prefer to enter customizations in a rename table.

During an upgrade from OLAP 10*g*, the unique object names in `CUBE_UPGRADE_INFO` are used as the names of 12*c* objects in the new analytic workspace. However, `INITIALIZE_CUBE_UPGRADE` does not automatically provide unique names for cubes, dimensions, and measure folders. To complete an upgrade, you must assure that these objects have unique names within the 12*c* namespace. You can provide these objects with new names in the `CUBE_UPGRADE_INFO` table or in a rename table.

OLAP 12*c* clients automatically use `CUBE_UPGRADE_INFO` when it exists in the same schema as the OLAP 10*g* analytic workspace.

> **See Also:** "INITIALIZE_CUBE_UPGRADE Procedure" on page 42-53

Rename Table

You can create a rename table that contains new object names for an OLAP 12*c* analytic workspace. You can then use the rename table in the `CREATE_IMPORT_OPTIONS` and `UPGRADE_AW` procedures.

When upgrading within the same schema, you must provide a unique name for the 12*c* analytic workspace. The `UPGRADE_AW` procedure provides a parameter for this purpose; otherwise, you must provide the new name in the rename table. The duplication of cube names does not create ambiguity because the 12*c* cubes are created in a different namespace than the 10*g* cubes.

The names provided in a rename table are used only during an upgrade and overwrite any names entered in the `CUBE_UPGRADE_INFO` table.

To create a rename table:

1. Open SQL*Plus or another SQL client, and connect to Oracle Database as the owner of the 10*g* analytic workspace.
2. Issue a command like the following:

```
CREATE TABLE table_name (
          source_id    VARCHAR2(300),
          new_name     VARCHAR2(30),
          object_type  VARCHAR2(30));
```

3. Populate the rename table with the appropriate values, as follows.

`table_name` is the name of the rename table.

`source_id` is the identifier for an object described in the XML document supplied to IMPORT_XML. The identifier must have this format:

`schema_name.object_name``[.`*`subobject_name`*`]`

`new_name` is the object name given during the import to the object specified by `source_id`.

`object_type` is the object type as described in the XML, such as StandardDimension or DerivedMeasure.

For example, these SQL statements populate the table with new names for the analytic workspace, a cube, and four dimensions:

```
INSERT INTO my_object_map VALUES('GLOBAL_AW.GLOBAL10.AW', 'GLOBAL12', 'AW');
INSERT INTO my_object_map VALUES('GLOBAL_AW.UNITS_CUBE', 'UNIT_SALES_CUBE',
'Cube');
INSERT INTO my_object_map VALUES('GLOBAL_AW.CUSTOMER', 'CUSTOMERS',
'StandardDimension');
INSERT INTO my_object_map VALUES('GLOBAL_AW.CHANNEL', 'CHANNELS',
'StandardDimension');
INSERT INTO my_object_map VALUES('GLOBAL_AW.PRODUCT', 'PRODUCTS',
'StandardDimension');
INSERT INTO my_object_map VALUES('GLOBAL_AW.TIME', 'TIME_PERIODS',
'TimeDimension');
```

See Also: "CREATE_IMPORT_OPTIONS Procedure" on page 42-35

Simple Upgrade

A simple upgrade creates an OLAP 12*c* analytic workspace from an OLAP 10*g* analytic workspace.

To perform a simple upgrade of an Oracle OLAP 10*g* analytic workspace:

1. Open SQL*Plus or a similar SQL command-line interface and connect to Oracle Database 12*c* as the schema owner for the OLAP 12*c* analytic workspace.
2. To rename any objects in the 12*c* analytic workspace, create a rename table as described in "Rename Table" on page 42-14. (Optional)
3. Perform the upgrade, as described in "UPGRADE_AW Procedure" on page 42-57.
4. Use the `DBMS_CUBE.BUILD` procedure to load data into the cube.

Example 42–1 Performing a Simple Upgrade to the GLOBAL Analytic Workspace

This example creates an OLAP 12*c* analytic workspace named `GLOBAL12` from an OLAP 10*g* analytic workspace named `GLOBAL10`. `GLOBAL10` contains no naming conflicts between cubes, dimensions, measure folders, or tables in the schema, so a rename table is not needed in this example.

```
BEGIN

  -- Upgrade the analytic workspace
  dbms_cube.upgrade_aw(sourceaw =>'GLOBAL10', destaw => 'GLOBAL12');

  -- Load and aggregate the data
  dbms_cube.build(script => 'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/
```

Custom Upgrade

A custom upgrade enables you to set the export and import options.

To perform a custom upgrade of an Oracle OLAP 10*g* analytic workspace:

1. Open SQL*Plus or a similar SQL command-line interface and connect to Oracle Database 12*c* as the schema owner of the OLAP 12*c* analytic workspace.
2. Generate an initialization table, as described in "Initialization Table" on page 42-13. Review the new, default object names and modify them as desired.
3. Create a rename table, as described in "Rename Table" on page 42-14. If you are upgrading in the same schema, you must use a rename table to provide a unique name for the 12*c* analytic workspace. Otherwise, a rename table is needed only if names are duplicated among the cubes, dimensions, and measure folders of the analytic workspace, or between those names and the existing cubes, dimensions, measure folders, or tables of the destination schema.
4. Create a SQL script that does the following:
   a. Create an XML document for the export options, as described in "CREATE_EXPORT_OPTIONS Procedure" on page 42-32. The `SUPPRESS_NAMESPACE` option must be set to `TRUE` for the upgrade to occur.
   b. Create an XML document for the import options, as described in "CREATE_IMPORT_OPTIONS Procedure" on page 42-35.
   c. Create an XML template in OLAP 12*c* format, as described in "EXPORT_XML Procedure" on page 42-46.
   d. Create an OLAP 12*c* analytic workspace from the XML template, as described in "IMPORT_XML Procedure" on page 42-50.
5. Load and aggregate the data in the new analytic workspace, as described in "BUILD Procedure" on page 42-19.

Example 42–2 Performing a Custom Upgrade to the GLOBAL Analytic Workspace

This example upgrades the `GLOBAL10` analytic workspace from OLAP 10*g* metadata to OLAP 12*c* metadata in the `GLOBAL_AW` schema.

The rename table provides the new name of the analytic workspace. These commands define the rename table.

```
CREATE TABLE my_object_map(
       source_id    VARCHAR2(300),
       new_name     VARCHAR2(30),
       object_type  VARCHAR2(30));

INSERT INTO my_object_map VALUES('GLOBAL_AW.GLOBAL10.AW',  'GLOBAL12', 'AW');
COMMIT;
```

Following is the script for performing the upgrade.

```
set serverout on

DECLARE
  importClob    clob;
  exportClob    clob;
  exportOptClob clob;
  importOptClob clob;
```

```
BEGIN

  -- Create table of reconciled names
  dbms_cube.initialize_cube_upgrade;

  -- Create a CLOB containing the export options
  dbms_lob.createtemporary(exportOptClob, TRUE);
  dbms_cube.create_export_options(out_options_xml=>exportOptClob, suppress_
namespace=>TRUE, preserve_table_owners=>TRUE);

  -- Create a CLOB containing the import options
  dbms_lob.createtemporary(importOptClob, TRUE);
  dbms_cube.create_import_options(out_options_xml=>importOptClob, rename_table =>
'MY_OBJECT_MAP');

   -- Create CLOBs for the metadata
  dbms_lob.createtemporary(importClob, TRUE);
  dbms_lob.createtemporary(exportClob, TRUE);

  -- Export metadata from a 10g analytic workspace to a CLOB
  dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob, out_
xml=>exportClob);

  -- Import metadata from the CLOB
  dbms_cube.import_xml(in_xml => exportClob, options_xml=>importOptClob, out_
xml=>importClob);

  -- Load and aggregate the data
  dbms_cube.build('UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/
```

Summary of DBMS_CUBE Subprograms

Table 42–1 DBMS_CUBE Subprograms

Subprogram	Description
BUILD Procedure on page 42-19	Loads data into one or more cubes and dimensions, and prepares the data for querying.
CREATE_EXPORT_ OPTIONS Procedure on page 42-32	Creates an input XML document of processing options for the EXPORT_XML procedure.
CREATE_IMPORT_ OPTIONS Procedure on page 42-35	Creates an input XML document of processing options for the IMPORT_XML procedure.
CREATE_MVIEW Function on page 42-37	Creates a cube materialized view from the definition of a relational materialized view.
DERIVE_FROM_MVIEW Function on page 42-42	Creates an XML template for a cube materialized view from the definition of a relational materialized view.
DROP_MVIEW Procedure on page 42-44	Drops a cube materialized view.
EXPORT_XML Procedure on page 42-46	Exports the XML of an analytic workspace to a CLOB.
EXPORT_XML_TO_FILE Procedure on page 42-48	Exports the XML of an analytic workspace to a file.
IMPORT_XML Procedure on page 42-50	Creates, modifies, or drops an analytic workspace by using an XML template
INITIALIZE_CUBE_ UPGRADE Procedure on page 42-53	Processes Oracle OLAP 10*g* objects with naming conflicts to enable Oracle 12*c* clients to access them.
REFRESH_MVIEW Procedure on page 42-55	Refreshes a cube materialized view.
UPGRADE_AW Procedure on page 42-57	Upgrades an analytic workspace from Oracle OLAP 10*g* to 12*c*.
VALIDATE_XML Procedure on page 42-59	Checks the XML to assure that it is valid, without committing the results to the database.

BUILD Procedure

This procedure loads data into one or more cubes and dimensions, and generates aggregate values in the cubes. The results are automatically committed to the database.

Syntax

```
DBMS_CUBE.BUILD (
       script                IN  VARCHAR2,
       method                IN  VARCHAR2        DEFAULT NULL,
       refresh_after_errors  IN  BOOLEAN         DEFAULT FALSE,
       parallelism           IN  BINARY_INTEGER  DEFAULT 0,
       atomic_refresh        IN  BOOLEAN         DEFAULT FALSE,
       automatic_order       IN  BOOLEAN         DEFAULT TRUE,
       add_dimensions        IN  BOOLEAN         DEFAULT TRUE,
       scheduler_job         IN  VARCHAR2        DEFAULT NULL,
       master_build_id       IN  BINARY_INTEGER  DEFAULT 0,
       nested                IN  BOOLEAN         DEFAULT FALSE);
       job_class             IN  VARCHAR2        DEFAULT 'DEFAULT_JOB_CLASS'
```

Parameters

Table 42–2 BUILD Procedure Parameters

Parameter	Description
`script`	A list of cubes and dimensions and their build options (see "SCRIPT Parameter" on page 42-20).
`method`	A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated. You can specify a method for each cube and dimension in sequential order, or a single method to apply to all cubes and dimensions. If you list more objects than methods, then the last method applies to the additional objects. ■ `C`: Complete refresh clears all dimension values before loading. (Default) ■ `F`: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table. ■ `?`: Fast refresh if possible, and otherwise a complete refresh. ■ `P`: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables. ■ `S`: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values. See the "Usage Notes" on page 42-26 for additional details. Methods do not apply to dimensions.
`refresh_after_errors`	`TRUE` to roll back just the cube or dimension with errors, and then continue building the other objects. `FALSE` to roll back all objects in the build.
`parallelism`	Number of parallel processes to allocate to this job (see Usage Notes).

Table 42–2 (Cont.) BUILD Procedure Parameters

Parameter	Description
atomic_refresh	TRUE prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state. FALSE enables users to access intermediate results during an build.
automatic_order	TRUE enables optimization of the build order. Dimensions are loaded before cubes. FALSE builds objects in the order you list them in the script.
add_dimensions	TRUE automatically includes all the dimensions of the cubes in the build, whether or not you list them in the script. If a cube materialized view with a particular dimension is fresh, then that dimension is not reloaded. You can list a cube once in the script. FALSE includes only dimensions specifically listed in the script.
scheduler_job	Any text identifier for the job, which will appear in the log table. The string does not need to be unique.
master_build_id	A unique name for the build.
nested	TRUE performs nested refresh operations for the specified set of cube materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables. All objects must reside in a single analytic workspace.
job_class	The class this job is associated with.

SCRIPT Parameter

The SCRIPT parameter identifies the objects to include in the build, and specifies the type of processing to perform on each one. The parameter has this syntax:

```
[VALIDATE | NO COMMIT] objects [ USING ( commands ) ][,...]
```

Where:

VALIDATE checks all steps of the build and sends the planned steps to CUBE_BUILD_LOG without executing the steps. You can view all generated SQL in the OUTPUT column of the log table.

NO COMMIT builds the objects in the current attach mode (or Read Only when the analytic workspace is not attached) but does not commit the changes. This option supports what-if analysis, since it enables you to change data values temporarily. See "SCRIPT Parameter: USING Clause: SET command" on page 42-25.

objects is the qualified name of one or more cubes or dimensions, separated by commas, in the form *[aw_name.]object*, such as UNITS_CUBE or GLOBAL.UNITS_CUBE.

SCRIPT Parameter: USING Clause

The USING clause specifies the processing options. It consists of one or more commands separated by commas.

> **Note:** A cube with a rewrite materialized view cannot have a USING clause, except for the ANALYZE command. It uses the default build options.

The commands can be any of the following.

- AGGREGATE USING [MEASURE]

  Generates aggregate values using the syntax described in "SCRIPT Parameter: USING Clause: AGGREGATE command".

- ANALYZE

  Runs DBMS_AW_STATS.ANALYZE, which generates and stores optimizer statistics for cubes and dimensions.

- CLEAR [VALUES | LEAVES | AGGREGATES] [SERIAL | PARALLEL]

  Prepares the cube for a data refresh. It can also be used on dimensions, but CLEAR removes all dimension keys, and thus deletes all data values for cubes that use the dimension.

  These optional arguments control the refresh method. If you omit the argument, then the behavior of CLEAR depends on the refresh method. The 'C' (complete) refresh method runs CLEAR VALUES, and all other refresh methods run CLEAR LEAVES.

  – VALUES: Clears all data in the cube. All facts must be reloaded and all aggregates must be recomputed. This option supports the COMPLETE refresh method. (Default for the C and F methods)

  – LEAVES: Clears the detail data and retains the aggregates. All facts must be reloaded, and the aggregates for any new or changed facts must be computed. This option supports the FAST refresh method. (Default for the ? method)

  – AGGREGATES: Retains the detail data and clears the aggregates. All aggregates must be recomputed.

  These optional arguments control the load method, and can be combined with any of the refresh options:

  – PARALLEL: Each partition is cleared separately. (Default)

  – SERIAL: All partitions are cleared together.

  If you omit the CLEAR command, DBMS_CUBE loads new and updated facts, but does not delete any old detail data. This is equivalent to a LOAD NO SYNC for dimensions.

- COMPILE [SORT | NO SORT | SORT ONLY]

  Creates the supporting structures for the dimension. (Dimensions only)

  These options control the use of a sort order attribute:

  – SORT: The user-defined sort order attribute populates the sort column in the embedded-total (ET) view. (Default)

  – NO SORT: Any sort order attribute is ignored. This option is for very large dimensions where sorting could consume too many resources.

  – SORT ONLY: The compile step only runs the sort.

- EXECUTE PLSQL string

Executes a PL/SQL command or script in the database.

- `EXECUTE OLAP DML string [PARALLEL | SERIAL]`

  Executes an OLAP DML command or program in the analytic workspace. The options control execution of the command or program:

  – `PARALLEL`: Execute the command or program once for each partition. This option can be used to provide a performance boost to complex DML operations, such as forecasts and models.

  – `SERIAL`: Execute the command or program once for the entire cube. (Default)

- `[INSERT | MERGE] INTO [ALL HIERARCHIES | HIERARCHIES (`*`dimension.hierarchy`*`)] VALUES (`*`dim_key, parent, level_name`*`)`

  Adds a dimension member to one or more hierarchies. `INSERT` throws an error if the member already exists, while `MERGE` does not. See "Dimension Maintenance Example" on page 42-29.

  `dimension.hierarchy`: The name of a hierarchy the new member belongs to. Enclose each part of the name in double quotes, for example, `"PRODUCT"."PRIMARY"`.

  `dim_key`: The `DIM_KEY` value of the dimension member.

  `parent`: The parent of the dimension key.

  `level_name`: The level of the dimension key.

- `UPDATE [ALL HIERARCHIES | HIERARCHIES (`*`dimension.hierarchy`*`)] SET PARENT = `*`parent`*`, LEVEL=`*`level_name`*` WHERE MEMBER = `*`dim_key`*

  Alters the level or parent of an existing dimension member. See `INSERT` for a description of the options. Also see "Dimension Maintenance Example" on page 42-29.

- `DELETE FROM DIMENSION WHERE MEMBER=`*`dim_key`*

  Deletes a dimension member. See "Dimension Maintenance Example" on page 42-29.

  `dim_key`: The `DIM_KEY` value of the dimension member to be deleted.

- `SET `*`dimension.attribute[qdr]`*` = CAST('`*`attribute_value`*`' AS VARCHAR2))`

  Sets the value of an attribute for a dimension member. See "Dimension Maintenance Example" on page 42-29.

  `dimension.attribute`: The name of the attribute. Enclose each part of the name in double quotes, for example, `"PRODUCT"."LONG_DESCRIPTION"`.

  `qdr`: The dimension member being given an attribute value in the form of a qualified data reference, such as `"PRODUCT"='OPT MOUSE'`.

  `attribute_value`: The value of the attribute, such as 'Optical Mouse'.

- `FOR `*`dimension_clause measure_clause`*` BUILD (`*`commands`*`)`

  Restricts the build to particular measures and dimension values, using the following arguments. See "FOR Clause Example" on page 42-28.

  – *`dimension_clause`*:

    `dimension` `ALL | NONE | WHERE `*`condition`*` | LEVELS (`*`level`*` [, `*`level`*`...])`

    `dimension` is the name of a dimension of the cube.

ALL sets the dimension status to all members before executing the list of commands.

NONE loads values for no dimension members.

WHERE loads values for those dimension members that match the condition.

LEVELS loads values for dimension members in the named levels.

level is a level of the named dimension.

– *measure_clause*:

MEASURES (*measure* [, *measure*...])

measure is the name of a measure in the cube.

– *commands*: Any of the other USING commands.

- LOAD [SYNCH | NO SYNCH | RETAIN] [PRUNE | PARALLEL | SERIAL] [WHERE *condition*]

  Loads data into the dimension or cube.

  – WHERE limits the load to those values in the mapped relational table that match *condition*.

  – *condition* is a valid predicate based on the columns of the mapped table. See the "Examples" on page 42-28.

  These optional arguments apply only to dimensions:

  – SYNCH matches the dimension keys to the relational data source. (Default)

  – NO SYNCH loads new dimension keys but does not delete old keys.

    If the parent of a dimension key has changed in the relational data source, this option allows the load to change the parent/child relation in the analytic workspace.

  – RETAIN loads new dimension keys but does not delete old keys.

    This option does not allow the parent of a dimension key to change. If the parent has changed, the load rejects the record. The rejection generates an error in the rejected records log, if the log is enabled.

  These optional arguments apply only to cubes:

  – PRUNE: Runs a full table scan on the fact table to determine which partitions to load. For example, if a cube is partitioned by month and the fact table has values only for the last two months, then jobs are only started to load the partitions for the last two months.

  – PARALLEL: Each partition is loaded separately. (Default)

  – SERIAL: All partitions are loaded in one SELECT statement.

- MODEL model_name [PARALLEL | SERIAL]

  Executes a model previously created for the cube. It accepts these arguments:

  – PARALLEL: The model runs separately on each partition.

  – SERIAL: The model runs on all cubes at the same time. (Default)

- SET

  Supports write-back to the cube using the syntax described in "SCRIPT Parameter: USING Clause: SET command" on page 42-25. (Cubes only)

- SOLVE [PARALLEL | SERIAL]

  Aggregates the cube using the rules defined for the cube, including the aggregation operator and the precompute specifications. (Cubes only)

  It accepts these arguments:

  – PARALLEL: Each partition is solved separately. (Default)

  – SERIAL: All partitions are solved at the same time.

SCRIPT Parameter: USING Clause: AGGREGATE command

The AGGREGATE command in a script specifies the aggregation rules for one or more measures.

> **Note:** The AGGREGATE command is available only for uncompressed cubes.

AGGREGATE has the following syntax:

```
{ AGGREGATE USING MEASURE
     WHEN measure1 THEN operator1
     WHEN measure2 THEN operator2...
          ELSE default_operator
|
 [AGGREGATE USING] operator_clause }
processing_options
OVER { ALL | dimension | dimension HIERARCHIES (hierarchy)}
```

USING MEASURE Clause

This clause enables you to specify different aggregation operators for different measures in the cube.

Operator Clause

The operator_clause has this syntax:

```
operator(WEIGHTBY expression | SCALEBY expression)
```

WEIGHTBY multiplies each data value by an expression before aggregation.

SCALEBY adds the value of an expression to each data value before aggregation.

Table 42–3 Aggregation Operators

Operator	Option	Description
AVG	WEIGHTBY	Adds data values, then divides the sum by the number of data values that were added together.
FIRST	WEIGHTBY	The first real data value.
HIER_AVG	WEIGHTBY	Adds data values, then divides the sum by the number of the children in the dimension hierarchy. Unlike AVERAGE, which counts only non-NA children, HAVERAGE counts all of the logical children of a parent, regardless of whether each child does or does not have a value.
HIER_FIRST	WEIGHTBY	The first data value in the hierarchy, even when that value is NA.

Table 42–3 (Cont.) Aggregation Operators

Operator	Option	Description
HIER_LAST	WEIGHTBY	The last data value in the hierarchy, even when that value is NA.
LAST	WEIGHTBY	The last real data value.
MAX	WEIGHTBY	The largest data value among the children of each parent.
MIN	WEIGHTBY	The smallest data value among the children of each parent.
NO AGGREGATION	No option	Do not aggregate the values of the dimension or dimensions. Leave all aggregated values as NA.
SUM	SCALEBY | WEIGHTBY	Adds data values. (Default)

Processing Options

You can specify these processing options for aggregation:

- (ALLOW | DISALLOW) OVERFLOW

  Specifies whether to allow decimal overflow, which occurs when the result of a calculation is very large and can no longer be represented by the exponent portion of the numerical representation.

  - ALLOW: A calculation that generates overflow executes without error and produces null results. (Default)
  - DISALLOW: A calculation involving overflow stops executing and generates an error message.

- (ALLOW | DISALLOW) DIVISION BY ZERO

  Specifies whether to allow division by zero.

  - ALLOW: A calculation involving division by zero executes without error but returns a null value. (Default)
  - DISALLOW: A calculation involving division by zero stops executing and generates an error message.

- (CONSIDER | IGNORE) NULLS

  Specifies whether nulls are included in the calculations.

  - CONSIDER: Nulls are included in the calculations. A calculation that includes a null value returns a null value.
  - IGNORE: Only actual data values are used in calculations. Nulls are treated as if they do not exist. (Default)

- MAINTAIN COUNT

  Stores an up-to-date count of the number of dimension members for use in calculating averages. Omit this option to count the members on the fly.

SCRIPT Parameter: USING Clause: SET command

The SET command in a script assigns values to one or more cells in a stored measure. It has this syntax:

```
SET target = expression
```

Where:

target is a a measure or a qualified data reference.

expression returns values of the appropriate datatype for *target*.

Qualified Data References

Qualified data references (QDRs) limit a dimensional object to a single member in one or more dimensions for the duration of a query.

A QDR has the following syntax:

```
expression [ { dimension = member }[ , { dimension = member } ...] ]
```

Where:

expression is a dimensional expression, typically the name of a measure.

dimension is a primary dimension of expression.

member is a value of dimension.

The outside square brackets shown in bold are literal syntax elements; they do not indicate an optional argument. The inside square brackets shown in regular text delimit an optional argument and are not syntax elements.

This example returns Sales values for calendar year 2007:

```
global.sales[global.time = 'CY2007'
]
```

The next example returns Sales values only for the United States in calendar year 2007:

```
sales[customer = 'US', time = 'CY2007'
]
```

See the Examples for qualified data references in SET commands.

Usage Notes

Build Methods

The `C`, `S`, and `?` methods always succeed and can be used on any cube.

The `F` and `P` methods require that the cube have a materialized view that was created as a fast or a rewrite materialized view.

Parallelism

Partitioned cubes can be loaded and aggregated in parallel processes. For example, a cube with five partitions can use up to five processes. Dimensions are always loaded serially.

The number of parallel processes actually allocated by a build is controlled by the smallest of these factors:

- Number of cubes in the build and the number of partitions in each cube.
- Setting of the `PARALLELISM` argument of the `BUILD` procedure.
- Setting of the `JOB_QUEUE_PROCESSES` database initialization parameter.

Suppose `UNITS_CUBE` has 12 partitions, `PARALLELISM` is set to 10, and `JOB_QUEUE_PROCESSES` is set to 4. OLAP uses four processes, which appear as slave processes in the build log.

The SQL engine may allocate additional processes when the PARALLEL_DEGREE_POLICY database initialization parameter is set to AUTO or LIMITED. For example, if OLAP allocates four processes, the SQL engine might determine that two of those processes should be done by four processes instead, for a total of six processes.

Build Logs

OLAP generates three logs that provide diagnostic information about builds:

- Cube build log
- Rejected records log
- Cube dimension compile log

Analytic Workspace Manager creates these logs automatically as tables in the same schema as the analytic workspace. If you do not use Analytic Workspace Manager, you can create and manage the logs in PL/SQL using the `DBMS_CUBE_LOG` package.

You can also create the cube log file by running `$ORACLE_HOME/olap/admin/utlolaplog.sql`. This script creates three additional views:

- `CUBE_BUILD_LATEST`: Returns rows only from the last build.
- `CUBE_BUILD_REPORT`: Returns one row for each command with elapsed times.
- `CUBE_BUILD_REPORT_LATEST`: Returns a report like `CUBE_BUILD_REPORT` only from the last build.

This report shows a successfully completed build of the objects in the `GLOBAL` analytic workspace, which has four dimensions and two cubes.

```
SELECT command, status, build_object, build_object_type type
     FROM cube_build_report_latest;

COMMAND                   STATUS     BUILD_OBJECT                   TYPE
------------------------- ---------- ------------------------------ ----------
BUILD                     COMPLETED                                 BUILD
FREEZE                    COMPLETED                                 BUILD
LOAD NO SYNCH             COMPLETED  CHANNEL                        DIMENSION
COMPILE                   COMPLETED  CHANNEL                        DIMENSION
UPDATE/COMMIT             COMPLETED  CHANNEL                        DIMENSION
LOAD NO SYNCH             COMPLETED  CUSTOMER                       DIMENSION
COMPILE                   COMPLETED  CUSTOMER                       DIMENSION
UPDATE/COMMIT             COMPLETED  CUSTOMER                       DIMENSION
LOAD NO SYNCH             COMPLETED  PRODUCT                        DIMENSION
COMPILE                   COMPLETED  PRODUCT                        DIMENSION
UPDATE/COMMIT             COMPLETED  PRODUCT                        DIMENSION
LOAD NO SYNCH             COMPLETED  TIME                           DIMENSION
COMPILE                   COMPLETED  TIME                           DIMENSION
UPDATE/COMMIT             COMPLETED  TIME                           DIMENSION
COMPILE AGGMAP            COMPLETED  PRICE_CUBE                    CUBE
UPDATE/COMMIT             COMPLETED  PRICE_CUBE                    CUBE
COMPILE AGGMAP            COMPLETED  UNITS_CUBE                    CUBE
UPDATE/COMMIT             COMPLETED  UNITS_CUBE                    CUBE
DBMS_SCHEDULER.CREATE_JOB COMPLETED  PRICE_CUBE                    CUBE
DBMS_SCHEDULER.CREATE_JOB COMPLETED  UNITS_CUBE                    CUBE
BUILD                     COMPLETED                                BUILD
LOAD                      COMPLETED  PRICE_CUBE                    CUBE
SOLVE                     COMPLETED  PRICE_CUBE                    CUBE
UPDATE/COMMIT             COMPLETED  PRICE_CUBE                    CUBE
BUILD                     COMPLETED                                BUILD
LOAD                      COMPLETED  UNITS_CUBE                    CUBE
SOLVE                     COMPLETED  UNITS_CUBE                    CUBE
```

```
UPDATE/COMMIT            COMPLETED  UNITS_CUBE                    CUBE
ANALYZE                  COMPLETED  PRICE_CUBE                    CUBE
ANALYZE                  COMPLETED  UNITS_CUBE                    CUBE
THAW                     COMPLETED                                BUILD

31 rows selected.
```

Examples

This example uses the default parameters to build UNITS_CUBE.

```
EXECUTE DBMS_CUBE.BUILD('GLOBAL.UNITS_CUBE');
```

The next example builds UNITS_CUBE and explicitly builds two of its dimensions, TIME and CHANNEL. The dimensions use the complete (C) method, and the cube uses the fast solve (S) method.

```
BEGIN
  DBMS_CUBE.BUILD(
    script=>'GLOBAL."TIME", GLOBAL.CHANNEL, GLOBAL.UNITS_CUBE',
    method=>'CCS',
    parallelism=>2);
END;
/
```

The following example loads only the selection of data identified by the WHERE clause:

```
BEGIN
  DBMS_CUBE.BUILD(q'!
  GLOBAL."TIME",
  GLOBAL.CHANNEL,
  GLOBAL.CUSTOMER,
  GLOBAL.PRODUCT,
  GLOBAL.UNITS_CUBE USING (LOAD NO SYNCH
     WHERE UNITS_FACT.MONTH_ID LIKE '2006%'
     AND UNITS_FACT.SALES > 5000)!');
END;
/
```

FOR Clause Example

In this example, the Time dimension is partitioned by calendar year, and DBMS_CUBE builds only the partition identified by CY2006. The HIER_ANCESTOR is an analytic function in the OLAP expression syntax.

```
BEGIN
   dbms_cube.build(q'!
   UNITS_CUBE USING
   (
   FOR "TIME"
     WHERE HIER_ANCESTOR(WITHIN "TIME".CALENDAR LEVEL "TIME".CALENDAR_YEAR) =
'CY2006'
     BUILD (LOAD, SOLVE)
   )!',
   parallelism=>1);
END;
/
```

The next example uses a FOR clause to limit the build to the SALES measure in 2006. All objects are built using the complete (C) method.

```
BEGIN
  DBMS_CUBE.BUILD(
```

```
  script => '
  GLOBAL."TIME",
  GLOBAL.CHANNEL,
  GLOBAL.CUSTOMER,
  GLOBAL.PRODUCT,
  GLOBAL.UNITS_CUBE USING
  (
    FOR MEASURES(GLOBAL.UNITS_CUBE.SALES)
      BUILD(LOAD NO SYNCH WHERE GLOBAL.UNITS_FACT.MONTH_ID LIKE ''2006%'')
   )',
  method => 'C',
  parallelism => 2);
END;
/
```

Write-Back Examples

The following examples show various use of the `SET` command in a `USING` clause.

This example sets Sales Target to Sales increased by 5%:

```
DBMS_CUBE.BUILD('UNITS_CUBE USING(
   SET UNITS_CUBE.SALES_TARGET = UNITS_CUBE.SALES * 1.05, SOLVE)');
```

This example sets the price of the Deluxe Mouse in May 2007 to $29.99:

```
DBMS_CUBE.BUILD('PRICE_CUBE USING(
  SET PRICE_CUBE.UNIT_PRICE["TIME"=''2007.05'', "PRODUCT"=''DLX MOUSE'']
  = 29.99, SOLVE)');
```

The next example contains two SET commands, but does not reaggregate the cube:

```
DBMS_CUBE.BUILD('PRICE_CUBE USING(
   SET PRICE_CUBE.UNIT_PRICE["TIME"=''2006.12'', "PRODUCT"=''DLX MOUSE'']
   = 29.49,
   SET PRICE_CUBE.UNIT_PRICE["TIME"=''2007.05'', "PRODUCT"=''DLX MOUSE'']
   = 29.99)');
```

Dimension Maintenance Example

This script shows dimension maintenance. It adds a new dimension member named `OPT MOUSE` to all hierarchies, alters its position in the Primary hierarchy, assigns it a long description, then deletes it from the dimension.

```
BEGIN
dbms_output.put_line('Add optical mouse');
dbms_cube.build(q'!
   "PRODUCT" using (MERGE INTO ALL HIERARCHIES
   VALUES ('ITEM_OPT MOUSE', 'CLASS_SFT', "PRODUCT"."FAMILY"))
!');

dbms_output.put_line('Alter optical mouse');
dbms_cube.build(q'!
   "PRODUCT" using (UPDATE HIERARCHIES ("PRODUCT"."PRIMARY")
   SET PARENT = 'FAMILY_ACC', LEVEL = "PRODUCT"."ITEM"
   WHERE MEMBER = 'ITEM_OPT MOUSE')
!');

dbms_output.put_line('Provide attributes to optical mouse');
dbms_cube.build(q'!
   "PRODUCT" USING (SET "PRODUCT"."LONG_DESCRIPTION"["PRODUCT" = 'ITEM_OPT MOUSE']
    = CAST('Optical Mouse' AS VARCHAR2))
!');
```

```
dbms_output.put_line('Delete optical mouse');
dbms_cube.build(q'!
   "PRODUCT" USING (DELETE FROM DIMENSION WHERE MEMBER='ITEM_OPT MOUSE')
!');

END;
/
```

OLAP DML Example

This example uses the OLAP DML to add comments to the cube build log:

```
BEGIN
 DBMS_CUBE.BUILD(q'!
  global.units_cube USING (
   EXECUTE OLAP DML 'SHOW STATLEN(units_cube_prt_list)' PARALLEL,
   EXECUTE OLAP DML 'SHOW LIMIT(units_cube_prt_list KEEP ALL)' PARALLEL,
   EXECUTE OLAP DML 'SHOW STATLEN(time)' parallel,
   EXECUTE OLAP DML 'SHOW LIMIT(time KEEP time_levelrel ''CALENDAR_YEAR'')'
parallel)!',
  parallelism=>2,
  add_dimensions=>false);
END;
/
```

This query shows the comments in the cube build log:

```
SELECT partition, slave_number, TO_CHAR(output) output
   FROM cube_build_log
   WHERE command = 'OLAP DML'
   AND status = 'COMPLETED'
   ORDER BY slave_number, time;

PARTITION    SLAVE_NUMBER OUTPUT

```

CREATE_EXPORT_OPTIONS Procedure

This procedure creates an input XML document that describes processing options for the EXPORT_XML Procedure on page 42-46 and the EXPORT_XML_TO_FILE Procedure on page 42-48.

Syntax

```
DBMS_CUBE.CREATE_EXPORT_OPTIONS (
          out_options_xml         IN/OUT  CLOB,
          target_version          IN      VARCHAR2  DEFAULT NULL,
          suppress_owner          IN      BOOLEAN   DEFAULT FALSE,
          suppress_namespace      IN      BOOLEAN   DEFAULT FALSE,
          preserve_table_owners   IN      BOOLEAN   DEFAULT FALSE,
          metadata_changes        IN      CLOB      DEFAULT NULL);
```

Parameters

Table 42–4 CREATE_EXPORT_OPTIONS Procedure Parameters

Parameter	Description
`out_options_xml`	Contains the generated XML document, which can be passed into the `options_xml` parameter of the EXPORT_XML Procedure.
`target_version`	Specifies the version of Oracle Database in which the XML document generated by EXPORT_XML or EXPORT_XML_TO_FILE will be imported. You can specify two to five digits, such as 12.1 or 12.1.0.1.0. This parameter defaults to the current database version, and so can typically be omitted.
`suppress_owner`	Controls the use of the Owner attribute in XML elements and the owner qualifier in object names. Enter `True` to drop the owner from the XML, or enter `False` to retain it. Enter `True` if you plan to import the exported metadata into a different schema.
`suppress_namespace`	Controls the use of Namespace attributes in XML elements and the namespace qualifier in object names. Enter `True` to drop the namespace from the XML, or enter `False` to retain it (default). Enter `True` when upgrading to Oracle OLAP 12*c* metadata. Namespaces allow objects created in Oracle 10*g* to coexist with objects created in Oracle 12*c*. You cannot set or change namespaces.
`preserve_table_owners`	Controls the use of the owner in qualifying table names in the mapping elements, such as GLOBAL.UNITS_HISTORY_FACT instead of UNITS_HISTORY_FACT. Enter `True` to retain the table owner, or enter `False` to default to the current schema for table mappings. If you plan to import the exported metadata to a different schema, you must set this option to `True` to load data from tables and views in the original schema, unless the destination schema has its own copies of the tables and views.
`metadata_changes`	Contains an 12*c* XML description of an object that overwrites the exported object description. The XML document must contain all parent XML elements of the modified element with the attributes needed to uniquely identify them. Use the Name attribute if it exists. See the Examples.

Examples

The following example generates an XML document of export options:

```
DECLARE
   optionsClob  CLOB;

BEGIN
   dbms_lob.createtemporary(optionsClob, false, dbms_lob.CALL);
   dbms_cube.create_export_options(out_options_xml=>optionsClob, suppress_
namespace=>TRUE);
   dbms_output.put_line(optionsClob);
END;
/
```

The `DBMS_OUTPUT.PUT_LINE` procedure displays this XML document (formatted for readability:

```
<?xml version="1.0"?>
<Export TargetVersion="12.1.0.1">
  <ExportOptions>
    <Option Name="SuppressOwner" Value="FALSE"/>
    <Option Name="SuppressNamespace" Value="TRUE"/>
    <Option Name="PreserveTableOwners" Value="FALSE"/>
  </ExportOptions>
</Export>
```

The next example generates an XML document with a metadata change to the mapping of the American long description attribute of the `CHANNEL` dimension.

```
DECLARE
  importClob         clob;
  exportClob         clob;
  overClob           clob;
  exportOptClob      clob;
  importOptClob      clob;

BEGIN
  dbms_lob.createtemporary(overClob, TRUE);
  dbms_lob.open(overClob, DBMS_LOB.LOB_READWRITE);
  dbms_lob.writeappend(overClob,58, '<Metadata Version="1.3"
MinimumDatabaseVersion="12.1.0.1">');
  dbms_lob.writeappend(overClob,34, '<StandardDimension Name="CHANNEL">');
  dbms_lob.writeappend(overClob,75, '<Description Type="Description"
Language="AMERICAN" Value="Sales Channel"/>');
  dbms_lob.writeappend(overClob,20, '</StandardDimension>');
  dbms_lob.writeappend(overClob,11, '</Metadata>');
  dbms_lob.close(overClob);

  -- Enable Oracle Database 12c Release 1 (12.1) clients to access 10g metadata
  dbms_cube.initialize_cube_upgrade;

  -- Create a CLOB containing the export options
  dbms_lob.createtemporary(exportOptClob, TRUE);
  dbms_cube.create_export_options(out_options_xml=>exportOptClob, suppress_
namespace=>TRUE, metadata_changes=>overClob);

  -- Create a CLOB containing the import options
  dbms_lob.createtemporary(importOptClob, TRUE);
  dbms_cube.create_import_options(out_options_xml=>importOptClob, rename_table =>
'MY_OBJECT_MAP');

   -- Create CLOBs for the metadata
  dbms_lob.createtemporary(importClob, TRUE);
  dbms_lob.createtemporary(exportClob, TRUE);
```

```
  -- Export metadata from a 10g analytic workspace to a CLOB
  dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob, out_
xml=>exportClob);

  -- Import metadata from the CLOB
  dbms_cube.import_xml(in_xml => exportClob, options_xml=>importOptClob, out_
xml=>importClob);

  -- Load and aggregate the data
  dbms_cube.build(script=>'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/
```

The following is the content of `exportClob` (formatting added for readability). The XML document changes the description of Channel to Sales Channel.

```
<Metadata Version="1.3" MinimumDatabaseVersion="12.1.0.1">
  <StandardDimension Name="CHANNEL">
    <Description Type="Description" Language="AMERICAN" Value="Sales Channel"/>
  </StandardDimension>
</Metadata>
```

CREATE_IMPORT_OPTIONS Procedure

This procedure creates an input XML document that describes processing options for the IMPORT_XML Procedure on page 42-50.

Syntax

```
DBMS_CUBE.CREATE_IMPORT_OPTIONS (
          out_options_xml  IN/OUT  CLOB,
          validate_only    IN      BOOLEAN   DEFAULT FALSE,
          rename_table     IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 42–5 CREATE_IMPORT_OPTIONS Procedure Parameters

Parameter	Description
out_options_xml	Contains the generated XML document, which can be passed to the options_xml parameter of the IMPORT_XML Procedure.
validate_only	TRUE causes the IMPORT_XML procedure to validate the metadata described in the input file or the in_xml parameter, without committing the changes to the metadata.
rename_table	The name of a table identifying new names for the imported objects, in the form [*schema_name*.]*table_name*. The IMPORT_XML procedure creates objects using the names specified in the table instead of the ones specified in the XML document. See the Usage Notes for the format of the rename table.

Usage Notes

See "Rename Table" on page 42-14.

Examples

This example specifies validation only and a rename table. For an example of the import CLOB being used in an import, see "IMPORT_XML Procedure" on page 42-50.

```
DECLARE
importClob  clob;

BEGIN
  dbms_lob.createtemporary(importClob, TRUE);

  dbms_cube.create_import_options(out_options_xml => importClob, rename_table =>
'MY_OBJECT_MAP', validate_only => TRUE);

  dbms_output.put_line(importClob);
END;
/
```

It generates the following XML document:

```
<?xml version="1.0"?>
<Import>
  <ImportOptions>
    <Option Name="ValidateOnly" Value="TRUE"/>
    <Option Name="RenameTable" Value="MY_OBJECT_MAP"/>
  </ImportOptions>
```

```
</Import>
```

CREATE_MVIEW Function

This function creates a cube materialized view from the definition of a relational materialized view.

Syntax

```
DBMS_CUBE.CREATE_MVIEW (
          mvowner        IN  VARCHAR2,
          mvname         IN  VARCHAR2,
          sam_parameters IN  CLOB  DEFAULT NULL)
    RETURN VARCHAR2;
```

Parameters

Table 42–6 CREATE_MVIEW Function Parameters

Parameter	Description
mvowner	Owner of the relational materialized view.
mvname	Name of the relational materialized view. For restrictions, see "Requirements for the Relational Materialized View" on page 42-6. A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.
sam_parameters	Parameters in the form '*parameter1=value1, parameter2=value2,...*'. See "SQL Aggregation Management Parameters".

SQL Aggregation Management Parameters

The CREATE_MVIEW and DERIVE_FROM_MVIEW functions use the SQL aggregation management (SAM) parameters described in Table 42–7. Some parameters support the development of cubes with advanced analytics. Other parameters support the development of Java applications. The default settings are appropriate for cube materialized views that are direct replacements for relational materialized views.

Table 42–7 SQL Aggregation Management Parameters

Parameter	Description
ADDTOPS	Adds a top level and a level member to every dimension hierarchy in the cube. If the associated relational dimension has no hierarchy, then a dimension hierarchy is created. TRUE: Creates levels named ALL_*dimension* with level members All_*dimension*. (Default) FALSE: Creates only the hierarchies and levels identified by the relational dimensions.
ADDUNIQUEKEYPREFIX	Controls the creation of dimension keys. TRUE: Creates cube dimension keys by concatenating the level name with the relational dimension key. This practice assures that the dimension keys are unique across all levels, such as CITY_NEW_YORK and STATE_NEW_YORK. (Default) FALSE: Uses the relational dimension keys as cube dimension keys.

Table 42–7 (Cont.) SQL Aggregation Management Parameters

Parameter	Description
ATRMAPTYPE	Specifies whether attributes are mapped by hierarchy levels, dimension levels, or both. HIER_LEVEL: Maps attributes to the levels of a particular dimension hierarchy. (Default) DIM_LEVEL: Maps attributes to the levels of the dimension regardless of hierarchy. BOTH: Maps attributes to both dimension and hierarchy levels. AUTO: Maps attributes to the levels of the dimension for a star schema and to the levels of a particular dimension hierarchy for a snowflake schema.
AWNAME	Provides the name of the analytic workspace that owns the cube. Choose a simple database object name of 1 to 30 bytes. The default name is *fact_tablename*_AW*n*.
BUILD	Specifies whether a data refresh will immediately follow creation of the cube materialized view. IMMEDIATE: Refreshes immediately. DEFERRED: Does not perform a data refresh. (Default) **Note**: Only the CREATE_MVIEW function uses this parameter.
CUBEMVOPTION	Controls validation and creation of a cube materialized view. Regardless of this setting, the function creates an analytic workspace containing a cube and its related cube dimensions. COMPLETE_REFRESH: Creates a complete refresh cube materialized view (full update). FAST_REFRESH: Creates a fast refresh materialized view (incremental update). REWRITE_READY: Runs validation checks for a rewrite cube materialized view, but does not create it. REWRITE: Creates a rewrite cube materialized view. REWRITE_WITH_ATTRIBUTES: Creates a rewrite cube materialized view that includes columns with dimension attributes, resulting in faster query response times. (Default) **Note**: *The following settings do not create a cube materialized view.* Use Analytic Workspace Manager to drop an analytic workspace that does not have a cube materialized view. You can use the DROP_MVIEW procedure to delete an analytic workspace only when it supports a cube materialized view. NONE: Does not create a cube materialized view. COMPLETE_REFRESH_READY: Runs validation checks for a complete refresh cube materialized view, but does not create it. FAST_REFRESH_READY: Runs validation checks for fast refresh, but does not create the cube materialized view.
CUBENAME	Provides the name of the cube derived from the relational materialized view. Choose simple database object name of 1 to 30 bytes. The default name is *fact_tablename*_C*n*.

Table 42–7 (Cont.) SQL Aggregation Management Parameters

Parameter	Description
DIMJAVABINDVARS	Supports access by Java programs to the XML document. TRUE: Generates an XML template that uses Java bind variable notation for the names of dimensions. No XML validation is performed. You cannot use the IMPORT_XML procedure to create a cube using this template. FALSE: Generates an XML template that does not support Java bind variables. (Default)
DISABLEQRW	Controls disabling of query rewrite on the source relational materialized view. TRUE: Issues an ALTER MATERIALIZED VIEW *mview_name* DISABLE QUERY REWRITE command. FALSE: No action. **Note**: Only the CREATE_MVIEW function with BUILD=IMMEDIATE uses this parameter.
EXPORTXML	Exports the XML that defines the dimensional objects to a file, which you specify as *dir/filename*. Both the directory and the file name are case sensitive. *dir*: Name of a database directory. *filename*: The name of the file, typically given an XML filename extension.
FILTERPARTITIONANCESTORLEVELS	Controls the generation of aggregate values above the partitioning level of a partitioned cube. TRUE: Removes levels above the partitioning level from the cube. Requests for summary values above the partitioning level are solved by SQL. FALSE: All levels are retained in the cube. Requests for summary values are solved by OLAP. (Default)
LOGDEST	Directs and stores log messages. By default, the messages are not available. SERVEROUT: Sends messages to server output (typically the screen), which is suitable when working interactively such as in SQL*Plus or SQL Developer. TRACEFILE: Sends messages to the session trace file.
PARTITIONOPTION	Controls partitioning of the cube. NONE: Prevents partitioning. DEFAULT: Allows the Sparsity Advisor to determine whether partitioning is needed and how to partition the cube. (Default) FORCE: Partitions the cube even when the Sparsity Advisor recommends against it. The Sparsity Advisor identifies the best dimension, hierarchy, and level to use for partitioning. *dimension.hierarchy.level*: Partitions the cube using the specified dimension, hierarchy, and level.
POPULATELINEAGE	Controls the appearance of attributes in a cube materialized view. TRUE: Includes all dimension attributes in the cube materialized view. (Default) FALSE: Omits all dimension attributes from the cube materialized view.

Table 42–7 (Cont.) SQL Aggregation Management Parameters

Parameter	Description
PRECOMPUTE	Identifies a percentage of the data that is aggregated and stored. The remaining values are calculated as required by queries during the session. *precompute_percentage*[:*precompute_top_percentage*] Specify the top percentage for partitioned cubes. The default value is 35:0, which specifies precomputing 35% of the bottom partition and 0% of the top partition. If the cube is not partitioned, then the second number is ignored.
REMAPCOMPOSITEKEYS	Controls how multicolumn keys are rendered in the cube. TRUE: Creates a unique key attribute whose values are concatenated string expressions with an underscore between the column values. For example, the value BOSTON_MA_USA might be an expression produced from a multicolumn key composed of CITY, STATE, and COUNTRY columns. In addition, an attribute is created for each individual column to store the relational keys. (Default) FALSE: Creates a unique key attribute for each column.
RENDERINGMODE	Controls whether a loss in fidelity between the relational materialized view and the cube materialized view results in a warning message or an exception. See "Requirements for the Relational Materialized View" on page 42-6. LOOSE: Losses are noted in the optional logs generated by the CREATE_MVIEW Function and the DERIVE_FROM_MVIEW Function. No exceptions are raised. (Default) STRICT: Any loss in fidelity raises an exception so that no XML template is created.
SEEFILTERS	Controls whether conditions in the WHERE clause of the relational materialized view's defining query are retained or ignored. TRUE: Renders valid conditions in the XML template. (Default) FALSE: Ignores all conditions.
UNIQUENAMES	Controls whether top level dimensional objects have unique names. Cross namespace conflicts may occur because dimensional objects have different namespaces than relational objects. TRUE: Modifies all relational names when they are rendered in the cube.(Default) FALSE: Duplicates relational names in the cube unless a naming conflict is detected. In that case, a unique name is created.
UNKNOWNKEYASDIM	Controls handling of simple columns with no levels or hierarchies in the GROUP BY clause of the relational materialized view's defining query. TRUE: Renders a simple column without a relational dimension as a cube dimension with no levels or hierarchies. FALSE: Raises an exception when no relational dimension is found for the column. (Default)
VALIDATEXML	Controls whether the generated XML document is validated. TRUE: Validates the template using the VALIDATE_XML procedure. (Default) FALSE: No validation is done.

Returns

The name of the cube materialized view created by the function.

Usage Notes

See "Using SQL Aggregation Management" on page 42-4

Examples

All examples for the SQL Aggregate Management subprograms use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: CAL_MONTH_SALES_MV and FWEEK_PSCAT_SALES_MV.

The following script creates a cube materialized view using CAL_MONTH_SALES_MV as the relational materialized view. It uses all default options.

```
SET serverout ON format wrapped

DECLARE
     salesaw  varchar2(30);

BEGIN
     salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH_SALES_MV');
END;
/
```

The next example sets several parameters for creating a cube materialized view from FWEEK_PSCAT_SALES_MV. These parameters change the cube materialized view in the following ways:

- ADDTOPS: Adds a top level consisting of a single value to the hierarchies. All of the dimensions in Sales History have a top level already.
- PRECOMPUTE: Changes the percentage of materialized aggregates from 35:0 to 40:10.
- EXPORTXML: Creates a text file for the XML document.
- BUILD: Performs a data refresh.

```
DECLARE
     salescubemv   varchar2(30);
     sam_param     clob := 'ADDTOPS=FALSE,
                            PRECOMPUTE=40:10,
                            EXPORTXML=WORK_DIR/sales.xml,
                            BUILD=IMMEDIATE';

BEGIN
     salescubemv := dbms_cube.create_mview('SH', 'FWEEK_PSCAT_SALES_MV',
                     sam_param);
END;
/
```

DERIVE_FROM_MVIEW Function

This function generates an XML template that defines a cube with materialized view capabilities, using the information derived from an existing relational materialized view.

Syntax

```
DBMS_CUBE.DERIVE_FROM_MVIEW (
          mvowner        IN  VARCHAR2,
          mvname         IN  VARCHAR2,
          sam_parameters IN  CLOB  DEFAULT NULL)
     RETURN CLOB;
```

Parameters

Table 42–8 DERIVE_FROM_MVIEW Function Parameters

Parameter	Description
mvowner	Owner of the relational materialized view.
mvname	Name of the relational materialized view. For restrictions, see "Requirements for the Relational Materialized View" on page 42-6. A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.
sam_parameters	Optional list of parameters in the form '*parameter1=value1, parameter2=value2,...*'. See "SQL Aggregation Management Parameters" on page 42-37.

Returns

An XML template that defines an analytic workspace containing a cube enabled as a materialized view.

Usage Notes

To create a cube materialized view from an XML template, use the IMPORT_XML procedure. Then use the REFRESH_MVIEW procedure to refresh the cube materialized view with data.

See "Using SQL Aggregation Management" on page 42-4.

Examples

The following example generates an XML template named sales_cube.xml from the CAL_MONTH_SALES_MV relational materialized view in the SH schema.

```
DECLARE
     salescubexml  clob := null;
     sam_param     clob := 'exportXML=WORK_DIR/sales_cube.xml';

BEGIN
     salescubexml := dbms_cube.derive_from_mview('SH', 'CAL_MONTH_SALES_MV',
     sam_param);
```

```
END;
/
```

DROP_MVIEW Procedure

This procedure drops a cube materialized view and all associated objects from the database. These objects include the dimension materialized views, cubes, cube dimensions, levels, hierarchies, and the analytic workspace.

Syntax

```
DBMS_CUBE.DROP_MVIEW (
          mvowner        IN  VARCHAR2,
          mvname         IN  VARCHAR2,
          sam_parameters IN  CLOB  DEFAULT NULL);
```

Parameters

Table 42–9 DROP_MVIEW Procedure Parameters

Parameter	Description
mvowner	Owner of the cube materialized view
mvname	Name of the cube materialized view
sam_parameters	EXPORTXML: Exports the XML that drops the dimensional objects to a file, which you specify as *dir/filename*. Both the directory and the file name are case sensitive. *dir*: Name of a database directory. *filename*: The name of the file, typically given an XML filename extension.

Usage Notes

Use this procedure to drop a cube materialized view that you created using the CREATE_MVIEW and DERIVE_FROM_MVIEW functions. If you make modifications to the cubes or dimensions, then DROP_MVIEW may not be able to drop the cube materialized view.

Some of the CUBEMVOPTION parameters used by the CREATE_MVIEW and DERIVE_FROM_MVIEW functions do not create a materialized view. Use Analytic Workspace Manager to drop the analytic workspace, cubes, and cube dimensions.

If you use the EXPORTXML parameter, then you can use the XML document to drop the cube materialized view, after you re-create it. Use the IMPORT_XML procedure.

See "Using SQL Aggregation Management" on page 42-4.

Examples

The current schema has four materialized views. CB$CAL_MONTH_SALES is a cube materialized view for the SALES table. CB$TIMES_DIM_D1_CAL_ROLLUP is a cube dimension materialized view for the TIMES_DIM dimension on the TIMES dimension table. The others are relational materialized views.

```
SELECT mview_name FROM user_mviews;

MVIEW_NAME
------------------------------
CB$CAL_MONTH_SALES
CB$TIMES_DIM_D1_CAL_ROLLUP
CAL_MONTH_SALES_MV
```

```
FWEEK_PSCAT_SALES_MV
```

The following command drops both CB$CAL_MONTH_SALES and CB$TIMES_DIM_D1_CAL_ROLLUP.

```
EXECUTE dbms_cube.drop_mview('SH', 'CB$CAL_MONTH_SALES');

Dropped cube organized materialized view "SH"."CAL_MONTH_SALES"
including container analytic workspace "SH"."CAL_MONTH_SALES_AW"
at 20130213 16:31:40.056.
```

This query against the data dictionary confirms that the materialized views have been dropped.

```
SELECT mview_name FROM user_mviews;

MVIEW_NAME
------------------------------
CAL_MONTH_SALES_MV
FWEEK_PSCAT_SALES_MV
```

EXPORT_XML Procedure

This procedure writes OLAP metadata to a CLOB.

Syntax

```
DBMS_CUBE.EXPORT_XML
       (object_ids             IN      VARCHAR2,
        out_xml                IN/OUT  CLOB;

DBMS_CUBE.EXPORT_XML
       (object_ids             IN      VARCHAR2,
        options_xml            IN      CLOB,
        out_xml                IN/OUT  CLOB;

DBMS_CUBE.EXPORT_XML
       (object_ids             IN      VARCHAR2,
        options_dirname        IN      VARCHAR2,
        options_filename       IN      VARCHAR2,
        out_xml                IN/OUT  CLOB;
```

Parameters

Table 42–10 EXPORT_XML Procedure Parameters

Parameter	Description
`object_ids`	Any of these identifiers. ▪ The name of a schema, such as `GLOBAL`. ▪ The fully qualified name of an analytic workspace in the form *`owner.aw_name`*`.AW`, such as `GLOBAL.GLOBAL.AW`. ▪ Cube ▪ Dimension ▪ Named build process ▪ Measure folder You can specify multiple objects by separating the names with commas. **Note**: When exporting an individual object, be sure to export any objects required to reconstruct it. For example, when exporting a cube, you must also export the dimensions of the cube.
`options_dirname`	The case-sensitive name of a database directory that contains *`options_filename`*.
`options_filename`	A file containing an XML document of export options.
`options_xml`	A CLOB variable that contains an XML document of export options. Use the CREATE_EXPORT_OPTIONS Procedure to generate this document.
`out_xml`	A CLOB variable that will store the XML document of OLAP metadata for the objects listed in *`object_ids`*.

Export Options

The default settings for the export options are appropriate in many cases, so you can omit the *`options_xml`* parameter or the *`options_dirname`* and *`options_filename`*

parameters. However, when upgrading Oracle OLAP 10*g* metadata to OLAP 12*c*, you must specify an XML document that changes the default settings. This example changes all of the parameters from False to True; set them appropriately for your schema.

```
<?xml version="1.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
</Export>
```

You can create this XML document manually or by using the CREATE_EXPORT_OPTIONS Procedure on page 42-32.

Usage Notes

See "Upgrading 10g Analytic Workspaces" on page 42-12.

Example

For an example of using `EXPORT_XML` in an upgrade to the same schema, see "Upgrading 10g Analytic Workspaces" on page 42-12.

The following PL/SQL script copies an OLAP 12*c* analytic workspace named `GLOBAL12` from the `GLOBAL_AW` schema to the `GLOBAL` schema. No upgrade is performed.

To upgrade into a different schema, change the example as follows:

- Call the `INITIALIZE_CUBE_UPGRADE` procedure.
- Call the `CREATE_EXPORT_OPTIONS` procedure with the additional parameter setting `SUPPRESS_NAMESPACE=>TRUE`.

The PL/SQL client must be connected to the database as `GLOBAL`. The `GLOBAL` user must have `SELECT` permissions on `GLOBAL_AW.AW$GLOBAL` and on all relational data sources.

```
BEGIN
  -- Create a CLOB for the export options
  dbms_lob.createtemporary(optionsClob, TRUE);
  dbms_cube.create_export_options(out_options_xml=>optionsClob, suppress_
owner=>TRUE, preserve_table_owners=>TRUE);

  -- Create a CLOB for the XML template
  dbms_lob.createtemporary(exportClob, TRUE);

  -- Export metadata from an analytic workspace to a CLOB
  dbms_cube.export_xml(object_ids=>'GLOBAL_AW.GLOBAL12.AW', options_
xml=>optionsClob, out_xml=>exportClob);

  -- Import metadata from the CLOB
  dbms_cube.import_xml(in_xml=>exportClob);

  -- Load and aggregate the data
  dbms_cube.build(script=>'GLOBAL.UNITS_CUBE, GLOBAL.PRICE_AND_COST_CUBE');

END;
/
```

EXPORT_XML_TO_FILE Procedure

This procedure exports OLAP metadata to a file. This file can be imported into a new or existing analytic workspace using the `IMPORT_XML` procedure. In this way, you can create a copy of the analytic workspace in another schema or database.

This procedure can also be used as part of the process for upgrading OLAP standard form metadata contained in an Oracle OLAP 10*g* analytic workspace to OLAP 12*c* format.

Syntax

```
DBMS_CUBE.EXPORT_XML_TO_FILE
       (object_ids             IN      VARCHAR2,
        output_dirname         IN      VARCHAR2,
        output_filename        IN      VARCHAR2;

DBMS_CUBE.EXPORT_XML_TO_FILE
       (object_ids             IN      VARCHAR2,
        options_dirname        IN      VARCHAR2,
        options_filename       IN      VARCHAR2,
        output_dirname         IN      VARCHAR2,
        output_filename        IN      VARCHAR2;
```

Parameters

Table 42–11 EXPORT_XML_TO_FILE Procedure Parameters

Parameter	Description
`object_ids`	Any of these identifiers. ▪ The name of a schema, such as `GLOBAL`. ▪ The fully qualified name of an analytic workspace in the form *`owner.aw_name`*`.AW`, such as `GLOBAL.GLOBAL.AW`. ▪ Cube ▪ Dimension ▪ Named build process ▪ Measure folder You can specify multiple objects by separating the names with commas. **Note**: When exporting an individual object, be sure to export any objects required to reconstruct it. For example, when you export a cube, you must also export the dimensions of the cube.
`options_dirname`	The case-sensitive name of a database directory that contains `options_filename`. See "Export Options".
`options_filename`	The name of a file containing an XML document of export options. See "Export Options".
`output_dirname`	The case-sensitive name of a database directory where *`output_filename`* is created.
`output_filename`	The name of the template file created by the procedure.

Export Options

The default settings for the export options are appropriate in most cases, and you can omit the *options_dirname* and *options_filename* parameters. However, when upgrading Oracle OLAP 10*g* metadata to OLAP 12*c*, you must specify an XML document that changes the default settings, like the following:

```
<?xml version="2.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
</Export>
```

You can create this XML document manually or by using the CREATE_EXPORT_OPTIONS Procedure on page 42-32.

Usage Notes

See "Upgrading 10g Analytic Workspaces" on page 42-12.

Examples

The following example generates an XML file named global.xml in OLAP 12*c* format using the default export settings. The metadata is derived from all analytic workspaces and CWM metadata in the GLOBAL_AW schema. The output file is generated in the WORK_DIR database directory.

```
execute dbms_cube.export_xml_to_file('GLOBAL_AW', 'WORK_DIR', 'global.xml');
```

The next example also generates an XML file named global.xml in OLAP 12*c* format using the export options set in options.xml. The metadata is derived from the GLOBAL analytic workspace in the GLOBAL_AW schema. Both the options file and the output file are in the WORK_DIR database directory.

```
execute dbms_cube.export_xml_to_file('GLOBAL_AW.GLOBAL.AW', 'WORK_DIR',
'options.xml', 'WORK_DIR', 'global.xml');
```

IMPORT_XML Procedure

This procedure creates, modifies, or drops an analytic workspace by using an XML template.

Syntax

```
DBMS_CUBE.IMPORT_XML
       (dirname               IN      VARCHAR2,
        filename              IN      VARCHAR2 );

DBMS_CUBE.IMPORT_XML
       (dirname               IN      VARCHAR2,
        filename              IN      VARCHAR2,
        out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML
       (input_dirname         IN      VARCHAR2,
        input_filename        IN      VARCHAR2
        options_dirname       IN      VARCHAR2,
        options_filename      IN      VARCHAR2,
        out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML
       (in_xml                IN      CLOB );

DBMS_CUBE.IMPORT_XML
       (in_xml                IN      CLOB,
        out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML

       (in_xml                IN      CLOB,
        options_xml           IN      CLOB,
        out_xml               IN/OUT  CLOB );
```

Parameters

Table 42–12 IMPORT_XML Procedure Parameters

Parameter	Description
dirname	The case-sensitive name of a database directory containing the XML document describing an analytic workspace.
filename	A file containing an XML document describing an analytic workspace.
in_xml	A CLOB containing an XML document describing an analytic workspace.
input_dirname	The case-sensitive name of a database directory containing the XML document describing an analytic workspace.
input_filename	A file containing an XML document describing an analytic workspace.
options_dirname	The case-sensitive name of a database directory containing a file of import options.
options_filename	A file of import options.

Table 42–12 (Cont.) IMPORT_XML Procedure Parameters

Parameter	Description
options_xml	An XML document describing the import options. Use the CREATE_IMPORT_OPTIONS Procedure on page 42-35 to generate this document.
out_xml	An XML document that either describes the analytic workspace or, for validation only, describes any errors. It may contain changes that DBMS_CUBE made to the imported XML, such as setting default values or making minor corrections to the XML.

Usage Notes

The XML can define, modify, or drop an entire analytic workspace, or one or more cubes or dimensions. When defining just cubes or dimensions, you must do so within an existing analytic workspace.

You can also use IMPORT_XML to drop an analytic workspace by using the XML document generated by the DROP_MVIEW procedure with the EXPORTXML parameter.

See "Upgrading 10g Analytic Workspaces" on page 42-12.

Example

This example loads an XML template from a file named GLOBAL.XML and located in a database directory named XML_DIR.

```
EXECUTE dbms_cube.import_xml('XML_DIR', 'GLOBAL.XML');
```

The next example exports an OLAP 10*g* template and uses IMPORT_XML to validate it before an upgrade to 12*c*.

```
DECLARE

  exportOptClob clob;
  importOptClob clob;
  importClob    clob;
  exportClob    clob;

BEGIN

  -- Create a CLOB for the export options
  dbms_lob.createtemporary(exportOptClob, TRUE);
  dbms_cube.create_export_options(out_options_xml=>exportOptClob, suppress_
namespace=>TRUE, preserve_table_owners=>TRUE);

  -- Create a CLOB for the XML template
  dbms_lob.createtemporary(exportClob, TRUE);

  -- Create a CLOB for import options
  dbms_lob.createtemporary(importOptClob, TRUE);
  dbms_cube.create_import_options(out_options_xml=>importOptClob, validate_
only=>TRUE);

  -- Create a CLOB for the change log
  dbms_lob.createtemporary(importClob, TRUE);

  -- Enable Oracle Database 12c Release 1 (12.1) clients to access 10g metadata
  dbms_cube.initialize_cube_upgrade;

  -- Export metadata from an analytic workspace to a CLOB
```

```
  dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob, out_
xml=>exportClob);

  /* Import metadata from the CLOB. No objects are committed to the database
     because the validate_only parameter of CREATE_IMPORT_OPTIONS is set to
     TRUE.
  */

  dbms_cube.import_xml(in_xml=>exportClob, options_xml=>importOptClob, out_
xml=>importClob);

   -- Output the metadata changes
  dbms_output.put_line('This is the validation log:');
  dbms_output.put_line(importClob);

END;
/
```

The contents of `importClob` show that the XML is valid. Otherwise, error messages appear in the `<RootCommitResult>` element.

```
This is the validation log:
<?xml version="1.0" encoding="UTF-16"?>
<RootCommitResult>

</RootCommitResult>
```

For an example of `IMPORT_XML` within the context of an upgrade from 10*g* to 12*c* metadata, see "Custom Upgrade" on page 42-16.

INITIALIZE_CUBE_UPGRADE Procedure

This procedure processes analytic workspaces created in Oracle OLAP 10*g* so they can be used by Oracle OLAP 12*c* clients. It processes all analytic workspaces in the current schema. Run this procedure once for each schema in which there are 10*g* analytic workspaces.

Without this processing step, 12*c* clients cannot connect to a database containing a 10*g* analytic workspace with subobjects of a dimension or cube having the same name. Additionally, some DBMS_CUBE procedures and functions, such as EXPORT_XML and EXPORT_XML_TO_FILE, do not work on the 10*g* metadata.

After processing, OLAP 12*c* clients can connect and use the alternate names provided by INITIALIZE_CUBE_UPGRADE for the conflicting subobjects. OLAP 10*g* clients continue to use the original names.

INITIALIZE_CUBE_UPGRADE does not upgrade any OLAP 10*g* objects to OLAP 12*c* format.

See "Upgrading 10g Analytic Workspaces" on page 42-12.

Syntax

```
DBMS_CUBE.INITIALIZE_CUBE_UPGRADE;
```

Usage Notes

This procedure creates and populates a table named CUBE_UPGRADE_INFO. If it already exists, the table is truncated and repopulated.

While the 10*g* namespace allowed subobjects with the same name in the same dimension or cube, the 12*c* namespace does not. When INITIALIZE_CUBE_UPGRADE detects a name conflict among subobjects such as levels, hierarchies, and dimension attributes, it creates a row in CUBE_UPGRADE_INFO providing a new, unique name for each one. Rows may also be created for objects that do not require renaming; these rows are distinguished by a value of 0 or null in the CONFLICT column. Top-level objects, such as dimensions and cubes, are not listed.

You can edit the table using SQL INSERT and UPDATE if you want to customize the names of OLAP 10*g* objects on OLAP 12*c* clients.

The UPGRADE_AW, EXPORT_XML and EXPORT_XML_TO_FILE procedures use the names specified in the NEW_NAME column of the table to identify objects in CWM or OLAP standard form (AWXML) analytic workspaces, rather than the original names.

The following table describes the columns of CUBE_UPGRADE_INFO.

Column	Datatype	NULL	Description
OWNER	VARCHAR2	NOT NULL	Owner of the analytic workspace.
AW	VARCHAR2	NOT NULL	Name of the analytic workspace.
AWXML_ID	VARCHAR2	NOT NULL	Full logical name of the object requiring modification, in the form *simple_name.[subtype_name].object_type*. For example, TIME.DIMENSION and PRODUCT.COLOR.ATTRIBUTE.
NEW_NAME	VARCHAR2	NOT NULL	The name the object will have in Oracle 12*c* after the upgrade.

Column	Datatype	NULL	Description
OBJECT_CLASS	VARCHAR2	--	DerivedMeasure for calculated measures, or empty for all other object types.
CONFLICT	NUMBER	--	Indicates the reason that the row was added to CUBE_UPGRADE_INFO: ■ 0: The object does not have a naming conflict but appears in the table for other reasons. ■ 1: Two objects have the same name and would create a conflict in the OLAP 12*c* namespace. The object type (such as level or hierarchy) will be added to the names.

Examples

The following command creates and populates the CUBE_UPGRADE_INFO table:

```
EXECUTE dbms_cube.initialize_cube_upgrade;
```

The table shows that the OLAP 10*g* analytic workspace has a hierarchy and a level named MARKET_SEGMENT, which will be renamed. The table also contains rows for calculated measures, but these objects do not require renaming: The value of CONFLICT is 0.

```
SELECT awxml_id, new_name, conflict FROM cube_upgrade_info;

AWXML_ID                                    NEW_NAME                    CONFLICT
------------------------------------------- --------------------------- ----------
CUSTOMER.MARKET_SEGMENT.HIERARCHY           MARKET_SEGMENT_HIERARCHY             1
CUSTOMER.MARKET_SEGMENT.LEVEL               MARKET_SEGMENT_LEVEL                 1
UNITS_CUBE.EXTENDED_COST.MEASURE            EXTENDED_COST                        0
UNITS_CUBE.EXTENDED_MARGIN.MEASURE          EXTENDED_MARGIN                      0
UNITS_CUBE.CHG_SALES_PP.MEASURE             CHG_SALES_PP                         0
UNITS_CUBE.CHG_SALES_PY.MEASURE             CHG_SALES_PY                         0
UNITS_CUBE.PCTCHG_SALES_PP.MEASURE          PCTCHG_SALES_PP                      0
UNITS_CUBE.PCTCHG_SALES_PY.MEASURE          PCTCHG_SALES_PY                      0
UNITS_CUBE.PRODUCT_SHARE.MEASURE            PRODUCT_SHARE                        0
UNITS_CUBE.CHANNEL_SHARE.MEASURE            CHANNEL_SHARE                        0
UNITS_CUBE.MARKET_SHARE.MEASURE             MARKET_SHARE                         0
UNITS_CUBE.CHG_EXTMRGN_PP.MEASURE           CHG_EXTMRGN_PP                       0
UNITS_CUBE.CHG_EXTMRGN_PY.MEASURE           CHG_EXTMRGN_PY                       0
UNITS_CUBE.PCTCHG_EXTMRGN_PP.MEASURE        PCTCHG_EXTMRGN_PP                    0
UNITS_CUBE.PCTCHG_EXTMRGN_PY.MEASURE        PCTCHG_EXTMRGN_PY                    0
UNITS_CUBE.CHG_UNITS_PP.MEASURE             CHG_UNITS_PP                         0
UNITS_CUBE.EXTMRGN_PER_UNIT.MEASURE         EXTMRGN_PER_UNIT                     0
UNITS_CUBE.SALES_YTD.MEASURE                SALES_YTD                            0
UNITS_CUBE.SALES_YTD_PY.MEASURE             SALES_YTD_PY                         0
UNITS_CUBE.PCTCHG_SALES_YTD_PY.MEASURE      PCTCHG_SALES_YTD_PY                  0
UNITS_CUBE.SALES_QTD.MEASURE                SALES_QTD                            0
UNITS_CUBE.CHG_UNITS_PY.MEASURE             CHG_UNITS_PY                         0
```

REFRESH_MVIEW Procedure

This procedure refreshes the data in a cube materialized view.

Syntax

```
DBMS_CUBE.REFRESH_MVIEW (
          mvowner              IN  VARCHAR2,
          mvname               IN  VARCHAR2,
          method               IN  VARCHAR2       DEFAULT NULL,
          refresh_after_errors IN  BOOLEAN        DEFAULT FALSE,
          parallelism          IN  BINARY_INTEGER DEFAULT 0,
          atomic_refresh       IN  BOOLEAN        DEFAULT FALSE,
          scheduler_job        IN  VARCHAR2       DEFAULT NULL,
          sam_parameters       IN  CLOB           DEFAULT NULL,
          nested               IN  BOOLEAN        DEFAULT FALSE );
```

Parameters

Table 42–13 REFRESH_MVIEW Procedure Parameters

Parameter	Description
mvowner	Owner of the cube materialized view.
mvname	Name of the cube materialized view.
method	A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated. You can specify a method for each cube in sequential order, or a single method to apply to all cubes. If you list more cubes than methods, then the last method applies to the additional cubes. ■ C: Complete refresh clears all dimension values before loading. (Default) ■ F: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table. ■ ?: Fast refresh if possible, and otherwise a complete refresh. ■ P: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables. ■ S: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values. See the "Usage Notes" for the BUILD procedure on page 42-26 for additional details.
refresh_after_errors	TRUE to roll back just the cube or dimension with errors, and then continue building the other objects. FALSE to roll back all objects in the build.
parallelism	Number of parallel processes to allocate to this job. See the "Usage Notes" for the BUILD procedure for additional details.

Table 42–13 (Cont.) REFRESH_MVIEW Procedure Parameters

Parameter	Description
atomic_refresh	TRUE prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state. FALSE enables users to access intermediate results during an build.
scheduler_job	Any text identifier for the job, which will appear in the log table. The string does not need to be unique.
sam_parameters	None.
nested	TRUE performs nested refresh operations for the specified set of cube materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables. All objects must reside in a single analytic workspace.

Usage Notes

REFRESH_MVIEW changes *mvname* to the name of the cube, then passes the cube name and all parameters to the BUILD procedure. Thus, you can use the BUILD procedure to refresh a cube materialized view. See the "BUILD Procedure" on page 42-19 for additional information about the parameters.

Examples

The following example uses the default settings to refresh a cube materialized view named CB$FWEEK_PSCAT_SALES.

```
SET serverout ON format wrapped

EXECUTE dbms_cube.refresh_mview('SH', 'CB$FWEEK_PSCAT_SALES');
```

The next example changes the refresh method to use fast refresh if possible, continue refreshing after an error, and use two parallel processes.

```
EXECUTE dbms_cube.refresh_mview('SH', 'CB$FWEEK_PSCAT_SALES', '?', TRUE, 2);
```

After successfully refreshing the cube materialized view, REFRESH_MVIEW returns a message like the following:

```
Completed refresh of cube mview "SH"."CB$FWEEK_PSCAT_SALES" at 20130212
15:04:46.370.
```

UPGRADE_AW Procedure

This procedure creates an Oracle OLAP 12*c* analytic workspace from a copy of the metadata contained in an OLAP 10*g* analytic workspace. The original OLAP 10*g* analytic workspace is not affected and can exist at the same time and in the same schema as the OLAP 12*c* analytic workspace.

UPGRADE_AW automatically runs INITIALIZE_CUBE_UPGRADE if the CUBE_UPGRADE_INFO table does not exist. If it does exist, then UPGRADE_AW does not overwrite it, thus preserving any changes you made to the table.

See "Upgrading 10g Analytic Workspaces" on page 42-12.

Syntax

```
DBMS_CUBE.UPGRADE_AW
       (sourceaw              IN  VARCHAR2,
        destaw                IN  VARCHAR2,
        upgoptions            IN  CLOB DEFAULT NULL);
```

Parameters

Table 42–14 UPGRADE_AW Procedure Parameters

Parameter	Description
sourceaw	The name of a 10*g* analytic workspace.
destaw	A new name for the generated 12*c* analytic workspace. It cannot be the same as *sourceaw*.
upgoptions	One or more of these upgrade options, as a string in the form '*OPTION=VALUE*'. Separate multiple options with commas. ■ PRESERVE_TABLE_OWNERS: YES preserves the original source table mappings. Use this option when creating an OLAP 12*c* analytic workspace in a different schema from the 10*g* analytic workspace, and you want the new objects mapped to tables in the original schema. (Default) NO removes the schema owner from the source table mappings. Use this option when creating an OLAP 12*c* analytic workspace in a different schema from the 10*g* analytic workspace, and you want the new objects mapped to tables in the destination schema. ■ RENAME_TABLE: The name of a table that specifies new names for objects as they are created in OLAP 12*c* format. These changes are in addition to those specified by the INITIALIZE_CUBE_UPGRADE procedure. See "CREATE_IMPORT_OPTIONS Procedure" on page 42-35 for information about creating a rename table.

Examples

This example upgrades an OLAP 10*g* analytic workspace named GLOBAL10 to an OLAP 12*c* analytic workspace named GLOBAL12, using a rename table named MY_OBJECT_MAP:

```
BEGIN

  -- Upgrade the analytic workspace
  dbms_cube.upgrade_aw(sourceaw =>'GLOBAL10', destaw => 'GLOBAL12', upgoptions =>
```

```
'RENAME_TABLE=MY_OBJECT_MAP');

  -- Load and aggregate the data
  dbms_cube.build(script=>'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/
```

VALIDATE_XML Procedure

This procedure checks the XML to assure that it is valid without committing the results to the database. It does not create an analytic workspace.

Syntax

```
DBMS_CUBE.VALIDATE_XML
       (dirname               IN  VARCHAR2,
        filename              IN  VARCHAR2 );

DBMS_CUBE.VALIDATE_XML
       (in_xml                IN  CLOB );
```

Parameters

Table 42–15 VALIDATE_XML Procedure Parameters

Parameter	Description
dirname	The case-sensitive name of a database directory.
filename	The name of a file containing an XML template.
IN_XML	The name of a CLOB containing an XML template.

Usage Notes

You should always load a template into the same version and release of Oracle Database as the one used to generate the template. The XML may not be valid if it was generated by a different release of the software.

Example

This example reports a problem in the schema:

```
EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');
BEGIN dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML'); END;

*
ERROR at line 1:
ORA-37162: OLAP error
'GLOBAL.PRICE_CUBE.$AW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for
cube "GLOBAL.PRICE_CUBE" contains multiple BuildSpecifications with the same
name.
'GLOBAL.UNITS_CUBE.$AW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for
cube "GLOBAL.UNITS_CUBE" contains multiple BuildSpecifications with the same
name.
XOQ-01400: invalid metadata objects
ORA-06512: at "SYS.DBMS_CUBE", line 411
ORA-06512: at "SYS.DBMS_CUBE", line 441
ORA-06512: at "SYS.DBMS_CUBE", line 501
ORA-06512: at "SYS.DBMS_CUBE", line 520
ORA-06512: at line 1
```

After the problems are corrected, the procedure reports no errors:

```
EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');

PL/SQL procedure successfully completed.
```

This example loads an XML template into a temporary CLOB, then validates it. The script is named GLOBAL.XML, and it is located in a database directory named XML_DIR.

```
DEFINE xml_file = 'GLOBAL.XML';

SET ECHO ON;
SET SERVEROUT ON;

DECLARE
     xml_file     BFILE := bfilename('XML_DIR', '&xml_file');
     in_xml       CLOB;
     out_xml      CLOB := NULL;
     dest_offset  INTEGER := 1;
     src_offset   INTEGER := 1;
     lang_context INTEGER := 0;
     warning      INTEGER;
BEGIN
     -- Setup the clob from a file
     DBMS_LOB.CREATETEMPORARY(in_xml, TRUE);
     DBMS_LOB.OPEN(in_xml, DBMS_LOB.LOB_READWRITE);
     DBMS_LOB.OPEN(xml_file, DBMS_LOB.FILE_READONLY);
     DBMS_LOB.LOADCLOBFROMFILE(in_xml, xml_file, DBMS_LOB.LOBMAXSIZE,
        dest_offset, src_offset, 0, lang_context, warning);

     -- Validate the xml
     DBMS_CUBE.VALIDATE_XML(in_xml);
END;
/
```

43

DBMS_CUBE_ADVISE

DBMS_CUBE_ADVISE contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite.

This chapter contains the following topics:

- Using DBMS_CUBE_ADVISE
- Summary of DBMS_CUBE_ADVISE Subprograms

> **See Also:** *Oracle OLAP User's Guide* for information about cube materialized views

Using DBMS_CUBE_ADVISE

Security Model

The `MV_CUBE_ADVICE` function requires the `ADVISOR` privilege.

Summary of DBMS_CUBE_ADVISE Subprograms

Table 43–1 Summary of DBMS_CUBE_ADVISE Subprograms

Subprogram	Description
MV_CUBE_ADVICE Function on page 43-5	Evaluates the metadata of a cube materialized view and generates recommendations for constraints, SQL dimension objects, and materialized view logs to support a broad range of query rewrite and fast refresh opportunities.
SET_CNS_EXCEPTION_LOG Procedure on page 43-8	Identifies the name of an exception log used in validated constraints generated by `MV_CUBE_ADVICE`.
TRACE Procedure on page 43-9	Displays or suppresses diagnostic messages for `MV_CUBE_ADVICE`.

MV_CUBE_ADVICE Function

This table function evaluates the metadata for a specified cube materialized view. It generates recommendations and returns them as a SQL result set. These SQL statements can be used to create constraints, SQL dimension objects, and materialized view logs that allow the broadest range of query rewrite transformations and log-based fast refresh of the cube materialized view.

Syntax

```
DBMS_CUBE_ADVISE.MV_CUBE_ADVICE (
          owner        IN  VARCHAR2  DEFAULT USER,
          mvname       IN  VARCHAR2,
          reqtype      IN  VARCHAR2  DEFAULT '0',
          validate     IN  NUMBER    DEFAULT 0)
     RETURN COAD_ADVICE_T  PIPELINED;
```

Parameters

Table 43–2 MV_CUBE_ADVICE Function Parameters

Parameter	Description
owner	Owner of the cube materialized view
mvname	Name of the cube, such as UNITS_CUBE, or the cube materialized view, such as CB$UNITS_CUBE
reqtype	Type of advice to generate: ■ 0: All applicable advice types ■ 1: Column NOT NULL constraints ■ 2: Primary key constraints ■ 3: Foreign key constraints ■ 4: Relational dimension objects ■ 5: Cube materialized view logs with primary key
validate	Validation option: ■ 0: Validate the constraints ■ 1: Do not validate the constraints

Returns

A table of type COAD_ADVICE_T, consisting of a set of rows of type COAD_ADVICE_REC. Table 43–3 describes the columns.

Table 43–3 MV_CUBE_ADVICE Return Values

Column	Datatype	Description
OWNER	VARCHAR2(30)	Owner of the dimensional object identified in APIOBJECT.
APIOBJECT	VARCHAR2(30)	Name of a cube enhanced with materialized view capabilities, such as UNITS_CUBE.
SQLOBJOWN	VARCHAR2(30)	Owner of the relational object identified in SQLOBJECT.
SQLOBJECT	VARCHAR2(65)	Name of the master table, such as UNITS_FACT, or the cube materialized view, such as CB$UNITS_CUBE.

Table 43–3 (Cont.) MV_CUBE_ADVICE Return Values

Column	Datatype	Description
ADVICETYPE	NUMBER(38,0)	Type of recommendation: ■ 1: Create NOT NULL constraints on the foreign key columns ■ 2: Create primary key constraints on the master table ■ 3: Create primary key constraints on the master view ■ 4: Create foreign key constraints on the master table ■ 5: Create foreign key constraints on the master view ■ 6: Create relational dimensions on the master dimension tables ■ 7: Create a materialized view log ■ 8: Compile the materialized view
DISPOSITION	CLOB	Pre-existing conditions that conflict with the recommendations and should be resolved before SQLTEXT can be executed.
SQLTEXT	CLOB	SQL statement that implements the recommendation.
DROPTEXT	CLOB	SQL statement that reverses SQLTEXT. Pre-existing conditions may prevent these statements from restoring the schema to its previous state.

Usage Notes

This function is available in Analytic Workspace Manager as the Materialized View Advisor, which will generate a SQL script with the recommendations.

You can query the returned rows the same as any other table, as shown in the example.

MV_CUBE_ADVICE generates unique object names each time it is called. You should execute the function once, capture the results, and work with those SQL statements.

Take care when dropping database objects. If a table already has a materialized view log, it will have the same name used in the SQL DROP MATERIALIZED VIEW LOG statement in the DROPTEXT column. You should avoid inadvertently dropping materialized view logs, especially when they may be used for remote data replication.

Examples

The following query displays the SQL statements recommended by MV_CUBE_ADVICE. UNITS_FACT is the master table for UNITS_CUBE, and MV_CUBE_ADVICE generates an ALTER TABLE command to add primary key constraints.

It also generates an ALTER MATERIALIZED VIEW command to compile the CB$UNITS_CUBE cube materialized view.

```
SQL> SELECT apiobject, sqlobject, sqltext
      FROM TABLE(dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'));

APIOBJECT    SQLOBJECT       SQLTEXT
------------ --------------- --------------------------------------------
UNITS_CUBE   UNITS_FACT      alter table "GLOBAL"."UNITS_FACT" add constra
                             int "COAD_PK000208" PRIMARY KEY ("CHANNEL_ID"
```

```
                                , "ITEM_ID", "SHIP_TO_ID", "MONTH_ID") rely d
                                isable novalidate

UNITS_CUBE    CB$UNITS_CUBE     alter materialized view "GLOBAL"."CB$UNITS_CU
                                BE" compile
```

SET_CNS_EXCEPTION_LOG Procedure

This procedure identifies the name of an exception log used in validated constraints generated by MV_CUBE_ADVICE.

Syntax

```
DBMS_CUBE_ADVISE.SET_CNS_EXCEPTION_LOG (
       exceptlogtab     IN   VARCHAR2  DEFAULT user.EXCEPTIONS);
```

Parameters

Table 43–4 SET_CNS_EXCEPTION_LOG Procedure Parameters

Parameter	Description
exceptlogtab	The name of an existing exception log.

Usage Notes

To create an exception log, use the utlexcpt.sql or the utlexpt1.sql script before executing SET_CNS_EXCEPTION_LOG.

The validate parameter of MV_CUBE_ADVICE must be set to 1.

Examples

The utlexcpt.sql script creates a table named EXCEPTIONS, and the SET_CNS_EXCEPTION_LOG procedure identifies it as the exception log for MV_CUBE_ADVICE. The ALTER TABLE statement now includes the clause VALIDATE EXCEPTIONS INTO "GLOBAL"."EXCEPTIONS".

```
SQL> @utlexcpt
Table created.

SQL> EXECUTE dbms_cube_advise.set_cns_exception_log;
PL/SQL procedure successfully completed.

SQL> SELECT apiobject, sqlobject, advicetype type, sqltext
     FROM TABLE(
     dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE', '2', 1));

APIOBJECT    SQLOBJECT       TYPE SQLTEXT
------------ --------------- ---- ----------------------------------------------
UNITS_CUBE   UNITS_FACT         2 alter table "GLOBAL"."UNITS_FACT" add constrai
                                  nt "COAD_PK000219" PRIMARY KEY ("CHANNEL_ID",
                                  "ITEM_ID", "SHIP_TO_ID", "MONTH_ID") norely en
                                  able validate exceptions into "GLOBAL"."EXCEPT
                                  IONS"

UNITS_CUBE   CB$UNITS_CUBE      8 alter materialized view "GLOBAL"."CB$UNITS_CUB
                                  E" compile
```

TRACE Procedure

This procedure turns on and off diagnostic messages to server output for the MV_CUBE_ADVICE function.

Syntax

```
DBMS_CUBE_ADVISE.TRACE (
     diaglevel       IN  BINARY_INTEGER DEFAULT 0);
```

Parameters

Table 43–5 TRACE Procedure Parameters

Parameter	Description
diaglevel	0 to turn tracing off, or 1 to turn tracing on.

Examples

The following example directs the diagnostic messages to server output. The SQL*Plus SERVEROUTPUT setting displays the messages.

```
SQL> SET SERVEROUT ON FORMAT WRAPPED
SQL> EXECUTE dbms_cube_advise.trace(1);
DBMS_COAD_DIAG: Changing diagLevel from [0] to [1]

PL/SQL procedure successfully completed.

SQL> SELECT sqlobject, sqltext, droptext
     FROM TABLE(
     dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'))
     WHERE apiobject='UNITS_CUBE';

SQLOBJECT       SQLTEXT                                    DROPTEXT
--------------- ------------------------------------------ ----------------------------------------
UNITS_FACT      alter table "GLOBAL"."UNITS_FACT" add co alter table "GLOBAL"."UNITS_FACT" drop c
                nstraint "COAD_PK000222" PRIMARY KEY ("C onstraint "COAD_PK000222" cascade
                HANNEL_ID", "ITEM_ID", "SHIP_TO_ID", "MO
                NTH_ID") rely disable novalidate

CB$UNITS_CUBE   alter materialized view "GLOBAL"."CB$UNI alter materialized view "GLOBAL"."CB$UNI
                TS_CUBE" compile                         TS_CUBE" compile

44

DBMS_CUBE_LOG

DBMS_CUBE_LOG contains subprograms for creating and managing logs for cubes and cube dimensions.

> **See Also:** *Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topics:

Using DBMS_CUBE_LOG

DBMS_CUBE_LOG manages several logs. These logs enable you to track the progress of long running processes, then use the results to profile performance characteristics. They provide information to help you diagnose and remedy problems that may occur during development and maintenance of a cube, such as hierarchies that are improperly structured in the relational source tables, records that fail to load, or data refreshes that take too long to complete. They also help diagnose performance problems in querying cubes.

Analytic Workspace Manager creates the logs automatically using the default names and types. It also disables the logs when Analytic Workspace Manager is closed. To use the same logs outside of Analytic Workspace Manager, you must first enable them. Alternatively, you can create and manage different logs for use outside of Analytic Workspace Manager.

This section contains the following topics:

Logging Types

Several logs are available, each one dedicated to storing messages of a particular type. You may use all of them or only those that you find particularly valuable. The logs and their contents are described later in this topic.

- Cube Build Log
- Cube Dimension Compile Log
- Cube Operations Log
- Cube Rejected Records Log

`DBMS_CUBE_LOG` provides functions that return the binary integer for each log type. You can produce more readable code by using these functions instead of integers for the argument values of other `DBMS_CUBE_LOG` procedures and functions. Refer to these descriptions:

- TYPE_BUILD Function
- TYPE_DIMENSION_COMPILE Function
- TYPE_OPERATIONS Function
- TYPE_REJECTED_RECORDS Function

Logging Targets

The TABLE_CREATE procedure creates database tables for storing the logs. Using the ENABLE procedure, you can create additional targets with changes in the destination or logging level. For example, you might target the Cube Operations log to both a table and a disk file. These are the available targets:

- Disk file
- LOB
- Database table
- Trace file

See "ENABLE Procedure" on page 44-17 for more information about creating multiple targets.

DBMS_CUBE_LOG provides functions that return the binary integer for each target type. You can produce more readable code by using these functions instead of integers for the argument values of other DBMS_CUBE_LOG procedures and functions. Refer to these descriptions:

- TARGET_FILE Function
- TARGET_LOB Function
- TARGET_TABLE Function
- TARGET_TRACE Function

Verbosity Levels

You can decide how much information is recorded in a log. You may want fewer details when leaving a job to run overnight than when you are monitoring the success of a new build. You can choose from these verbosity levels. Each level adds to the preceding level.

- `LOWEST`: Logs the status of each command used to build the cube dimensions and cubes, the use of slave processes, and summary records. This is the basic logging level.
- `LOW`: Logs messages from the OLAP engine, such as start and finish records for SQL Import, Aggregate, and Update.
- `MEDIUM`: Logs messages at the level used by Analytic Workspace Manager.
- `HIGH`: Logs messages that provide tuning information, such as composite lengths, partitioning details, object sizes, and aggregation work lists. This level is intended for use by Oracle Field Services.
- `HIGHEST`: Logs debugging messages and other information typically sent to a trace file. This level is intended for use by Oracle Support Services.

`DBMS_CUBE_LOG` provides functions that return the binary integer for each verbosity level. You can produce more readable code by using these functions instead of integers for the argument values of other `DBMS_CUBE_LOG` procedures and functions. Refer to these descriptions:

- LEVEL_LOWEST Function
- LEVEL_LOW Function
- LEVEL_MEDIUM Function
- LEVEL_HIGH Function
- LEVEL_HIGHEST Function

Security Model

The TABLE_CREATE procedure requires the CREATE TABLE privilege.

Creating Cube Logs

To store logging information in a database table, you must create that table using the TABLE_CREATE procedure. Cube Build logs are always stored in tables. The ENABLE procedure creates the other target types for the other logs.

To create a Cube Build log:

- Execute the `TABLE_CREATE` procedure.

The following command creates a Cube Build log with the default name of `CUBE_BUILD_LOG`:

```
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_build);
```

To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a database table target:

1. Execute the `TABLE_CREATE` procedure to create the table.
2. Execute the `ENABLE` procedure to begin logging.

These commands create and enable a Cube Operations table with the default name of `CUBE_OPERATIONS_LOG` and the default verbosity level:

```
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_operations);
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations);
```

To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a trace file, disk file, or LOB target:

- Execute the `ENABLE` procedure.

This command enables the Cube Rejected Records log, sets verbosity to the lowest level, and directs the output to a disk file named `rejects.log` in the `WORK_DIR` database directory:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_rejected_records, -
     dbms_cube_log.target_file, dbms_cube_log.level_lowest, -
     'WORK_DIR/rejects.log');
```

Cube Build Log

The Cube Build log provides information about what happened during a build. Use this log to determine whether the build produced the results you were expecting, and if not, why not.

The contents of the Cube Build log are refreshed continuously during a build. You can query the log at any time to evaluate the progress of the build and to estimate the time to completion.

The default name of the Cube Build log is CUBE_BUILD_LOG. The following table describes its contents.

Note: To manage a Cube Build log, use only the TABLE_CREATE and VERSION procedures.

Column	Datatype	NULL	Description
BUILD_ID	NUMBER	--	A unique sequence number for the build. The same number is used for slave processes in a parallel build.
SLAVE_NUMBER	NUMBER	--	A counter for slave processes in a parallel build: 0 is the master process, 1 is the first slave, 2 is the second slave, and so forth.
STATUS	VARCHAR2(10)	--	The current status of the command: STARTED, COMPLETED, FAILED, or WORKING.
COMMAND	VARCHAR2(25)	--	The name of the command being executed, such as BUILD, LOAD, and SOLVE.
BUILD_OBJECT	VARCHAR2(500)	--	The name of the cube or cube dimension being processed.
BUILD_OBJECT_TYPE	VARCHAR2(10)	--	The type of object: CUBE, DIMENSION, or BUILD.
OUTPUT	CLOB	--	Information structured like an XML document about the command, or NULL when there is no additional information, such as for a STARTED row.
AW	VARCHAR2(30)	--	The name of the analytic workspace that contains the objects of the build.
OWNER	VARCHAR2(30)		The owner of the analytic workspace and all the objects of the build.
PARTITION	VARCHAR2(10)	--	The name of the partition being processed, or NULL when the current operation does not correspond to a partition.
SCHEDULER_JOB	VARCHAR2(100)	--	A user-specified string to identify the build.
TIME	TIMESTAMP(6)	--	The time the row is added to the table.
BUILD_SCRIPT	CLOB	--	The cube build script. Populated only in rows where COMMAND is BUILD.
BUILD_TYPE	VARCHAR2(22)	--	The origin of the build: DBMS_CUBE, DBMS_MVIEW, JAVA, or SLAVE.
COMMAND_DEPTH	NUMBER(2)	--	The nesting depth of the command. For example, COMPILE HIERARCHIES is a component step of COMPILE, so if COMPILE has a depth of 1, then COMPILE HIERARCHIES has a depth of 2.

Column	Datatype	NULL	Description
BUILD_SUB_OBJECT	VARCHAR2(30)	--	The name of a subobject being processed, such as a measure that does not inherit the aggregation rules of the cube.
REFRESH_METHOD	VARCHAR2(1)	--	The refresh method, such as C or F, that is associated with the current command. The refresh method is important only for the CLEAR step.
SEQ_NUMBER	NUMBER	--	Not currently used.
COMMAND_NUMBER	NUMBER	--	The sequence number of the command in the current process, which can be used to distinguish the same command on different objects. For example, a LOAD on PRODUCT and a LOAD on TIME.
IN_BRANCH	NUMBER(1)	--	Not currently used.
COMMAND_STATUS_ NUMBER	NUMBER	--	Identifies the sequence number of all rows for a particular command. For example, a particular command might be represented by four rows: The first row has a status of STARTED and the last row has a status of COMPLETED. This column is used for sorting.

Cube Dimension Compile Log

When solving a cube, OLAP checks the dimension hierarchies to make sure they are valid. Errors that occur during this validation are written to the Cube Dimension Compile log. The checks include:

- Circularity: Hierarchies are defined by parent-child relations among dimension members. Circularity occurs when a dimension member is specified as its own ancestor or descendant.
- Hierarchy type: Hierarchies can be level based or value based. You can define a cube so that only level-based hierarchies are valid, such as a cube materialized view.
- Level options: Level-based hierarchies can be regular, ragged, or skip level. You can define a dimension so that only regular hierarchies are valid, such as a Time dimension.

The default name of the Cube Dimension Compile log is `CUBE_DIMENSION_COMPILE`. The following table describes its contents.

Column	Datatype	NULL	Description
`ID`	`NUMBER`	--	Current operation identifier
`SEQ_NUMBER`	`NUMBER`	--	Sequence number in the Cube Build log
`ERROR#`	`NUMBER(8)`	`NOT NULL`	Number of the error being reported
`ERROR_MESSAGE`	`VARCHAR2(2000)`	--	Error message associated with the error
`DIMENSION`	`VARCHAR2(100)`	--	Name of the dimension being compiled
`DIMENSION_MEMBER`	`VARCHAR2(100)`	--	Faulty dimension member
`MEMBER_ANCESTOR`	`VARCHAR2(100)`	--	Parent of `DIMENSION_MEMBER`
`HIERARCHY1`	`VARCHAR2(100)`	--	First hierarchy involved in the error
`HIERARCHY2`	`VARCHAR2(100)`	--	Second hierarchy involved in the error
`ERROR_CONTEXT`	`CLOB`	--	Additional information about the error

Cube Operations Log

The Cube Operations log contains messages and debugging information for all OLAP engine events. You can track current operations at a very detailed level. Using the SQL_ID column, you can join the Cube Operations log to dynamic performance views such as VSQL, VSESSION, and V$SESSION_LONGOPS to see cube operations in the context of other database operations such as I/O Wait and CPU.

The default name of the Cube Operations log is CUBE_OPERATIONS_LOG. The following table describes its contents.

Column	Datatype	NULL	Description
INST_ID	NUMBER	NOT NULL	Instance identifier
SID	NUMBER	NOT NULL	Session identifier
SERIAL#	NUMBER	NOT NULL	Session serial number
USER#	NUMBER	NOT NULL	User identifier
SQL_ID	VARCHAR2(13)	--	Executing SQL statement identifier
JOB	NUMBER	--	Job identifier
ID	NUMBER	--	Current operation identifier
PARENT_ID	NUMBER	--	Parent operation identifier
SEQ_NUMBER	NUMBER	--	Sequence number in the Cube Build log
TIME	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Time the record was added to the Cube Operations log
LOG_LEVEL	NUMBER(4)	NOT NULL	Verbosity level of the record, as specified by the DBMS_CUBE_LOG.ENABLE procedure.
DEPTH	NUMBER(4)	--	Nesting depth of the record. For example, a level of 0 indicates that the operation and suboperation are not nested within other operations and suboperations.
OPERATION	VARCHAR2(15)	NOT NULL	Current operation, such as AGGREGATE, ROWSOURCE, or SQLIMPORT.
SUBOPERATION	VARCHAR2(20)	--	Current suboperation, such as Loading or Import
STATUS	VARCHAR2(10)	NOT NULL	Current status of the operation, such as START, TRACE, COMPLETED, or Failed.
NAME	VARCHAR2(20)	NOT NULL	Name of the record, such as ROWS LOADED, AVE_ROW_LEN, and PAGEPOOLSIZE
VALUE	VARCHAR2(4000)	--	Value of NAME
DETAILS	CLOB	--	Additional information about NAME.

Cube Rejected Records Log

The Cube Rejected Records log contains a summary of the loader job and any records that were rejected because they did not meet the expected format.

A single row in the source table may have errors in more than one field. Each field generates an error in the log, resulting in multiple rows with the same rowid4

in the SOURCE_ROW column.

The default name of the Cube Rejected Records log is CUBE_REJECTED_RECORDS. The following table describes its contents.

Column	Datatype	NULL	Description
ID	NUMBER	--	Current operation identifier
SEQ_NUMBER	NUMBER	--	Sequence number in the Cube Build log
ERROR#	NUMBER(8)	NOT NULL	Number of the error triggered by the record
ERROR_MESSAGE	VARCHAR2	--	Error message associated with the error
RECORD#	NUMBER(38)	--	Input record number
SOURCE_ROW	ROWID	--	Rowid of the row in the source table; null when the source is a view or a query

Summary of DBMS_CUBE_LOG Subprograms

Table 44–1 DBMS_CUBE_LOG Subprograms

Subprogram	Description
DEFAULT_NAME Function on page 44-15	Returns the default table names of the various log types.
DISABLE Procedure on page 44-16	Turns logging off for the duration of a session.
ENABLE Procedure on page 44-17	Turns on logging for the duration of a session, redirects logging to additional output types, and changes the verbosity level in the logs.
FLUSH Procedure on page 44-19	Forces all buffered messages to be written to the logs.
GET_LOG Procedure on page 44-20	Returns the current settings for the level and location of a particular log.
GET_LOG_SPEC Function on page 44-22	Retrieves a description of all active logs.
GET_PARAMETER Function on page 44-23	Returns the current values of the options that control various aspects of logging.
LEVEL_HIGH Function on page 44-24	Returns the integer value of the high verbosity level.
LEVEL_HIGHEST Function on page 44-25	Returns the integer value of the highest verbosity level.
LEVEL_LOW Function on page 44-26	Returns the integer value of the low verbosity level.
LEVEL_LOWEST Function on page 44-27	Returns the integer value of the lowest verbosity level.
LEVEL_MEDIUM Function on page 44-28	Returns the integer value of the medium verbosity level.
SET_LOG_SPEC Procedure on page 44-29	Sets all logging to the values specified in the input string.
SET_PARAMETER Procedure on page 44-30	Sets options that control various aspects of logging.
TABLE_CREATE Procedure on page 44-32	Creates the table targets for the OLAP logs.
TARGET_FILE Function on page 44-33	Returns the integer value of a disk file target.
TARGET_LOB Function on page 44-34	Returns the integer value of a LOB target.
TARGET_TABLE Function on page 44-35	Returns the integer value of a database table target
TARGET_TRACE Function on page 44-36	Returns the integer value of a trace file target.
TYPE_BUILD Function on page 44-37	Returns the integer value of the Cube Build log.
TYPE_DIMENSION_ COMPILE Function on page 44-38	Returns the integer value of the Cube Dimension Compile log.

Table 44–1 (Cont.) DBMS_CUBE_LOG Subprograms

Subprogram	Description
TYPE_OPERATIONS Function on page 44-39	Returns the integer value of the Cube Operations log.
TYPE_REJECTED_ RECORDS Function on page 44-40	Returns the integer value of the Cube Rejected Records log.
VERSION Function on page 44-41	Returns the version number of a specific log table or the current version number of a specific log type.

DEFAULT_NAME Function

This function returns the default table names of the various log types.

Syntax

```
DBMS_CUBE_LOG.DEFAULT_NAME (
           LOG_TYPE       IN   BINARY_INTEGER  DEFAULT TYPE_OPERATIONS)
     RETURN VARCHAR2;
```

Parameters

Table 44–2 DEFAULT_NAME Function Parameters

Parameter	Description
log_type	One of the following log types: ■ 1: TYPE_OPERATIONS ■ 2: TYPE_REJECTED_RECORDS ■ 3: TYPE_DIMENSION_COMPILE ■ 4: TYPE_BUILD See "Logging Types" on page 44-3.

Returns

The default table name of the specified log type.

Examples

This example returns the default name of the Cube Operations log:

```
SELECT dbms_cube_log.default_name FROM dual;

DEFAULT_NAME
------------------------------
CUBE_OPERATIONS_LOG
```

The next example returns the default name of the Cube Rejected Records log:

```
select dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) -
     "Default Name" from dual;

Default Name
-------------------------
CUBE_REJECTED_RECORDS
```

DISABLE Procedure

This procedure turns logging off for the duration of a session, unless logging is explicitly turned on again with the ENABLE procedure.

Syntax

```
DBMS_CUBE_LOG.DISABLE (
          LOG_TYPE       IN   BINARY_INTEGER  DEFAULT,
          LOG_TARGET     IN   BINARY_INTEGER  DEFAULT);
```

Parameters

Table 44–3 DISABLE Procedure Parameters

Parameter	Description
log_type	One of the following log types: ■ 1: TYPE_OPERATIONS ■ 2: TYPE_REJECTED_RECORDS ■ 3: TYPE_DIMENSION_COMPILE **Note**: You cannot disable the Cube Build log with this procedure. See "Logging Types" on page 44-3.
log_target	One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the ENABLE procedure. ■ 1: TARGET_TABLE ■ 2: TARGET_TRACE ■ 3: TARGET_FILE ■ 4: TARGET_LOB See "Logging Targets" on page 44-4

Example

This command disables the dimension compilation error log table:

```
EXECUTE dbms_cube_log.disable(dbms_cube_log.type_dimension_compile);
```

ENABLE Procedure

This procedure turns on logging for the duration of a session or until it is turned off using the DISABLE procedure.

The ENABLE procedure also allows you to direct logging to additional output types and to change the amount of detail in the logs. You can enable a log type to each of the log targets. For example, you can enable the Cube Operations log to the trace file, a table, and a file at different verbosity levels, but you cannot enable the Cube Operations log to two files at the same time.

This procedure also checks the format of the logs and updates them if necessary.

Syntax

```
DBMS_CUBE_LOG.ENABLE (
          LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL);

DBMS_CUBE_LOG.ENABLE (
          LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_LOCATION   IN     VARCHAR2        DEFAULT NULL);

DBMS_CUBE_LOG.ENABLE (
          LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_LOCATION   IN/OUT CLOB );
```

Parameters

Table 44–4 ENABLE Procedure Parameters

Parameter	Description
log_type	One of the following log types: ■ 1: TYPE_OPERATIONS ■ 2: TYPE_REJECTED_RECORDS ■ 3: TYPE_DIMENSION_COMPILE **Note**: You cannot disable the Cube Build log with this procedure. See "Logging Types" on page 44-3.
log_target	One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the ENABLE procedure. ■ 1: TARGET_TABLE ■ 2: TARGET_TRACE ■ 3: TARGET_FILE ■ 4: TARGET_LOB See "Logging Targets" on page 44-4

Table 44–4 (Cont.) ENABLE Procedure Parameters

Parameter	Description
log_level	One of the following log verbosity levels. Each level adds new types of messages to the previous level. ■ 1: LEVEL_LOWEST ■ 2: LEVEL_LOW ■ 3: LEVEL_MEDIUM ■ 4: LEVEL_HIGH ■ 5: LEVEL_HIGHEST See "Verbosity Levels" on page 44-5.
log_location	The full identity of the log, such as *owner.table_name* when log_target is a table.

Examples

The following command enables all cube logs:

```
EXECUTE dbms_cube_log.enable;
```

The following PL/SQL procedure sets the log level to LEVEL_LOWEST:

```
BEGIN
     dbms_cube_log.disable(dbms_cube_log.type_rejected_records);
     dbms_cube_log.enable(dbms_cube_log.type_rejected_records,
          dbms_cube_log.target_table, dbms_cube_log.level_lowest);
END;
/
```

FLUSH Procedure

This procedure forces all buffered messages to be written to the logs. The buffers are flushed automatically throughout a session, but manually flushing them before viewing the logs assures that you can view all of the messages.

Syntax

```
DBMS_CUBE_LOG.FLUSH ( );
```

Example

The following example flushes the buffers for all of the logs:

```
EXECUTE dbms_cube_log.flush;
```

GET_LOG Procedure

This procedure returns the current settings for the level and location of a particular log.

Syntax

```
DBMS_CUBE_LOG.GET_LOG (
          LOG_TYPE       IN   BINARY_INTEGER  DEFAULT TYPE_OPERATIONS,
          LOG_TARGET     IN   BINARY_INTEGER  DEFAULT TARGET_TABLE,
          LOG_LEVEL      OUT  BINARY_INTEGER,
          LOG_LOCATION   OUT  VARCHAR2 );
```

Parameters

Table 44–5 GET_LOG Procedure Parameters

Parameter	Description
log_type	One of the following log types: ■ 1: TYPE_OPERATIONS ■ 2: TYPE_REJECTED_RECORDS ■ 3: TYPE_DIMENSION_COMPILE See "Logging Types" on page 44-3.
log_target	One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the ENABLE procedure. ■ 1: TARGET_TABLE ■ 2: TARGET_TRACE ■ 3: TARGET_FILE ■ 4: TARGET_LOB See "Logging Targets" on page 44-4
log_level	One of the following log verbosity levels. Each level adds new types of messages to the previous level. ■ 1: LEVEL_LOWEST ■ 2: LEVEL_LOW ■ 3: LEVEL_MEDIUM ■ 4: LEVEL_HIGH ■ 5: LEVEL_HIGHEST See "Verbosity Levels" on page 44-5.
log_location	The full identity of the log, such as *owner.table_name* when log_target is a table.

Usage Notes

If log_type is not active, then log_level and log_location are null. Use DBMS_CUBE_LOG.ENABLE to activate a log.

Examples

This PL/SQL procedure provides information about the Cube Rejected Records log:

```
SET serverout ON format wrapped

DECLARE
     myloglevel  binary_integer;
     mylogtarget varchar2(128);

BEGIN
     dbms_cube_log.get_log(dbms_cube_log.type_rejected_records,
     dbms_cube_log.target_table, myloglevel, mylogtarget);

     dbms_output.put_line('Log Level: ' || myloglevel);
     dbms_output.put_line('Log Target: ' || mylogtarget);
END;
/
```

The procedure generates results like the following:

```
Log Level: 5

Log Target: GLOBAL.CUBE_REJECTED_RECORDS
```

GET_LOG_SPEC Function

This function retrieves a description of all active Cube Operations logs, Cube Rejected Records logs, and Cube Dimension Compile logs.

Syntax

```
DBMS_CUBE_LOG.GET_LOG_SPEC ( )
     RETURN VARCHAR2;
```

Returns

The type and target of all active logs.

Usage Notes

You can use the output from this function as the input to `SET_LOG_SPEC`.

Examples

The following example shows that the Cube Operations log, Cube Rejected Records log, and Cube Dimension Compile log are active. The Cube Operations log is stored in the session trace file and the other logs are stored in tables.

```
SELECT dbms_cube_log.get_log_spec FROM dual;

GET_LOG_SPEC
--------------------------------------------------------------------------------
OPERATIONS(TABLE, TRACE) REJECTED_RECORDS(TABLE[DEBUG])
```

GET_PARAMETER Function

This function returns the current values of the options that control various aspects of logging. To set these options, use the SET_PARAMETER function.

Syntax

```
DBMS_CUBE_LOG.GET_PARAMETER (
          LOG_TYPE       IN   BINARY_INTEGER,
          LOG_PARAMETER  IN   BINARY_INTEGER )
     RETURN BINARY_INTEGER;
```

Parameters

Table 44–6 GET_PARAMETER Function Parameters

Parameter	Description
log_type	One of the following log types: ■ 1: TYPE_OPERATIONS ■ 2: TYPE_REJECTED_RECORDS ■ 3: TYPE_DIMENSION_COMPILE See "Logging Types" on page 44-3.
log_parameter	One of the following options: ■ 1: MAX_ERRORS ■ 2: FLUSH_INTERVAL ■ 3: LOG_FULL_RECORD ■ 4: LOG_EVERY_N ■ 5: ALLOW_ERRORS See "SET_PARAMETER Procedure" on page 44-30.

Returns

The value of the specified *log_parameter*.

Examples

This example shows the current maximum number of errors in the Cube Rejected Records log before logging stops. This parameter was previously set with the SET_PARAMETER procedure.

```
SELECT dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1) -
     "Maximum Records" FROM dual;

Maximum Records
---------------
            100
```

LEVEL_HIGH Function

This function returns the integer value of the high verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_HIGH ()
     RETURN BINARY_INTEGER;
```

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the *LOG_LEVEL* parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 44-5.

Example

This command sets the verbosity level of the cube operations table to high:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
     dbms_cube_log.target_table, dbms_cube_log.level_high);
```

LEVEL_HIGHEST Function

This function returns the integer value of the highest verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_HIGHEST ()
     RETURN BINARY_INTEGER;
```

Returns

5

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 44-5.

Example

This command sets the verbosity level of the cube operations table to highest:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
     dbms_cube_log.target_table, dbms_cube_log.level_highest);
```

LEVEL_LOW Function

This function returns the integer value of the low verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_LOW ()
     RETURN BINARY_INTEGER;
```

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 44-5.

Example

This command sets the verbosity level of the cube operations table to low:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
     dbms_cube_log.target_table, dbms_cube_log.level_low);
```

LEVEL_LOWEST Function

This function returns the integer value of the lowest verbosity level. This level logs the status of each command used to build the cube dimensions and cubes, the use of slave processes, and summary records.

Syntax

```
DBMS_CUBE_LOG.LEVEL_LOWEST ()
     RETURN BINARY_INTEGER;
```

Returns

```
1
```

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_LEVEL` parameter in `DBMS_CUBE_LOG` subprograms. See "Verbosity Levels" on page 44-5.

Example

This command sets the verbosity level of the cube operations table to lowest:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
     dbms_cube_log.target_table, dbms_cube_log.level_lowest);
```

LEVEL_MEDIUM Function

This function returns the integer value of the medium verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_MEDIUM ()
     RETURN BINARY_INTEGER;
```

Returns

3

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 44-5.

Example

This command sets the verbosity level of the cube operations table to medium:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
     dbms_cube_log.target_table, dbms_cube_log.level_medium);
```

SET_LOG_SPEC Procedure

This procedure sets all logging to the values specified in the input string.

Syntax

```
DBMS_CUBE_LOG.SET_LOG_SPEC (
          LOG_SPEC       IN   VARCHAR2 );
```

Parameters

Table 44–7 SET_LOG_SPEC Procedure Parameters

Parameter	Description
log_spec	A string consisting of *type*(*target*) pairs. *Type* can be: ■ OPERATIONS ■ REJECTED_RECORDS ■ DIMENSION_COMPILE *Target* can be: ■ TABLE ■ TRACE ■ FILE ■ LOB

Usage Notes

The GET_LOG_SPEC function returns a properly formatted string for SET_LOG_SPEC.

Examples

This PL/SQL procedure disables all logs, verifies that they are disabled, then activates the Cube Operations log and the Cube Rejected Records log.

```
BEGIN
     dbms_cube_log.disable;
     dbms_output.put_line('Cube Logs: ' || dbms_cube_log.get_log_spec);

     dbms_cube_log.set_log_spec('OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)');
     dbms_output.put_line('Cube Logs: ' || dbms_cube_log.get_log_spec);
END;
/
```

The output from the procedure verifies that the DISABLE function de-activated all logs, and the SET_LOG_SPEC function activated two logs:

```
Cube Logs:

Cube Logs: OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)
```

SET_PARAMETER Procedure

This procedure sets options that control various aspects of logging. To obtain the current value of these options, use the GET_PARAMETER function.

Syntax

```
DBMS_CUBE_LOG.SET_PARAMETER (
          LOG_TYPE       IN   BINARY_INTEGER,
          LOG_PARAMETER  IN   BINARY_INTEGER,
          VALUE          IN   BINARY_INTEGER );
```

Parameters

Table 44–8 SET_PARAMETER Procedure Parameters

Parameter	Description
log_type	One of the following log types: ■ 1: TYPE_OPERATIONS ■ 2: TYPE_REJECTED_RECORDS ■ 3: TYPE_DIMENSION_COMPILE ■ 4: TYPE_BUILD See "Logging Types" on page 44-3.
log_parameter	One of the following parameters: ■ 1: MAX_ERRORS Maximum number of records before signalling an end to logging, such as the number of rejected records in the Cube Rejected Records log or the number of compilation errors in the dimension compilation error log. ■ 2: FLUSH_INTERVAL The number of seconds to buffer the records before writing them to a log. When this parameter is 0, the records are written directly to the logs without buffering. ■ 3: LOG_FULL_RECORD Controls logging of rejected records. Set this parameter to one of the following constants: 0: FULL_RECORD_AUTO: Log the full record when no row ID is available. 1: FULL_RECORD_ALWAYS: Always log the full record. 2: FULL_RECORD_NEVER: Never log the full record. ■ 4: LOG_EVERY_N Enters a progress message every *n* rows during data maintenance. ■ 5: ALLOW_ERRORS: Displays logging errors, which are initially turned off to allow processing to proceed.
value	The new value of *log_parameter*.

Examples

This PL/SQL procedure sets the two parameters, then uses the GET_PARAMETER function to show the settings:

```
BEGIN
     dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 1, 150);
     dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 2, 5);

     dbms_output.put_line('Max rejected records: ' ||
        dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1));

     dbms_output.put_line('Buffer time: ' ||
        dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 2) ||
          ' seconds');
END;
/
```

The procedure displays this information:

```
Max rejected records: 150

Buffer time: 5 seconds
```

TABLE_CREATE Procedure

This procedure creates the table targets for the OLAP logs. You must have the CREATE TABLE privilege to use this procedure.

TABLE_CREATE also upgrades existing log tables to the current version while preserving the data.

Syntax

```
DBMS_CUBE_LOG.TABLE_CREATE (
          LOG_TYPE       IN   BINARY_INTEGER  DEFAULT,
          TBLNAME        IN   VARCHAR2        DEFAULT );
```

Parameters

Table 44–9 TABLE_CREATE Procedure Parameters

Parameter	Description
log_type	One of the following log types: ■ 1: TYPE_OPERATIONS ■ 2: TYPE_REJECTED_RECORDS ■ 3: TYPE_DIMENSION_COMPILE ■ 4: TYPE_BUILD See "Logging Types" on page 44-3.
tblname	A table name for the log. These are the default names: ■ CUBE_OPERATIONS_LOG ■ CUBE_REJECTED_RECORDS ■ CUBE_DIMENSION_COMPILE ■ CUBE_BUILD_LOG

Examples

This example creates a Cube Operations log table named CUBE_OPERATIONS_LOG:

```
EXECUTE dbms_cube_log.table_create;
```

This example creates a Cube Rejected Records log table named CUBE_REJECTED_RECORDS:

```
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_rejected_records);
```

The next example creates a Cube Build log table named MY_BUILD_LOG:

```
EXECUTE dbms_cube_log.table_create -
     (dbms_cube_log.type_build, 'MY_BUILD_LOG');
```

TARGET_FILE Function

This function returns the integer value of a file target in DBMS_CUBE_LOG subprograms.

Syntax

```
DBMS_CUBE_LOG.TARGET_FILE ()
     RETURN BINARY_INTEGER;
```

Returns

3

Usage Notes

Use this function instead of its binary integer equivalent for the *LOG_LEVEL* parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets" on page 44-4.

Example

This command disables the Cube Operations log file:

```
EXECUTE dbms_cube_log.disable -
     (dbms_cube_log.type_operations, dbms_cube_log.target_file);
```

TARGET_LOB Function

This function returns the integer value of a LOB target.

Syntax

```
DBMS_CUBE_LOG.TARGET_LOB ()
     RETURN BINARY_INTEGER;
```

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the *LOG_LEVEL* parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets" on page 44-4.

Example

This command disables the Cube Operations log LOB:

```
EXECUTE dbms_cube_log.disable -
     (dbms_cube_log.type_operations, dbms_cube_log.target_lob);
```

TARGET_TABLE Function

This function returns the integer value of a table target.

Syntax

```
DBMS_CUBE_LOG.TARGET_TABLE ()
     RETURN BINARY_INTEGER;
```

Returns

1

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_TARGET` parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Targets" on page 44-4.

Example

This command disables the Cube Operations log table:

```
EXECUTE dbms_cube_log.disable -
     (dbms_cube_log.type_operations, dbms_cube_log.target_table);
```

TARGET_TRACE Function

This function returns the integer value of a trace file target.

Syntax

```
DBMS_CUBE_LOG.TARGET_TRACE ()
     RETURN BINARY_INTEGER;
```

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TARGET parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets" on page 44-4.

Example

This command disables the Cube Operations log trace file:

```
EXECUTE dbms_cube_log.disable -
     (dbms_cube_log.type_operations, dbms_cube_log.target_trace);
```

TYPE_BUILD Function

This function returns the integer value of the Cube Build log.

Syntax

```
DBMS_CUBE_LOG.TYPE_BUILD ()
     RETURN BINARY_INTEGER;
```

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_TYPE` parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Types" on page 44-3.

Example

This query returns the default name of a Cube Build log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_build) "Log Name" -
     FROM dual;

Log Name
-------------------------
CUBE_BUILD_LOG
```

TYPE_DIMENSION_COMPILE Function

This function returns the integer value of the Cube Dimension Compile log.

Syntax

```
DBMS_CUBE_LOG.TYPE_DIMENSION_COMPILE ()
     RETURN BINARY_INTEGER;
```

Returns

```
3
```

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_TYPE` parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Types" on page 44-3.

Example

This query returns the default name of a Cube Dimension Compile log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_dimension_compile) -
     "Log Name" FROM dual;

Log Name
-------------------------
CUBE_DIMENSION_COMPILE
```

TYPE_OPERATIONS Function

This function returns the integer value of the Cube Operations log.

Syntax

```
DBMS_CUBE_LOG.TYPE_OPERATIONS ()
     RETURN BINARY_INTEGER;
```

Returns

```
1
```

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_TYPE` parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Types" on page 44-3.

Example

This query returns the default name of a Cube Dimension Compile log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_operations) "Log Name" -
     FROM dual;

Log Name
-------------------------
CUBE_OPERATIONS_LOG
```

TYPE_REJECTED_RECORDS Function

This function returns the integer value of the cube Cube Rejected Records log.

Syntax

```
DBMS_CUBE_LOG.TYPE_REJECTED_RECORDS ()
     RETURN BINARY_INTEGER;
```

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_TYPE` parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Types" on page 44-3.

Example

This query returns the default name of a Cube Rejected Records log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) -
     "Log Name" FROM dual;

Log Name
-------------------------
CUBE_REJECTED_RECORDS
```

VERSION Function

This function returns the version number of a specific log table or the current version number of a specific log type.

Syntax

```
DBMS_CUBE_LOG.VERSION (
          LOG_TYPE       IN   BINARY_INTEGER  DEFAULT 1,
          TBLNAME        IN   VARCHAR2        DEFAULT NULL)
     RETURN BINARY_INTEGER;
```

Parameters

Table 44–10 VERSION Function Parameters

Parameter	Description
log_type	One of the following log types: ■ 1: TYPE_OPERATIONS ■ 2: TYPE_REJECTED_RECORDS ■ 3: TYPE_DIMENSION_COMPILE ■ 4: TYPE_BUILD See "Logging Types" on page 44-3.
tblname	The name of the log table whose version is returned.

Returns

A version number

Examples

This example returns the current version of the Cube Operations log:

```
SELECT dbms_cube_log.version FROM dual;

   VERSION
----------
         2
```

This example returns the version number of an existing Cube Rejected Records log named CUBE_REJECTED_RECORDS.

```
SELECT dbms_cube_log.version(dbms_cube_log.type_rejected_records, -
     'CUBE_REJECTED_RECORDS') version FROM dual;

   VERSION
----------
         2
```

DBMS_DATA_MINING

The DBMS_DATA_MINING package is the application programming interface for creating, evaluating, and querying data mining models.

- Chapter 46, "DBMS_DATA_MINING_TRANSFORM"
- Chapter 113, "DBMS_PREDICTIVE_ANALYTICS"

This chapter contains the following topics:

Using DBMS_DATA_MINING

This section contains topics that relate to using the `DBMS_DATA_MINING` package.

Overview

Oracle Data Mining supports both supervised and unsupervised data mining. Supervised data mining predicts a target value based on historical data. Unsupervised data mining discovers natural groupings and does not use a target. You can use Oracle Data Mining to mine structured data and unstructured text.

Supervised data mining functions include:

- Classification
- Regression
- Feature Selection (Attribute Importance)

Unsupervised data mining functions include:

- Clustering
- Association
- Feature Extraction
- Anomaly Detection

The steps you use to build and apply a mining model depend on the data mining function and the algorithm being used. The algorithms supported by Oracle Data Mining are listed in Table 45–1.

Table 45–1 Oracle Data Mining Algorithms

Algorithm	Abbreviation	Function
Apriori	AP	Association
Decision Tree	DT	Classification
Expectation Maximization	EM	Clustering
Generalized Linear Model	GLM	Classification, Regression
k-Means	KM	Clustering
Minimum Descriptor Length	MDL	Attribute Importance)
Naive Bayes	NB	Classification
Non-Negative Matrix Factorization	NMF	Feature Extraction
Orthogonal Partitioning Clustering	O-Cluster	Clustering
Singular Value Decomposition and Principal Component Analysis	SVD and PCA	Feature Extraction
Support Vector Machine	SVM	Classification, Regression, Anomaly Detection

Oracle Data Mining supports more than one algorithm for the classification, regression, clustering, and feature extraction mining functions. Each of these mining functions has a default algorithm, as shown in Table 45–2.

Table 45–2 Oracle Data Mining Default Algorithms

Mining Function	Default Algorithm
Classification	Naive Bayes

Table 45–2 (Cont.) Oracle Data Mining Default Algorithms

Mining Function	Default Algorithm
Clustering	*k*-Means
Feature Extraction	Non-Negative Matrix Factorization
Feature Selection	Minimum Descriptor Length
Regression	Support Vector Machine

Security Model

The DBMS_DATA_MINING package is owned by user SYS and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

The DBMS_DATA_MINING package exposes APIs that are leveraged by the Oracle Data Mining component of the Advanced Analytics Option. Users who wish to create mining models in their own schema require the CREATE MINING MODEL system privilege (as well as the CREATE TABLE and CREATE VIEW system privilege). Users who wish to create mining models in other schemas require the CREATE ANY MINING MODEL system privilege (as well as the corresponding table and view creation privileges).

Users have full control over managing models that exist within their own schema. Additional system privileges necessary for managing data mining models in other schemas include ALTER ANY MINING MODEL, DROP ANY MINING MODEL, SELECT ANY MINING MODEL, COMMENT ANY MINING MODEL, and AUDIT ANY.

Individual object privileges on mining models, ALTER MINING MODEL and SELET MINING MODEL, can be used to selectively grant privileges on a model to a different user.

> **See Also:** *Oracle Data Mining User's Guide* for more information about the security features of Oracle Data Mining

Mining Functions

A data mining **function** refers to the methods for solving a given class of data mining problems. The mining function must be specified when a model is created. (See **CREATE_MODEL Procedure**.)

Table 45–3 Mining Functions

Value	Description
ASSOCIATION	Association is a descriptive mining function. An association model identifies relationships and the probability of their occurrence within a data set. Association models use the Apriori algorithm.
ATTRIBUTE_IMPORTANCE	Attribute importance is a predictive mining function, also known as feature selection. An attribute importance model identifies the relative importance of an attribute in predicting a given outcome. Attribute importance models use Minimum Description Length.
CLASSIFICATION	Classification is a predictive mining function. A classification model uses historical data to predict a categorical target. Classification models can use: Naive Bayes, Decision Tree, Logistic Regression, or Support Vector Machine. The default is Naive Bayes. The classification function can also be used for **anomaly detection**. In this case, the SVM algorithm with a null target is used (One-Class SVM).
CLUSTERING	Clustering is a descriptive mining function. A clustering model identifies natural groupings within a data set. Clustering models can use *k*-Means, O-Cluster, or Expectation Maximization. The default is *k*-Means.
FEATURE_EXTRACTION	Feature Extraction is a descriptive mining function. A feature extraction model creates an optimized data set on which to base a model. Feature extraction models can use Non-Negative Matrix Factorization, Singular Value Decomposition, or Principal Component Analysis. Non-Negative Matrix Factorization is the default.
REGRESSION	Regression is a predictive mining function. A regression model uses historical data to predict a numerical target. Regression models can use Support Vector Machine or Linear Regression. The default is Support Vector Machine.

See Also: *Oracle Data Mining Concepts* for more information about mining functions

Model Settings

Oracle Data Mining uses settings to specify the algorithm and other characteristics of a model. Some settings are general, some are specific to a mining function, and some are specific to an algorithm.

All settings have default values. If you want to override one or more of the settings for a model, you must create a settings table. The settings table must have the column names and datatypes shown in Table 45–4.

Table 45–4 Required Columns in the Model Settings Table

Column Name	Datatype
SETTING_NAME	VARCHAR2(30)
SETTING_VALUE	VARCHAR2(4000)

The information you provide in the settings table is used by the model at build time. The name of the settings table is an optional argument to the CREATE_MODEL Procedure.

You can find the settings used by a model by querying the data dictionary view ALL_MINING_MODEL_SETTINGS. This view lists the model settings used by the mining models to which you have access. All the setting values are included in the view, whether default or user-specified.

See Also:

- ALL_MINING_MODEL_SETTINGS in *Oracle Database Reference*
- *Oracle Data Mining User's Guide* for information about specifying model settings

Algorithm Names

The **ALGO_NAME** setting specifies the model algorithm. The values for the ALGO_NAME setting are listed in Table 45–5.

Table 45–5 Algorithm Names

ALGO_NAME Value	Description	Mining Function
ALGO_AI_MDL	Minimum Description Length	Attribute Importance
ALGO_APRIORI_ASSOCIATION_RULES	Apriori	Association Rules
ALGO_DECISION_TREE	Decision Tree	Classification
ALGO_EXPECTATION_MAXIMIZATION	Expectation Maximization	Clustering
ALGO_GENERALIZED_LINEAR_MODEL	Generalized Linear Model	Classification, Regression; also Feature Selection and Extraction
ALGO_KMEANS	Enhanced *k*_Means	Clustering
ALGO_NAIVE_BAYES	Naive Bayes	Classification
ALGO_NONNEGATIVE_MATRIX_FACTOR	Non-Negative Matrix Factorization	Feature Extraction
ALGO_O_CLUSTER	O-Cluster	Clustering
ALGO_SINGULAR_VALUE_DECOMP	Singular Value Decomposition	Feature Extraction
ALGO_SUPPORT_VECTOR_MACHINES	Support Vector Machine	Classification and Regression

See Also: *Oracle Data Mining Concepts* for information about algorithms

Automatic Data Preparation

The **PREP_AUTO** setting indicates whether or not the model will use Automatic Data Preparation (ADP). By default ADP is disabled.

When you enable ADP, the model uses heuristics to transform the build data according to the requirements of the algorithm. The transformation instructions are stored with the model and reused whenever the model is applied. You can view the transformation instructions in the model details (`DBMS_DATA_MINING.GET_MODEL_DETAILS_*` functions).

You can choose to supplement automatic data preparations by specifying additional transformations in the `xform_list` parameter when you build the model. (See "CREATE_MODEL Procedure" on page 45-53.)

If you do not use ADP (default) *and* do not specify transformations in the `xform_list` parameter to `CREATE_MODEL` (also the default), you must implement your own transformations separately in the build, test, and scoring data. You must take special care to implement the exact same transformations in each data set.

If you do not use ADP, but you *do* specify transformations in the `xform_list` parameter to `CREATE_MODEL`, Oracle Data Mining embeds the transformation definitions in the model and prepares the test and scoring data to match the build data.

The values for the `PREP_AUTO` setting are described in Table 45–6.

Table 45–6 PREP_AUTO Setting

PREP_AUTO Value	Description
`PREP_AUTO_OFF`	Disable Automatic Data Preparation (default).
`PREP_AUTO_ON`	Enable Automatic Data Preparation.

See Also: *Oracle Data Mining User's Guide* for information about data transformations

Mining Function Settings

The settings described in Table 45–7 apply to a mining function.

Table 45–7 Mining Function Settings

Mining Function	Setting Name	Setting Value	Description
Association	`ASSO_MAX_RULE_LENGTH`	`TO_CHAR( 2<= numeric_expr <=20)`	Maximum rule length for association rules. Default is 4.
Association	`ASSO_MIN_CONFIDENCE`	`TO_CHAR( 0<= numeric_expr <=1)`	Minimum confidence for association rules. Default is 0.1.
Association	`ASSO_MIN_SUPPORT`	`TO_CHAR( 0<= numeric_expr <=1)`	Minimum support for association rules. Default is 0.1.

Table 45–7 (Cont.) Mining Function Settings

Mining Function	Setting Name	Setting Value	Description
Classification	CLAS_COST_TABLE_NAME	*table_name*	(Decision Tree only) Name of a table that stores a cost matrix to be used by the algorithm in building the model. The cost matrix specifies the costs associated with misclassifications. Only Decision Tree models can use a cost matrix at build time. All classification algorithms can use a cost matrix at apply time. The cost matrix table is user-created. See "ADD_COST_MATRIX Procedure" on page 45-26 for the column requirements. See *Oracle Data Mining Concepts* for information about costs.
Classification	CLAS_PRIORS_TABLE_NAME	*table_name*	(Naive Bayes) Name of a table that stores prior probabilities to offset differences in distribution between the build data and the scoring data. The priors table is user-created. See *Oracle Data Mining User's Guide* for the column requirements. See *Oracle Data Mining Concepts* for additional information about priors.
Classification	CLAS_WEIGHTS_TABLE_NAME	*table_name*	(GLM and SVM only) Name of a table that stores weighting information for individual target values in SVM classification and GLM logistic regression models. The weights are used by the algorithm to bias the model in favor of higher weighted classes. The class weights table is user-created. See *Oracle Data Mining User's Guide* for the column requirements. See *Oracle Data Mining Concepts* for additional information about class weights.
Clustering	CLUS_NUM_CLUSTERS	*TO_CHAR(numeric_expr* >=1)	Maximum number of leaf clusters generated by a clustering algorithm. The algorithm may return fewer clusters, depending on the data. Enhanced *k*-Means usually produces the exact number of clusters specified by CLUS_NUM_CLUSTERS, unless there are fewer distinct data points. Expectation Maximization (EM) may return fewer clusters than the number specified by CLUS_NUM_CLUSTERS depending on the data. The number of clusters returned by EM cannot be greater than the number of components, which is governed by algorithm-specific settings. (See Table 45–10, " Expectation Maximization Settings for Data Preparation and Analysis") Depending on these settings, there may be fewer clusters than components. If component clustering is disabled, the number of clusters equals the number of components. For EM, the default value of CLUS_NUM_CLUSTERS is system-determined. For *k*-Means and O-CLuster, the default is 10.
Feature Extraction	FEAT_NUM_FEATURES	TO_CHAR(*numeric_expr* >=1)	Number of features to be extracted by a feature extraction model. The default is estimated from the data by the algorithm.

See Also: *Oracle Data Mining Concepts* for information about mining functions

Global Settings

The configuration settings in Table 45–8 are applicable to any type of model, but are currently only implemented for specific algorithms.

Table 45–8 Global Settings

Setting Name	Setting Value	Description
ODMS_APPROXIMATE_COMPUTATION	ODMS_APPR_COMP_ENABLE ODMS_APPR_COMP_DISABLE	(EM, GLM, and SVD) Whether the algorithm should use approximate computations to improve performance. For EM, approximation is appropriate for large models with many components and for data sets with many columns. The approximate computation uses localized parameter optimization that restricts learning to parameters that are likely to have the most significant impact on the model. For SVD, approximation is often appropriate for data sets with many columns. An approximate low-rank decomposition provides good solutions at a reasonable computational cost. If you disable ODMS_APPROXIMATE_COMPUTATION for SVD, approximation is dependent on the characteristics of the data. For data sets with more than 2500 attributes (the maximum number of features allowed) only approximate decomposition is possible. If approximate computation is disabled for a data set with more than 2500 attributes, an exception is raised. For GLM, approximation is appropriate for data sets that have many rows and are densely populated (not sparse). Default is system determined.
ODMS_ITEM_ID_COLUMN_NAME	*column_name*	(Association Rules only) Name of a column that contains the items in a transaction. When this setting is specified, the algorithm expects the data to be presented in native transactional format, consisting of two columns: ■ Case ID, either categorical or numerical ■ Item ID, either categorical or numerical, specified by ODMS_ITEM_ID_COLUMN_NAME A typical example of transactional data is market basket data, wherein a case represents a basket that may contain many items. Each item is stored in a separate row, and many rows may be needed to represent a case. The case ID values do not uniquely identify each row. Transactional data is also called multi-record case data. Association Rules is normally used with transactional data, but it can also be applied to single-record case data (similar to other algorithms). For more information about single-record and multi-record case data, see *Oracle Data Mining User's Guide*.
ODMS_ITEM_VALUE_COLUMN_NAME	*column_name*	(Association Rules only) Name of a column that contains a value associated with each item in a transaction. This setting is only used when a value has been specified for ODMS_ITEM_ID_COLUMN_NAME indicating that the data is presented in native transactional format. When ODMS_ITEM_VALUE_COLUMN_NAME is specified, the algorithm expects the build data to consist of three columns: ■ Case ID, either categorical or numerical ■ Item ID, either categorical or numerical, specified by ODMS_ITEM_ID_COLUMN_NAME ■ Item value, either categorical or numerical, specified by ODMS_ITEM_VALUE_COLUMN_NAME The item value column may specify information such as the number of items (for example, three apples) or the type of the item (for example, macintosh apples).

Table 45–8 (Cont.) Global Settings

Setting Name	Setting Value	Description
ODMS_MISSING_VALUE_TREATMENT	ODMS_MISSING_VALUE_MEAN_MODE ODMS_MISSING_VALUE_DELETE_ROW	(GLM only) How to treat missing values in the training data. This setting does not affect the scoring data. The default value is ODMS_MISSING_VALUE_MEAN_MODE, which causes missing numeric values in the training data to be replaced with the mean and missing categorical values in the training data to be replaced with the mode. Oracle Data Mining replaces missing values with the mean (numeric attributes) or the mode (categorical attributes) both at build time and apply time. You can set ODMS_MISSING_VALUE_TREATMENT to ODMS_MISSING_VALUE_DELETE_ROW to override this behavior in the training data. When ODMS_MISSING_VALUE_TREATMENT is set to ODMS_MISSING_VALUE_DELETE_ROW, the rows in the training data that contain missing values are deleted. However, if you want to replicate this missing value treatment in the scoring data, you must perform the transformation explicitly. The value ODMS_MISSING_VALUE_DELETE_ROW is only valid for tables without nested columns. If this value is used with nested data, an exception is raised.
ODMS_ROW_WEIGHT_COLUMN_NAME	*column_name*	(GLM only) Name of a column in the training data that contains a weighting factor for the rows. The column datatype must be NUMBER. Row weights can be used as a compact representation of repeated rows, as in the design of experiments where a specific configuration is repeated several times. Row weights can also be used to emphasize certain rows during model construction. For example, to bias the model towards rows that are more recent and away from potentially obsolete data.
ODMS_TEXT_POLICY_NAME	The name of an Oracle Text POLICY created using CTX_DDL.CREATE_POLICY.	Affects how individual tokens are extracted from unstructured text. For details about CTX_DDL.CREATE_POLICY, see *Oracle Text Reference*.
ODMS_TEXT_MAX_FEATURES	1 <= *value* <= 100000	Maximum number of distinct features, across all text attributes, to use from a document set passed to CREATE_MODEL. The default is 3000.

Algorithm Settings: Decision Tree

These settings configure the behavior of the Decision Tree algorithm.

Table 45–9 Decision Tree Settings

Setting Name	Setting Value	Description
TREE_IMPURITY_METRIC	TREE_IMPURITY_ENTROPY	Tree impurity metric for Decision Tree.
	TREE_IMPURITY_GINI	Tree algorithms seek the best test question for splitting data at each node. The best splitter and split value are those that result in the largest increase in target value homogeneity (purity) for the entities in the node. Purity is measured in accordance with a metric. Decision trees can use either gini (TREE_IMPURITY_GINI) or entropy (TREE_IMPURITY_ENTROPY) as the purity metric. By default, the algorithm uses gini.
TREE_TERM_MAX_DEPTH	TO_CHAR(2<= *numeric_expr* <=20)	Criteria for splits: maximum tree depth (the maximum number of nodes between the root and any leaf node, including the leaf node).
		Default is 7.
TREE_TERM_MINPCT_MODE	TO_CHAR(0<= *numeric_expr* <=10)	No child shall have fewer records than this number, which is expressed as a percentage of the training rows.
		Default is 0.05, indicating 0.05%.
TREE_TERM_MINPCT_SPLIT	TO_CHAR(0 <= *numeric_expr* <=20)	Criteria for splits: minimum number of records in a parent node expressed as a percent of the total number of records used to train the model. No split is attempted if number of records is below this value.
		Default is 0.1, indicating 0.1%.
TREE_TERM_MINREC_NODE	TO_CHAR(*numeric_expr* >=0)	No child shall have fewer records than this number.
		Default is 10.
TREE_TERM_MINREC_SPLIT	TO_CHAR(numeric_expr >=0)	Criteria for splits: minimum number of records in a parent node expressed as a value. No split is attempted if number of records is below this value.
		Default is 20.

See Also: *Oracle Data Mining Concepts* for information about Decision Tree

Algorithm Settings: Expectation Maximization

The settings described in the following tables configure the behavior of the Expectation Maximization algorithm.

- Table 45–10, " Expectation Maximization Settings for Data Preparation and Analysis"
- Table 45–11, " Expectation Maximization Settings for Learning"
- Table 45–12, " Expectation Maximization Settings for Component Clustering"
- Table 45–13, " Expectation Maximization Settings for Cluster Statistics"

See Also: *Oracle Data Mining Concepts* for information about Expectation Maximization

Table 45–10 Expectation Maximization Settings for Data Preparation and Analysis

Setting Name	Setting Value	Description
EMCS_ATTRIBUTE_FILTER	EMCS_ATTR_FILTER_ENABLE EMCS_ATTR_FILTER_DISABLE	Whether or not to include uncorrelated attributes in the model. When EMCS_ATTRIBUTE_FILTER is enabled, uncorrelated attributes are not included. Note: This setting applies only to attributes that are not nested. Default is system-determined.
EMCS_MAX_NUM_ATTR_2D	TO_CHAR(*numeric_expr* >=1)	Maximum number of correlated attributes to include in the model. Note: This setting applies only to attributes that are not nested (2D). Default is 50.
EMCS_NUM_DISTRIBUTION	EMCS_NUM_DISTR_BERNOULLI EMCS_NUM_DISTR_GAUSSIAN EMCS_NUM_DISTR_SYSTEM	The distribution for modeling numeric attributes. Applies to the input table/view as a whole and does not allow per-attribute specifications. The options include Bernoulli, Gaussian, or system-determined distribution. When Bernoulli or Gaussian distribution is chosen, all numerical attributes are modeled using the same type of distribution. When the distribution is system-determined, individual attributes may use different distributions (either Bernoulli or Gaussian), depending on the data. Default is EMCS_NUM_DISTR_SYSTEM.
EMCS_NUM_EQUIWIDTH_BINS	TO_CHAR(1 <*numeric_expr* <=255)	Number of equi-width bins that will be used for gathering cluster statistics for numerical columns. Default is 11.
EMCS_NUM_PROJECTIONS	TO_CHAR(*numeric_expr* >=1)	Specifies the number of projections that will be used for each nested column. If a column has fewer distinct attributes than the specified number of projections, the data will not be projected. The setting applies to all nested columns. Default is 50.
EMCS_NUM_QUANTILE_BINS	TO_CHAR(1 <*numeric_expr* <=255)	Specifies the number of quantile bins that will be used for modeling numerical columns with multivalued Bernoulli distributions. Default is system-determined.
EMCS_NUM_TOPN_BINS	TO_CHAR(1 <*numeric_expr* <=255)	Specifies the number of top-N bins that will be used for modeling categorical columns with multivalued Bernoulli distributions. Default is system-determined.

Table 45–11 Expectation Maximization Settings for Learning

Setting Name	Setting Value	Description
EMCS_CONVERGENCE_CRITERION	EMCS_CONV_CRIT_HELDASIDE EMCS_CONV_CRIT_BIC	The convergence criterion for EM. The convergence criterion may be based on a held-aside data set, or it may be Bayesian Information Criterion. Default is system determined.
EMCS_LOGLIKE_IMPROVEMENT	TO_CHAR(0 < *numeric_expr* < 1)	When the convergence criterion is based on a held-aside data set (EMCS_CONVERGENCE_CRITERION = EMCS_CONV_CRIT_HELDASIDE), this setting specifies the percentage improvement in the value of the log likelihood function that is required for adding a new component to the model. Default value is 0.001.
EMCS_NUM_COMPONENTS	TO_CHAR(*numeric_expr* >=1)	Maximum number of components in the model. The algorithm automatically determines the number of components, based on improvements in the likelihood function or based on regularization, up to the specified maximum. The number of components must be greater than or equal to the number of clusters. Default is 20.
EMCS_NUM_ITERATIONS	TO_CHAR(*numeric_expr* >=1)	Specifies the maximum number of iterations in the EM algorithm. Default is 100.

Table 45–12 Expectation Maximization Settings for Component Clustering

Setting Name	Setting Value	Description
EMCS_CLUSTER_COMPONENTS	EMCS__CLUSTER_COMP_ENABLE EMCS_CLUSTER_COMP_DISABLE	Enables or disables the grouping of EM components into high-level clusters. When disabled, the components themselves are treated as clusters. When component clustering is enabled, model scoring through the SQL CLUSTER function will produce assignments to the higher level clusters. When clustering is disabled, the CLUSTER function will produce assignments to the original components. Default is EMCS_CLUSTER_COMP_ENABLE.
EMCS_CLUSTER_THRESH	TO_CHAR(*numeric_expr* >=1)	Dissimilarity threshold that controls the clustering of EM components. When the dissimilarity measure is less than the threshold, the components are combined into a single cluster. A lower threshold may produce more clusters that are more compact. A higher threshold may produce fewer clusters that are more spread out. Default is 2.
EMCS_LINKAGE_FUNCTION	EMCS_LINKAGE_SINGLE EMCS_LINKAGE_AVERAGE EMCS_LINKAGE_COMPLETE	Allows the specification of a linkage function for the agglomerative clustering step. EMCS_LINKAGE_SINGLE uses the nearest distance within the branch. The clusters tend to be larger and have arbitrary shapes. EMCS_LINKAGE_AVERAGE uses the average distance within the branch. There is less chaining effect and the clusters are more compact. EMCS_LINKAGE_COMPLETE uses the maximum distance within the branch. The clusters are smaller and require strong component overlap. Default is EMCS_LINKAGE_SINGLE.

Table 45–13 Expectation Maximization Settings for Cluster Statistics

Setting Name	Setting Value	Description
EMCS_CLUSTER_STATISTICS	EMCS_CLUS_STATS_ENABLE EMCS_CLUS_STATS_DISABLE	Enables or disables the gathering of descriptive statistics for clusters (centroids, histograms, and rules). When statistics are disabled, model size is reduced, and GET_MODEL_DETAILS_EM only returns taxonomy (hierarchy) and cluster counts. Default is EMCS_CLUS_STATS_ENABLE.
EMCS_MIN_PCT_ATTR_SUPPORT	TO_CHAR(0 < *numeric_expr* < 1)	Minimum support required for including an attribute in the cluster rule. The support is the percentage of the data rows assigned to a cluster that must have non-null values for the attribute. Default is 0.1

Algorithm Settings: Generalized Linear Models

These settings configure the behavior of Generalized Linear Models.

Table 45–14 GLM Settings

Setting Name	Setting Value	Description
GLMS_CONF_LEVEL	TO_CHAR(0< *numeric_expr* <1)	The confidence level for coefficient confidence intervals. The default confidence level is 0.95.
GLMS_DIAGNOSTICS_TABLE_NAME	*table_name*	The name of a table to contain row-level diagnostic information for GLM. The table is created during model build. The specified table name must not be the name of an existing table. If you use a diagnostics table, you must specify a case ID for the model. (See the CREATE_MODEL Procedure.) If you specify a diagnostics table name but do not provide a case ID for the model, an exception is raised. For information about GLM diagnostics, see *Oracle Data Mining Concepts*.
GLMS_FTR_ACCEPTANCE	GLMS_FTR_ACCEPTANCE_STRICT GLMS_FTR_ACCEPTANCE_RELAXED	Whether to use a strict or relaxed approach to feature acceptance. A strict approach guards against spurious features but may miss some true features, especially in small data samples. A relaxed approach is unlikely to miss true features, but might include some spurious features. When feature selection or generation is enabled, the algorithm automatically chooses a strict or relaxed approach to feature acceptance based on the data.
GLMS_FTR_GEN_METHOD	GLMS_FTR_GEN_QUADRATIC GLMS_FTR_GEN_CUBIC	Whether feature generation is quadratic or cubic. When feature generation is enabled, the algorithm automatically chooses the most appropriate feature generation method based on the data.
GLMS_FTR_GENERATION	GLMS_FTR_GENERATION_ENABLE GLMS_FTR_GENERATION_DISABLE	Whether or not feature generation is enabled for GLM. By default, feature generation is not enabled. **Note:** Feature generation can only be enabled when feature selection is also enabled.
GLMS_FTR_IDENTIFICATION	GLMS_FTR_IDENT_QUICK GLMS_FTR_IDENT_COMPLETE	Whether or not GLM uses internal sampling for identifying model features. With sampling, GLM operates on a reduced set of rows and thus can identify the model features more quickly. When GLM operates on all the rows in the data set, the identification of features can be a more lengthy process. By default, GLM chooses whether or not to sample and determines the sample size based on characteristics of the training data, including the number of rows and attributes.

Table 45–14 (Cont.) GLM Settings

Setting Name	Setting Value	Description
GLMS_FTR_SEL_CRIT	GLMS_FTR_SEL_AIC GLMS_FTR_SEL_SBIC GLMS_FTR_SEL_RIC GLMS_FTR_SEL_ALPHA_INV	Feature selection penalty criterion for adding a feature to the model. When feature selection is enabled, the algorithm automatically chooses the penalty criterion based on the data.
GLMS_FTR_SELECTION	GLMS_FTR_SELECTION_ENABLE GLMS_FTR_SELECTION_DISABLE	Whether or not feature selection is enabled for GLM. By default, feature selection is not enabled.
GLMS_MAX_FEATURES	TO_CHAR(0 < *numeric_expr* <= 2000)	When feature selection is enabled, this setting specifies the maximum number of features that can be selected for the final model. By default, the algorithm limits the number of features to ensure sufficient memory.
GLMS_PRUNE_MODEL	GLMS_PRUNE_MODEL_ENABLE GLMS_PRUNE_MODEL_DISABLE	Whether or not to prune the features in the final model. Pruning is based on t-statistics for linear regression or wald statistics for logistic regression. Features are pruned in a loop until all features are statistically significant with respect to the full data. When feature selection is enabled, the algorithm automatically determines whether or not to perform pruning based on the data.
GLMS_REFERENCE_CLASS_NAME	*target_value*	The target value to be used as the reference class in a binary logistic regression model. Probabilities will be produced for the other class. By default, the algorithm chooses the value with the highest prevalence (the most cases) for the reference class.
GLMS_RIDGE_REGRESSION	GLMS_RIDGE_REG_ENABLE GLMS_RIDGE_REG_DISABLE	Whether or not to use ridge regression. Ridge applies to both regression and classification mining functions. When ridge is enabled, prediction bounds are not produced by the PREDICTION_BOUNDS SQL function. By default, the algorithm determines whether or not to use ridge. **Note**: Ridge may only be enabled when feature selection is not specified or has been explicitly disabled. If ridge regression and feature selection are both explicitly enabled, an exception is raised.
GLMS_RIDGE_VALUE	TO_CHAR(*numeric_expr* > 0)	The value of the ridge parameter. This setting is only used when the algorithm is configured to use ridge regression. If ridge regression is enabled internally by the algorithm, the ridge parameter is determined by the algorithm.
GLMS_SELECT_BLOCK	GLMS_SELECT_BLOCK_ENABLE GLMS_SELECT_BLOCK_DISABLE	Whether to add the entire group of values for a categorical attribute to the model all at once or one at a time. A categorical attribute is represented as a collection of binary (exploded) attributes. When GLMS_SELECT_BLOCK is enabled, the values are added all at once. When feature selection is enabled, the algorithm automatically determines whether to add the exploded categorical values all at once or one at a time.
GLMS_VIF_FOR_RIDGE	GLMS_VIF_RIDGE_ENABLE GLMS_VIF_RIDGE_DISABLE	(Linear regression only) Whether or not to produce Variance Inflation Factor (VIF) statistics when ridge is being used. VIF statistics can only be produced when ridge regression is explicitly enabled (GLMS_RIDGE_REGRESSION = GLMS_RIDGE_REG_ENABLE). When ridge is explicitly enabled and you request VIF, the algorithm produces VIF if there is sufficient memory. By default, VIF is not produced when ridge is enabled.

See Also: *Oracle Data Mining Concepts* for information about GLM

Algorithm Settings: *k*-Means

These settings configure the behavior of the *k*-Means algorithm.

Table 45–15 k-Means Settings

Setting Name	Setting Value	Description
KMNS_BLOCK_GROWTH	TO_CHAR(1<*numeric_expr*<=5)	Growth factor for memory allocated to hold cluster data. The default block growth factor is 2
KMNS_CONV_TOLERANCE	TO_CHAR(0<*numeric_expr*<=0.5)	Minimum convergence tolerance for *k*-Means. The algorithm iterates until the minimum convergence tolerance is satisfied or until the maximum number of iterations, specified in KMNS_ITERATIONS, is reached. Decreasing the convergence tolerance produces a more accurate solution but may result in longer run times. The default convergence tolerance is 0.01.
KMNS_DISTANCE	KMNS_COSINE KMNS_EUCLIDEAN KMNS_FAST_COSINE	Distance function for *k*-Means. The default distance function is euclidean.
KMNS_ITERATIONS	TO_CHAR(*positive_numeric_expr*)	Maximum number of iterations for *k*-Means. The algorithm iterates until either the maximum number of iterations is reached or the minimum convergence tolerance, specified in KMNS_CONV_TOLERANCE, is satisfied. The default number of iterations is 3.
KMNS_MIN_PCT_ATTR_SUPPORT	TO_CHAR(0<=*numeric_expr*<=1)	Minimum percentage of attribute values that must be non-null in order for the attribute to be included in the rule description for the cluster. If the data is sparse or includes many missing values, a minimum support that is too high can cause very short rules or even empty rules. The default minimum support is 0.1.
KMNS_NUM_BINS	TO_CHAR(*numeric_expr*>0)	Number of bins in the attribute histogram produced by *k*-Means. The bin boundaries for each attribute are computed globally on the entire training data set. The binning method is equi-width. All attributes have the same number of bins with the exception of attributes with a single value that have only one bin. The default number of histogram bins is 10.
KMNS_SPLIT_CRITERION	KMNS_SIZE KMNS_VARIANCE	Split criterion for *k*-Means. The split criterion controls the initialization of new *k*-Means clusters. The algorithm builds a binary tree and adds one new cluster at a time. When the split criterion is based on size, the new cluster is placed in the area where the largest current cluster is located. When the split criterion is based on the variance, the new cluster is placed in the area of the most spread-out cluster. The default split criterion is the variance.

See Also: *Oracle Data Mining Concepts* for information about *k*-Means

Algorithm Settings: Naive Bayes

These settings configure the behavior of the Naive Bayes Algorithm.

Table 45–16 Naive Bayes Settings

Setting Name	Setting Value	Description
NABS_PAIRWISE_THRESHOLD	TO_CHAR(0<= *numeric_expr* <=1)	Value of pairwise threshold for NB algorithm Default is 0.01.
NABS_SINGLETON_THRESHOLD	TO_CHAR(0<= *numeric_expr* <=1)	Value of singleton threshold for NB algorithm Default value is 0.01

See Also: *Oracle Data Mining Concepts* for information about Naive Bayes

Algorithm Settings: Non-Negative Matrix Factorization

These settings configure the behavior of the Non-Negative Matrix Factorization algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Database Reference* for information about *_MINING_MODEL_SETTINGS.

Table 45–17 NMF Settings

Setting Name	Setting Value	Description
NMFS_CONV_TOLERANCE	TO_CHAR(0< *numeric_expr* <=0.5)	Convergence tolerance for NMF algorithm Default is 0.05
NMFS_NONNEGATIVE_SCORING	NMFS_NONNEG_SCORING_ENABLE NMFS_NONNEG_SCORING_DISABLE	Whether negative numbers should be allowed in scoring results. When set to NMFS_NONNEG_SCORING_ENABLE, negative feature values will be replaced with zeros. When set to NMFS_NONNEG_SCORING_DISABLE, negative feature values will be allowed. Default is NMFS_NONNEG_SCORING_ENABLE
NMFS_NUM_ITERATIONS	TO_CHAR(1 <= *numeric_expr* <=500)	Number of iterations for NMF algorithm Default is 50
NMFS_RANDOM_SEED	TO_CHAR(*numeric_expr*)	Random seed for NMF algorithm. Default is –1.

See Also: *Oracle Data Mining Concepts* for information about NMF

Algorithm Settings: O-Cluster

These settings configure the behavior of the O-Cluster algorithm.

Table 45–18 O-CLuster Settings

Setting Name	Setting Value	Description
OCLT_MAX_BUFFER	TO_CHAR(*numeric_expr* >0)	Buffer size for O-Cluster. Default is 50,000.
OCLT_SENSITIVITY	TO_CHAR(0 <=*numeric_expr* <=1)	A fraction that specifies the peak density required for separating a new cluster. The fraction is related to the global uniform density. Default is 0.5.

See Also: *Oracle Data Mining Concepts* for information about O-Cluster

Algorithm Constants and Settings: Singular Value Decomposition

The following constant affects the behavior of the Singular Value Decomposition algorithm.

Table 45–19 Singular Value Decomposition Constant

Constant Name	Constant Value	Description
SVDS_MAX_NUM_FEATURES	2500	The maximum number of features supported by SVD.

These settings configure the behavior of the Singular Value Decomposition algorithm.

Table 45–20 Singular Value Decomposition Settings

Setting Name	Setting Value	Description
SVDS_U_MATRIX_OUTPUT	SVDS_U_MATRIX_ENABLE	Whether or not to persist the U matrix produced by SVD.
	SVDS_U_MATRIX_DISABLE	The U matrix in SVD has as many rows as the number of rows in the build data. To avoid creating a large model, the U matrix is persisted only when SVDS_U_MATRIX_OUTPUT is enabled. When SVDS_U_MATRIX_OUTPUT is enabled, the build data must include a case ID. If no case ID is present and the U matrix is requested, an exception is raised. Default is SVDS_U_MATRIX_DISABLE.
SVDS_SCORING_MODE	SVDS_SCORING_SVD	Whether to use SVD or PCA scoring for the model.
	SVDS_SCORING_PCA	When the build data is scored with SVD, the projections will be the same as the U matrix. When the build data is scored with PCA, the projections will be the product of the U and S matrices. Default is SVDS_SCORING_SVD.

See Also: *Oracle Data Mining Concepts*

Algorithm Settings: Support Vector Machine

These settings configure the behavior of the Support Vector Machine algorithm.

Table 45–21 SVM Settings

Setting Name	Setting Value	Description
SVMS_ACTIVE_LEARNING	SVMS_AL_DISABLE SVMS_AL_ENABLE	Whether active learning is enabled or disabled. By default, active learning is enabled. When active learning is enabled, the SVM algorithm uses active learning to build a reduced size model. When active learning is disabled, the SVM algorithm builds a standard model.
SVMS_COMPLEXITY_FACTOR	TO_CHAR(*numeric_expr* >0)	Value of complexity factor for SVM algorithm (both classification and regression). Default value estimated from the data by the algorithm.
SVMS_CONV_TOLERANCE	TO_CHAR(*numeric_expr* >0)	Convergence tolerance for SVM algorithm. Default is 0.001.
SVMS_EPSILON	TO_CHAR(*numeric_expr* >0)	Value of epsilon factor for SVM regression. Default value estimated from the data by the algorithm.
SVMS_KERNEL_CACHE_SIZE	TO_CHAR(*numeric_expr* >0)	Value of kernel cache size for SVM algorithm. Applies to Gaussian kernel only. Default is 50000000 bytes.

Table 45–21 (Cont.) SVM Settings

Setting Name	Setting Value	Description
SVMS_KERNEL_FUNCTION	svm_gaussian svms_linear	Kernel for Support Vector Machine. The default is determined by the algorithm based on the number of attributes in the training data. When there are many attributes, the algorithm uses a linear kernel, otherwise it uses a nonlinear (Gaussian) kernel. The number of attributes does not correspond to the number of columns in the training data. The algorithm explodes categorical attributes to binary, numeric attributes. In addition, Oracle Data Mining handles each row in a nested column as a separate attribute. SVM takes these factors into account when choosing the kernel function.
SVMS_OUTLIER_RATE	TO_CHAR(*0< numeric_expr* <1)	The desired rate of outliers in the training data. Valid for One-Class SVM models only (anomaly detection). Default is.1.
SVMS_STD_DEV	TO_CHAR(*numeric_expr* >0)	Value of standard deviation for SVM algorithm. This is applicable only for Gaussian kernel. Default value estimated from the data by the algorithm.

See Also: *Oracle Data Mining Concepts* for information about SVM

Datatypes

The DBMS_DATA_MINING package defines object datatypes for storing information about model attributes. Most of these types are returned by the table functions GET_*n*, where *n* identifies the type of information to return. These functions take a model name as input and return the requested information as a collection of rows. For a list of the GET functions, see "Summary of DBMS_DATA_MINING Subprograms" on page 45-24.

The DBMS_DATA_MINING package also defines object datatypes for mining transactional data. These types are called DM_NESTED_*n*, where *n* identifies the Oracle datatype of the nested attributes. For more information about mining nested data, see *Oracle Data Mining User's Guide*.

All the table functions use pipelining, which causes each row of output to be materialized as it is read from model storage, without waiting for the generation of the complete table object. For more information on pipelined, parallel table functions, consult the *Oracle Database PL/SQL Language Reference.*

The Data Mining object datatypes are described in Table 45–22.

Table 45–22 DBMS_DATA_MINING Summary of Datatypes

Datatype	Description
DM_CENTROID	The centroid of a cluster.
DM_CENTROIDS	A collection of DM_CENTROID. A member of DM_CLUSTER.
DM_CHILD	A child node of a cluster.
DM_CHILDREN	A collection of DM_CHILD. A member of DM_CLUSTER.
DM_CLUSTER	A cluster. A cluster includes DM_PREDICATES, DM_CHILDREN, DM_CENTROIDS, and DM_HISTOGRAMS. It also includes a DM_RULE.
DM_CLUSTERS	A collection of DM_CLUSTER. Returned by GET_MODEL_DETAILS_KM Function, GET_MODEL_DETAILS_OC Function, and GET_MODEL_DETAILS_EM Function.
DM_CONDITIONAL	The conditional probability of an attribute in a Naive Bayes model.
DM_CONDITIONALS	A collection of DM_CONDITIONAL. Returned by GET_MODEL_DETAILS_NB Function.
DM_COST_ELEMENT	The actual and predicted values in a cost matrix.
DM_COST_MATRIX	A collection of DM_COST_ELEMENT. Returned by GET_MODEL_COST_MATRIX Function.
DM_EM_COMPONENT	A component of an Expectation Maximization model.
DM_EM_COMPONENT_SET	A collection of DM_EM_COMPONENT. Returned by GET_MODEL_DETAILS_EM_COMP Function.
DM_EM_PROJECTION	A projection of an Expectation Maximization model.
DM_EM_PROJECTION_SET	A collection of DM_EM_PROJECTION. Returned by GET_MODEL_DETAILS_EM_PROJ Function.
DM_GLM_COEFF	The coefficient and associated statistics of an attribute in a Generalized Linear Model.
DM_GLM_COEFF_SET	A collection of DM_GLM_COEFF. Returned by GET_MODEL_DETAILS_GLM Function.
DM_HISTOGRAM_BIN	A histogram associated with a cluster.

Table 45–22 (Cont.) DBMS_DATA_MINING Summary of Datatypes

Datatype	Description
DM_HISTOGRAMS	A collection of DM_HISTOGRAM_BIN. A member of DM_CLUSTER.
DM_ITEM	An item in an association rule.
DM_ITEMS	A collection of DM_ITEM.
DM_ITEMSET	A collection of DM_ITEMS.
DM_ITEMSETS	A collection of DM_ITEMSET. Returned by GET_FREQUENT_ITEMSETS Function.
DM_MODEL_GLOBAL_DETAIL	High-level statistics about a model.
DM_MODEL_GLOBAL_DETAILS	A collection of DM_MODEL_GLOBAL_DETAIL. Returned by GET_MODEL_DETAILS_GLOBAL Function.
DM_NB_DETAIL	Information about an attribute in a Naive Bayes model.
DM_NB_DETAILS	A collection of DM_DB_DETAIL. Returned by GET_MODEL_DETAILS_NB Function.
DM_NESTED_BINARY_DOUBLE	The name and value of a numerical attribute of type BINARY_DOUBLE.
DM_NESTED_BINARY_DOUBLES	A collection of DM_NESTED_BINARY_DOUBLE.
DM_NESTED_BINARY_FLOAT	The name and value of a numerical attribute of type BINARY_FLOAT.
DM_NESTED_BINARY_FLOATS	A collection of DM_NESTED_BINARY_FLOAT.
DM_NESTED_CATEGORICAL	The name and value of a categorical attribute of type CHAR, VARCHAR, or VARCHAR2.
DM_NESTED_CATEGORICALS	A collection of DM_NESTED_CATEGORICAL.
DM_NESTED_NUMERICAL	The name and value of a numerical attribute of type NUMBER or FLOAT.
DM_NESTED_NUMERICALS	A collection of DM_NESTED_NUMERICAL.
DM_NMF_ATTRIBUTE	An attribute in a feature of a Non-Negative Matrix Factorization model.
DM_NMF_ATTRIBUTE_SET	A collection of DM_NMF_ATTRIBUTE. A member of DM_NMF_FEATURE.
DM_NMF_FEATURE	A feature in a Non-Negative Matrix Factorization model.
DM_NMF_FEATURE_SET	A collection of DM_NMF_FEATURE. Returned by GET_MODEL_DETAILS_NMF Function.
DM_PREDICATE	Antecedent and consequent in a rule.
DM_PREDICATES	A collection of DM_PREDICATE. A member of DM_RULE and DM_CLUSTER. Predicates are returned by GET_ASSOCIATION_RULES Function, GET_MODEL_DETAILS_EM Function, GET_MODEL_DETAILS_KM Function, and GET_MODEL_DETAILS_OC Function.
DM_RANKED_ATTRIBUTE	An attribute ranked by its importance in an Attribute Importance model.
DM_RANKED_ATTRIBUTES	A collection of DM_RANKED_ATTRIBUTE. Returned by GET_MODEL_DETAILS_AI Function.

Table 45–22 (Cont.) DBMS_DATA_MINING Summary of Datatypes

Datatype	Description
DM_RULE	A rule that defines a conditional relationship. The rule can be one of the association rules returned by GET_ASSOCIATION_RULES Function, or it can be a rule associated with a cluster in the collection of clusters returned by GET_MODEL_DETAILS_KM Function and GET_MODEL_DETAILS_OC Function.
DM_RULES	A collection of DM_RULE. Returned by GET_ASSOCIATION_RULES Function.
DM_SVD_MATRIX	A factorized matrix S, V, or U returned by a Singular Value Decomposition model.
DM_SVD_MATRIX_SET	A collection of DM_SVD_MATRIX. Returned by GET_MODEL_DETAILS_SVD Function.
DM_SVM_ATTRIBUTE	The name, value, and coefficient of an attribute in a Support Vector Machine model.
DM_SVM_ATTRIBUTE_SET	A collection of DM_SVM_ATTRIBUTE. Returned by GET_MODEL_DETAILS_SVM Function. Also a member of DM_SVM_LINEAR_COEFF.
DM_SVM_LINEAR_COEFF	The linear coefficient of each attribute in a Support Vector Machine model.
DM_SVM_LINEAR_COEFF_SET	A collection of DM_SVM_LINEAR_COEFF. Returned by GET_MODEL_DETAILS_SVM Function for an SVM model built using the linear kernel.
DM_TRANSFORM	The transformation and reverse transformation expressions for an attribute.
DM_TRANSFORMS	A collection of DM_TRANSFORM. Returned by GET_MODEL_TRANSFORMATIONS Function.
TRANSFORM_LIST	A list of user-specified transformations for a model. Accepted as a parameter by the CREATE_MODEL Procedure. This collection type is defined in the DBMS_DATA_MINING_TRANSFORM package.

Summary of DBMS_DATA_MINING Subprograms

Table 45–23 summarizes the subprograms included in the `DBMS_DATA_MINING` package.

Table 45–23 DBMS_DATA_MINING Package Subprograms

Subprogram	Purpose
ADD_COST_MATRIX Procedure on page 45-26	Adds a cost matrix to a classification model
ALTER_REVERSE_EXPRESSION Procedure on page 45-29	Changes the reverse transformation expression to an expression that you specify
APPLY Procedure on page 45-33	Applies a model to a data set (scores the data)
COMPUTE_CONFUSION_MATRIX Procedure on page 45-37	Computes the confusion matrix for a classification model
COMPUTE_LIFT Procedure on page 45-43	Computes lift for a a classification model
COMPUTE_ROC Procedure on page 45-48	Computes Receiver Operating Characteristic (ROC) for a classification model
CREATE_MODEL Procedure on page 45-53	Creates a model
DROP_MODEL Procedure on page 45-57	Drops a model
EXPORT_MODEL Procedure on page 45-58	Exports a model to a dump file
GET_ASSOCIATION_RULES Function on page 45-61	Returns the rules from an association model
GET_FREQUENT_ITEMSETS Function on page 45-66	Returns the frequent itemsets for an association model
GET_MODEL_COST_MATRIX Function on page 45-68	Returns the cost matrix for a model
GET_MODEL_DETAILS_AI Function on page 45-70	Returns details about an Attribute Importance model
GET_MODEL_DETAILS_EM Function on page 45-72	Returns details about an Expectation Maximization model
GET_MODEL_DETAILS_EM_COMP Function on page 45-76	Returns details about the parameters of an Expectation Maximization model
GET_MODEL_DETAILS_EM_PROJ Function on page 45-78	Returns details about the projects of an Expectation Maximization model
GET_MODEL_DETAILS_GLM Function on page 45-80	Returns details about a Generalized Linear Model
GET_MODEL_DETAILS_GLOBAL Function on page 45-83	Returns high-level statistics about a model
GET_MODEL_DETAILS_KM Function on page 45-87	Returns details about a *k*-Means model
GET_MODEL_DETAILS_NB Function on page 45-91	Returns details about a Naive Bayes model
GET_MODEL_DETAILS_NMF Function on page 45-93	Returns details about a Non-Negative Matrix Factorization model

Table 45–23 (Cont.) DBMS_DATA_MINING Package Subprograms

Subprogram	Purpose
GET_MODEL_DETAILS_OC Function on page 45-95	Returns details about an O-Cluster model
GET_MODEL_DETAILS_SVD Function on page 45-99	Returns details about a Singular Value Decomposition model
GET_MODEL_DETAILS_SVM Function on page 45-101	Returns details about a Support Vector Machine model with a linear kernel
GET_MODEL_DETAILS_XML Function on page 45-103	Returns details about a Decision Tree model
GET_MODEL_ TRANSFORMATIONS Function on page 45-105	Returns the transformations embedded in a model
GET_TRANSFORM_LIST Procedure on page 45-107	Converts between two different transformation specification formats
IMPORT_MODEL Procedure on page 45-110	Imports a model into a user schema
RANK_APPLY Procedure on page 45-115	Ranks the predictions from the `APPLY` results for a classification model
REMOVE_COST_MATRIX Procedure on page 45-118	Removes a cost matrix from a model
RENAME_MODEL Procedure on page 45-119	Renames a model

ADD_COST_MATRIX Procedure

This procedure associates a cost matrix table with a classification model. The cost matrix biases the model by assigning costs or benefits to specific model outcomes.

The cost matrix is stored with the model and taken into account when the model is scored. The stored cost matrix is the default scoring matrix for the model.

You can also specify a cost matrix inline when you invoke a Data Mining SQL function for scoring. When an inline cost matrix is specified, it is used instead of the default, stored cost matrix (if one exists).

To obtain the default scoring matrix for a model, use the `GET_MODEL_COST_MATRIX` function. To remove the default scoring matrix from a model, use the `REMOVE_COST_MATRIX` procedure. See "GET_MODEL_COST_MATRIX Function" on page 45-68 and "REMOVE_COST_MATRIX Procedure" on page 45-118.

See Also:

- "Biasing a Classification Model" in *Oracle Data Mining Concepts* for more information about costs
- *Oracle Database SQL Language Reference* for syntax of inline cost matrix

Syntax

```
DBMS_DATA_MINING.ADD_COST_MATRIX (
       model_name                IN VARCHAR2,
       cost_matrix_table_name    IN VARCHAR2,
       cost_matrix_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 45–24 ADD_COST_MATRIX Procedure Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name.*]*model_name*. If you do not specify a schema, your own schema is assumed.
`cost_matrix_table_name`	Name of the cost matrix table (described in Table 45–25).
`cost_matrix_schema_name`	Schema of the cost matrix table. If no schema is specified, the current schema is used.

Usage Notes

1. If the model is not in your schema, then `ADD_COST_MATRIX` requires the `ALTER ANY MINING MODEL` system privilege or the `ALTER` object privilege for the mining model.
2. The cost matrix table must have the columns shown in Table 45–25.

Table 45–25 Required Columns in a Cost Matrix Table

Column Name	Datatype
`ACTUAL_TARGET_VALUE`	Valid target data type
`PREDICTED_TARGET_VALUE`	Valid target data type

Table 45–25 (Cont.) Required Columns in a Cost Matrix Table

Column Name	Datatype
COST	NUMBER, FLOAT, BINARY_DOUBLE, or BINARY_FLOAT

See Also: *Oracle Data Mining User's Guide* for valid target datatypes

3. The types of the actual and predicted target values must be the same as the type of the model target. For example, if the target of the model is BINARY_DOUBLE, then the actual and predicted values must be BINARY_DOUBLE. If the actual and predicted values are CHAR or VARCHAR, ADD_COST_MATRIX treats them as VARCHAR2 internally.

   If the types do not match, or if the actual or predicted value is not a valid target value, the ADD_COST_MATRIX procedure raises an error.

   Note: If a reverse transformation is associated with the target, the actual and predicted values must be consistent with the target after the reverse transformation has been applied.

   See "Reverse Transformations and Model Transparency" on page 46-7 for more information.

4. Since a benefit can be viewed as a negative cost, you can specify a benefit for a given outcome by providing a negative number in the costs column of the cost matrix table.

5. All classification algorithms can use a cost matrix for scoring. The Decision Tree algorithm can also use a cost matrix at build time. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the CLAS_COST_TABLE_NAME setting in the settings table for the model. See Table 45–7, " Mining Function Settings".

   The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, use the REMOVE_COST_MATRIX procedure to remove the cost matrix and the ADD_COST_MATRIX procedure to add a new one.

Example

This example creates a cost matrix table called COSTS_NB and adds it to a Naive Bayes model called NB_SH_CLAS_SAMPLE. The model has a binary target: 1 means that the customer responds to a promotion; 0 means that the customer does not respond. The cost matrix assigns a cost of .25 to misclassifications of customers who do not respond and a cost of .75 to misclassifications of customers who do respond. This means that it is three times more costly to misclassify responders than it is to misclassify non-responders.

```
CREATE TABLE costs_nb (
  actual_target_value           NUMBER,
  predicted_target_value        NUMBER,
  cost                          NUMBER);
INSERT INTO costs_nb values (0, 0, 0);
INSERT INTO costs_nb values (0, 1, .25);
INSERT INTO costs_nb values (1, 0, .75);
INSERT INTO costs_nb values (1, 1, 0);
COMMIT;
```

```
EXEC dbms_data_mining.add_cost_matrix('nb_sh_clas_sample', 'costs_nb');

SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
   FROM mining_data_apply_v
   WHERE PREDICTION(nb_sh_clas_sample COST MODEL
      USING cust_marital_status, education, household_size) = 1
   GROUP BY cust_gender
   ORDER BY cust_gender;

C        CNT    AVG_AGE
- ---------- ----------
F         72         39
M        555         44
```

ALTER_REVERSE_EXPRESSION Procedure

This procedure replaces a reverse transformation expression with an expression that you specify. If the attribute does not have a reverse expression, the procedure creates one from the specified expression.

You can also use this procedure to customize the output of clustering, feature extraction, and anomaly detection models.

Syntax

```
DBMS_DATA_MINING.ALTER_REVERSE_EXPRESSION (
         model_name             VARCHAR2,
         expression             CLOB,
         attribute_name         VARCHAR2 DEFAULT NULL,
         attribute_subname      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 45–26 ALTER_REVERSE_EXPRESSION Procedure Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
`expression`	An expression to replace the reverse transformation associated with the attribute.
`attribute_name`	Name of the attribute. Specify `NULL` if you wish to apply *`expression`* to a cluster, feature, or One-Class SVM prediction.
`attribute_subname`	Name of the nested attribute if *`attribute_name`* is a nested column, otherwise `NULL`.

Usage Notes

1. For purposes of model transparency, Oracle Data Mining provides reverse transformations for transformations that are embedded in a model. Reverse transformations are applied to the attributes returned in model details (`GET_MODEL_DETAILS_*` functions) and to the scored target of predictive models.

   See Also: About Transformation Lists in Chapter 46, "DBMS_DATA_MINING_TRANSFORM"

2. If you alter the reverse transformation for the target of a model that has a cost matrix, you must specify a transformation expression that has the same type as the actual and predicted values in the cost matrix. Also, the reverse transformation that you specify must result in values that are present in the cost matrix.

   See Also: "ADD_COST_MATRIX Procedure" on page 45-26 and *Oracle Data Mining Concepts* for information about cost matrixes.

3. To prevent reverse transformation of an attribute, you can specify `NULL` for *`expression`*.

4. The reverse transformation expression can contain a reference to a PL/SQL function that returns a valid Oracle datatype. For example, you could define a

function like the following for a categorical attribute named blood_pressure that has values 'Low', 'Medium' and 'High'.

```
CREATE OR REPLACE FUNCTION numx(c char) RETURN NUMBER IS
  BEGIN
    CASE c WHEN ''Low'' THEN RETURN 1;
           WHEN ''Medium'' THEN RETURN 2;
           WHEN ''High'' THEN RETURN 3;
           ELSE RETURN null;
    END CASE;
  END numx;
```

Then you could invoke ALTER_REVERSE_EXPRESION for blood_pressure as follows.

```
EXEC dbms_data_mining.alter_reverse_expression(
            '<model_name>', 'NUMX(blood_pressure)', 'blood_pressure');
```

5. You can use ALTER_REVERSE_EXPRESSION to label clusters produced by clustering models and features produced by feature extraction.

   You can use ALTER_REVERSE_EXPRESSION to replace the zeros and ones returned by anomaly-detection models. By default, anomaly-detection models label anomalous records with 0 and all other records with 1.

   See Also: *Oracle Data Mining Concepts* for information about anomaly detection

Examples

1. In this example, the target (affinity_card) of the model CLASS_MODEL is manipulated internally as yes or no instead of 1 or 0 but returned as 1s and 0s when scored. The ALTER_REVERSE_EXPRESSION procedure causes the target values to be returned as TRUE or FALSE.

   The data sets MINING_DATA_BUILD and MINING_DATA_TEST are included with the Oracle Data Mining sample programs. See *Oracle Data Mining User's Guide* for information about the sample programs.

```
DECLARE
        v_xlst dbms_data_mining_transform.TRANSFORM_LIST;
  BEGIN
    dbms_data_mining_transform.SET_TRANSFORM(v_xlst,
          'affinity_card', NULL,
          'decode(affinity_card, 1, ''yes'', ''no'')',
          'decode(affinity_card, ''yes'', 1, 0)');
    dbms_data_mining.CREATE_MODEL(
      model_name             => 'CLASS_MODEL',
      mining_function        => dbms_data_mining.classification,
      data_table_name        => 'mining_data_build',
      case_id_column_name    => 'cust_id',
      target_column_name     => 'affinity_card',
      settings_table_name    => NULL,
      data_schema_name       => 'dmuser',
      settings_schema_name   => NULL,
      xform_list             => v_xlst );
  END;
/
SELECT cust_income_level, occupation,
           PREDICTION(CLASS_MODEL USING *) predict_response
      FROM mining_data_test WHERE age = 60 AND cust_gender IN 'M'
      ORDER BY cust_income_level;
```

APPLY Procedure

This procedure applies a mining model to the data of interest, and generates the results in a table. The apply process is also referred to as **scoring**.

For predictive mining functions, the apply process generates predictions in a target column. For descriptive mining functions such as clustering, the apply process assigns each case to a cluster with a probability.

In Oracle Data Mining, the apply operation is not applicable to association models and attribute importance models.

Note: Scoring can also be performed directly in SQL using the Data Mining functions. See

- "Data Mining Functions" in *Oracle Database SQL Language Reference*
- "Scoring and Deployment" in *Oracle Data Mining User's Guide*

Syntax

```
DBMS_DATA_MINING.APPLY (
      model_name           IN VARCHAR2,
      data_table_name      IN VARCHAR2,
      case_id_column_name  IN VARCHAR2,
      result_table_name    IN VARCHAR2,
      data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 45–27 APPLY Procedure Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
`data_table_name`	Name of table or view containing the data to be scored
`case_id_column_name`	Name of the case identifier column
`result_table_name`	Name of the table in which to store apply results
`data_schema_name`	Name of the schema containing the data to be scored

Usage Notes

1. The data provided for `APPLY` must undergo the same preprocessing as the data used to create and test the model. When you use Automatic Data Preparation, the preprocessing required by the algorithm is handled for you by the model — both at build time and apply time. (See "Automatic Data Preparation" on page 45-8.)
2. `APPLY` creates a table in the user's schema to hold the results. The columns are algorithm-specific.

   The columns in the results table are listed in Table 45–28 through Table 45–32. The case ID column name in the results table will match the case ID column name provided by you. The type of the incoming case ID column is also preserved in `APPLY` output.

Note: Make sure that the case ID column does not have the same name as one of the columns that will be created by `APPLY`. For example, when applying a classification model, the case ID in the scoring data must not be '`PREDICTION`' or '`PROBABILITY`' (See Table 45–28).

3. The datatype for the '`PREDICTION`', '`CLUSTER_ID`', and '`FEATURE_ID`' output columns is influenced by any reverse expression that is embedded in the model by the user. If the user does not provide a reverse expression that alters the scored value type, then the types will conform to the descriptions in the following tables. See "ALTER_REVERSE_EXPRESSION Procedure" on page 45-29.

Classification

The results table for classification has the columns described in Table 45–28. If the target of the model is categorical, the `PREDICTION` column will have a `VARCHAR2` datatype. If the target has a binary type, the `PREDICTION` column will have the binary type of the target.

Table 45–28 APPLY Results Table for Classification

Column Name	Datatype
`Case ID column name`	Type of the case ID
`PREDICTION`	Type of the target
`PROBABILITY`	`BINARY_DOUBLE`

Anomaly Detection

The results table for anomaly detection has the columns described in Table 45–29.

Table 45–29 APPLY Results Table for Anomaly Detection

Column Name	Datatype
`Case ID column name`	Type of the case ID
`PREDICTION`	`NUMBER`
`PROBABILITY`	`BINARY_DOUBLE`

Values in the `PREDICTION` column can be either 0 or 1. When the prediction is 1, the case is a typical example. When the prediction is 0, the case is an outlier.

Regression

The results table for regression has the columns described in Table 45–30.

Table 45–30 APPLY Results Table for Regression

Column Name	Datatype
`Case ID column name`	Type of the case ID
`PREDICTION`	Type of the target

Clustering

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the cluster identifier corresponding to a case, and the associated probability. The results table has the columns described in Table 45–31.

Table 45–31 APPLY Results Table for Clustering

Column Name	Datatype
Case ID column name	Type of the case ID
CLUSTER_ID	NUMBER
PROBABILITY	BINARY_DOUBLE

Feature Extraction

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the feature identifier corresponding to a case, and the associated match quality. The results table has the columns described in Table 45–32.

Table 45–32 APPLY Results Table for Feature Extraction

Column Name	Datatype
Case ID column name	Type of the case ID
FEATURE_ID	NUMBER
MATCH_QUALITY	BINARY_DOUBLE

Examples

This example applies the GLM regression model GLMR_SH_REGR_SAMPLE to the data in the MINING_DATA_APPLY_V view. The apply results are output to the table REGRESSION_APPLY_RESULT.

```
SQL> BEGIN
       DBMS_DATA_MINING.APPLY (
       model_name     => 'glmr_sh_regr_sample',
       data_table_name     => 'mining_data_apply_v',
       case_id_column_name => 'cust_id',
       result_table_name   => 'regression_apply_result');
    END;
    /

SQL> SELECT * FROM regression_apply_result WHERE cust_id >  101485;

   CUST_ID PREDICTION
---------- ----------
    101486 22.8048824
    101487 25.0261101
    101488 48.6146619
    101489   51.82595
    101490 22.6220714
    101491 61.3856816
    101492 24.1400748
    101493  58.034631
    101494 45.7253149
    101495 26.9763318
```

```
101496 48.1433425

101498 49.8965531
101499  56.270656
101500 21.1153047
```

COMPUTE_CONFUSION_MATRIX Procedure

This procedure computes a confusion matrix, stores it in a table in the user's schema, and returns the model accuracy.

A confusion matrix is a test metric for classification models. It compares the predictions generated by the model with the actual target values in a set of test data. The confusion matrix lists the number of times each class was correctly predicted and the number of times it was predicted to be one of the other classes.

COMPUTE_CONFUSION_MATRIX accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

See Also:

Oracle Data Mining Concepts for more details about confusion matrixes and other test metrics for classification

"COMPUTE_LIFT Procedure" on page 45-43

"COMPUTE_ROC Procedure" on page 45-48

Syntax

```
DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
      accuracy                     OUT NUMBER,
      apply_result_table_name      IN  VARCHAR2,
      target_table_name            IN  VARCHAR2,
      case_id_column_name          IN  VARCHAR2,
      target_column_name           IN  VARCHAR2,
      confusion_matrix_table_name  IN  VARCHAR2,
      score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',
      cost_matrix_table_name       IN  VARCHAR2 DEFAULT NULL,
      apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,
      target_schema_name           IN  VARCHAR2 DEFAULT NULL,
      cost_matrix_schema_name      IN  VARCHAR2 DEFAULT NULL,
      score_criterion_type         IN  VARCHAR2 DEFAULT 'PROBABILITY');
```

Parameters

Table 45–33 COMPUTE_CONFUSION_MATRIX Procedure Parameters

Parameter	Description
accuracy	Output parameter containing the overall percentage accuracy of the predictions.
apply_result_table_name	Table containing the predictions.
target_table_name	Table containing the known target values from the test data.
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.
confusion_matrix_table_name	Table containing the confusion matrix. The table will be created by the procedure in the user's schema. The columns in the confusion matrix table are described in the Usage Notes.
score_column_name	Column containing the predictions in the apply results table. The default column name is PREDICTION, which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 45-33).
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains either the probabilities or the costs that determine the predictions. By default, scoring is based on probability; the class with the highest probability is predicted for each case. If scoring is based on cost, the class with the lowest cost is predicted. The score_criterion_type parameter indicates whether probabilities or costs will be used for scoring. The default column name is 'PROBABILITY', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 45-33). See the Usage Notes for additional information.
cost_matrix_table_name	(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the score_criterion_type parameter is set to 'COSTS', the costs in this table will be used as the scoring criteria. The columns in a cost matrix table are described in the Usage Notes.
apply_result_schema_name	Schema of the apply results table. If null, the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets. If null, the user's schema is assumed.
cost_matrix_schema_name	Schema of the cost matrix table, if one is provided. If null, the user's schema is assumed.

Table 45–33 (Cont.) COMPUTE_CONFUSION_MATRIX Procedure Parameters

Parameter	Description
score_criterion_type	Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter. The default value of score_criterion_type is 'PROBABILITY'. To use costs as the scoring criterion, specify 'COST'. If score_criterion_type is set to 'COST' but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring. See the Usage Notes and the Examples.

Usage Notes

- The predictive information you pass to COMPUTE_CONFUSION_MATRIX may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the confusion matrix.
- Instead of passing a cost matrix to COMPUTE_CONFUSION_MATRIX, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION_COST function to populate the score criterion column.
- The predictions that you pass to COMPUTE_CONFUSION_MATRIX are in a table or view specified in apply_result_table_name.

```
CREATE TABLE apply_result_table_name AS (
            case_id_column_name           VARCHAR2,
            score_column_name             VARCHAR2,
            score_criterion_column_name   VARCHAR2);
```

- A cost matrix must have the columns described in Table 45–34.

Table 45–34 Columns in a Cost Matrix

Column Name	Datatype
actual_target_value	Type of the target column in the build data
predicted_target_value	Type of the predicted target in the test data. The type of the predicted target must be the same as the type of the actual target unless the predicted target has an associated reverse transformation.
cost	BINARY_DOUBLE

See Also:

Oracle Data Mining User's Guide for valid target datatypes

Oracle Data Mining Concepts for more information about cost matrixes

- The confusion matrix created by COMPUTE_CONFUSION_MATRIX has the columns described in Table 45–35.

Table 45–35 Columns in a Confusion Matrix

Column Name	Datatype
actual_target_value	Type of the target column in the build data
predicted_target_value	Type of the predicted target in the test data. The type of the predicted target is the same as the type of the actual target unless the predicted target has an associated reverse transformation.
value	BINARY_DOUBLE

See Also: *Oracle Data Mining Concepts* for more information about confusion matrixes

Examples

These examples use the Naive Bayes model nb_sh_clas_sample, which is created by one of the Oracle Data Mining sample programs.

Compute a Confusion Matrix Based on Probabilities

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
       SELECT cust_id,
              PREDICTION(nb_sh_clas_sample USING *) prediction,
              PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
       FROM mining_data_test_v;
```

Using probabilities as the scoring criterion, you can compute the confusion matrix as follows.

```
DECLARE
   v_accuracy    NUMBER;
      BEGIN
        DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
                   accuracy                     => v_accuracy,
                   apply_result_table_name      => 'nb_apply_results',
                   target_table_name            => 'mining_data_test_v',
                   case_id_column_name          => 'cust_id',
                   target_column_name           => 'affinity_card',
                   confusion_matrix_table_name  => 'nb_confusion_matrix',
                   score_column_name            => 'PREDICTION',
                   score_criterion_column_name  => 'PROBABILITY'
                   cost_matrix_table_name       =>  null,
                   apply_result_schema_name     =>  null,
                   target_schema_name           =>  null,
                   cost_matrix_schema_name      =>  null,
                   score_criterion_type         => 'PROBABILITY');
        DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
      END;
      /
```

The confusion matrix and model accuracy are shown as follows.

```
 **** MODEL ACCURACY ****: .7847

SQL>SELECT * from nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
```

```
                  1                    0         60
                  0                    0        891
                  1                    1        286
                  0                    1        263
```

Compute a Confusion Matrix Based on a Cost Matrix Table

The confusion matrix in the previous example shows a high rate of false positives. For 263 cases, the model predicted 1 when the actual value was 0. You could use a cost matrix to minimize this type of error.

The cost matrix table `nb_cost_matrix` specifies that a false positive is 3 times more costly than a false negative.

```
SQL> SELECT * from nb_cost_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE       COST
------------------- ---------------------- ----------
                  0                      0          0
                  0                      1        .75
                  1                      0        .25
                  1                      1          0
```

This statement shows how to generate the predictions using `APPLY`.

```
BEGIN
    DBMS_DATA_MINING.APPLY(
          model_name          => 'nb_sh_clas_sample',
          data_table_name     => 'mining_data_test_v',
          case_id_column_name => 'cust_id',
          result_table_name   => 'nb_apply_results');
 END;
/
```

This statement computes the confusion matrix using the cost matrix table. The score criterion column is named '`PROBABILITY`', which is the name generated by `APPLY`.

```
DECLARE
  v_accuracy    NUMBER;
     BEGIN
       DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
                accuracy                     => v_accuracy,
                apply_result_table_name      => 'nb_apply_results',
                target_table_name            => 'mining_data_test_v',
                case_id_column_name          => 'cust_id',
                target_column_name           => 'affinity_card',
                confusion_matrix_table_name  => 'nb_confusion_matrix',
                score_column_name            => 'PREDICTION',
                score_criterion_column_name  => 'PROBABILITY',
                cost_matrix_table_name       => 'nb_cost_matrix',
                apply_result_schema_name     => null,
                target_schema_name           => null,
                cost_matrix_schema_name      => null,
                score_criterion_type         => 'COST');
       DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
    END;
    /
```

The resulting confusion matrix shows a decrease in false positives (212 instead of 263).

```
**** MODEL ACCURACY ****: .798
```

```
SQL> SELECT * FROM nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
                  1                      0         91
                  0                      0        942
                  1                      1        255
                  0                      1        212
```

Compute a Confusion Matrix Based on Embedded Costs

You can use the ADD_COST_MATRIX procedure to embed a cost matrix in a model. The embedded costs can be used instead of probabilities for scoring. This statement adds the previously-defined cost matrix to the model.

```
BEGIN    DBMS_DATA_MINING.ADD_COST_MATRIX ('nb_sh_clas_sample', 'nb_cost_
matrix');END;/
```

The following statement applies the model to the test data using the embedded costs and stores the results in a table.

```
CREATE TABLE nb_apply_results AS
         SELECT cust_id,
              PREDICTION(nb_sh_clas_sample COST MODEL USING *) prediction,
              PREDICTION_COST(nb_sh_clas_sample COST MODEL USING *) cost
          FROM mining_data_test_v;
```

You can compute the confusion matrix using the embedded costs.

```
DECLARE
   v_accuracy         NUMBER;
   BEGIN
       DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
            accuracy                     => v_accuracy,
            apply_result_table_name      => 'nb_apply_results',
            target_table_name            => 'mining_data_test_v',
            case_id_column_name          => 'cust_id',
            target_column_name           => 'affinity_card',
            confusion_matrix_table_name  => 'nb_confusion_matrix',
            score_column_name            => 'PREDICTION',
            score_criterion_column_name  => 'COST',
            cost_matrix_table_name       => null,
            apply_result_schema_name     => null,
            target_schema_name           => null,
            cost_matrix_schema_name      => null,
            score_criterion_type         => 'COST');
   END;
   /
```

The results are:

```
**** MODEL ACCURACY ****: .798

SQL> SELECT * FROM nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
                  1                      0         91
                  0                      0        942
                  1                      1        255
                  0                      1        212
```

COMPUTE_LIFT Procedure

This procedure computes lift and stores the results in a table in the user's schema.

Lift is a test metric for binary classification models. To compute lift, one of the target values must be designated as the positive class. COMPUTE_LIFT compares the predictions generated by the model with the actual target values in a set of test data. Lift measures the degree to which the model's predictions of the positive class are an improvement over random chance.

Lift is computed on scoring results that have been ranked by probability (or cost) and divided into quantiles. Each quantile includes the scores for the same number of cases.

COMPUTE_LIFT calculates quantile-based and cumulative statistics. The number of quantiles and the positive class are user-specified. Additionally, COMPUTE_LIFT accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs associated with the predictions
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

      cost_matrix_schema_name      IN VARCHAR2 DEFAULT NULL
      score_criterion_type         IN VARCHAR2 DEFAULT 'PROBABILITY');
```

Parameters

Table 45–36 COMPUTE_LIFT Procedure Parameters

Parameter	Description
apply_result_table_name	Table containing the predictions.
target_table_name	Table containing the known target values from the test data.
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.
lift_table_name	Table containing the lift statistics. The table will be created by the procedure in the user's schema. The columns in the lift table are described in the Usage Notes.
positive_target_value	The positive class. This should be the class of interest, for which you want to calculate lift. If the target column is a NUMBER, you can use the TO_CHAR() operator to provide the value as a string.
score_column_name	Column containing the predictions in the apply results table. The default column name is 'PREDICTION', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 45-33).
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains either the probabilities or the costs that determine the predictions. By default, scoring is based on probability; the class with the highest probability is predicted for each case. If scoring is based on cost, the class with the lowest cost is predicted. The score_criterion_type parameter indicates whether probabilities or costs will be used for scoring. The default column name is 'PROBABILITY', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 45-33). See the Usage Notes for additional information.
num_quantiles	Number of quantiles to be used in calculating lift. The default is 10.
cost_matrix_table_name	(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the score_criterion_type parameter is set to 'COST', the costs will be used as the scoring criteria. The columns in a cost matrix table are described in the Usage Notes.
apply_result_schema_name	Schema of the apply results table. If null, the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets. If null, the user's schema is assumed.

Table 45–36 (Cont.) COMPUTE_LIFT Procedure Parameters

Parameter	Description
cost_matrix_schema_name	Schema of the cost matrix table, if one is provided. If null, the user's schema is assumed.
score_criterion_type	Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter. The default value of score_criterion_type is 'PROBABILITY'. To use costs as the scoring criterion, specify 'COST'. If score_criterion_type is set to 'COST' but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring. See the Usage Notes and the Examples.

Usage Notes

- The predictive information you pass to COMPUTE_LIFT may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the lift.
- Instead of passing a cost matrix to COMPUTE_LIFT, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION_COST function to populate the score criterion column.
- The predictions that you pass to COMPUTE_LIFT are in a table or view specified in apply_results_table_name.

```
CREATE TABLE apply_result_table_name AS (
            case_id_column_name           VARCHAR2,
            score_column_name             VARCHAR2,
            score_criterion_column_name   VARCHAR2);
```

- A cost matrix must have the columns described in Table 45–37.

Table 45–37 Columns in a Cost Matrix

Column Name	Datatype
actual_target_value	Type of the target column in the build data
predicted_target_value	Type of the predicted target in the test data. The type of the predicted target must be the same as the type of the actual target unless the predicted target has an associated reverse transformation.
cost	NUMBER

See Also: *Oracle Data Mining Concepts* for more information about cost matrixes

- The table created by COMPUTE_LIFT has the columns described in Table 45–38

Table 45–38 Columns in a Lift Table

Column Name	Datatype
quantile_number	NUMBER
probability_threshold	NUMBER
gain_cumulative	NUMBER
quantile_total_count	NUMBER
quantile_target_count	NUMBER
percent_records_cumulative	NUMBER
lift_cumulative	NUMBER
target_density_cumulative	NUMBER
targets_cumulative	NUMBER
non_targets_cumulative	NUMBER
lift_quantile	NUMBER
target_density	NUMBER

See Also: *Oracle Data Mining Concepts* for details about the information in the lift table

- When a cost matrix is passed to COMPUTE_LIFT, the cost threshold is returned in the probability_threshold column of the lift table.

Examples

This example uses the Naive Bayes model nb_sh_clas_sample, which is created by one of the Oracle Data Mining sample programs.

The example illustrates lift based on probabilities. For examples that show computation based on costs, see "COMPUTE_CONFUSION_MATRIX Procedure" on page 45-37.

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
    SELECT cust_id, t.prediction, t.probability
    FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using probabilities as the scoring criterion, you can compute lift as follows.

```
BEGIN
   DBMS_DATA_MINING.COMPUTE_LIFT (
        apply_result_table_name        => 'nb_apply_results',
        target_table_name              => 'mining_data_test_v',
        case_id_column_name            => 'cust_id',
        target_column_name             => 'affinity_card',
        lift_table_name                => 'nb_lift',
        positive_target_value          =>  to_char(1),
        score_column_name              => 'PREDICTION',
        score_criterion_column_name    => 'PROBABILITY',
        num_quantiles                  =>  10,
        cost_matrix_table_name         =>  null,
        apply_result_schema_name       =>  null,
        target_schema_name             =>  null,
```

```
      cost_matrix_schema_name        =>  null,
      score_criterion_type           =>  'PROBABILITY');
  END;
  /
```

This query displays some of the statistics from the resulting lift table.

```
SQL>SELECT quantile_number, probability_threshold, gain_cumulative,
           quantile_total_count
           FROM nb_lift;

QUANTILE_NUMBER PROBABILITY_THRESHOLD GAIN_CUMULATIVE QUANTILE_TOTAL_COUNT
--------------- --------------------- --------------- --------------------
              1            .989335775       .15034965                   55
              2            .980534911       .26048951                   55
              3            .968506098      .374125874                   55
              4            .958975196      .493006993                   55
              5            .946705997      .587412587                   55
              6            .927454174       .66958042                   55
              7            .904403627      .748251748                   55
              8            .836482525      .839160839                   55
             10            .500184953               1                   54
```

COMPUTE_ROC Procedure

This procedure computes receiver operating characteristic (ROC), stores the results in a table in the user's schema, and returns a measure of the model accuracy.

ROC is a test metric for binary classification models. To compute ROC, one of the target values must be designated as the positive class. `COMPUTE_ROC` compares the predictions generated by the model with the actual target values in a set of test data.

ROC measures the impact of changes in the probability threshold. The probability threshold is the decision point used by the model for predictions. In binary classification, the default probability threshold is 0.5. The value predicted for each case is the one with a probability greater than 50%.

ROC can be plotted as a curve on an X-Y axis. The false positive rate is placed on the X axis. The true positive rate is placed on the Y axis. A false positive is a positive prediction for a case that is negative in the test data. A true positive is a positive prediction for a case that is positive in the test data.

`COMPUTE_ROC` accepts two input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing probabilities
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values

See Also:

Oracle Data Mining Concepts for more details about ROC and test metrics for classification

"COMPUTE_CONFUSION_MATRIX Procedure" on page 45-37

"COMPUTE_LIFT Procedure" on page 45-43

Syntax

```
DBMS_DATA_MINING.COMPUTE_ROC (
      roc_area_under_curve         OUT NUMBER,
      apply_result_table_name      IN  VARCHAR2,
      target_table_name            IN  VARCHAR2,
      case_id_column_name          IN  VARCHAR2,
      target_column_name           IN  VARCHAR2,
      roc_table_name               IN  VARCHAR2,
      positive_target_value        IN  VARCHAR2,
      score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',
      apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,
      target_schema_name           IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 45–39 COMPUTE_ROC Procedure Parameters

Parameter	Description
roc_area_under_the_curve	Output parameter containing the area under the ROC curve (AUC). The AUC measures the likelihood that an actual positive will be predicted as positive. The greater the AUC, the greater the flexibility of the model in accommodating trade-offs between positive and negative class predictions. AUC can be especially important when one target class is rarer or more important to identify than another.
apply_result_table_name	Table containing the predictions.
target_table_name	Table containing the known target values from the test data.
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.
roc_table_name	Table containing the ROC output. The table will be created by the procedure in the user's schema. The columns in the ROC table are described in the Usage Notes.
positive_target_value	The positive class. This should be the class of interest, for which you want to calculate ROC. If the target column is a NUMBER, you can use the TO_CHAR() operator to provide the value as a string.
score_column_name	Column containing the predictions in the apply results table. The default column name is 'PREDICTION', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 45-33).
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains the probabilities that determine the predictions. The default column name is 'PROBABILITY', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 45-33).
apply_result_schema_name	Schema of the apply results table. If null, the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets. If null, the user's schema is assumed.

Usage Notes

- The predictive information you pass to COMPUTE_ROC may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the receiver operating characteristic.
- The predictions that you pass to COMPUTE_ROC are in a table or view specified in apply_results_table_name.

```
CREATE TABLE apply_result_table_name AS (
            case_id_column_name           VARCHAR2,
            score_column_name             VARCHAR2,
            score_criterion_column_name   VARCHAR2);
```

- The table created by COMPUTE_ROC has the columns shown in Table 45–40.

Table 45–40 COMPUTE_ROC Output

Column	Datatype
probability	BINARY_DOUBLE
true_positives	NUMBER
false_negatives	NUMBER
false_positives	NUMBER
true_negatives	NUMBER
true_positive_fraction	NUMBER
false_positive_fraction	NUMBER

> **See Also:** *Oracle Data Mining Concepts* for details about the output of COMPUTE_ROC

- ROC is typically used to determine the most desirable probability threshold. This can be done by examining the true positive fraction and the false positive fraction. The true positive fraction is the percentage of all positive cases in the test data that were correctly predicted as positive. The false positive fraction is the percentage of all negative cases in the test data that were incorrectly predicted as positive.

  Given a probability threshold, the following statement returns the positive predictions in an apply result table ordered by probability.

```
SELECT case_id_column_name
       FROM apply_result_table_name
       WHERE probability > probability_threshold
       ORDER BY probability DESC;
```

- There are two approaches to identifying the most desirable probability threshold. Which approach you use depends on whether or not you know the relative cost of positive versus negative class prediction errors.

  If the costs are known, you can apply the relative costs to the ROC table to compute the minimum cost probability threshold. Suppose the relative cost ratio is: Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query like this.

```
WITH cost AS (
  SELECT probability_threshold, 20 * false_negatives + false_positives cost
    FROM ROC_table
  GROUP BY probability_threshold),
    minCost AS (
      SELECT min(cost) minCost
        FROM cost)
      SELECT max(probability_threshold)probability_threshold
        FROM cost, minCost
    WHERE cost = minCost;
```

If relative costs are not well known, you can simply scan the values in the ROC table (in sorted order) and make a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable.

```
SELECT * FROM ROC_table
         ORDER BY probability_threshold;
```

Examples

This example uses the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
    SELECT cust_id, t.prediction, t.probability
    FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using the predictions and the target values from the test data, you can compute ROC as follows.

```
DECLARE
     v_area_under_curve NUMBER;
  BEGIN
     DBMS_DATA_MINING.COMPUTE_ROC (
         roc_area_under_curve          => v_area_under_curve,
         apply_result_table_name       => 'nb_apply_results',
         target_table_name             => 'mining_data_test_v',
         case_id_column_name           => 'cust_id',
         target_column_name            => 'affinity_card',
         roc_table_name                => 'nb_roc',
         positive_target_value         => '1',
         score_column_name             => 'PREDICTION',
         score_criterion_column_name   => 'PROBABILITY');
     DBMS_OUTPUT.PUT_LINE('**** AREA UNDER ROC CURVE ****: ' ||
     ROUND(v_area_under_curve,4));
  END;
 /
```

The resulting AUC and a selection of columns from the ROC table are shown as follows.

```
**** AREA UNDER ROC CURVE ****: .8212

SQL> SELECT probability, true_positive_fraction, false_positive_fraction
            FROM nb_roc;

PROBABILITY  TRUE_POSITIVE_FRACTION  FALSE_POSITIVE_FRACTION
-----------  ----------------------  -----------------------
     .00000                       1                        1
     .50018             .826589595              .227902946
     .53851             .823699422              .221837088
     .54991             .820809249              .217504333
     .55628             .815028902              .215771231
     .55628             .817919075              .215771231
     .57563             .800578035              .214904679
     .57563             .812138728              .214904679
      .                   .                       .
      .                   .                       .
      .                   .                       .
```

CREATE_MODEL Procedure

This procedure creates a mining model with a given mining function.

By passing an `xform_list` to `CREATE_MODEL`, you can specify a list of transformations to be performed on the input data. If the `PREP_AUTO` setting is on, the transformations are used in addition to the automatic transformations. If the `PREP_AUTO` setting is off, the specified transformations are the only ones implemented by the model. In both cases, the transformation definitions are embedded in the model and executed automatically whenever the model is applied. See "Automatic Data Preparation" on page 45-8.

Syntax

```
DBMS_DATA_MINING.CREATE_MODEL (
      model_name            IN VARCHAR2,
      mining_function       IN VARCHAR2,
      data_table_name       IN VARCHAR2,
      case_id_column_name   IN VARCHAR2,
      target_column_name    IN VARCHAR2 DEFAULT NULL,
      settings_table_name   IN VARCHAR2 DEFAULT NULL,
      data_schema_name      IN VARCHAR2 DEFAULT NULL,
      settings_schema_name  IN VARCHAR2 DEFAULT NULL,
      xform_list            IN TRANSFORM_LIST DEFAULT NULL);
```

Parameters

Table 45–41 CREATE_MODEL Procedure Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used. See the Usage Notes for model naming restrictions.
`mining_function`	The mining function. Values are listed in Table 45–3, " Mining Functions".
`data_table_name`	Table or view containing the build data.
`case_id_column_name`	Case identifier column in the build data.
`target_column_name`	For supervised models, the target column in the build data. `NULL` for unsupervised models.
`settings_table_name`	Table containing build settings for the model. `NULL` if there is no settings table (only default settings are used).
`data_schema_name`	Schema hosting the build data. If `NULL`, the user's schema is assumed.
`settings_schema_name`	Schema hosting the settings table. If `NULL`, the user's schema is assumed.

Table 45–41 (Cont.) CREATE_MODEL Procedure Parameters

Parameter	Description

xform_list	A list of transformations to be used in addition to or instead of automatic transformations, depending on the value of the PREP_AUTO setting. (See "Automatic Data Preparation" on page 45-8.)
	
	The datatype of xform_list is TRANSFORM_LIST, which consists of records of type TRANSFORM_REC. Each TRANSFORM_REC specifies the transformation information for a single attribute.
	
	`TYPE`
	`  TRANFORM_REC     IS RECORD (`
	`    attribute_name       VARCHAR2(4000),`
	`    attribute_subname    VARCHAR2(4000),`
	`    expression           EXPRESSION_REC,`
	`    reverse_expression   EXPRESSION_REC,`
	`    attribute_spec       VARCHAR2(4000));`
	
	The expression field stores a SQL expression for transforming the attribute. The reverse_expression field stores a SQL expression for reversing the transformation in model details and, if the attribute is a target, in the results of scoring. The SQL expressions are manipulated by routines in the DBMS_DATA_MINING_TRANSFORM package:
	
	■ SET_EXPRESSION Procedure
	■ GET_EXPRESSION Function
	■ SET_TRANSFORM Procedure
	
	The attribute_spec field identifies individualized treatment for the attribute. See the Usage Notes for details.
	
	See Table 46–1, " Datatypes in DBMS_DATA_MINING_TRANSFORM"for details about the TRANSFORM_REC type.

Usage Notes

1. You can use the attribute_spec field of the xform_list argument to identify an attribute as unstructured text or to disable Automatic Data Preparation for the attribute. The attribute_spec can have the following values:

   - TEXT — Indicates that the attribute contains unstructured text. The TEXT value may optionally be followed by an Oracle Text POLICY name. (For information about creating a Text POLICY, see CTX_DDL.CREATE_POLICY in *Oracle Text Reference*.)

     Oracle Data Mining can process columns of VARCHAR2/CHAR, CLOB, BLOB, and BFILE as text. If the column is VARCHAR2 or CHAR and you do not specify TEXT, Oracle Data Mining will process the column as categorical data. If the column is CLOB, Oracle Data Mining will process it as text by default (You do not need to specify it as TEXT). If the column is BLOB or BFILE, you must specify it as TEXT, otherwise CREATE_MODEL will return an error.

     If you specify TEXT for a nested column or for an attribute in a nested column, CREATE_MODEL will return an error.

   - NOPREP — Disables ADP for the attribute. When ADP is off, the NOPREP value is ignored.

     You can specify NOPREP for a nested column, but not for an attribute in a nested column. If you specify NOPREP for an attribute in a nested column when ADP is on, CREATE_MODEL will return an error.

2. You can obtain information about a model by querying the data dictionary views.

   ```
   ALL/USER/DBA_MINING_MODELS
   ALL/USER/DBA_MINING_MODEL_ATTRIBUTES
   ALL/USER/DBA_MINING_MODEL_SETTINGS
   ```

3. You can obtain information about model attributes by querying the model details.

   ```
   dbms_data_mining.get_model_details_algorithm (model_name)
   ```

4. The naming rules for models are more restrictive than the naming rules for most database schema objects. A model name must satisfy the following additional requirements:

   - It must be 25 or fewer characters long.
   - It must be a nonquoted identifier. Oracle requires that nonquoted identifiers contain only alphanumeric characters, the underscore (_), dollar sign ($), and pound sign (#); the initial character must be alphabetic. Oracle strongly discourages the use of the dollar sign and pound sign in nonquoted literals.

   Naming requirements for schema objects are fully documented in *Oracle Database SQL Language Reference*.

Examples

The first example builds a classification model using the Support Vector Machine algorithm.

```
-- Create the settings table
CREATE TABLE svm_model_settings (
  setting_name  VARCHAR2(30),
  setting_value VARCHAR2(30));

-- Populate the settings table
-- Specify SVM. By default, Naive Bayes is used for classification.
-- Specify ADP. By default, ADP is not used.
BEGIN
  INSERT INTO svm_model_settings (setting_name, setting_value) VALUES
     (dbms_data_mining.algo_name, dbms_data_mining.algo_support_vector_machines);
  INSERT INTO svm_model_settings (setting_name, setting_value) VALUES
     (dbms_data_mining.prep_auto,dbms_data_mining.prep_auto_on);
  COMMIT;
END;
/
-- Create the model using the specified settings
BEGIN
  DBMS_DATA_MINING.CREATE_MODEL(
    model_name          => 'svm_model',
    mining_function     => dbms_data_mining.classification,
    data_table_name     => 'mining_data_build_v',
    case_id_column_name => 'cust_id',
    target_column_name  => 'affinity_card',
    settings_table_name => 'svm_model_settings');
END;
/
```

You can display the model settings with the following query.

```
SELECT * FROM user_mining_model_settings
       WHERE model_name IN 'SVM_MODEL';
```

```
MODEL_NAME     SETTING_NAME            SETTING_VALUE                  SETTING
-------------  ----------------------  -----------------------------  -------
SVM_MODEL      ALGO_NAME               ALGO_SUPPORT_VECTOR_MACHINES  INPUT
SVM_MODEL      SVMS_KERNEL_CACHE_SIZE  50000000                       DEFAULT
SVM_MODEL      SVMS_ACTIVE_LEARNING    SVMS_AL_ENABLE                 DEFAULT
SVM_MODEL      SVMS_STD_DEV            3.004524                       DEFAULT
SVM_MODEL      PREP_AUTO               ON                             INPUT
SVM_MODEL      SVMS_COMPLEXITY_FACTOR  1.887389                       DEFAULT
SVM_MODEL      SVMS_KERNEL_FUNCTION    SVMS_GAUSSIAN                  DEFAULT
SVM_MODEL      SVMS_CONV_TOLERANCE     .001                           DEFAULT
```

The second example creates an anomaly detection model. Anomaly detection uses SVM classification without a target. This example uses the same settings table created for the SVM classification model in the first example.

```
BEGIN
  DBMS_DATA_MINING.CREATE_MODEL(
    model_name          => 'anomaly_detect_model',
    mining_function     => dbms_data_mining.classification,
    data_table_name     => 'mining_data_build_v',
    case_id_column_name => 'cust_id',
    target_column_name  => null,
    settings_table_name => 'svm_model_settings');
END;
/
```

This query shows that the models created in these examples are the only ones in your schema.

```
SELECT model_name, mining_function, algorithm FROM user_mining_models;

MODEL_NAME              MINING_FUNCTION      ALGORITHM
----------------------  -------------------- ------------------------------
SVM_MODEL               CLASSIFICATION       SUPPORT_VECTOR_MACHINES
ANOMALY_DETECT_MODEL    CLASSIFICATION       SUPPORT_VECTOR_MACHINES
```

This query shows that only the SVM classification model has a target.

```
SELECT model_name, attribute_name, attribute_type, target
       FROM user_mining_model_attributes
       WHERE target = 'YES';

MODEL_NAME          ATTRIBUTE_NAME   ATTRIBUTE_TYPE     TARGET
------------------  ---------------  -----------------  ------
SVM_MODEL           AFFINITY_CARD    CATEGORICAL         YES
```

DROP_MODEL Procedure

This procedure deletes the specified mining model.

Syntax

```
DBMS_DATA_MINING.DROP_MODEL (model_name IN VARCHAR2,
                             force      IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 45–42 DROP_MODEL Procedure Parameters

Parameter	Description
`model_name`	Name of the mining model in the form [*schema_name.*]*model_name*. If you do not specify a schema, your own schema is used.
`force`	Forces the mining model to be dropped even if it is invalid. A mining model may be invalid if a serious system error interrupted the model build process.

Usage Note

To drop a mining model, you must be the owner or you must have the `DROP ANY MINING MODEL` privilege. See *Oracle Data Mining User's Guide* for information about privileges for data mining.

Example

You can use the following command to delete a valid mining model named `nb_sh_clas_sample` that exists in your schema.

```
BEGIN
  DBMS_DATA_MINING.DROP_MODEL(model_name => 'nb_sh_clas_sample');
END;
/
```

EXPORT_MODEL Procedure

This procedure exports the specified data mining models to a dump file set. To import the models from the dump file set, use the IMPORT_MODEL Procedure. EXPORT_MODEL and IMPORT_MODEL use Oracle Data Pump technology.

When Oracle Data Pump is used to export/import an entire schema or database, the mining models in the schema or database are included. However, EXPORT_MODEL and IMPORT_MODEL are the only utilities that support the export/import of individual models.

See Also:

Oracle Database Utilities for information about Oracle Data Pump

Oracle Data Mining User's Guide for more information about exporting and importing mining models

Syntax

```
DBMS_DATA_MINING.EXPORT_MODEL (
      filename          IN VARCHAR2,
      directory         IN VARCHAR2,
      model_filter      IN VARCHAR2 DEFAULT NULL,
      filesize          IN VARCHAR2 DEFAULT NULL,
      operation         IN VARCHAR2 DEFAULT NULL,
      remote_link       IN VARCHAR2 DEFAULT NULL,
      jobname           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 45–43 EXPORT_MODEL Procedure Parameters

Parameter	Description
filename	Name of the dump file set to which the models should be exported. The name must be unique within the schema. The dump file set can contain one or more files. The number of files in a dump file set is determined by the size of the models being exported (both metadata and data) and a specified or estimated maximum file size. You can specify the file size in the filesize parameter, or you can use the operation parameter to cause Oracle Data Pump to estimate the file size. If the size of the models to export is greater than the maximum file size, one or more additional files are created. When the export operation completes successfully, the name of the dump file set is automatically expanded to *filename01.dmp*, even if there is only one file in the dump set. If there are additional files, they are named sequentially as *filename02.dmp*, *filename03.dmp*, and so forth.
directory	Name of a pre-defined directory object that specifies where the dump file set should be created. The exporting user must have read/write privileges on the directory object and on the file system directory that it identifies. See *Oracle Database SQL Language Reference* for information about directory objects.

Table 45–43 (Cont.) EXPORT_MODEL Procedure Parameters

Parameter	Description
model_filter	Optional parameter that specifies which model or models to export. If you do not specify a value for model_filter, all models in the schema are exported. You can also specify NULL (the default) or 'ALL' to export all models. You can export individual models by name and groups of models based on mining function or algorithm. For instance, you could export all regression models or all Naive Bayes models. Examples are provided in Table 45–44.
filesize	Optional parameter that specifies the maximum size of a file in the dump file set. The size may be specified in bytes, kilobytes (K), megabytes (M), or gigabytes (G). The default size is 50 MB. If the size of the models to export is larger than filesize, one or more additional files are created within the dump set. See the description of the filename parameter for more information.
operation	Optional parameter that specifies whether or not to estimate the size of the files in the dump set. By default the size is not estimated and the value of the filesize parameter determines the size of the files. You can specify either of the following values for operation: ■ 'EXPORT' — Export all or the specified models. (Default) ■ 'ESTIMATE' — Estimate the size of the exporting models.
remote_link	Optional parameter that specifies the name of a database link to a remote system. The default value is NULL. A database link is a schema object in a local database that enables access to objects in a remote database. When you specify a value for remote_link, you can export the models in the remote database. The EXP_FULL_DATABASE role is required for exporting the remote models. The EXP_FULL_DATABASE privilege, the CREATE DATABASE LINK privilege, and other privileges may also be required.
jobname	Optional parameter that specifies the name of the export job. By default, the name has the form *username*_exp_*nnnn*, where *nnnn* is a number. For example, a job name in the SCOTT schema might be SCOTT_exp_134. If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. A log file for the export job, named *jobname.log*, is created in the same directory as the dump file set.

Usage Notes

The model_filter parameter specifies which models to export. You can list the models by name, or you can specify all models that have the same mining function or algorithm. You can query the USER_MINING_MODELS view to list the models in your schema.

```
SQL> describe user_mining_models
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 MODEL_NAME                                NOT NULL VARCHAR2(30)
 MINING_FUNCTION                                    VARCHAR2(30)
 ALGORITHM                                          VARCHAR2(30)
 CREATION_DATE                             NOT NULL DATE
 BUILD_DURATION                                     NUMBER
 MODEL_SIZE                                         NUMBER
 COMMENTS                                           VARCHAR2(4000)
```

Examples of model filters are provided in Table 45–44.

Table 45–44 Sample Values for the Model Filter Parameter

Sample Value	Meaning
`'mymodel'`	Export the model named `mymodel`
`'name= ''mymodel'''`	Export the model named `mymodel`
`'name IN (''mymodel2'',''mymodel3'')'`	Export the models named `mymodel2` and `mymodel3`
`'ALGORITHM_NAME = ''NAIVE_BAYES'''`	Export all Naive Bayes models. See Table 45–5 for a list of algorithm names.
`'FUNCTION_NAME =''CLASSIFICATION'''`	Export all classification models. See Table 45–3 for a list of mining functions.

Examples

1. The following statement exports all the models in the `DMUSER3` schema to a dump file set called `models_out` in the directory `$ORACLE_HOME/rdbms/log`. This directory is mapped to a directory object called `DATA_PUMP_DIR`. The `DMUSER3` user has read/write access to the directory and to the directory object.

```
SQL>execute dbms_data_mining.export_model ('models_out', 'DATA_PUMP_DIR');
```

   You can exit SQL*Plus and list the resulting dump file and log file.

```
SQL>EXIT
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
```

2. The following example uses the same directory object and is executed by the same user.This example exports the models called `NMF_SH_SAMPLE` and `SVMR_SH_REGR_SAMPLE` to a different dump file set in the same directory.

```
SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL ( 'models2_out', 'DATA_PUMP_DIR',
            'name in (''NMF_SH_SAMPLE'', ''SVMR_SH_REGR_SAMPLE'')');
SQL>EXIT
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
 DMUSER3_exp_924.log  models2_out01.dmp
```

3. The following examples show how to export models with specific algorithm and mining function names.

```
SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL('algo.dmp','DM_DUMP',
        'ALGORITHM_NAME IN (''O_CLUSTER'',''GENERALIZED_LINEAR_MODEL'',
        ''SUPPORT_VECTOR_MACHINES'',''NAIVE_BAYES'')');

SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL('func.dmp', 'DM_DUMP',
        'FUNCTION_NAME IN (CLASSIFICATION,CLUSTERING,FEATURE_EXTRACTION)');
```

GET_ASSOCIATION_RULES Function

This table function returns the rules produced by an association model.

You can specify filtering criteria to cause GET_ASSOCIATION_RULES to return a subset of the rules. Filtering criteria can improve the performance of the table function. If the number of rules is large, the greatest performance improvement will result from specifying the topn parameter.

Syntax

```
DBMS_DATA_MINING.GET_ASSOCIATION_RULES (
   model_name            IN VARCHAR2,
   topn                  IN NUMBER                 DEFAULT NULL,
   rule_id               IN NUMBER (38)            DEFAULT NULL,
   min_confidence        IN NUMBER                 DEFAULT NULL,
   min_support           IN NUMBER                 DEFAULT NULL,
   max_rule_length       IN NUMBER (38)            DEFAULT NULL,
   min_rule_length       IN NUMBER (38)            DEFAULT NULL,
   sort_order            IN ORA_MINING_VARCHAR2_NT DEFAULT NULL,
   antecedent_items      IN DM_ITEMS               DEFAULT NULL,
   consequent_items      IN DM_ITEMS               DEFAULT NULL,
   min_lift              IN NUMBER                 DEFAULT NULL)
 RETURN DM_RULES PIPELINED;
```

Parameters

Table 45–45 GET_ASSOCIATION_RULES Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used. This is the only required parameter of GET_ASSOCIATION_RULES. All other parameters specify optional filters on the rules to return.
topn	Return the *n* top rules ordered by confidence and then support, both descending. If you specify a sort order, the top *n* rules are derived after the sort is performed. If topn is specified and no maximum or minimum rule length is specified, then the only columns allowed in the sort order are RULE_CONFIDENCE and RULE_SUPPORT. If topn is specified and a maximum or minimum rule length *is* specified, then RULE_CONFIDENCE, RULE_SUPPORT, and NUMBER_OF_ITEMS are allowed in the sort order.
rule_id	Identifier of the rule to return. If you specify a value for rule_id, do not specify values for the other filtering parameters.
min_confidence	Return the rules with confidence greater than or equal to this number.
min_support	Return the rules with support greater than or equal to this number.
max_rule_length	Return the rules with a length less than or equal to this number. Rule length refers to the number of items in the rule (See NUMBER_OF_ITEMS in Table 45–46). For example, in the rule A=>B (if A, then B), the number of items is 2. If max_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.

Table 45–45 (Cont.) GET_ASSOCIATION_RULES Function Parameters

Parameter	Description
min_rule_length	Return the rules with a length greater than or equal to this number. See max_rule_length for a description of rule length. If min_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.
sort_order	Sort the rules by the values in one or more of the returned columns. Specify one or more column names, each followed by ASC for ascending order or DESC for descending order. (See Table 45–46, " GET_ASSOCIATION RULES Function Return Values" for the column names.) For example, to sort the result set in descending order first by the NUMBER_OF_ITEMS column, then by the RULE_CONFIDENCE column, you would specify: ORA_MINING_VARCHAR2_NT('NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC') If you specify topn, the results will vary depending on the sort order. By default, the results are sorted by confidence in descending order, then by support in descending order.
antecedent_items	Return the rules with these items in the antecedent.
consequent_items	Return the rules with this item in the consequent.
min_lift	Return the rules with lift greater than or equal to this number.

Return Values

The object type returned by GET_ASSOCIATION_RULES is described in Table 45–46. For descriptions of each field, see the Usage Notes.

Table 45–46 GET_ASSOCIATION RULES Function Return Values

Return Value	Description
DM_RULES	A set of rows of type DM_RULE. The rows have the following columns: (rule_id INTEGER, antecedent DM_PREDICATES, consequent DM_PREDICATES, rule_support NUMBER, rule_confidence NUMBER, rule_lift NUMBER, antecedent_support NUMBER, consequent_support NUMBER, number_of_items INTEGER) The antecedent and consequent columns each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER)

Usage Notes

1. This table function pipes out rows of type DM_RULES. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.
2. The ORA_MINING_VARCHAR2_NT type is defined as a table of VARCHAR2(4000).
3. The columns returned by GET_ASSOCIATION_RULES are described as follows. (See Table 45–46 for the DM_RULE column data types.)

Column in DM_RULES	Description
rule_id	Unique identifier for the rule
antecedent	The independent condition in the rule. When this condition exists, the dependent condition in the consequent also exists. The condition is a combination of attribute values called a predicate (DM_PREDICATE). The predicate specifies a condition for each attribute. The condition may specify equality (=), inequality (<>), greater than (>), less than (<), greater than or equal to (>=), or less than or equal to (<=) a given value. Support and confidence for each attribute condition in the antecedent is returned in the predicate. Support is the number of transactions that satisfy the antecedent. Confidence is the likelihood that a transaction will satisfy the antecedent. **Note:** The occurence of the attribute as a DM_PREDICATE indicates the presence of the item in the transaction. The actual value for attribute_num_value or attribute_str_value is meaningless. For example, the following predicate indicates that 'Mouse Pad' is present in the transaction *even though* the attribute value is NULL. `DM_PREDICATE('PROD_NAME', 'Mouse Pad', '= ', NULL, NULL, NULL, NULL))`
consequent	The dependent condition in the rule. This condition exists when the antecedent exists. The consequent, like the antecedent, is a predicate (DM_PREDICATE). Support and confidence for each attribute condition in the consequent is returned in the predicate. Support is the number of transactions that satisfy the consequent. Confidence is the likelihood that a transaction will satisfy the consequent.
rule_support	The number of transactions that satisfy the rule.
rule_confidence	The likelihood of a transaction satisfying the rule.
rule_lift	The degree of improvement in the prediction over random chance when the rule is satisfied.
antecedent_support	The ratio of the number of transactions that satisfy the antecedent to the total number of transactions.
consequent_support	The ratio of the number of transactions that satisfy the consequent to the total number of transactions.
number_of_items	The total number of attributes referenced in the antecedent and consequent of the rule.

Examples

The following example demonstrates an Association model build followed by several invocations of the GET_ASSOCIATION_RULES table function.

```
-- prepare a settings table to override default settings
```

```
CREATE TABLE market_settings AS
SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
 WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE market_settings
   SET setting_value = TO_CHAR(0.081)
 WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

-- build an AR model
DBMS_DATA_MINING.CREATE_MODEL(
  model_name => 'market_model',
  function => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name => 'market_build',
  case_id_column_name => 'item_id',
  target_column_name => NULL,
  settings_table_name => 'market_settings');
END;
/
-- View the (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model'));
```

In the previous example, you view all rules. To view just the top 20 rules, use the following statement.

```
-- View the top 20 (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model', 20));
```

The following query uses the association model `AR_SH_SAMPLE`, which is created from one of the Oracle Data Mining sample programs. (See *Oracle Data Mining User's Guide* for information about the sample programs.)

```
SELECT * FROM TABLE (
   DBMS_DATA_MINING.GET_ASSOCIATION_RULES (
      'AR_SH_SAMPLE', 10, NULL, 0.5, 0.01, 2, 1,
         ORA_MINING_VARCHAR2_NT (
         'NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC', 'RULE_SUPPORT DESC'),
         DM_ITEMS(DM_ITEM('CUSTPRODS', 'Mouse Pad', 1, NULL),
                  DM_ITEM('CUSTPRODS', 'Standard Mouse', 1, NULL)),
         DM_ITEMS(DM_ITEM('CUSTPRODS', 'Extension Cable', 1, NULL))));
```

The query returns three rules, shown as follows.

```
13  DM_PREDICATES(
       DM_PREDICATE('CUSTPRODS', 'Mouse Pad', '= ', 1, NULL, NULL, NULL),
       DM_PREDICATE('CUSTPRODS', 'Standard Mouse', '= ', 1, NULL, NULL, NULL))
    DM_PREDICATES(
       DM_PREDICATE('CUSTPRODS', 'Extension Cable', '= ', 1, NULL, NULL, NULL))
    .15532      .84393   2.7075     .18404     .3117   2

11  DM_PREDICATES(
       DM_PREDICATE('CUSTPRODS', 'Standard Mouse', '= ', 1, NULL, NULL, NULL))
    DM_PREDICATES(
       DM_PREDICATE('CUSTPRODS', 'Extension Cable', '= ', 1, NULL, NULL, NULL))
    .18085      .56291   1.8059     .32128     .3117   1
```

```
9   DM_PREDICATES(
       DM_PREDICATE('CUSTPRODS', 'Mouse Pad', '= ', 1, NULL, NULL, NULL))
    DM_PREDICATES(
       DM_PREDICATE('CUSTPRODS', 'Extension Cable', '= ', 1, NULL, NULL, NULL))
      .17766    .55116   1.7682     .32234     .3117   1
```

GET_FREQUENT_ITEMSETS Function

This table function returns a set of rows that represent the frequent itemsets from an Association model. For a detailed description of frequent itemsets, consult *Oracle Data Mining Concepts*.

Syntax

```
DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS (
    model_name          IN VARCHAR2,
    topn                IN NUMBER DEFAULT NULL,
    max_itemset_length  IN NUMBER DEFAULT NULL)
  RETURN DM_ITEMSETS PIPELINED;
```

Parameters

Table 45–47 GET_FREQUENT_ITEMSETS Function Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
`topn`	When not `NULL`, return the top *n* rows ordered by support in descending order
`max_itemset_length`	Maximum length of an item set.

Return Values

Table 45–48 GET_FREQUENT_ITEMSETS Function Return Values

Return Value	Description

`DM_ITEMSETS`	A set of rows of type `DM_ITEMSET`. The rows have the following columns:
	`(itemsets_id NUMBER,`
	`items DM_ITEMS,`
	`support NUMBER,`
	`number_of_items NUMBER)`
	The `items` column returns a nested table of type `DM_ITEMS`. The rows have type `DM_ITEM`:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`attribute_num_value NUMBER,`
	`attribute_str_value VARCHAR2(4000))`

Usage Notes

This table function pipes out rows of type `DM_ITEMSETS`. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.

Examples

The following example demonstrates an Association model build followed by an invocation of `GET_FREQUENT_ITEMSETS` table function from Oracle SQL.

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
```

```
    SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
 WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE market_settings
   SET setting_value = TO_CHAR(0.081)
 WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

/* build a AR model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name           => 'market_model',
  function             => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name      => 'market_build',
  case_id_column_name  => 'item_id',
  target_column_name   => NULL,
  settings_table_name  => 'market_settings');
END;
/

-- View the (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
  FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model'));
```

In the example above, you view all itemsets. To view just the top 20 itemsets, use the following statement:

```
-- View the top 20 (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
  FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model', 20));
```

GET_MODEL_COST_MATRIX Function

This function returns the rows of the default scoring matrix associated with the specified model.

By default, this function returns the scoring matrix that was added to the model with the ADD_COST_MATRIX procedure. If you wish to obtain the cost matrix used to create a model, specify cost_matrix_type_create as the matrix_type. See Table 45–49.

See also ADD_COST_MATRIX Procedure.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_COST_MATRIX (
      model_name        IN VARCHAR2,
      matrix_type       IN VARCHAR2 DEFAULT cost_matrix_type_score)
RETURN DM_COST_MATRIX PIPELINED;
```

Parameters

Table 45–49 GET_MODEL_COST_MATRIX Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
matrix_type	The type of cost matrix. COST_MATRIX_TYPE_SCORE — cost matrix used for scoring. (Default.) COST_MATRIX_TYPE_CREATE — cost matrix used to create the model (Decision Tree only).

Return Values

Table 45–50 GET_MODEL_COST_MATRIX Function Return Values

Return Value	Description
DM_COST_MATRIX	A set of rows of type DM_COST_ELEMENT. The rows have the following columns: actual VARCHAR2(4000), NUMBER, predicted VARCHAR2(4000), cost NUMBER)

Usage Notes

Only Decision Tree models can be built with a cost matrix. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the CLAS_COST_TABLE_NAME setting in the settings table for the model. See Table 45–7, " Mining Function Settings".

The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, you can modify the values in the cost matrix table or you can use the REMOVE_COST_MATRIX procedure to remove the cost matrix and the ADD_COST_MATRIX procedure to add a new one.

Example

This example returns the scoring cost matrix associated with the Naive Bayes model NB_SH_CLAS_SAMPLE.

```
column actual format a10
column predicted format a10
SELECT *
    FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
    ORDER BY predicted, actual;

ACTUAL     PREDICTED   COST
---------- ---------- -----
0          0            .00
1          0            .75
0          1            .25
1          1            .00
```

GET_MODEL_DETAILS_AI Function

This table function returns a set of rows that provide the details of an Attribute Importance model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_AI (
  model_name          IN VARCHAR2)
 RETURN DM_RANKED_ATTRIBUTES PIPELINED;
```

Parameters

Table 45–51 GET_MODEL_DETAILS_AI Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 45–52 GET_MODEL_DETAILS_AI Function Return Values

Return Value	Description
DM_RANKED_ATTRIBUTES	A set of rows of type DM_RANKED_ATTRIBUTE. The rows have the following columns: (attribute_name VARCHAR2(4000, attribute_subname VARCHAR2(4000), importance_value NUMBER, rank NUMBER(38))

Examples

The following example returns model details for the attribute importance model AI_SH_sample, which was created by the sample program dmaidemo.sql. For information about the sample programs, see *Oracle Data Mining User's Guide*.

```
SELECT attribute_name, importance_value, rank
    FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_AI('AI_SH_sample'))
    ORDER BY RANK;

ATTRIBUTE_NAME                          IMPORTANCE_VALUE       RANK
--------------------------------------- ---------------- ----------
HOUSEHOLD_SIZE                                .151685183          1

CUST_INCOME_LEVEL                           -.03951311          16
```

GET_MODEL_DETAILS_EM Function

This table function returns a set of rows that provide statistics about the clusters produced by an Expectation Maximization model.

By default, the EM algorithm groups components into high-level clusters, and GET_MODEL_DETAILS_EM returns only the high-level clusters with their hierarchies. Alternatively, you can configure EM to disable the grouping of components into high-level clusters. In this case, GET_MODEL_DETAILS_EM returns the components themselves as clusters with their hierarchies. See Table 45–10, " Expectation Maximization Settings for Data Preparation and Analysis".

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_EM (
          model_name          VARCHAR2,
          cluster_id          NUMBER    DEFAULT NULL,
          attribute           VARCHAR2  DEFAULT NULL,
          centroid            NUMBER    DEFAULT 1,
          histogram           NUMBER    DEFAULT 1,
          rules               NUMBER    DEFAULT 2,
          attribute_subname   VARCHAR2  DEFAULT NULL,
          topn_attributes     NUMBER    DEFAULT NULL)
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

Table 45–53 GET_MODEL_DETAILS_EM Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
cluster_id	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
attribute	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned
centroid	This parameter accepts the following values: ■ 1 — Details about centroids are returned (default) ■ 0 — Details about centroids are not returned
histogram	This parameter accepts the following values: ■ 1 — Details about histograms are returned (default) ■ 0 — Details about histograms are not returned
rules	This parameter accepts the following values: ■ 2 — Details about rules are returned (default) ■ 1 — Rule summaries are returned ■ 0 — No information about rules is returned

Table 45–53 (Cont.) GET_MODEL_DETAILS_EM Function Parameters

Parameter	Description
attribute_subname	The name of a nested attribute. The full name of a nested attribute has the form: *attribute_name.attribute_subname* where *attribute_name* is the name of the column and *attribute_subname* is the name of the nested attribute in that column. If the attribute is not nested, attribute_subname is null.
topn_attributes	Restricts the number of attributes returned in the centroid, histogram, and rules objects. Only the *n* attributes with the highest confidence values in the rules are returned. If the number of attributes included in the rules is less than *topn*, then up to *n* additional attributes in alphabetical order are returned. If both the attribute and topn_attributes parameters are specified, then topn_attributes is ignored.

Return Values

Table 45–54 GET_MODEL_DETAILS_EM Function Return Values

Return Value	Description
DM_CLUSTERS	A set of rows of type DM_CLUSTER. The rows have the following columns: (id NUMBER, cluster_id VARCHAR2(4000), record_count NUMBER, parent NUMBER, tree_level NUMBER, dispersion NUMBER, split_predicate DM_PREDICATES, child DM_CHILDREN, centroid DM_CENTROIDS, histogram DM_HISTOGRAMS, rule DM_RULES) Note: The Expectation Maximization algorithm uses all the fields except dispersion and split_predicate. The split_predicate column of DM_CLUSTER returns a nested table of type DM_PREDICATES. Each row, of type DM_PREDICATE, has the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2) /*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER) The child column of DM_CLUSTER returns a nested table of type DM_CHILDREN. The rows, of type DM_CHILD, have a single column of type NUMBER, which contains the identifiers of each child.

Table 45–54 (Cont.) GET_MODEL_DETAILS_EM Function Return Values

Return Value	Description
	The centroid column of DM_CLUSTER returns a nested table of type DM_CENTROIDS. The rows, of type DM_CENTROID, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), mean NUMBER, mode_value VARCHAR2(4000), variance NUMBER) The histogram column of DM_CLUSTER returns a nested table of type DM_HISTOGRAMS. The rows, of type DM_HISTOGRAM_BIN, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), bin_id NUMBER, lower_bound NUMBER, upper_bound NUMBER, label VARCHAR2(4000), count NUMBER) The rule column of DM_CLUSTER returns a single row of type DM_RULE. The columns are: (rule_id INTEGER, antecedent DM_PREDICATES, consequent DM_PREDICATES, rule_support NUMBER, rule_confidence NUMBER, rule_lift NUMBER, antecedent_support NUMBER, consequent_support NUMBER, number_of_items INTEGER) The antecedent and consequent columns each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2) /*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER)

Usage Notes

1. This table function pipes out rows of type DM_CLUSTERS. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.
2. GET_MODEL_DETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.
3. When cluster statistics are disabled (EMCS_CLUSTER_STATISTICS is set to EMCS_CLUS_STATS_DISABLE), GET_MODEL_DETAILS_EM does not return centroids, histograms, or rules. Only taxonomy (hierarchy) and cluster counts are returned.

4. For descriptions of predicates (`DM_PREDICATE`) and rules (`DM_RULE`), see GET_ASSOCIATION_RULES Function.

GET_MODEL_DETAILS_EM_COMP Function

This table function returns a set of rows that provide details about the parameters of an Expectation Maximization model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_EM_COMP (
          model_name         VARCHAR2)
RETURN DM_EM_COMPONENT_SET PIPELINED;
```

Parameters

Table 45–55 GET_MODEL_DETAILS_EM_COMP Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 45–56 GET_MODEL_DETAILS_EM_COMP Function Return Values

Return Value	Description
DM_EM_COMPONENT_SET	A set of rows of type DM_EM_COMPONENT. The rows have the following columns: (info_type VARCHAR2(30), component_id NUMBER, cluster_id NUMBER, attribute_name VARCHAR2(4000), covariate_name VARCHAR2(4000), attribute_value VARCHAR2(4000), value NUMBER)

Usage Notes

1. This table function pipes out rows of type DM_EM_COMPONENT. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.

   The columns in each row returned by GET_MODEL_DETAILS_EM_COMP are described as follows:

Column in DM_EM_COMPONENT	Description
info_type	The type of information in the row. The following information types are supported: ■ cluster ■ prior ■ mean ■ covariance ■ frequency
component_id	Unique identifier of a component

Column in DM_EM_COMPONENT	Description
cluster_id	Unique identifier of the high-level leaf cluster for each component
attribute_name	Name of an original attribute or a derived feature ID. The derived feature ID is used in models built on data with nested columns. The derived feature definitions can be obtained from the GET_MODEL_DETAILS_EM_PROJ Function.
covariate_name	Name of an original attribute or a derived feature ID used in variance/covariance definition
attribute_value	Categorical value or bin interval for binned numerical attributes
value	Encodes different information depending on the value of info_type, as follows: ■ cluster — The value field is NULL ■ prior — The value field returns the component prior ■ mean — The value field returns the mean of the attribute specified in attribute_name ■ covariance — The value field returns the covariance of the attributes specified in attribute_name and covariate_name. Using the same attribute in attribute_name and covariate_name, returns the variance. ■ frequency— The value field returns the multivalued Bernoulli frequency parameter for the attribute/value combination specified by attribute_name and attribute_value See Usage Note 2 for details.

2. The following table shows which fields are used for each info_type. The blank cells represent NULLs.

info_type	component_id	cluster_id	attribute_name	covariate_name	attribute_value	value
cluster	X	X				
prior	X	X				X
mean	X	X	X			X
covariance	X	X	X	X		X
frequency	X	X	X		X	X

3. GET_MODEL_DETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

GET_MODEL_DETAILS_EM_PROJ Function

This table function returns a set of rows that provide statistics about the projections produced by an Expectation Maximization model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_EM_PROJ (
          model_name          VARCHAR2 )
RETURN DM_EM_PROJECTION_SET PIPELINED;
```

Parameters

Table 45–57 GET_MODEL_DETAILS_EM_PROJ Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 45–58 GET_MODEL_DETAILS_EM_PROJ Function Return Values

Return Value	Description
DM_EM_PROJECTION_SET	A set of rows of type DM_EM_PROJECTION. The rows have the following columns: (feature_name VARCHAR2(4000), attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_value VARCHAR2(4000), coefficient NUMBER) See Usage Notes for details.

Usage Notes

1. This table function pipes out rows of type DM_EM_PROJECTION. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.

   The columns in each row returned by GET_MODEL_DETAILS_EM_PROJ are described as follows:

Column in DM_EM_PROJECTION	Description
feature_name	Name of a derived feature. The feature maps to the attribute_name returned by the GET_MODEL_DETAILS_EM Function.
attribute_name	Name of a column in the build data
attribute_subname	Subname in a nested column
attribute_value	Categorical value.
coefficient	Projection coefficient. The representation is sparse; only the non-zero coefficients are returned.

2. `GET_MODEL_DETAILS` functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

   The coefficients are related to the transformed, not the original, attributes. When returned directly with the model details, the coefficients may not provide meaningful information. If you want `GET_MODEL_DETAILS_SVM` to transform the coefficients such that they relate to the original attributes, set the `reverse_coef` parameter to 1.

GET_MODEL_DETAILS_GLM Function

This table function returns the coefficient statistics for a Generalized Linear Model.

The same set of statistics is returned for both linear and logistic regression, but statistics that do not apply to the mining function are returned as NULL. For more details, see the Usage Notes.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_GLM (
             model_name             VARCHAR2)
RETURN DM_GLM_COEFF_SET PIPELINED;
```

Parameters

Table 45–59 GET_MODEL_DETAILS_GLM Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 45–60 GET_MODEL_DETAILS_GLM Return Values

Return Value	Description
DM_GLM_COEFF_SET	A set of rows of type DM_GLM_COEFF. The rows have the following columns: (class VARCHAR2(4000), attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_value VARCHAR2(4000), feature_expression VARCHAR2(4000), coefficient NUMBER, std_error NUMBER, test_statistic NUMBER, p_value NUMBER, VIF NUMBER, std_coefficient NUMBER, lower_coeff_limit NUMBER, upper_coeff_limit NUMBER, exp_coefficient BINARY_DOUBLE, exp_lower_coeff_limit BINARY_DOUBLE, exp_upper_coeff_limit BINARY_DOUBLE)

GET_MODEL_DETAILS_GLM returns a row of statistics for each attribute and one extra row for the intercept, which is identified by a null value in the attribute name. Each row has the DM_GLM_COEFF datatype. The statistics are described in Table 45–61.

Table 45–61 DM_GLM_COEFF Datatype Description

Column	Description
class	The non-reference target class for logistic regression. The model is built to predict the probability of this class. The other class (the reference class) is specified in the model setting GLMS_REFERENCE_CLASS_NAME. See Table 45–14, " GLM Settings". For linear regression, class is null.
attribute_name	The attribute name when there is no subname, or first part of the attribute name when there is a subname. The value of attribute_name is also the name of the column in the case table that is the source for this attribute. For the intercept, attribute_name is null. Intercepts are equivalent to the bias term in SVM models.
attribute_subname	The name of an attribute in a nested table. The full name of a nested attribute has the form: *attribute_name.attribute_subname* where *attribute_name* is the name of the nested column in the case table that is the source for this attribute. If the attribute is not nested, attribute_subname is null. If the attribute is an intercept, both the attribute_name and the attribute_subname are null.
attribute_value	The value of the attribute (categorical attribute only). For numerical attributes, attribute_value is null.
feature_expression	The feature name constructed by the algorithm when feature selection is enabled. If feature selection is not enabled, the feature name is simply the fully-qualified attribute name (*attribute_name.attribute_subname* if the attribute is in a nested column). For categorical attributes, the algorithm constructs a feature name that has the following form: *fully-qualified_attribute_name.attribute_value* For numerical attributes, the algorithm constructs a name for the higher-order feature by subtracting the mean from each of the component attributes and taking the product of the resulting values: (*attrib1*-mean(*attrib1*))*(*attrib2*-mean(*attrib2*))*..... where *attrib1* and *attrib2* are fully-qualified attribute names.
coefficient	The linear coefficient estimate.
std_error	Standard error of the coefficient estimate.
test_statistic	For linear regression, the t-value of the coefficient estimate. For logistic regression, the Wald chi-square value of the coefficient estimate.
p-value	Probability of the test_statistic. Used to analyze the significance of specific attributes in the model.
VIF	Variance Inflation Factor. The value is zero for the intercept. For logistic regression, VIF is null.
std_coefficient	Standardized estimate of the coefficient.
lower_coeff_limit	Lower confidence bound of the coefficient.

Table 45–61 (Cont.) DM_GLM_COEFF Datatype Description

Column	Description
upper_coeff_limit	Upper confidence bound of the coefficient.
exp_coefficient	Exponentiated coefficient for logistic regression. For linear regression, exp_coefficient is null.
exp_lower_coeff_limit	Exponentiated coefficient for lower confidence bound of the coefficient for logistic regression. For linear regression, exp_lower_coeff_limit is null.
exp_upper_coeff_limit	Exponentiated coefficient for upper confidence bound of the coefficient for logistic regression. For linear regression, exp_lower_coeff_limit is null.

Usage Notes

Not all statistics are necessarily returned for each coefficient. Statistics will be null if:

- They do not apply to the mining function. For example, exp_coefficient does not apply to linear regression.
- They cannot be computed from a theoretical standpoint. For example, when ridge regression is enabled, the coefficient values are returned with no statistics except VIF if it is enabled. (For information on ridge regression, see Table 45–14, " GLM Settings".)
- They cannot be computed because of limitations in system resources.
- Their values would be infinity.

Examples

The following example returns some of the model details for the GLM regression model GLMR_SH_Regr_sample, which was created by the sample program dmglrdem.sql. For information about the sample programs, see *Oracle Data Mining User's Guide*.

```
SQL> SELECT *
   FROM (SELECT class, attribute_name, attribute_value, coefficient, std_error
              FROM TABLE(dbms_data_mining.get_model_details_glm(
                           'GLMR_SH_Regr_sample'))
           ORDER BY class, attribute_name, attribute_value)
     WHERE ROWNUM < 11;

```

GET_MODEL_DETAILS_GLOBAL Function

This table function returns statistics about the model as a whole. Global details are available for Generalized Linear Models, Association Rules, Singular Value Decomposition, and Expectation Maximization.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_GLOBAL (
      model_name     IN  VARCHAR2)
RETURN DM_MODEL_GLOBAL_DETAILS PIPELINED;
```

Parameters

Table 45–62 GET_MODEL_DETAILS_GLOBAL Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 45–63 GET_MODEL_DETAILS_GLOBAL Function Return Values

Return Value	Description
DM_MODEL_GLOBAL_DETAILS	A collection of rows of type DM_MODEL_GLOBAL_DETAIL. The rows have the following columns: (global_detail_name VARCHAR2(30), global_detail_value NUMBER)

Global Details for GLM: Linear Regression

Table 45–64 Global Details for Linear Regression

GLOBAL_DETAIL_NAME	Description
MODEL_DF	Model degrees of freedom
MODEL_SUM_SQUARES	Model sum of squares
MODEL_MEAN_SQUARE	Model mean square
F_VALUE	Model *F* value statistic
MODEL_F_P_VALUE	Model *F* value probability
ERROR_DF	Error degrees of freedom
ERROR_SUM_SQUARES	Error sum of squares
ERROR_MEAN_SQUARE	Error mean square
CORRECTED_TOTAL_DF	Corrected total degrees of freedom
CORRECTED_TOT_SS	Corrected total sum of squares
ROOT_MEAN_SQ	Root mean square error
DEPENDENT_MEAN	Dependent mean
COEFF_VAR	Coefficient of variation

Table 45–64 (Cont.) Global Details for Linear Regression

GLOBAL_DETAIL_NAME	Description
R_SQ	R-Square
ADJUSTED_R_SQUARE	Adjusted R-Square
AIC	Akaike's information criterion
SBIC	Schwarz's Bayesian information criterion
GMSEP	Estimated mean square error of the prediction, assuming multivariate normality
HOCKING_SP	Hocking Sp statistic
J_P	JP statistic (the final prediction error)
NUM_PARAMS	Number of parameters (the number of coefficients, including the intercept)
NUM_ROWS	Number of rows
MODEL_CONVERGED	Whether or not the model converged. Value is 1 if it converged, or 0 if it did not converge
VALID_COVARIANCE_MATRIX	Valid covariance matrix. Value is 1 if the covariance matrix was computed, or 0 if it was not computed

Global Details for GLM: Logistic Regression

Table 45–65 Global Details for Logistic Regression

GLOBAL_DETAIL_NAME	Description
AIC_INTERCEPT	Akaike's criterion for the fit of the intercept only model
AIC_MODEL	Akaike's criterion for the fit of the intercept and the covariates (predictors) mode
SC_INTERCEPT	Schwarz's Criterion for the fit of the intercept only model
SC_MODEL	Schwarz's Criterion for the fit of the intercept and the covariates (predictors) model
NEG2_LL_INTERCEPT	-2 log likelihood of the intercept only model
NEG2_LL_MODEL	-2 log likelihood of the model
LR_DF	Likelihood ratio degrees of freedom
LR_CHI_SQ	Likelihood ratio chi-square value
LR_CHI_SQ_P_VALUE	Likelihood ratio chi-square probability value
PSEUDO_R_SQ_CS	Pseudo R-square Cox and Snell
PSEUDO_R_SQ_N	Pseudo R-square Nagelkerke
DEPENDENT_MEAN	Dependent mean
PCT_CORRECT	Percent of correct predictions
PCT_INCORRECT	Percent of incorrectly predicted rows
PCT_TIED	Percent of cases where probability for both cases is the same
NUM_PARAMS	Number of parameters (the number of coefficients, including the intercept)
NUM_ROWS	Number of rows

Table 45–65 (Cont.) Global Details for Logistic Regression

GLOBAL_DETAIL_NAME	Description
MODEL_CONVERGED	Whether or not the model converged. Value is 1if it converged, or 0 if it did not converge.
VALID_COVARIANCE_MATRIX	Valid covariance matrix. Value is 1 if the covariance matrix was computed, or 0 if the covariance matrix not computed

Note: When ridge regression is enabled, fewer global details are returned. For information about ridge, see *Oracle Data Mining Concepts*.

Global Detail for Association Rules

A single global detail is produced by an Association model.

Table 45–66 Global Detail for Association Rules

GLOBAL_DETAIL_NAME	Description
RULE_COUNT	The number of association rules in the model.

Global Details for Singular Value Decomposition

Table 45–67 Global Details for Singular Value Decomposition

GLOBAL_DETAIL_NAME	Description
NUM_COMPONENTS	Number of features (components) produced by the model
SUGGESTED_CUTOFF	Suggested cutoff that indicates how many of the top computed features capture most of the variance in the model. Using only the features below this cutoff would be a reasonable strategy for dimensionality reduction.

Global Details for Expectation Maximization

Table 45–68 Global Details for Expectation Maximization

GLOBAL_DETAIL_NAME	Description
NUM_COMPONENTS	Number of components produced by the model
NUM_CLUSTERS	Number of clusters produced by the model
LOGLIKELIHOOD	Percent improvement in the value of the log likelihood function required to add a new component to the model.

Examples

The following example returns the global model details for the GLM regression model GLMR_SH_Regr_sample, which was created by the sample program dmglrdem.sql. For information about the sample programs, see *Oracle Data Mining User's Guide*.

```
SELECT *
  FROM TABLE(dbms_data_mining.get_model_details_global(
              'GLMR_SH_Regr_sample'))

```

GET_MODEL_DETAILS_KM Function

This table function returns a set of rows that provide the details of a *k*-Means clustering model.

You can provide input to GET_MODEL_DETAILS_KM to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, GET_MODEL_DETAILS_KM returns all the information about the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_KM (
          model_name          VARCHAR2,
          cluster_id          NUMBER    DEFAULT NULL,
          attribute           VARCHAR2  DEFAULT NULL,
          centroid            NUMBER    DEFAULT 1,
          histogram           NUMBER    DEFAULT 1,
          rules               NUMBER    DEFAULT 2,
          attribute_subname   VARCHAR2  DEFAULT NULL,
          topn_attributes     NUMBER    DEFAULT NULL)
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

Table 45–69 GET_MODEL_DETAILS_KM Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
cluster_id	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
attribute	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned
centroid	This parameter accepts the following values: ■ 1 — Details about centroids are returned (default) ■ 0 — Details about centroids are not returned
histogram	This parameter accepts the following values: ■ 1 — Details about histograms are returned (default) ■ 0 — Details about histograms are not returned
rules	This parameter accepts the following values: ■ 2 — Details about rules are returned (default) ■ 1 — Rule summaries are returned ■ 0 — No information about rules is returned
attribute_subname	The name of a nested attribute. The full name of a nested attribute has the form: *attribute_name.attribute_subname* where *attribute_name* is the name of the column and *attribute_subname* is the name of the nested attribute in that column. If the attribute is not nested, attribute_subname is null.

Table 45–69 (Cont.) GET_MODEL_DETAILS_KM Function Parameters

Parameter	Description
topn_attributes	Restricts the number of attributes returned in the centroid, histogram, and rules objects. Only the *n* attributes with the highest confidence values in the rules are returned. If the number of attributes included in the rules is less than *topn*, then up to *n* additional attributes in alphabetical order are returned. If both the attribute and topn_attributes parameters are specified, then topn_attributes is ignored.

Return Values

Table 45–70 GET_MODEL_DETAILS_KM Function Return Values

Return Value	Description
DM_CLUSTERS	A set of rows of type DM_CLUSTER. The rows have the following columns: (id NUMBER, cluster_id VARCHAR2(4000), record_count NUMBER, parent NUMBER, tree_level NUMBER, dispersion NUMBER, split_predicate DM_PREDICATES, child DM_CHILDREN, centroid DM_CENTROIDS, histogram DM_HISTOGRAMS, rule DM_RULE) The split_predicate column of DM_CLUSTER returns a nested table of type DM_PREDICATES. Each row, of type DM_PREDICATE, has the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2) /*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER) The child column of DM_CLUSTER returns a nested table of type DM_CHILDREN. The rows, of type DM_CHILD, have a single column of type NUMBER, which contains the identifiers of each child. The centroid column of DM_CLUSTER returns a nested table of type DM_CENTROIDS. The rows, of type DM_CENTROID, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), mean NUMBER, mode_value VARCHAR2(4000), variance NUMBER)

Table 45–70 (Cont.) GET_MODEL_DETAILS_KM Function Return Values

Return Value	Description

	The `histogram` column of `DM_CLUSTER` returns a nested table of type `DM_HISTOGRAMS`. The rows, of type `DM_HISTOGRAM_BIN`, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`bin_id NUMBER,`
	`lower_bound NUMBER,`
	`upper_bound NUMBER,`
	`label VARCHAR2(4000),`
	`count NUMBER)`
	The `rule` column of `DM_CLUSTER` returns a single row of type `DM_RULE`. The columns are:
	`(rule_id INTEGER,`
	`antecedent DM_PREDICATES,`
	`consequent DM_PREDICATES,`
	`rule_support NUMBER,`
	`rule_confidence NUMBER,`
	`rule_lift NUMBER,`
	`antecedent_support NUMBER,`
	`consequent_support NUMBER,`
	`number_of_items INTEGER)`
	The `antecedent` and `consequent` columns of `DM_RULE` each return nested tables of type `DM_PREDICATES`. The rows, of type `DM_PREDICATE`, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/,`
	`attribute_num_value NUMBER,`
	`attribute_str_value VARCHAR2(4000),`
	`attribute_support NUMBER,`
	`attribute_confidence NUMBER)`

Usage Notes

1. The table function pipes out rows of type `DM_CLUSTERS`. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.
2. For descriptions of predicates (`DM_PREDICATE`) and rules (`DM_RULE`), see GET_ASSOCIATION_RULES Function.

Examples

The following example returns model details for the *k*-Means clustering model `KM_SH_Clus_sample`, which was created by the sample program `dmkmdemo.sql`. For information about the sample programs, see *Oracle Data Mining User's Guide*.

```
SELECT T.id           clu_id,
       T.record_count rec_cnt,
       T.parent       parent,
       T.tree_level   tree_level,
       T.dispersion   dispersion
  FROM (SELECT *
          FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_KM(
                     'KM_SH_Clus_sample'))
```

```
       ORDER BY id) T
 WHERE ROWNUM < 6;

    CLU_ID    REC_CNT     PARENT TREE_LEVEL DISPERSION
---------- ---------- ---------- ---------- ----------
         1       1500                   1  5.9152211
         2        638          1          2 3.98458982
         3        862          1          2 5.83732097
         4        376          3          3 5.05192137
         5        486          3          3 5.42901522
```

GET_MODEL_DETAILS_NB Function

This table function returns a set of rows that provide the details of a Naive Bayes model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_NB (
   model_name      IN       VARCHAR2)
 RETURN DM_NB_DETAILS PIPELINED;
```

Parameters

Table 45–71 GET_MODEL_DETAILS_NB Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 45–72 GET_MODEL_DETAILS_NB Function Return Values

Return Value	Description
DM_NB_DETAILS	A set of rows of type DM_NB_DETAIL. The rows have the following columns: (target_attribute_name VARCHAR2(30), target_attribute_str_value VARCHAR2(4000), target_attribute_num_value NUMBER, prior_probability NUMBER, conditionals DM_CONDITIONALS) The conditionals column of DM_NB_DETAIL returns a nested table of type DM_CONDITIONALS. The rows, of type DM_CONDITIONAL, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_str_value VARCHAR2(4000), attribute_num_value NUMBER, conditional_probability NUMBER)

Usage Notes

The table function pipes out rows of type DM_NB_DETAILS. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.

Examples

The following query is from the sample program dmnbdemo.sql. It returns model details about the model NB_SH_Clas_sample. For information about the sample programs, see *Oracle Data Mining User's Guide*.

The query creates labels from the bin boundary tables that were used to bin the training data. It replaces the attribute values with the labels. For numeric bins, the labels are (*lower_boundary*,*upper_boundary*]; for categorical bins, the label matches

the value it represents. (This method of categorical label representation will only work for cases where one value corresponds to one bin.) The target was not binned.

```
WITH
    bin_label_view AS (
    SELECT col, bin, (DECODE(bin,'1','[','(') || lv || ',' || val || ']') label
      FROM (SELECT col,
                   bin,
                   LAST_VALUE(val) OVER (
                   PARTITION BY col ORDER BY val
                   ROWS BETWEEN UNBOUNDED PRECEDING AND 1 PRECEDING) lv,
                   val
              FROM nb_sh_sample_num)
   UNION ALL
   SELECT col, bin, val label
     FROM nb_sh_sample_cat
   ),
   model_details AS (
   SELECT T.target_attribute_name                                          tname,
         NVL(TO_CHAR(T.target_attribute_num_value,T.target_attribute_str_value))
tval,
          C.attribute_name                                                 pname,
          NVL(L.label, NVL(C.attribute_str_value, C.attribute_num_value)) pval,
          T.prior_probability                                            priorp,
          C.conditional_probability                                       condp
     FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NB('NB_SH_Clas_sample')) T,
          TABLE(T.conditionals) C,
          bin_label_view L
    WHERE C.attribute_name = L.col (+) AND
          (NVL(C.attribute_str_value,C.attribute_num_value) = L.bin(+))
   ORDER BY 1,2,3,4,5,6
   )
   SELECT tname, tval, pname, pval, priorp, condp
     FROM model_details
    WHERE ROWNUM < 11;

TNAME          TVAL PNAME                     PVAL           PRIORP   CONDP

```

GET_MODEL_DETAILS_NMF Function

This table function returns a set of rows that provide the details of a Non-Negative Matrix Factorization model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF (
   model_name        IN        VARCHAR2)
 RETURN DM_NMF_FEATURE_SET PIPELINED;
```

Parameters

Table 45–73 GET_MODEL_DETAILS_NMF Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 45–74 GET_MODEL_DETAILS_NMF Function Return Values

Return Value	Description

DM_NMF_FEATURE_SET	A set of rows of DM_NMF_FEATURE. The rows have the following columns:
	`(feature_id NUMBER,`
	`mapped_feature_id VARCHAR2(4000),`
	`attribute_set DM_NMF_ATTRIBUTE_SET)`
	The attribute_set column of DM_NMF_FEATURE returns a nested table of type DM_NMF_ATTRIBUTE_SET. The rows, of type DM_NMF_ATTRIBUTE, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`attribute_value VARCHAR2(4000),`
	`coefficient NUMBER)`

Usage Notes

The table function pipes out rows of type DM_NMF_FEATURE_SET. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.

Examples

The following example returns model details for the feature extraction model NMF_SH_Sample, which was created by the sample program dmnmdemo.sql. For information about the sample programs, see *Oracle Data Mining User's Guide*.

```
SELECT * FROM (
SELECT F.feature_id,
       A.attribute_name,
       A.attribute_value,
       A.coefficient
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF('NMF_SH_Sample')) F,
       TABLE(F.attribute_set) A
```

```
ORDER BY feature_id,attribute_name,attribute_value
) WHERE ROWNUM < 11;

```

GET_MODEL_DETAILS_OC Function

This table function returns a set of rows that provide the details of an O-Cluster clustering model. The rows are an enumeration of the clustering patterns generated during the creation of the model.

You can provide input to GET_MODEL_DETAILS_OC to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, GET_MODEL_DETAILS_OC returns all the information about the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_OC (
          model_name         VARCHAR2,
          cluster_id         NUMBER    DEFAULT NULL,
          attribute          VARCHAR2  DEFAULT NULL,
          centroid           NUMBER    DEFAULT 1,
          histogram          NUMBER    DEFAULT 1,
          rules              NUMBER    DEFAULT 2,
          topn_attributes    NUMBER    DEFAULT NULL)
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

Table 45–75 GET_MODEL_DETAILS_OC Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
cluster_id	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
attribute	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned
centroid	This parameter accepts the following values: ■ 1 — Details about centroids are returned (default) ■ 0 — Details about centroids are not returned
histogram	This parameter accepts the following values: ■ 1 — Details about histograms are returned (default) ■ 0 — Details about histograms are not returned
rules	This parameter accepts the following values: ■ 2 — Details about rules are returned (default) ■ 1 — Rule summaries are returned ■ 0 — No information about rules is returned

Table 45–75 (Cont.) GET_MODEL_DETAILS_OC Function Parameters

Parameter	Description
topn_attributes	Restricts the number of attributes returned in the centroid, histogram, and rules objects. Only the *n* attributes with the highest confidence values in the rules are returned. If the number of attributes included in the rules is less than *topn*, then up to *n* additional attributes in alphabetical order are returned. If both the attribute and topn_attributes parameters are specified, then topn_attributes is ignored.

Return Values

Table 45–76 GET_MODEL_DETAILS_OC Function Return Values

Return Value	Description
DM_CLUSTERS	A set of rows of type DM_CLUSTER. The rows have the following columns: (id NUMBER, cluster_id VARCHAR2(4000), record_count NUMBER, parent NUMBER, tree_level NUMBER, dispersion NUMBER, split_predicate DM_PREDICATES, child DM_CHILDREN, centroid DM_CENTROIDS, histogram DM_HISTOGRAMS, rule DM_RULE) The split_predicate column of DM_CLUSTER returns a nested table of type DM_PREDICATES. Each row, of type DM_PREDICATE, has the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2) /*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER) The child column of DM_CLUSTER returns a nested table of type DM_CHILDREN. The rows, of type DM_CHILD, have a single column of type NUMBER, which contains the identifiers of each child. The centroid column of DM_CLUSTER returns a nested table of type DM_CENTROIDS. The rows, of type DM_CENTROID, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), mean NUMBER, mode_value VARCHAR2(4000), variance NUMBER)

Table 45–76 (Cont.) GET_MODEL_DETAILS_OC Function Return Values

Return Value	Description

	The `histogram` column of `DM_CLUSTER` returns a nested table of type `DM_HISTOGRAMS`. The rows, of type `DM_HISTOGRAM_BIN`, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`bin_id NUMBER,`
	`lower_bound NUMBER,`
	`upper_bound NUMBER,`
	`label VARCHAR2(4000),`
	`count NUMBER)`
	The `rule` column of `DM_CLUSTER` returns a single row of type `DM_RULE`. The columns are:
	`(rule_id INTEGER,`
	`antecedent DM_PREDICATES,`
	`consequent DM_PREDICATES,`
	`rule_support NUMBER,`
	`rule_confidence NUMBER,`
	`rule_lift NUMBER,`
	`antecedent_support NUMBER,`
	`consequent_support NUMBER,`
	`number_of_items INTEGER)`
	The `antecedent` and `consequent` columns each return nested tables of type `DM_PREDICATES`. The rows, of type `DM_PREDICATE`, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/,`
	`attribute_num_value NUMBER,`
	`attribute_str_value VARCHAR2(4000),`
	`attribute_support NUMBER,`
	`attribute_confidence NUMBER)`

Usage Notes

1. The table function pipes out rows of type `DM_CLUSTER`. For information about Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.
2. For descriptions of predicates (`DM_PREDICATE`) and rules (`DM_RULE`), see GET_ASSOCIATION_RULES Function.

Examples

The following example returns model details for the clustering model `OC_SH_Clus_sample`, which was created by the sample program `dmocdemo.sql`. For information about the sample programs, see *Oracle Data Mining User's Guide*.

For each cluster in this example, the split predicate indicates the attribute and the condition used to assign records to the cluster's children during model build. It provides an important piece of information on how the population within a cluster can be divided up into two smaller clusters.

```
SELECT clu_id, attribute_name, op, s_value
     FROM (SELECT a.id clu_id, sp.attribute_name, sp.conditional_operator op,
                  sp.attribute_str_value s_value
```

```
            FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_OC(
                   'OC_SH_Clus_sample')) a,
                 TABLE(a.split_predicate) sp
          ORDER BY a.id, op, s_value)
     WHERE ROWNUM < 11;

     CLU_ID ATTRIBUTE_NAME       OP S_VALUE
----------- -------------------- ---------------------------------
          1 OCCUPATION           IN ?
          1 OCCUPATION           IN Armed-F
          1 OCCUPATION           IN Cleric.
          1 OCCUPATION           IN Crafts
          2 OCCUPATION           IN ?
          2 OCCUPATION           IN Armed-F
          2 OCCUPATION           IN Cleric.
          3 OCCUPATION           IN Exec.
          3 OCCUPATION           IN Farming
          3 OCCUPATION           IN Handler
```

GET_MODEL_DETAILS_SVD Function

This table function returns a set of rows that provide the details of a Singular Value Decomposition model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_SVD (
        model_name        VARCHAR2,
        matrix_type       VARCHAR2 DEFAULT NULL)
 RETURN DM_SVD_MATRIX_SET PIPELINED;
```

Parameters

Table 45–77 GET_MODEL_DETAILS_SVD Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
matrix_type	Specifies which of the three SVD matrix types to return. Values are: U, S, V, and NULL. When matrix_type is null (default), all matrices are returned. The U matrix is only computed when the SVDS_U_MATRIX_OUTPUT setting is enabled. It is not computed by default. If the model does not contain U matrices and you set matrix_type to U, an empty set of rows is returned. See Table 45–20, " Singular Value Decomposition Settings".

Return Values

Table 45–78 GET_MODEL_DETAILS_SVD Function Return Values

Return Value	Description
DM_SVD_MATRIX_SET	A set of rows of type DM_SVD_MATRIX. The rows have the following columns: (matrix_type CHAR(1), feature_id NUMBER, mapped_feature_id VARCHAR2(4000), attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), case_id VARCHAR2(4000), value NUMBER, variance NUMBER, pct_cum_variance NUMBER) See Usage Notes for details.

Usage Notes

1. This table function pipes out rows of type DM_SVD_MATRIX. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.

   The columns in each row returned by GET_MODEL_DETAILS_SVD are described as follows:

Column in DM_SVD_MATRIX_SET	Description
matrix_type	The type of matrix. Possible values are **S**, **V**, and **U**. This field is never null.
feature_id	The feature that the matrix entry refers to.
mapped_feature_id	A descriptive name for the feature.
attribute_name	Column name in the **V** matrix component bases. This field is null for the **S** and **U** matrices.
attribute_subname	Subname in the **V** matrix component bases. This is relevant only in the case of a nested column. This field is null for the **S** and **U** matrices.
case_id	Unique identifier of the row in the build data described by the **U** matrix projection. This field is null for the **S** and **V** matrices.
value	The matrix entry value.
variance	The variance explained by a component. It is non-null only for **S** matrix entries.
pct_cum_variance	The percent cumulative variance explained by the components thus far. The components are ranked by the explained variance in descending order.

2. The output of GET_MODEL_DETAILS is in sparse format. Zero values are not returned. Only the diagonal elements of the **S** matrix, the non-zero coefficients in the **V** matrix bases, and the non-zero **U** matrix projections are returned.

   There is one exception: If the data row does not produce non-zero **U** matrix projections, the case ID for that row is returned with nulls for the feature ID and value. This is done to avoid losing any records from the original data.

3. GET_MODEL_DETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

GET_MODEL_DETAILS_SVM Function

This table function returns a set of rows that provide the details of a linear Support Vector Machine (SVM) model. If invoked for nonlinear SVM, it returns ORA-40215.

In linear SVM models, only nonzero coefficients are stored. This reduces storage and speeds up model loading. As a result, if an attribute is missing in the coefficient list returned by GET_MODEL_DETAILS_SVM, then the coefficient of this attribute should be interpreted as zero.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM (
        model_name        VARCHAR2,
        reverse_coef      NUMBER DEFAULT 0)
 RETURN DM_SVM_LINEAR_COEFF_SET PIPELINED;
```

Parameters

Table 45–79 GET_MODEL_DETAILS_SVM Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
reverse_coef	Whether or not GET_MODEL_DETAILS_SVM should transform the attribute coefficients using the original attribute transformations. When reverse_coef is set to 0 (default), GET_MODEL_DETAILS_SVM returns the coefficients directly from the model without applying transformations. When reverse_coef is set to 1, GET_MODEL_DETAILS_SVM transforms the coefficients and bias by applying the normalization shifts and scales that were generated using automatic data preparation. See Usage Note 4.

Return Values

Table 45–80 GET_MODEL_DETAILS_SVM Function Return Values

Return Value	Description

DM_SVM_LINEAR_COEFF_SET	A set of rows of type DM_SVM_LINEAR_COEFF. The rows have the following columns:
	`(class VARCHAR2(4000), attribute_set DM_SVM_ATTRIBUTE_SET)`
	The attribute_set column returns a nested table of type DM_SVM_ATTRIBUTE_SET. The rows, of type DM_SVM_ATTRIBUTE, have the following columns:
	`(attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_value VARCHAR2(4000), coefficient NUMBER)`
	See Usage Notes.

Usage Notes

1. This table function pipes out rows of type DM_SVM_LINEAR_COEFF. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.
2. The class column of DM_SVM_LINEAR_COEFF contains classification target values. For SVM regression models, class is null. For each classification target value, a set of coefficients is returned. For binary classification, one-class classification, and regression models, only a single set of coefficients is returned.
3. The attribute_value column in DM_SVM_ATTRIBUTE_SET is used for categorical attributes.
4. GET_MODEL_DETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

   The coefficients are related to the transformed, not the original, attributes. When returned directly with the model details, the coefficients may not provide meaningful information. If you want GET_MODEL_DETAILS_SVM to transform the coefficients such that they relate to the original attributes, set the reverse_coef parameter to 1.

Examples

The following example returns model details for the SVM classification model SVMC_SH_Clas_sample, which was created by the sample program dmsvcdem.sql. For information about the sample programs, see *Oracle Data Mining User's Guide*.

```
WITH
  mod_dtls AS (
  SELECT *
    FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM('SVMC_SH_Clas_sample'))
  ),
  model_details AS (
  SELECT D.class, A.attribute_name, A.attribute_value, A.coefficient
    FROM mod_dtls D,
      TABLE(D.attribute_set) A
    ORDER BY D.class, ABS(A.coefficient) DESC
  )
  SELECT class, attribute_name aname, attribute_value aval, coefficient coeff
    FROM model_details
    WHERE ROWNUM < 11;

CLASS      ANAME                     AVAL                      COEFF
---------- ------------------------- ------------------------- -----
1                                                             -2.85

1          EDUCATION                 11th                      -.71
1          EDUCATION                 Masters                    .63
```

GET_MODEL_DETAILS_XML Function

This function returns an XML object that provides the details of a Decision Tree model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_XML (
         model_name      IN       VARCHAR2)
   RETURN XMLTYPE;
```

Parameters

Table 45–81 GET_MODEL_DETAILS_XML Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name.*]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 45–82 GET_MODEL_DETAILS_XML Function Return Value

Return Value	Description
XMLTYPE	The XML definition for the decision tree model. See Chapter 285, "XMLTYPE" for details. The XML conforms to the Data Mining Group Predictive Model Markup Language (PMML) version 2.1 specification. The specification is available at http://www.dmg.org.

Usage Notes

Special characters that cannot be displayed by Oracle XML are converted to '#'.

Examples

The following statements in SQL*Plus return the details of the decision tree model dt_sh_clas_sample. This model is created by the program dmdtdemo.sql, one of the sample data mining programs provided with Oracle Database Examples.

Note: The "&quot" characters you will see in the XML output are a result of SQL*Plus behavior. To display the XML in proper format, cut and past it into a file and open the file in a browser.

```
column dt_details format a320
SELECT
 dbms_data_mining.get_model_details_xml('dt_sh_clas_sample')
 AS DT_DETAILS
FROM dual;

DT_DETAILS

</PMML>
```

GET_MODEL_TRANSFORMATIONS Function

This function returns the transformation expressions embedded in the specified model.

See Also:

"About Transformation Lists" in Chapter 46, "DBMS_DATA_MINING_TRANSFORM"

"GET_TRANSFORM_LIST Procedure" on page 45-107

"CREATE_MODEL Procedure" on page 45-53

Syntax

```
DBMS_DATA_MINING.GET_MODEL_TRANSFORMATIONS (
      model_name     IN VARCHAR2)
RETURN DM_TRANSFORMS PIPELINED;
```

Parameters

Table 45–83 GET_MODEL_TRANSFORMATIONS Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 45–84 GET_MODEL_TRANSFORMATIONS Function Return Value

Return Value	Description
DM_TRANSFORMS	The transformation expressions embedded in *model_name*. The DM_TRANSFORMS type is a table of DM_TRANSFORM objects. Each DM_TRANSFORM has these fields: attribute_name VARCHAR2(4000) attribute_subname VARCHAR2(4000) expression CLOB reverse_expression CLOB

Usage Notes

When Automatic Data Preparation (ADP) is enabled, both automatic and user-defined transformations may be associated with an attribute. In this case, the user-defined transformations are evaluated before the automatic transformations.

Examples

In this example, several columns in the SH.CUSTOMERS table are used to create a Naive Bayes model. A transformation expression is specified for one of the columns. The model does not use ADP.

```
CREATE OR REPLACE VIEW mining_data AS
   SELECT cust_id, cust_year_of_birth, cust_income_level,cust_credit_limit
   FROM sh.customers;
```

```
describe mining_data

```

GET_TRANSFORM_LIST Procedure

This procedure converts transformation expressions specified as DM_TRANSFORMS to a transformation list (TRANSFORM_LIST) that can be used in creating a model. DM_TRANSFORMS is returned by the GET_MODEL_TRANSFORMATIONS function.

You can also use routines in the DBMS_DATA_MINING_TRANSFORM package to construct a transformation list.

See Also:

"About Transformation Lists" in Chapter 46, "DBMS_DATA_MINING_TRANSFORM"

"GET_MODEL_TRANSFORMATIONS Function" on page 45-105

"CREATE_MODEL Procedure" on page 45-53

Syntax

```
DBMS_DATA_MINING.GET_TRANSFORM_LIST (
      xform_list           OUT NOCOPY TRANSFORM_LIST,
      model_xforms         IN  DM_TRANSFORMS);
```

Parameters

Table 45–85 GET_TRANSFORM_LIST Procedure Parameters

Parameter	Description
xform_list	A list of transformation specifications that can be embedded in a model. Accepted as a parameter to the CREATE_MODEL Procedure. The TRANSFORM_LIST type is a table of TRANSFORM_REC objects. Each TRANSFORM_REC has these fields: attribute_name VARCHAR2(30) attribute_subname VARCHAR2(4000) expression EXPRESSION_REC reverse_expression EXPRESSION_REC attribute_spec VARCHAR2(4000) For details about the TRANSFORM_LIST collection type, see Table 46–1, " Datatypes in DBMS_DATA_MINING_TRANSFORM".
model_xforms	A list of embedded transformation expressions returned by the GET_MODEL_TRANSFORMATIONS Function for a specific model. The DM_TRANSFORMS type is a table of DM_TRANSFORM objects. Each DM_TRANSFORM has these fields: attribute_name VARCHAR2(4000) attribute_subname VARCHAR2(4000) expression CLOB reverse_expression CLOB

Examples

In this example, a model mod1 is trained using several columns in the SH.CUSTOMERS table. The model uses ADP, which automatically bins one of the columns.

A second model mod2 is trained on the same data without ADP, but it uses a transformation list that was obtained from mod1. As a result, both mod1 and mod2 have the same embedded transformation expression.

```
CREATE OR REPLACE VIEW mining_data AS
     SELECT cust_id, cust_year_of_birth, cust_income_level, cust_credit_limit
     FROM sh.customers;

describe mining_data
 Name                                    Null?    Type
 ----------------------------------------- -------- ----------------------------

IMPORT_MODEL Procedure

This procedure imports one or more data mining models. The procedure is overloaded. You can call it to import mining models from a dump file set, or you can call it to import a single mining model from a PMML document.

Import from a dump file set

You can import mining models from a dump file set that was created by the EXPORT_MODEL Procedure. `IMPORT_MODEL` and `EXPORT_MODEL` use Oracle Data Pump technology to export to and import from a dump file set.

When Oracle Data Pump is used directly to export/import an entire schema or database, the mining models in the schema or database are included. `EXPORT_MODEL` and `IMPORT_MODEL` export/import mining models only.

Import from PMML

You can import a mining model represented in Predictive Model Markup Language (PMML). The model must be of type `RegressionModel`, either linear regression or binary logistic regression.

PMML is an XML-based standard specified by the Data Mining Group (`http://www.dmg.org`). Applications that are PMML-compliant can deploy PMML-compliant models that were created by any vendor. Oracle Data Mining supports the core features of PMML 3.1 for regression models.

See Also:

Oracle Data Mining User's Guide for more information about exporting and importing mining models

Oracle Database Utilities for information about Oracle Data Pump

`http://www.dmg.org/faq.html` for more information about PMML

Syntax

Imports a mining model from a dump file set:

```
DBMS_DATA_MINING.IMPORT_MODEL (
      filename          IN  VARCHAR2,
      directory         IN  VARCHAR2,
      model_filter      IN  VARCHAR2 DEFAULT NULL,
      operation         IN  VARCHAR2 DEFAULT NULL,
      remote_link       IN  VARCHAR2 DEFAULT NULL,
      jobname           IN  VARCHAR2 DEFAULT NULL,
      schema_remap      IN  VARCHAR2 DEFAULT NULL,
      tablespace_remap  IN  VARCHAR2 DEFAULT NULL);
```

Imports a mining model from a PMML document:

```
DBMS_DATA_MINING.IMPORT_MODEL (
      model_name        IN  VARCHAR2,
      pmmldoc           IN  XMLTYPE
      strict_check      IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 45–86 IMPORT_MODEL Procedure Parameters

Parameter	Description
filename	Name of the dump file set from which the models should be imported. The dump file set must have been created by the EXPORT_MODEL procedure or the expdp export utility of Oracle Data Pump. The dump file set can contain one or more files. (Refer to "EXPORT_MODEL Procedure" on page 45-58 for details.) If the dump file set contains multiple files, you can specify '*filename*%U' instead of listing them. For example, if your dump file set contains 3 files, archive01.dmp, archive02.dmp, and archive03.dmp, you can import them by specifying 'archive%U'.
directory	Name of a pre-defined directory object that specifies where the dump file set is located. Both the exporting and the importing user must have read/write access to the directory object and to the file system directory that it identifies. Note: The target database must have also have read/write access to the file system directory.
model_filter	Optional parameter that specifies one or more models to import. If you do not specify a value for model_filter, all models in the dump file set are imported. You can also specify NULL (the default) or 'ALL' to import all models. The value of model_filter can be one or more model names. The following are valid filters. 'mymodel1' 'name IN (''mymodel2'',''mymodel3'')' The first causes IMPORT_MODEL to import a single model named mymodel1. The second causes IMPORT_MODEL to import two models, mymodel2 and mymodel3.
operation	Optional parameter that specifies whether to import the models or the SQL statements that create the models. By default, the models are imported. You can specify either of the following values for operation: ■ 'IMPORT' — Import the models (Default) ■ 'SQL_FILE'— Write the SQL DDL for creating the models to a text file. The text file is named *job_name*.sql and is located in the dump set directory.
remote_link	Optional parameter that specifies the name of a database link to a remote system. The default value is NULL. A database link is a schema object in a local database that enables access to objects in a remote database. When you specify a value for remote_link, you can import models into the local database from the remote database. The import is fileless; no dump file is involved. The IMP_FULL_DATABASE role is required for importing the remote models. The EXP_FULL_DATABASE privilege, the CREATE DATABASE LINK privilege, and other privileges may also be required. (See Example 2.)
jobname	Optional parameter that specifies the name of the import job. By default, the name has the form *username*_imp_*nnnn*, where *nnnn* is a number. For example, a job name in the SCOTT schema might be SCOTT_imp_134. If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. A log file for the import job, named *jobname*.log, is created in the same directory as the dump file set.

Table 45–86 (Cont.) IMPORT_MODEL Procedure Parameters

Parameter	Description
schema_remap	Optional parameter for importing into a different schema. By default, models are exported and imported within the same schema. If the dump file set belongs to a different schema, you must specify a schema mapping in the form *export_user*:*import_user*. For example, you would specify 'SCOTT:MARY' to import a model exported by SCOTT into the MARY schema. Note: In some cases, you may need to have the IMP_FULL_DATABASE privilege or the SYS role to import a model from a different schema.
tablespace_remap	Optional parameter for importing into a different tablespace. By default, models are exported and imported within the same tablespace. If the dump file set belongs to a different tablespace, you must specify a tablespace mapping in the form *export_tablespace*:*import_tablespace*. For example, you would specify 'TBLSPC01:TBLSPC02' to import a model that was exported from tablespace TBLSPC01 into tablespace TBLSPC02. Note: In some cases, you may need to have the IMP_FULL_DATABASE privilege or the SYS role to import a model from a different tablespace.
model_name	Name for the new model that will be created in the database as a result of an import from PMML The name must be unique within the user's schema.
pmmldoc	The PMML document representing the model to be imported. The PMML document has an XMLTYPE object type. See Chapter 285, "XMLTYPE" for details.
strict_check	Whether or not an error occurs when the PMML document contains sections that are not part of core PMML (for example, Output or Targets). Oracle Data Mining supports only core PMML; any non-core features may affect the scoring representation. If the PMML does not strictly conform to core PMML and strict_check is set to TRUE, then IMPORT_MODEL returns an error. If strict_check is FALSE (the default), then the error is suppressed. The model may be imported and scored.

Examples

1. This example shows a model being exported and imported within the schema dmuser2. Then the same model is imported into the dmuser3 schema. The dmuser3 user has the IMP_FULL_DATABASE privilege. The dmuser2 user has been assigned the USER2 tablespace; dmuser3 has been assigned the USER3 tablespace.

```
SQL> connect dmuser2
Enter password: dmuser2_password
Connected.
SQL> select model_name from user_mining_models;

MODEL_NAME
------------------------------
NMF_SH_SAMPLE
SVMO_SH_CLAS_SAMPLE
SVMR_SH_REGR_SAMPLE

-- export the model called NMF_SH_SAMPLE to a dump file in same schema
SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL (
            filename =>'NMF_SH_SAMPLE_out',
            directory =>'DATA_PUMP_DIR',
            model_filter => 'name = ''NMF_SH_SAMPLE''');
```

```
-- import the model back into the same schema
SQL>EXECUTE DBMS_DATA_MINING.IMPORT_MODEL (
            filename => 'NMF_SH_SAMPLE_out01.dmp',
            directory => 'DATA_PUMP_DIR',
            model_filter => 'name = ''NMF_SH_SAMPLE''');

-- connect as different user
-- import same model into that schema
SQL> connect dmuser3
Enter password: dmuser3_password
Connected.
SQL>EXECUTE DBMS_DATA_MINING.IMPORT_MODEL (
            filename => 'NMF_SH_SAMPLE_out01.dmp',
            directory => 'DATA_PUMP_DIR',
            model_filter => 'name = ''NMF_SH_SAMPLE''',
            operation =>'IMPORT',
            remote_link => NULL,
            jobname => 'nmf_imp_job',
            schema_remap => 'dmuser2:dmuser3',
            tablespace_remap => 'USER2:USER3');
```

The following example shows user MARY importing all models from a dump file, model_exp_001.dmp, which was created by user SCOTT. User MARY has been assigned a tablespace named USER2; user SCOTT was assigned the tablespace USERS when the models were exported into the dump file model_exp_001.dmp.The dump file is located in the file system directory mapped to a directory object called DM_DUMP. If user MARY does not have IMP_FULL_DATABASE privileges, IMPORT_MODEL will raise an error.

```
-- import all models
DECLARE
  file_name  VARCHAR2(40);
BEGIN
  file_name := 'model_exp_001.dmp';
  DBMS_DATA_MINING.IMPORT_MODEL(
            filename=> 'file_name',
            directory=>'DM_DUMP',
            schema_remap=>'SCOTT:MARY',
            tablespace_remap=>'USERS:USER2');
  DBMS_OUTPUT.PUT_LINE(
           'DBMS_DATA_MINING.IMPORT_MODEL of all models from SCOTT done!');
END;
/
```

2. This example shows how the user xuser could import the model dmuser.r1mod from a remote database. The SQL*Net connection alias for the remote database is R1DB. The user xuser is assigned the SYSAUX tablespace; the user dmuser is assigned the TBS_1 tablespace.

```
CONNECT / AS SYSDBA;
GRANT CREATE DATABASE LINK TO xuser;
GRANT imp_full_database TO xuser;
CONNECT xuser/xuserpassword
CREATE DATABASE LINK dmuser_link
         CONNECT TO dmuser IDENTIFIED BY dmuserpassword USING 'R1DB';
EXEC dbms_data_mining.import_model (
    NULL,
   'DMUSER_DIR',
   'R1MOD',
    remote_link => 'DMUSER_LINK', schema_remap => 'DMUSER:XUSER',
```

```
                    tablespace_remap => 'TBS_1:SYSAUX' );
SELECT name FROM dm_user_models;

NAME
--------------------------------------------------------------------------------
R1MOD
```

3. This example shows how a PMML document called `SamplePMML1.xml` could be imported from a location referenced by directory object `PMMLDIR` into the schema of the current user. The imported model will be called `PMMLMODEL1`.

```
BEGIN
    dbms_data_mining.import_model ('PMMLMODEL1',
        XMLType (bfilename ('PMMLDIR', 'SamplePMML1.xml'),
          nls_charset_id ('AL32UTF8')
        ));
END;
```

RANK_APPLY Procedure

This procedure ranks the results of an APPLY operation based on a top-N specification for predictive and descriptive model results. For classification models, you can provide a cost matrix as input, and obtain the ranked results with costs applied to the predictions.

Syntax

```
DBMS_DATA_MINING.RANK_APPLY (
      apply_result_table_name        IN VARCHAR2,
      case_id_column_name            IN VARCHAR2,
      score_column_name              IN VARCHAR2,
      score_criterion_column_name    IN VARCHAR2,
      ranked_apply_table_name        IN VARCHAR2,
      top_N                          IN NUMBER (38) DEFAULT 1,
      cost_matrix_table_name         IN VARCHAR2    DEFAULT NULL,
      apply_result_schema_name       IN VARCHAR2    DEFAULT NULL,
      cost_matrix_schema_name        IN VARCHAR2    DEFAULT NULL);
```

Parameters

Table 45–87 RANK_APPLY Procedure Parameters

Parameter	Description
apply_result_table_name	Name of the table or view containing the results of an APPLY operation on the test data set (see Usage Notes)
case_id_column_name	Name of the case identifier column. This must be the same as the one used for generating APPLY results.
score_column_name	Name of the prediction column in the apply results table
score_criterion_column_name	Name of the probability column in the apply results table
ranked_apply_result_tab_name	Name of the table containing the ranked apply results
top_N	Top N predictions to be considered from the APPLY results for precision recall computation
cost_matrix_table_name	Name of the cost matrix table
apply_result_schema_name	Name of the schema hosting the APPLY results table
cost_matrix_schema_name	Name of the schema hosting the cost matrix table

Usage Notes

You can use RANK_APPLY to generate ranked apply results, based on a top-N filter and also with application of cost for predictions, if the model was built with costs.

The behavior of RANK_APPLY is similar to that of APPLY with respect to other DDL-like operations such as CREATE_MODEL, DROP_MODEL, and RENAME_MODEL. The procedure does not depend on the model; the only input of relevance is the apply results generated in a fixed schema table from APPLY.

The main intended use of RANK_APPLY is for the generation of the final APPLY results against the scoring data in a production setting. You can apply the model against test

data using APPLY, compute various test metrics against various cost matrix tables, and use the candidate cost matrix for RANK_APPLY.

The schema for the apply results from each of the supported algorithms is listed in subsequent sections. The case_id column will be the same case identifier column as that of the apply results.

Classification Models — NB and SVM

For numerical targets, the ranked results table will have the definition as shown:

```
(case_id       VARCHAR2/NUMBER,
prediction     NUMBER,
probability    NUMBER,
cost           NUMBER,
rank           INTEGER)
```

For categorical targets, the ranked results table will have the following definition:

```
(case_id       VARCHAR2/NUMBER,
prediction     VARCHAR2,
probability    NUMBER,
cost           NUMBER,
rank           INTEGER)
```

Clustering using *k*-Means or O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the cluster identifier corresponding to a case, and the associated probability. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the cluster ids ranked by top-N.

```
(case_id       VARCHAR2/NUMBER,
cluster_id     NUMBER,
probability    NUMBER,
rank           INTEGER)
```

Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the feature identifier corresponding to a case, and the associated match quality. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the feature ids ranked by top-N.

```
(case_id        VARCHAR2/NUMBER,
feature_id      NUMBER,
match_quality   NUMBER,
rank            INTEGER)
```

Examples

```
BEGIN
/* build a model with name census_model.
 * (See example under CREATE_MODEL)
 */

/* if training data was pre-processed in any manner,
 * perform the same pre-processing steps on apply
 * data also.
 * (See examples in the section on DBMS_DATA_MINING_TRANSFORM)
```

```
 */

/* apply the model to data to be scored */
DBMS_DATA_MINING.RANK_APPLY(
  apply_result_table_name       => 'census_apply_result',
  case_id_column_name           => 'person_id',
  score_column_name             => 'prediction',
  score_criterion_column_name   => 'probability
  ranked_apply_result_tab_name  => 'census_ranked_apply_result',
  top_N                         => 3,
  cost_matrix_table_name        => 'census_cost_matrix');
END;
/

-- View Ranked Apply Results
SELECT *
  FROM census_ranked_apply_result;
```

REMOVE_COST_MATRIX Procedure

Removes the default scoring matrix from a classification model.

See Also:

- "ADD_COST_MATRIX Procedure" on page 45-26
- "REMOVE_COST_MATRIX Procedure" on page 45-118

Syntax

```
DBMS_DATA_MINING.REMOVE_COST_MATRIX (
      model_name   IN  VARCHAR2);
```

Parameters

Table 45–88 Remove_Cost_Matrix Procedure Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Usage Notes

If the model is not in your schema, then REMOVE_COST_MATRIX requires the ALTER ANY MINING MODEL system privilege or the ALTER object privilege for the mining model.

Example

The Naive Bayes model NB_SH_CLAS_SAMPLE has an associated cost matrix that can be used for scoring the model.

```
SQL>SELECT *
      FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
      ORDER BY predicted, actual;

ACTUAL     PREDICTED        COST
---------- ---------- ----------
0          0                   0
1          0                 .75
0          1                 .25
1          1                   0
```

You can remove the cost matrix with REMOVE_COST_MATRIX.

```
SQL>EXECUTE dbms_data_mining.remove_cost_matrix('nb_sh_clas_sample');

SQL>SELECT *
      FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
      ORDER BY predicted, actual;

no rows selected
```

RENAME_MODEL Procedure

This procedure changes the name of the mining model indicated by *model_name* to the name that you specify as *new_model_name*. If a model with *new_model_name* already exists, then the procedure optionally renames *new_model_name* to *versioned_model_name* before renaming *model_name* to *new_model_name*.

The model name is in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used. For mining model naming restrictions, see the Usage Notes for "CREATE_MODEL Procedure" on page 45-53.

Syntax

```
DBMS_DATA_MINING.RENAME_MODEL (
     model_name            IN VARCHAR2,
     new_model_name        IN VARCHAR2,
     versioned_model_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 45–89 RENAME_MODEL Procedure Parameters

Parameter	Description
model_name	Model to be renamed.
new_model_name	New name for the model *model_name*.
versioned_model_name	New name for the model *new_model_name* if it already exists.

Usage Notes

If you attempt to rename a model while it is being applied, then the model will be renamed but the apply operation will return indeterminate results.

Examples

1. This example changes the name of model census_model to census_model_2012.

```
BEGIN
  DBMS_DATA_MINING.RENAME_MODEL(
    model_name      => 'census_model',
    new_model_name  => 'census_model_2012');
END;
/
```

2. In this example, there are two classification models in the user's schema: clas_mod, the working model, and clas_mod_tst, a test model. The RENAME_MODEL procedure preserves clas_mod as clas_mod_old and makes the test model the new working model.

```
SELECT model_name FROM user_mining_models;
MODEL_NAME
------------------------------------------------------------------------
CLAS_MOD
CLAS_MOD_TST

BEGIN
  DBMS_DATA_MINING.RENAME_MODEL(
    model_name            => 'clas_mod_tst',
```

```
    new_model_name        => 'clas_mod',
    versioned_model_name  => 'clas_mod_old');
END;
/

SELECT model_name FROM user_mining_models;
MODEL_NAME
------------------------------------------------------------------------
CLAS_MOD
CLAS_MOD_OLD
```

46

DBMS_DATA_MINING_TRANSFORM

DBMS_DATA_MINING_TRANSFORM implements a set of transformations that are commonly used in data mining.

See Also:

- Chapter 45, "DBMS_DATA_MINING"
- *Oracle Data Mining User's Guide*

This chapter contains the following topics:

Using DBMS_DATA_MINING_TRANSFORM

This section contains topics that relate to using the `DBMS_DATA_MINING_TRANSFORM` package.

Overview

A transformation is a SQL expression that modifies the data in one or more columns.

Data must typically undergo certain transformations before it can be used to build a mining model. Many data mining algorithms have specific transformation requirements.

Data that will be scored must be transformed in the same way as the data that was used to create (train) the model.

External or Embedded Transformations

DBMS_DATA_MINING_TRANSFORM offers two approaches to implementing transformations. For a given model, you can either:

- Create a list of transformation expressions and pass it to the CREATE_MODEL Procedure

  or

- Create a view that implements the transformations and pass the name of the view to the CREATE_MODEL Procedure

If you create a transformation list and pass it to CREATE_MODEL, the transformation expressions are embedded in the model and automatically implemented whenever the model is applied.

If you create a view, the transformation expressions are external to the model. You will need to re-create the transformations whenever you apply the model.

> **Note:** Embedded transformations significantly enhance the model's usability while simplifying the process of model management.

Automatic Transformations

Oracle Data Mining supports an Automatic Data Preparation (ADP) mode. When ADP is enabled, most algorithm-specific transformations are *automatically* embedded. Any additional transformations must be explicitly provided in an embedded transformation list or in a view.

If ADP is enabled and you create a model with a transformation list, both sets of transformations are embedded. The model will execute the user-specified transformations from the transformation list before executing the automatic transformations specified by ADP.

Within a transformation list, you can selectively disable ADP for individual attributes.

"Automatic Data Preparation" in Chapter 45, "DBMS_DATA_MINING"

Oracle Data Mining User's Guide for a more information about ADP

"About Transformation Lists" on page 46-7

Transformations in DBMS_DATA_MINING_TRANSFORM

The transformations supported by DBMS_DATA_MINING_TRANSFORM are summarized in this section.

Binning

Binning refers to the mapping of continuous or discrete values to discrete values of reduced cardinality.

- Supervised Binning (Categorical and Numerical)

  Binning is based on intrinsic relationships in the data as determined by a decision tree model.

  See "INSERT_BIN_SUPER Procedure" on page 46-51.

- Top-N Frequency Categorical Binning

  Binning is based on the number of cases in each category.

  See "INSERT_BIN_CAT_FREQ Procedure" on page 46-39

- Equi-Width Numerical Binning

  Binning is based on equal-range partitions.

  See "INSERT_BIN_NUM_EQWIDTH Procedure" on page 46-44.

- Quantile Numerical Binning

  Binning is based on quantiles computed using the SQL `NTILE` function.

  See "INSERT_BIN_NUM_QTILE Procedure" on page 46-48.

Linear Normalization

Normalization is the process of scaling continuous values down to a specific range, often between zero and one. Normalization transforms each numerical value by subtracting a number (the **shift**) and dividing the result by another number (the **scale**).

```
x_new = (x_old-shift)/scale
```

- Min-Max Normalization

  Normalization is based on the minimum and maximum with the following shift and scale:

  ```
  shift = min
  scale = max-min
  ```

  See "INSERT_NORM_LIN_MINMAX Procedure" on page 46-67.

- Scale Normalization

  Normalization is based on the minimum and maximum with the following shift and scale:

  ```
  shift = 0
  scale = max{abs(max), abs(min)}
  ```

  See "INSERT_NORM_LIN_SCALE Procedure" on page 46-70.

- Z-Score Normalization

  Normalization is based on the mean and standard deviation with the following shift and scale:

  ```
  shift = mean
  scale = standard_deviation
  ```

  See "INSERT_NORM_LIN_ZSCORE Procedure" on page 46-73.

Outlier Treatment

An outlier is a numerical value that is located far from the rest of the data. Outliers can artificially skew the results of data mining.

- Winsorizing

  Outliers are replaced with the nearest value that is not an outlier.

  See "INSERT_CLIP_WINSOR_TAIL Procedure" on page 46-58

- Trimming

  Outliers are set to `NULL`.

  See "INSERT_CLIP_TRIM_TAIL Procedure" on page 46-55.

Missing Value Treatment

Missing data may indicate sparsity or it may indicate that some values are missing at random. `DBMS_DATA_MINING_TRANSFORM` supports the following transformations for minimizing the effects of missing values:

- Missing numerical values are replaced with the mean.

  See "INSERT_MISS_NUM_MEAN Procedure" on page 46-64.

- Missing categorical values are replaced with the mode.

  See "INSERT_MISS_CAT_MODE Procedure" on page 46-61.

> **Note:** Oracle Data Mining also has default mechanisms for handling missing data. See *Oracle Data Mining User's Guide* for details.

Operational Notes

The DBMS_DATA_MINING_TRANSFORM package offers a flexible framework for specifying data transformations. If you choose to embed transformations in the model (the preferred method), you will create a **transformation list** object and pass it to the CREATE_MODEL Procedure. If you choose to transform the data without embedding, you will create a view.

When specified in a transformation list, the transformation expressions are executed by the model. When specified in a view, the transformation expressions are executed by the view.

Transformation Definitions

Transformation definitions are used to generate the SQL expressions that transform the data. For example, the transformation definitions for normalizing a numeric column are the shift and scale values for that data.

With the DBMS_DATA_MINING_TRANSFORM package, you can call procedures to compute the transformation definitions, or you can compute them yourself, or you can do both.

Transformation Definition Tables

DBMS_DATA_MINING_TRANSFORM provides **INSERT** procedures that compute transformation definitions and insert them in transformation definition tables. You can modify the values in the transformation definition tables or populate them yourself.

XFORM routines use populated definition tables to transform data in external views. **STACK** routines use populated definition tables to build transformation lists.

To specify transformations based on definition tables, follow these steps:

1. Use **CREATE** routines to create transformation definition tables.

   The tables have columns to hold the transformation definitions for a given type of transformation. For example, the CREATE_BIN_NUM Procedure creates a definition table that has a column for storing data values and another column for storing the associated bin identifiers.

2. Use **INSERT** routines to compute and insert transformation definitions in the tables.

   Each INSERT routine uses a specific technique for computing the transformation definitions. For example, the INSERT_BIN_NUM_EQWIDTH Procedure computes bin boundaries by identifying the minimum and maximum values then setting the bin boundaries at equal intervals.

3. Use **STACK** or **XFORM** routines to generate transformation expressions based on the information in the definition tables:

   - Use **STACK** routines to add the transformation expressions to a transformation list. Pass the transformation list to the CREATE_MODEL Procedure. The transformation expressions will be assembled into one long SQL query and embedded in the model.
   - Use **XFORM** routines to execute the transformation expressions within a view. The transformations will be external to the model and will need to be re-created whenever the model is applied to new data.

Transformations Without Definition Tables

STACK routines are not the only method for adding transformation expressions to a transformation list. You can also build a transformation list without using definition tables.

To specify transformations without using definition tables, follow these steps:

1. Write a SQL expression for transforming an attribute.
2. Write a SQL expression for reversing the transformation. (See "Reverse Transformations and Model Transparency" on page 46-7.)
3. Determine whether or not to disable ADP for the attribute. By default ADP is enabled for the attribute if it is specified for the model. (See "Disabling Automatic Data Preparation" on page 46-8.)
4. Specify the SQL expressions and ADP instructions in a call to the SET_TRANSFORM Procedure, which adds the information to a transformation list.
5. Repeat steps 1 through 4 for each attribute that you wish to transform.
6. Pass the transformation list to the CREATE_MODEL Procedure. The transformation expressions will be assembled into one long SQL query and embedded in the model.

> **Note:** SQL expressions that you specify with SET_TRANSFORM must fit within a VARCHAR2. To specify a longer expression, you can use the SET_EXPRESSION Procedure. With SET_EXPRESSION, you can build an expression by appending rows to a VARCHAR2 array.

About Transformation Lists

The elements of a transformation list are **transformation records**. Each transformation record provides all the information needed by the model for managing the transformation of a single attribute.

Each transformation record includes the following fields:

- *attribute_name* — Name of the column of data to be transformed
- *attribute_subname* — Name of the nested attribute if *attribute_name* is a nested column, otherwise NULL
- *expression* — SQL expression for transforming the attribute
- *reverse_expression* — SQL expression for reversing the transformation
- *attribute_spec* — Identifies special treatment for the attribute during the model build. See Table 46–33, " SET_TRANSFORM Procedure Parameters" for details.

See Also:

- Table 46–1 for details about the TRANSFORM_LIST and TRANSFORM_REC object types
- SET_TRANSFORM Procedure
- CREATE_MODEL Procedure

Reverse Transformations and Model Transparency

An algorithm manipulates transformed attributes to train and score a model. The transformed attributes, however, may not be meaningful to an end user. For example,

if attribute *x* has been transformed into bins 1 — 4, the bin names 1, 2 , 3, and 4 are manipulated by the algorithm, but a user is probably not interested in the model details about bins 1 — 4 or in predicting the numbers 1 — 4.

To return original attribute values in model details and predictions, you can provide a reverse expression in the transformation record for the attribute. For example, if you specify the transformation expression **`'log(10, y)'`** for attribute *y*, you could specify the reverse transformation expression **`'power(10, y)'`**.

Reverse transformations enable **model transparency**. They make internal processing transparent to the user.

Note: `STACK` procedures automatically reverse normalization transformations, but they do not provide a mechanism for reversing binning, clipping, or missing value transformations.

You can use the `DBMS_DATA_MINING.ALTER_REVERSE_EXPRESSION` procedure to specify or update reverse transformations expressions for an existing model.

See Also:

Example 46–1, "Stacking a Clipping Transformation"

"ALTER_REVERSE_EXPRESSION Procedure" on page 45-29

"Summary of DBMS_DATA_MINING Subprograms" on page 45-24 for links to the model details functions

Disabling Automatic Data Preparation

ADP is controlled by a model-specific setting (`PREP_AUTO`). The `PREP_AUTO` setting affects all model attributes unless you disable it for individual attributes.

If ADP is enabled and you set *`attribute_spec`* to `NOPREP`, only the transformations that you specify for that attribute will be evaluated. If ADP is enabled and you do *not* set *`attribute_spec`* to `NOPREP`, the automatic transformations will be evaluated *after* the transformations that you specify for the attribute.

If ADP is not enabled for the model, the *`attribute_spec`* field of the transformation record is ignored.

See Also: "Automatic Data Preparation" on page 45-8 for information about the `PREP_AUTO` setting

Adding Transformation Records to a Transformation List

A transformation list is a stack of transformation records. When a new transformation record is added, it is appended to the top of the stack. (See "About Stacking" for details.)

When you use `SET_TRANSFORM` to add a transformation record to a transformation list, you can specify values for all the fields in the transformation record.

When you use `STACK` procedures to add transformation records to a transformation list, only the transformation expression field is populated. For normalization transformations, the reverse transformation expression field is also populated.

You can use both `STACK` procedures and `SET_TRANSFORM` to build one transformation list. Each `STACK` procedure call adds transformation records for all the attributes in a

specified transformation definition table. Each SET_TRANSFORM call adds a transformation record for a single attribute.

About Stacking

Transformation lists are built by stacking transformation records. Transformation lists are evaluated from bottom to top. Each transformation expression depends on the result of the transformation expression below it in the stack.

Stack Procedures

STACK procedures create transformation records from the information in transformation definition tables. For example STACK_BIN_NUM builds a transformation record for each attribute specified in a definition table for numeric binning. STACK procedures stack the transformation records as follows:

- If an attribute is specified in the definition table but not in the transformation list, the STACK procedure creates a transformation record, computes the reverse transformation (if possible), inserts the transformation and reverse transformation in the transformation record, and appends the transformation record to the top of the transformation list.
- If an attribute is specified in the transformation list but not in the definition table, the STACK procedure takes no action.
- If an attribute is specified in the definition table *and* in the transformation list, the STACK procedure stacks the transformation expression from the definition table on top of the transformation expression in the transformation record and updates the reverse transformation. See Example 46–1, "Stacking a Clipping Transformation"and Example 46–4, "Stacking a Nested Normalization Transformation".

Example 46–1 Stacking a Clipping Transformation

This example shows how STACK_CLIP Procedure would add transformation records to a transformation list. Note that the clipping transformations are not reversed in COL1 and COL2 after stacking (as described in "Reverse Transformations and Model Transparency" on page 46-7).

Refer to:

- CREATE_CLIP Procedure — Creates the definition table
- INSERT_CLIP_TRIM_TAIL Procedure — Inserts definitions in the table
- INSERT_CLIP_WINSOR_TAIL Procedure — Inserts definitions in the table
- Table 46–1 — Describes the structure of the transformation list (TRANSFORM_LIST object)

Assume a clipping definition table populated as follows.

col	att	lcut	lval	rcut	rval
COL1	null	-1.5	-1.5	4.5	4.5
COL2	null	0	0	1	1

Assume the following transformation list before stacking.

```
------------------------
transformation record #1:
```

```
-------------------------
     attribute_name       = COL1
     attribute_subname    = null
     expression           = log(10, COL1)
     reverse_expression   = power(10, COL1)
-------------------------
transformation record #2:
-------------------------
     attribute_name       = COL3
     attribute_subname    = null
     expression           = ln(COL3)
     reverse_expression   = exp(COL3)
```

After stacking, the transformation list is as follows.

```
-------------------------
transformation record #1:
-------------------------
     attribute_name       = COL1
     attribute_subname    = null
     expression           = CASE WHEN log(10, COL1) < -1.5 THEN -1.5
                                 WHEN log(10, COL1) > 4.5  THEN 4.5
                                 ELSE log(10, COL1)
                            END;
     reverse_expression   = power(10, COL1)
-------------------------
transformation record #2:
-------------------------
     attribute_name       = COL3
     attribute_subname    = null
     expression           = ln(COL3)
     reverse_expression   = exp(COL3)
-------------------------
transformation record #3:
-------------------------
     attribute_name       = COL2
     attribute_subname    = null
     expression           = CASE WHEN COL2 < 0 THEN 0
                                 WHEN COL2 > 1 THEN 1
                                 ELSE COL2
                            END;
     reverse_expression   = null
```

Nested Data Transformations

The `CREATE` routines create transformation definition tables that include two columns, `col` and `att`, for identifying attributes. The column `col` holds the name of a column in the data table. If the data column is not nested, then `att` is null, and the name of the attribute is *`col`*. If the data column is nested, then `att` holds the name of the nested attribute, and the name of the attribute is *`col.att`*.

The `INSERT` and `XFORM` routines ignore the `att` column in the definition tables. Neither the `INSERT` nor the `XFORM` routines support nested data.

Only the `STACK` procedures and `SET_TRANSFORM` support nested data. Nested data transformations are always embedded in the model.

Nested columns in Oracle Data Mining can have the following types:

```
DM_NESTED_NUMERICALS
DM_NESTED_CATEGORICALS
DM_NESTED_BINARY_DOUBLES
```

DM_NESTED_BINARY_FLOATS

See Also:

"Constants" on page 46-16

Oracle Data Mining User's Guide for details about nested attributes in Oracle Data Mining

Specifying Nested Attributes in a Transformation Record

A transformation record (TRANSFORM_REC) includes two fields, attribute_name and attribute_subname, for identifying the attribute. The field attribute_name holds the name of a column in the data table. If the data column is not nested, then attribute_subname is null, and the name of the attribute is *attribute_name*. If the data column is nested, then attribute_subname holds the name of the nested attribute, and the name of the attribute is *attribute_name.attribute_subname*.

Transforming Individual Nested Attributes

You can specify different transformations for different attributes in a nested column, and you can specify a default transformation for all the remaining attributes in the column. To specify a default nested transformation, specify null in the attribute_name field and the name of the nested column in the attribute_subname field as shown in Example 46–2. Note that the keyword VALUE is used to represent the value of a nested attribute in a transformation expression.

Example 46–2 Transforming a Nested Column

The following statement transforms two of the nested attributes in COL_N1. Attribute ATTR1 is transformed with normalization; Attribute ATTR2 is set to null, which causes attribute removal transformation (ATTR2 is not used in training the model). All the remaining attributes in COL_N1 are divided by 10.

```
DECLARE
  stk dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.SET_TRANSFORM(
      stk,'COL_N1', 'ATTR1', '(VALUE - (-1.5))/20', 'VALUE *20 + (-1.5)');
  dbms_data_mining_transform.SET_TRANSFORM(
      stk,'COL_N1', 'ATTR2', NULL, NULL);
  dbms_data_mining_transform.SET_TRANSFORM(
      stk, NULL, 'COL_N1', 'VALUE/10', 'VALUE*10');
END;
/
```

The following SQL is generated from this statement.

```
CAST(MULTISET(SELECT DM_NESTED_NUMERICAL(
                               "ATTRIBUTE_NAME",
                               DECODE("ATTRIBUTE_NAME",
                                 'ATTR1', ("VALUE" - (-1.5))/20,
                                 "VALUE"/10))
                       FROM TABLE("COL_N1")
                      WHERE "ATTRIBUTE_NAME" IS NOT IN ('ATTR2'))
            AS DM_NESTED_NUMERICALS)
```

If transformations are not specified for COL_N1.ATTR1 and COL_N1.ATTR2, then the default transformation is used for all the attributes in COL_N1, and the resulting SQL does not include a DECODE.

```
    CAST(MULTISET(SELECT DM_NESTED_NUMERICAL(
                               "ATTRIBUTE_NAME",
```

```
                                "VALUE"/10)
                            FROM TABLE("COL_N1"))
                AS DM_NESTED_NUMERICALS)
```

Since DECODE is limited to 256 arguments, multiple DECODE functions are nested to support an arbitrary number of individual nested attribute specifications.

Adding a Nested Column

You can specify a transformation that adds a nested column to the data, as shown in Example 46–3.

Example 46–3 Adding a Nested Column to a Transformation List

```
DECLARE
    v_xlst dbms_data_mining_transform.TRANSFORM_LIST;
  BEGIN
    dbms_data_mining_transform.SET_TRANSFORM(v_xlst,
      'YOB_CREDLIM', NULL,
      'dm_nested_numericals(
           dm_nested_numerical(
                 ''CUST_YEAR_OF_BIRTH'', cust_year_of_birth),
           dm_nested_numerical(
                 ''CUST_CREDIT_LIMIT'', cust_credit_limit))',
        NULL);
    dbms_data_mining_transform.SET_TRANSFORM(
              v_xlst, 'CUST_YEAR_OF_BIRTH', NULL, NULL, NULL);
    dbms_data_mining_transform.SET_TRANSFORM(
              v_xlst, 'CUST_CREDIT_LIMIT', NULL, NULL, NULL);
    dbms_data_mining_transform.XFORM_STACK(
              v_xlst, 'mining_data', 'mining_data_v');
END;
/

set long 2000
SELECT text FROM user_views WHERE view_name IN 'MINING_DATA_V';

TEXT
--------------------------------------------------------------------------------
SELECT "CUST_ID","CUST_POSTAL_CODE",dm_nested_numericals(
        dm_nested_numerical(
           'CUST_YEAR_OF_BIRTH', cust_year_of_birth),
        dm_nested_numerical(
           'CUST_CREDIT_LIMIT', cust_credit_limit)) "YOB_CREDLIM" FROM mining_data

SELECT * FROM mining_data_v WHERE cust_id = 104500;

CUST_ID CUST_POSTAL_CODE YOB_CREDLIM(ATTRIBUTE_NAME, VALUE)
------- ---------------- ------------------------------------------------------
 104500 68524             DM_NESTED_NUMERICALS(DM_NESTED_NUMERICAL(
                         'CUST_YEAR_OF_BIRTH', 1962),
                          DM_NESTED_NUMERICAL('CUST_CREDIT_LIMIT', 15000))
```

Stacking Nested Transformations

Example 46–4 shows how the STACK_NORM_LIN Procedure would add transformation records for nested column COL_N to a transformation list.

Refer to:

- CREATE_NORM_LIN Procedure — Creates the definition table

- INSERT_NORM_LIN_MINMAX Procedure — Inserts definitions in the table
- INSERT_NORM_LIN_SCALE Procedure — Inserts definitions in the table
- INSERT_NORM_LIN_ZSCORE Procedure — Inserts definitions in the table
- Table 46–1 — Describes the structure of the transformation list

Example 46–4 Stacking a Nested Normalization Transformation

Assume a linear normalization definition table populated as follows.

col	att	shift	scale
COL_N	ATT2	0	20
null	COL_N	0	10

Assume the following transformation list before stacking.

```
-------------------------
transformation record #1:
-------------------------
     attribute_name       = COL_N
     attribute_subname    = ATT1
     expression           = log(10, VALUE)
     reverse_expression   = power(10, VALUE)
-------------------------
transformation record #2:
-------------------------
     attribute_name       = null
     attribute_subname    = COL_N
     expression           = ln(VALUE)
     reverse_expression   = exp(VALUE)
```

After stacking, the transformation list is as follows.

```
-------------------------
transformation record #1:
-------------------------
     attribute_name       = COL_N
     attribute_subname    = ATT1
     expression           = (log(10, VALUE) - 0)/10
     reverse_expression   = power(10, VALUE*10 + 0)
-------------------------
transformation record #2:
-------------------------
     attribute_name       = NULL
     attribute_subname    = COL_N
     expression           = (ln(VALUE)- 0)/10
     reverse_expression   = exp(VALUE *10 + 0)
-------------------------
transformation record #3:
-------------------------
     attribute_name       = COL_N
     attribute_subname    = ATT2
     expression           = (ln(VALUE) - 0)/20
     reverse_expression   = exp(VALUE * 20 + 0)
```

Security Model

The DBMS_DATA_MINING_TRANSFORM package is owned by user SYS and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

The DBMS_DATA_MINING_TRANSFORM.INSERT_* procedures have a *data_table_name* parameter that enables the user to provide the input data for transformation purposes. The value of *data_table_name* can be the name of a physical table or a view. The *data_table_name* parameter can also accept an inline query.

Important: Because an inline query can be used to specify the data for transformation, Oracle strongly recommends that the calling routine perform any necessary SQL injection checks on the input string.

See Also: "Operational Notes" on page 46-6 for a description of the DBMS_DATA_MINING_TRANSFORM.INSERT_* procedures

Datatypes

DBMS_DATA_MINING_TRANSFORM defines the datatypes described in Table 46–1.

Table 46–1 Datatypes in DBMS_DATA_MINING_TRANSFORM

List Type	List Elements	Description
COLUMN_LIST	VARRAY(1000) OF varchar2(32)	COLUMN_LIST stores quoted and non-quoted identifiers for column names. COLUMN_LIST is the datatype of the *exclude_list* parameter in the INSERT procedures. See "INSERT_AUTOBIN_NUM_EQWIDTH Procedure" on page 46-35 for an example. See *Oracle Database PL/SQL Language Reference* for information about populating VARRAY structures.
DESCRIBE_LIST	DBMS_SQL.DESC_TAB2 TYPE desc_tab2 IS TABLE OF desc_rec2 INDEX BY BINARY_INTEGER TYPE desc_rec2 IS RECORD (col_type BINARY_INTEGER := 0, col_max_len BINARY_INTEGER := 0, col_name VARCHAR2(32767):= '', col_name_len BINARY_INTEGER := 0, col_schema_name VARCHAR2(32) := '', col_schema_name_len BINARY_INTEGER := 0, col_precision BINARY_INTEGER := 0, col_scale BINARY_INTEGER := 0, col_charsetid BINARY_INTEGER := 0, col_charsetform BINARY_INTEGER := 0, col_null_ok BOOLEAN := TRUE);	DESCRIBE_LIST describes the columns of the data table after the transformation list has been applied. A DESCRIBE_LIST is returned by the DESCRIBE_STACK Procedure. The DESC_TAB2 and DESC_REC2 types are defined in the DBMS_SQL package. See "DESC_REC2 Record Type" on page 149-25. The col_type field of DESC_REC2 identifies the datatype of the column. The datatype is expressed as a numeric constant that represents a built-in datatype. For example, a 1 indicates a variable length character string. The codes for Oracle built-in datatypes are listed in *Oracle Database SQL Language Reference*. The codes for the Oracle Data Mining nested types are described in "Constants" on page 46-16. The col_name field of DESC_REC2 identifies the column name. It may be populated with a column name, an alias, or an expression. If the column name is a SELECT expression, it may be very long. If the expression is longer than 30 bytes, it cannot be used in a view unless it is given an alias.
TRANSFORM_LIST	**TABLE OF transform_rec** **TYPE transform_rec IS RECORD** (attribute_name VARCHAR2(30), attribute_subname VARCHAR2(4000), expression **EXPRESSION_REC**, reverse_expression **EXPRESSION_REC**, attribute_spec VARCHAR2(4000)); **TYPE expression_rec IS RECORD** (lstmt DBMS_SQL.VARCHAR2A, lb BINARY_INTEGER DEFAULT 1, ub BINARY_INTEGER DEFAULT 0); TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;	TRANSFORM_LIST is a list of transformations that can be embedded in a model. A TRANSFORM_LIST is accepted as an argument by the CREATE_MODEL Procedure. Each element in a TRANSFORM_LIST is a TRANSFORM_REC that specifies how to transform a single attribute. The attribute_name is a column name. The attribute_subname is the nested attribute name if the column is nested, otherwise attribute_subname is null. The expression field holds a SQL expression for transforming the attribute. See "About Transformation Lists" on page 46-7 for an explanation of reverse expressions. The attribute_spec field can be used to cause the attribute to be handled in a specific way during the model build. See Table 46–33, " SET_TRANSFORM Procedure Parameters" for details. The expressions in a TRANSFORM_REC have type EXPRESSION_REC. The lstmt field stores a VARCHAR2A, which is a table of VARCHAR2(32767). The VARCHAR2A datatype allows transformation expressions to be very long, as they can be broken up across multiple rows of VARCHAR2. The VARCHAR2A type is defined in the DBMS_SQL package. See "VARCHAR2A Table Type" on page 149-46. The ub (upper bound) and lb (lower bound) fields indicate how many rows there are in the VARCHAR2A table. If ub < lb (default) the EXPRESSION_REC is empty; if lb=ub=1 there is one row; if lb=1 and ub=2 there are 2 rows, and so on.

Constants

DBMS_DATA_MINING_TRANSFORM defines the constants described in Table 46–2.

Table 46–2 Constants in DBMS_DATA_MINING_TRANSFORM

Constant	Value	Description
NEST_NUM_COL_TYPE	100001	Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_NUMERICALS. Nested numerical attributes are defined as follows: attribute_name VARCHAR2(4000) value NUMBER
NEST_CAT_COL_TYPE	100002	Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_CATEGORICALS. Nested categorical attributes are defined as follows: attribute_name VARCHAR2(4000) value VARCHAR2(4000)
NEST_BD_COL_TYPE	100003	Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_BINARY_DOUBLES. Nested binary double attributes are defined as follows: attribute_name VARCHAR2(4000) value BINARY_DOUBLE
NEST_BF_COL_TYPE	100004	Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_BINARY_FLOATS. attribute_name VARCHAR2(4000) value BINARY_FLOAT

See Also: *Oracle Data Mining User's Guide* for information about nested data in Oracle Data Mining

Summary of DBMS_DATA_MINING_TRANSFORM Subprograms

Table 46–3 DBMS_DATA_MINING_TRANSFORM Package Subprograms

Subprogram	Purpose
CREATE_BIN_CAT Procedure on page 46-19	Creates a transformation definition table for categorical binning
CREATE_BIN_NUM Procedure on page 46-21	Creates a transformation definition table for numerical binning
CREATE_CLIP Procedure on page 46-23	Creates a transformation definition table for clipping
CREATE_COL_REM Procedure on page 46-25	Creates a transformation definition table for column removal
CREATE_MISS_CAT Procedure on page 46-26	Creates a transformation definition table for categorical missing value treatment
CREATE_MISS_NUM Procedure on page 46-28	Creates a transformation definition table for numerical missing values treatment
CREATE_NORM_LIN Procedure on page 46-30	Creates a transformation definition table for linear normalization
DESCRIBE_STACK Procedure on page 46-32	Describes the transformation list
GET_EXPRESSION Function on page 46-34	Returns a `VARCHAR2` chunk from a transformation expression
INSERT_AUTOBIN_NUM_EQWIDTH Procedure on page 46-34	Inserts numeric automatic equi-width binning definitions in a transformation definition table
INSERT_BIN_CAT_FREQ Procedure on page 46-39	Inserts categorical frequency-based binning definitions in a transformation definition table
INSERT_BIN_NUM_EQWIDTH Procedure on page 46-44	Inserts numeric equi-width binning definitions in a transformation definition table
INSERT_BIN_NUM_QTILE Procedure on page 46-48	Inserts numeric quantile binning expressions in a transformation definition table
INSERT_BIN_SUPER Procedure on page 46-51	Inserts supervised binning definitions in numerical and categorical transformation definition tables
INSERT_CLIP_TRIM_TAIL Procedure on page 46-55	Inserts numerical trimming definitions in a transformation definition table
INSERT_CLIP_WINSOR_TAIL Procedure on page 46-58	Inserts numerical winsorizing definitions in a transformation definition table
INSERT_MISS_CAT_MODE Procedure on page 46-61	Inserts categorical missing value treatment definitions in a transformation definition table
INSERT_MISS_NUM_MEAN Procedure on page 46-64	Inserts numerical missing value treatment definitions in a transformation definition table
INSERT_NORM_LIN_MINMAX Procedure on page 46-67	Inserts linear min-max normalization definitions in a transformation definition table
INSERT_NORM_LIN_SCALE Procedure on page 46-70	Inserts linear scale normalization definitions in a transformation definition table
INSERT_NORM_LIN_ZSCORE Procedure on page 46-73	Inserts linear zscore normalization definitions in a transformation definition table

Table 46–3 (Cont.) DBMS_DATA_MINING_TRANSFORM Package Subprograms

Subprogram	Purpose
SET_EXPRESSION Procedure on page 46-76	Adds a VARCHAR2 chunk to an expression
SET_TRANSFORM Procedure on page 46-78	Adds a transformation record to a transformation list
STACK_BIN_CAT Procedure on page 46-80	Adds a categorical binning expression to a transformation list
STACK_BIN_NUM Procedure on page 46-82	Adds a numerical binning expression to a transformation list
STACK_CLIP Procedure on page 46-85	Adds a clipping expression to a transformation list
STACK_COL_REM Procedure on page 46-87	Adds a column removal expression to a transformation list
STACK_MISS_CAT Procedure on page 46-89	Adds a categorical missing value treatment expression to a transformation list
STACK_MISS_NUM Procedure on page 46-91	Adds a numerical missing value treatment expression to a transformation list
STACK_NORM_LIN Procedure on page 46-93	Adds a linear normalization expression to a transformation list
XFORM_BIN_CAT Procedure on page 46-95	Creates a view of the data table with categorical binning transformations
XFORM_BIN_NUM Procedure on page 46-97	Creates a view of the data table with numerical binning transformations
XFORM_CLIP Procedure on page 46-100	Creates a view of the data table with clipping transformations
XFORM_COL_REM Procedure on page 46-102	Creates a view of the data table with column removal transformations
XFORM_EXPR_NUM Procedure on page 46-104	Creates a view of the data table with the specified numeric transformations
XFORM_EXPR_STR Procedure on page 46-106	Creates a view of the data table with the specified categorical transformations
XFORM_MISS_CAT Procedure on page 46-109	Creates a view of the data table with categorical missing value treatment
XFORM_MISS_NUM Procedure on page 46-112	Creates a view of the data table with numerical missing value treatment
XFORM_NORM_LIN Procedure on page 46-114	Creates a view of the data table with linear normalization transformations
XFORM_STACK Procedure on page 46-117	Creates a view of the transformation list

CREATE_BIN_CAT Procedure

This procedure creates a transformation definition table for categorical binning. The columns are described in Table 46–4.

Table 46–4 Columns in a Transformation Definition Table for Categorical Binning

Name	Datatype	Description
col	VARCHAR2(30)	Name of a column of categorical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see *Oracle Data Mining User's Guide*.
att	VARCHAR2(4000)	The attribute subname if *col* is a nested column. If *col* is nested, the attribute name is *col.att*. If *col* is not nested, *att* is null.
val	VARCHAR2(4000)	Values of the attribute
bin	VARCHAR2(4000)	Bin assignments for the values

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT (
     bin_table_name     IN VARCHAR2,
     bin_schema_name    IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 46–5 CREATE_BIN_CAT Procedure Parameters

Parameter	Description
bin_table_name	Name of the transformation definition table to be created
bin_schema_name	Schema of *bin_table_name*. If no schema is specified, the current schema is used.

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about categorical data.
2. See "Nested Data Transformations" on page 46-10 for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
   - INSERT_BIN_CAT_FREQ Procedure — frequency-based binning
   - INSERT_BIN_SUPER Procedure — supervised binning

See Also:

"Binning" on page 46-4

"Operational Notes" on page 46-6

Examples

The following statement creates a table called `bin_cat_xtbl` in the current schema. The table has columns that can be populated with bin assignments for categorical attributes.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT('bin_cat_xtbl');
END;
/
DESCRIBE bin_cat_xtbl
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 VAL                                                VARCHAR2(4000)
 BIN                                                VARCHAR2(4000)
```

CREATE_BIN_NUM Procedure

This procedure creates a transformation definition table for numerical binning. The columns are described in Table 46–6.

Table 46–6 Columns in a Transformation Definition Table for Numerical Binning

Name	Datatype	Description
col	VARCHAR2(30)	Name of a column of numerical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see *Oracle Data Mining User's Guide*.
att	VARCHAR2(4000)	The attribute subname if *col* is a nested column. If *col* is nested, the attribute name is *col.att*. If *col* is not nested, *att* is null.
val	NUMBER	Values of the attribute
bin	VARCHAR2(4000)	Bin assignments for the values

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM (
     bin_table_name    IN VARCHAR2,
     bin_schema_name   IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 46–7 CREATE_BIN_NUM Procedure Parameters

Parameter	Description
bin_table_name	Name of the transformation definition table to be created
bin_schema_name	Schema of *bin_table_name*. If no schema is specified, the current schema is used.

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about numerical data.
2. See "Nested Data Transformations" on page 46-10 for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
   - INSERT_AUTOBIN_NUM_EQWIDTH Procedure — automatic equi-width binning
   - INSERT_BIN_NUM_EQWIDTH Procedure — user-specified equi-width binning
   - INSERT_BIN_NUM_QTILE Procedure — quantile binning
   - INSERT_BIN_SUPER Procedure — supervised binning

See Also:

"Binning" on page 46-4

"Operational Notes" on page 46-6

Examples

The following statement creates a table called `bin_num_xtbl` in the current schema. The table has columns that can be populated with bin assignments for numerical attributes.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM('bin_num_xtbl');
END;
/

DESCRIBE bin_num_xtbl
 Name                                    Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                               VARCHAR2(30)
 ATT                                               VARCHAR2(4000)
 VAL                                               NUMBER
 BIN                                               VARCHAR2(4000)
```

CREATE_CLIP Procedure

This procedure creates a transformation definition table for clipping or winsorizing to minimize the effect of outliers. The columns are described in Table 46–8.

Table 46–8 Columns in a Transformation Definition Table for Clipping or Winsorizing

Name	Datatype	Description
col	VARCHAR2(30)	Name of a column of numerical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see *Oracle Data Mining User's Guide*.
att	VARCHAR2(4000)	The attribute subname if *col* is a nested column of DM_NESTED_NUMERICALS. If *col* is nested, the attribute name is *col.att*. If *col* is not nested, *att* is null.
lcut	NUMBER	The lowest typical value for the attribute. If the attribute values were plotted on an *xy* axis, *lcut* would be the left-most boundary of the range of values considered typical for this attribute. Any values to the left of *lcut* are outliers.
lval	NUMBER	Value assigned to an outlier to the left of *lcut*
rcut	NUMBER	The highest typical value for the attribute If the attribute values were plotted on an *xy* axis, *rcut* would be the right-most boundary of the range of values considered typical for this attribute. Any values to the right of *rcut* are outliers.
rval	NUMBER	Value assigned to an outlier to the right of *rcut*

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP (
     clip_table_name    IN VARCHAR2,
     clip_schema_name   IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 46–9 CREATE_CLIP Procedure Parameters

Parameter	Description
clip_table_name	Name of the transformation definition table to be created
clip_schema_name	Schema of *clip_table_name*. If no schema is specified, the current schema is used.

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about numerical data.
2. See "Nested Data Transformations" on page 46-10 for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
   - INSERT_CLIP_TRIM_TAIL Procedure — replaces outliers with nulls

- INSERT_CLIP_WINSOR_TAIL Procedure — replaces outliers with an average value

See Also:

"Outlier Treatment" on page 46-5

"Operational Notes" on page 46-6

Examples

The following statement creates a table called `clip_xtbl` in the current schema. The table has columns that can be populated with clipping instructions for numerical attributes.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP('clip_xtbl');
END;
/

DESCRIBE clip_xtbl
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 LCUT                                               NUMBER
 LVAL                                               NUMBER
 RCUT                                               NUMBER
 RVAL                                               NUMBER
```

CREATE_COL_REM Procedure

This procedure creates a transformation definition table for removing columns from the data table. The columns are described in Table 46–10.

Table 46–10 Columns in a Transformation Definition Table for Column Removal

Name	Datatype	Description
col	VARCHAR2(30)	Name of a column of data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see *Oracle Data Mining User's Guide*.
att	VARCHAR2(4000)	The attribute subname if *col* is nested (DM_NESTED_NUMERICALS or DM_NESTED_CATEGORICALS). If col is nested, the attribute name is *col.att*. If *col* is not nested, *att* is null.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM (
      rem_table_name           VARCHAR2,
      rem_schema_name          VARCHAR2 DEFAULT NULL );
```

Parameters

Table 46–11 CREATE_COL_REM Procedure Parameters

Parameter	Description
rem_table_name	Name of the transformation definition table to be created
rem_schema_name	Schema of *rem_table_name*. If no schema is specified, the current schema is used.

Usage Notes

1. See "Nested Data Transformations" on page 46-10 for information about transformation definition tables and nested data.
2. See "Operational Notes" on page 46-6.

Examples

The following statement creates a table called rem_att_xtbl in the current schema. The table has columns that can be populated with the names of attributes to exclude from the data to be mined.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('rem_att_xtbl');
END;
 /
DESCRIBE rem_att_xtbl
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
```

CREATE_MISS_CAT Procedure

This procedure creates a transformation definition table for replacing categorical missing values. The columns are described in Table 46–12.

Table 46–12 Columns in a Transformation Definition Table for Categorical Missing Value Treatment

Name	Datatype	Description
col	VARCHAR2(30)	Name of a column of categorical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see *Oracle Data Mining User's Guide*.
att	VARCHAR2(4000)	The attribute subname if *col* is a nested column of DM_NESTED_CATEGORICALS. If *col* is nested, the attribute name is *col.att*. If *col* is not nested, *att* is null.
val	VARCHAR2(4000)	Replacement for missing values in the attribute

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT (
     miss_table_name       IN VARCHAR2,
     miss_schema_name      IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 46–13 CREATE_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the transformation definition table to be created
miss_schema_name	Schema of *miss_table_name*. If no schema is specified, the current schema is used.

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about categorical data.
2. See "Nested Data Transformations" on page 46-10 for information about transformation definition tables and nested data.
3. You can use the INSERT_MISS_CAT_MODE Procedure to populate the transformation definition table.

See Also:

"Missing Value Treatment" on page 46-5

"Operational Notes" on page 46-6

Examples

The following statement creates a table called miss_cat_xtbl in the current schema. The table has columns that can be populated with values for missing data in categorical attributes.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT('miss_cat_xtbl');
```

```
END;
/

DESCRIBE miss_cat_xtbl
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 VAL                                                VARCHAR2(4000)
```

CREATE_MISS_NUM Procedure

This procedure creates a transformation definition table for replacing numerical missing values. The columns are described in Table 46–14.

Table 46–14 Columns in a Transformation Definition Table for Numerical Missing Value Treatment

Name	Datatype	Description
col	VARCHAR2(30)	Name of a column of numerical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see *Oracle Data Mining User's Guide*.
att	VARCHAR2(4000)	The attribute subname if *col* is a nested column of DM_NESTED_NUMERICALS. If *col* is nested, the attribute name is *col.att*. If *col* is not nested, *att* is null.
val	NUMBER	Replacement for missing values in the attribute

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM (
     miss_table_name       IN VARCHAR2,
     miss_schema_name      IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 46–15 CREATE_MISS_NUM Procedure Parameters

Parameter	Description
miss_table_name	Name of the transformation definition table to be created
miss_schema_name	Schema of *miss_table_name*. If no schema is specified, the current schema is used.

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about numerical data.
2. See "Nested Data Transformations" on page 46-10 for information about transformation definition tables and nested data.
3. You can use the INSERT_MISS_NUM_MEAN Procedure to populate the transformation definition table.

See Also:

"Missing Value Treatment" on page 46-5

"Operational Notes" on page 46-6

Example

The following statement creates a table called miss_num_xtbl in the current schema. The table has columns that can be populated with values for missing data in numerical attributes.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('miss_num_xtbl');
```

```
END;
/

DESCRIBE miss_num_xtbl
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 VAL                                                NUMBER
```

CREATE_NORM_LIN Procedure

This procedure creates a transformation definition table for linear normalization. The columns are described in Table 46–16.

Table 46–16 Columns in a Transformation Definition Table for Linear Normalization

Name	Datatype	Description
col	VARCHAR2(30)	Name of a column of numerical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see *Oracle Data Mining User's Guide*.
att	VARCHAR2(4000)	The attribute subname if *col* is a nested column of DM_NESTED_NUMERICALS. If *col* is nested, the attribute name is *col.att*. If *col* is not nested, *att* is null.
shift	NUMBER	A constant to subtract from the attribute values
scale	NUMBER	A constant by which to divide the shifted values

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN (
     norm_table_name       IN VARCHAR2,
     norm_schema_name      IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 46–17 CREATE_NORM_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the transformation definition table to be created
norm_schema_name	Schema of *norm_table_name*. If no schema is specified, the current schema is used.

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about numerical data.
2. See "Nested Data Transformations" on page 46-10 for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
   - INSERT_NORM_LIN_MINMAX Procedure — Uses linear min-max normalization
   - INSERT_NORM_LIN_SCALE Procedure — Uses linear scale normalization
   - INSERT_NORM_LIN_ZSCORE Procedure — Uses linear zscore normalization

See Also:

"Linear Normalization" on page 46-4

"Operational Notes" on page 46-6

Examples

The following statement creates a table called `norm_xtbl` in the current schema. The table has columns that can be populated with shift and scale values for normalizing numerical attributes.

```
BEGIN
     DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN('norm_xtbl');
END;
/

DESCRIBE norm_xtbl
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 SHIFT                                              NUMBER
 SCALE                                              NUMBER
```

DESCRIBE_STACK Procedure

This procedure describes the columns of the data table after a list of transformations has been applied. Only the columns that are specified in the transformation list are transformed. The remaining columns in the data table are included in the output without changes.

To create a view of the data table after the transformations have been applied, use the XFORM_STACK Procedure.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.DESCRIBE_STACK (
     xform_list           IN  TRANSFORM_LIST,
     data_table_name      IN  VARCHAR2,
     describe_list        OUT DESCRIBE_LIST,
     data_schema_name     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–18 DESCRIBE_STACK Procedure Parameters

Parameter	Description
xform_list	A list of transformations. See Table 46–1 for a description of the TRANSFORM_LIST object type.
data_table_name	Name of the table containing the data to be transformed
describe_list	Descriptions of the columns in the data table after the transformations specified in *xform_list* have been applied. See Table 46–1 for a description of the DESCRIBE_LIST object type.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.

Usage Notes

See "Operational Notes" on page 46-6 for information about transformation lists and embedded transformations.

Examples

This example shows the column name and datatype, the column name length, and the column maximum length for the view dmuser.cust_info after the transformation list has been applied. All the transformations are user-specified. The results of DESCRIBE_STACK do not include one of the columns in the original table, because the SET_TRANSFORM procedure sets that column to NULL.

```
CREATE OR REPLACE VIEW cust_info AS
         SELECT a.cust_id, c.country_id, c.cust_year_of_birth,
         CAST(COLLECT(DM_Nested_Numerical(
                  b.prod_name, 1))
                AS DM_Nested_Numericals) custprods
                 FROM sh.sales a, sh.products b, sh.customers c
                  WHERE a.prod_id = b.prod_id AND
                        a.cust_id=c.cust_id and
                        a.cust_id between 100001 AND 105000
         GROUP BY a.cust_id, country_id, cust_year_of_birth;

describe cust_info
```

```

GET_EXPRESSION Function

This function returns a row from a VARCHAR2 array that stores a transformation expression. The array is built by calls to the SET_EXPRESSION Procedure.

The array can be used for specifying SQL expressions that are too long to be used with the SET_TRANSFORM Procedure.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.GET_EXPRESSION (
     expression           IN EXPRESSION_REC,
     chunk_num            IN PLS_INTEGER DEFAULT NULL);
 RETURN VARCHAR2;
```

Parameters

Table 46–19 GET_EXPRESSION Function Parameters

Parameter	Description
expression	An expression record (EXPRESSION_REC) that specifies a transformation expression or a reverse transformation expression for an attribute. Each expression record includes a VARCHAR2 array and index fields for specifying upper and lower boundaries within the array. There are two EXPRESSION_REC fields within a transformation record (TRANSFORM_REC): one for the transformation expression; the other for the reverse transformation expression. See Table 46–1 for a description of the EXPRESSION_REC type.
chunk	A VARCHAR2 chunk (row) to be appended to *expression*.

Usage Notes

1. Chunk numbering starts with one. For chunks outside of the range, the return value is null. When a chunk number is null the whole expression is returned as a string. If the expression is too big, a VALUE_ERROR is raised.
2. See "About Transformation Lists" on page 46-7.
3. See "Operational Notes" on page 46-6.

Examples

See the example for the SET_EXPRESSION Procedure.

INSERT_AUTOBIN_NUM_EQWIDTH Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure identifies the minimum and maximum values and computes the bin boundaries at equal intervals.

INSERT_AUTOBIN_NUM_EQWIDTH computes the number of bins separately for each column. If you want to use equi-width binning with the same number of bins for each column, use the INSERT_BIN_NUM_EQWIDTH Procedure.

INSERT_AUTOBIN_NUM_EQWIDTH bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQWIDTH (
     bin_table_name         IN VARCHAR2,
     data_table_name        IN VARCHAR2,
     bin_num                IN PLS_INTEGER DEFAULT 3,
     max_bin_num            IN PLS_INTEGER DEFAULT 100,
     exclude_list           IN COLUMN_LIST DEFAULT NULL,
     round_num              IN PLS_INTEGER DEFAULT 6,
     sample_size            IN PLS_INTEGER DEFAULT 50000,
     bin_schema_name        IN VARCHAR2 DEFAULT NULL,
     data_schema_name       IN VARCHAR2 DEFAULT NULL,
     rem_table_name         IN VARCHAR2 DEFAULT NULL,
     rem_schema_name        IN VARCHAR2 DEFAULT NULL));
```

Parameters

Table 46–20 INSERT_AUTOBIN_NUM_EQWIDTH Procedure Parameters

Parameter	Description
bin_table_name	Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required: COL VARCHAR2(30) VAL NUMBER BIN VARCHAR2(4000) CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_AUTOBIN_NUM_EQWIDTH.
data_table_name	Name of the table containing the data to be transformed
bin_num	Minimum number of bins. If *bin_num* is 0 or NULL, it is ignored. The default value of *bin_num* is 3.
max_bin_num	Maximum number of bins. If *max_bin_num* is 0 or NULL, it is ignored. The default value of *max_bin_num* is 100.
exclude_list	List of numerical columns to be excluded from the binning process. If you do not specify *exclude_list*, all numerical columns in the data source are binned. The format of *exclude_list* is: dbms_data_mining_transform.COLUMN_LIST('col*1*','col*2*', ...'col*n*')

Table 46–20 (Cont.) INSERT_AUTOBIN_NUM_EQWIDTH Procedure Parameters

Parameter	Description
round_num	Specifies how to round the number in the VAL column of the transformation definition table. When *round_num* is positive, it specifies the most significant digits to retain. When *round_num* is negative, it specifies the least significant digits to remove. In both cases, the result is rounded to the specified number of digits. See the Usage Notes for an example. The default value of *round_num* is 6.
sample_size	Size of the data sample. If *sample_size* is less than the total number of non-NULL values in the column, then *sample_size* is used instead of the SQL COUNT function in computing the number of bins. If *sample_size* is 0 or NULL, it is ignored. See the Usage Notes. The default value of *sample_size* is 50,000.
bin_schema_name	Schema of *bin_table_name*. If no schema is specified, the current schema is used.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.
rem_table_name	Name of a transformation definition table for column removal. The table must have the columns described in "CREATE_COL_REM Procedure" on page 46-25. INSERT_AUTOBIN_NUM_EQWIDTH ignores columns with all nulls or only one unique value. If you specify a value for *rem_table_name*, these columns are removed from the mining data. If you do not specify a value for *rem_table_name*, these unbinned columns remain in the data.
rem_schema_name	Schema of *rem_table_name*. If no schema is specified, the current schema is used.

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about numerical data.
2. INSERT_AUTOBIN_NUM_EQWIDTH computes the number of bins for a column based on the number of non-null values (COUNT), the maximum (MAX), the minimum (MIN), the standard deviation (STDDEV), and the constant C=3.49/0.9:

   ```
   N=floor(power(COUNT,1/3)*(max-min)/(c*dev))
   ```

   If the *sample_size* parameter is specified, it is used instead of COUNT.

   See *Oracle Database SQL Language Reference* for information about the COUNT, MAX, MIN, STDDEV, FLOOR, and POWER functions.
3. INSERT_AUTOBIN_NUM_EQWIDTH uses absolute values to compute the number of bins. The sign of the parameters *bin_num*, *max_bin_num*, and *sample_size* has no effect on the result.
4. In computing the number of bins, INSERT_AUTOBIN_NUM_EQWIDTH evaluates the following criteria in the following order:
   1. The minimum number of bins (*bin_num*)
   2. The maximum number of bins (*max_bin_num*)
   3. The maximum number of bins for integer columns, calculated as the number of distinct values in the range *max-min+1*.
5. The *round_num* parameter controls the rounding of column values in the transformation definition table, as follows:

```
    For a value of 308.162:
    when round_num =  1       result is 300
    when round_num =  2       result is 310
    when round_num =  3       result is 308
    when round_num =  0       result is 308.162
    when round_num = -1       result is 308.16
    when round_num = -2       result is 308.2
```

Examples

In this example, INSERT_AUTOBIN_NUM_EQWIDTH computes the bin boundaries for the cust_year_of_birth column in sh.customers and inserts the transformations in a transformation definition table. The STACK_BIN_NUM Procedure creates a transformation list from the contents of the definition table. The CREATE_MODEL Procedure embeds the transformation list in a new model called nb_model.

The transformation and reverse transformation expressions embedded in nb_model are returned by the GET_MODEL_TRANSFORMATIONS Function.

```
CREATE OR REPLACE VIEW mining_data AS
       SELECT cust_id, cust_year_of_birth, cust_postal_code
       FROM sh.customers;

0;  ), NULL')
```

INSERT_BIN_CAT_FREQ Procedure

This procedure performs categorical binning and inserts the transformation definitions in a transformation definition table. The procedure computes the bin boundaries based on frequency.

INSERT_BIN_CAT_FREQ bins all the CHAR and VARCHAR2 columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_CAT_FREQ (
     bin_table_name       IN VARCHAR2,
     data_table_name      IN VARCHAR2,
     bin_num              IN PLS_INTEGER DEFAULT 9,
     exclude_list         IN COLUMN_LIST DEFAULT NULL,
     default_num          IN PLS_INTEGER DEFAULT 2,
     bin_support          IN NUMBER DEFAULT NULL,
     bin_schema_name      IN VARCHAR2 DEFAULT NULL,
     data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–21 INSERT_BIN_CAT_FREQ Procedure Parameters

Parameter	Description
bin_table_name	Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table.The following columns are required: COL VARCHAR2(30) VAL VARCHAR2(4000) BIN VARCHAR2(4000) CREATE_BIN_CAT creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_BIN_CAT_FREQ.
data_table_name	Name of the table containing the data to be transformed
bin_num	The number of bins to fill using frequency-based binning The total number of bins will be *bin_num*+1. The additional bin is the default bin. Classes that are not assigned to a frequency-based bin will be assigned to the default bin. The default binning order is from highest to lowest: the most frequently occurring class is assigned to the first bin, the second most frequently occurring class is assigned to the second bin, and so on.You can reverse the binning order by specifying a negative number for *bin_num*. The negative sign causes the binning order to be from lowest to highest. If the total number of distinct values (classes) in the column is less than *bin_num*, then a separate bin will be created for each value and the default bin will be empty. If you specify NULL or 0 for *bin_num*, no binning is performed. The default value of *bin_num* is 9.

Table 46–21 (Cont.) INSERT_BIN_CAT_FREQ Procedure Parameters

Parameter	Description
exclude_list	List of categorical columns to be excluded from the binning process. If you do not specify *exclude_list*, all categorical columns in the data source are binned. The format of *exclude_list* is: `dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')`
default_num	The number of class occurrences (rows of the same class) required for assignment to the default bin By default, *default_num* is the minimum number of occurrences required for assignment to the default bin. For example, if *default_num* is 3 and a given class occurs only once, it will not be assigned to the default bin. You can change the occurrence requirement from minimum to maximum by specifying a negative number for *default_num*. For example, if *default_num* is -3 and a given class occurs only once, it *will* be assigned to the default bin, but a class that occurs four or more times will not be included. If you specify NULL or 0 for *default_bin*, there are no requirements for assignment to the default bin. The default value of *default_num* is 2.
bin_support	The number of class occurrences (rows of the same class) required for assignment to a frequency-based bin. *bin_support* is expressed as a fraction of the total number of rows. By default, *bin_support* is the minimum percentage required for assignment to a frequency-based bin. For example, if there are twenty rows of data and you specify.2 for *bin_support*, then there must be four or more occurrences of a class (.2*20) in order for it to be assigned to a frequency-based bin. You can change *bin_support* from a minimum percentage to a maximum percentage by specifying a negative number for *bin_support*. For example, if there are twenty rows of data and you specify -.2 for *bin_support*, then there must be four or less occurrences of a class in order for it to be assigned to a frequency-based bin. Classes that occur less than a positive *bin_support* or more than a negative *bin_support* will be assigned to the default bin. If you specify NULL or 0 for *bin_support*, then there is no support requirement for frequency-based binning. The default value of *bin_support* is NULL.
bin_schema_name	Schema of *bin_table_name*. If no schema is specified, the current schema is used.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about categorical data.
2. If values occur with the same frequency, INSERT_BIN_CAT_FREQ assigns them in descending order when binning is from most to least frequent, or in ascending order when binning is from least to most frequent.

Examples

1. In this example, INSERT_BIN_CAT_FREQ computes the bin boundaries for the cust_postal_code and cust_city columns in sh.customers and inserts the transformations in a transformation definition table. The STACK_BIN_CAT

Procedure creates a transformation list from the contents of the definition table, and the CREATE_MODEL Procedure embeds the transformation list in a new model called nb_model.

The transformation and reverse transformation expressions embedded in nb_model are returned by the GET_MODEL_TRANSFORMATIONS Function.

```
CREATE OR REPLACE VIEW mining_data AS

```

INSERT_BIN_NUM_EQWIDTH Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure identifies the minimum and maximum values and computes the bin boundaries at equal intervals.

INSERT_BIN_NUM_EQWIDTH computes a specified number of bins (*n*) and assigns *(max-min)/n* values to each bin. The number of bins is the same for each column. If you want to use equi-width binning, but you want the number of bins to be calculated on a per-column basis, use the INSERT_AUTOBIN_NUM_EQWIDTH Procedure.

INSERT_BIN_NUM_EQWIDTH bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_EQWIDTH (
     bin_table_name        IN VARCHAR2,
     data_table_name       IN VARCHAR2,
     bin_num               IN PLS_INTEGER DEFAULT 10,
     exclude_list          IN COLUMN_LIST DEFAULT NULL,
     round_num             IN PLS_INTEGER DEFAULT 6,
     bin_schema_name       IN VARCHAR2 DEFAULT NULL,
     data_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–22 INSERT_BIN_NUM_EQWIDTH Procedure Parameters

Parameter	Description
bin_table_name	Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required: COL VARCHAR2(30) VAL NUMBER BIN VARCHAR2(4000) CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_BIN_NUM_EQWIDTH.
data_table_name	Name of the table containing the data to be transformed
bin_num	Number of bins. No binning occurs if *bin_num* is 0 or NULL. The default number of bins is 10.
exclude_list	List of numerical columns to be excluded from the binning process. If you do not specify *exclude_list*, all numerical columns in the data source are binned. The format of *exclude_list* is: dbms_data_mining_transform.COLUMN_LIST('col*1*','col*2*', ...'col*n*')

Table 46–22 (Cont.) INSERT_BIN_NUM_EQWIDTH Procedure Parameters

Parameter	Description
round_num	Specifies how to round the number in the VAL column of the transformation definition table. When *round_num* is positive, it specifies the most significant digits to retain. When *round_num* is negative, it specifies the least significant digits to remove. In both cases, the result is rounded to the specified number of digits. See the Usage Notes for an example. The default value of *round_num* is 6.
bin_schema_name	Schema of *bin_table_name*. If no schema is specified, the current schema is used.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about numerical data.
2. The *round_num* parameter controls the rounding of column values in the transformation definition table, as follows:

```
For a value of 308.162:
when round_num =  1       result is 300
when round_num =  2       result is 310
when round_num =  3       result is 308
when round_num =  0       result is 308.162
when round_num = -1       result is 308.16
when round_num = -2       result is 308.2
```

3. INSERT_BIN_NUM_EQWIDTH ignores columns with all NULL values or only one unique value.

Examples

In this example, INSERT_BIN_NUM_EQWIDTH computes the bin boundaries for the affinity_card column in mining_data_build and inserts the transformations in a transformation definition table. The STACK_BIN_NUM Procedure creates a transformation list from the contents of the definition table. The CREATE_MODEL Procedure embeds the transformation list in a new model called glm_model.

The transformation and reverse transformation expressions embedded in glm_model are returned by the GET_MODEL_TRANSFORMATIONS Function.

```
CREATE OR REPLACE VIEW mining_data AS
       SELECT cust_id, cust_income_level, cust_gender, affinity_card
       FROM mining_data_build;

DESCRIBE mining_data
 Name                      Null?    Type
 ------------------------- -------- -----------------

```

INSERT_BIN_NUM_QTILE Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure calls the SQL NTILE function to order the data and divide it equally into the specified number of bins (quantiles).

INSERT_BIN_NUM_QTILE bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE (
    bin_table_name       IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    bin_num              IN PLS_INTEGER DEFAULT 10,
    exclude_list         IN COLUMN_LIST DEFAULT NULL,
    bin_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–23 INSERT_BIN_NUM_QTILE Procedure Parameters

Parameter	Description
bin_table_name	Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required: COL VARCHAR2(30) VAL NUMBER BIN VARCHAR2(4000) CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_BIN_NUM_QTILE.
data_table_name	Name of the table containing the data to be transformed
bin_num	Number of bins. No binning occurs if *bin_num* is 0 or NULL. The default number of bins is 10.
exclude_list	List of numerical columns to be excluded from the binning process. If you do not specify *exclude_list*, all numerical columns in the data source are binned. The format of *exclude_list* is: dbms_data_mining_transform.COLUMN_LIST('col*1*','col*2*', ...'col*n*')
bin_schema_name	Schema of *bin_table_name*. If no schema is specified, the current schema is used.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about numerical data.
2. After dividing the data into quantiles, the NTILE function distributes any remainder values one for each quantile, starting with the first. See *Oracle Database SQL Language Reference* for details.

3. Columns with all NULL values are ignored by INSERT_BIN_NUM_QTILE.

Examples

In this example, INSERT_BIN_NUM_QTILE computes the bin boundaries for the cust_year_of_birth and cust_credit_limit columns in sh.customers and inserts the transformations in a transformation definition table. The STACK_BIN_NUM Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in STACK_VIEW. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
        SELECT cust_id, cust_year_of_birth, cust_credit_limit, cust_city
        FROM sh.customers;

DESCRIBE mining_data

,"CUST_CITY" FROM mining_data
```

INSERT_BIN_SUPER Procedure

This procedure performs numerical and categorical binning and inserts the transformation definitions in transformation definition tables. The procedure computes bin boundaries based on intrinsic relationships between predictors and a target.

INSERT_BIN_SUPER uses an intelligent binning technique known as **supervised binning**. It builds a single-predictor decision tree and derives the bin boundaries from splits within the tree.

INSERT_BIN_SUPER bins all the VARCHAR2, CHAR, NUMBER, and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_SUPER (
    num_table_name        IN VARCHAR2,
    cat_table_name        IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    target_column_name    IN VARCHAR2,
    max_bin_num           IN PLS_INTEGER  DEFAULT 1000,
    exclude_list          IN COLUMN_LIST  DEFAULT NULL,
    num_schema_name       IN VARCHAR2     DEFAULT NULL,
    cat_schema_name       IN VARCHAR2     DEFAULT NULL,
    data_schema_name      IN VARCHAR2     DEFAULT NULL,
    rem_table_name        IN VARCHAR2     DEFAULT NULL,
    rem_schema_name       IN VARCHAR2     DEFAULT NULL);
```

Parameters

Table 46–24 INSERT_BIN_SUPER Procedure Parameters

Parameter	Description
num_table_name	Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required: COL VARCHAR2(30) VAL VNUMBER BIN VARCHAR2(4000) CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_BIN_SUPER.
cat_table_name	Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The following columns are required: COL VARCHAR2(30) VAL VARCHAR2(4000) BIN VARCHAR2(4000) CREATE_BIN_CAT creates an additional column, ATT, which is used for specifying nested attributes. This column is not used by INSERT_BIN_SUPER.
data_table_name	Name of the table containing the data to be transformed
target_column_name	Name of a column to be used as the target for the decision tree models

Table 46–24 (Cont.) INSERT_BIN_SUPER Procedure Parameters

Parameter	Description
max_bin_num	The maximum number of bins. The default is 1000.
exclude_list	List of columns to be excluded from the binning process. If you do not specify *exclude_list*, all numerical and categorical columns in the data source are binned. The format of *exclude_list* is: `dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')`
num_schema_name	Schema of *num_table_name*. If no schema is specified, the current schema is used.
cat_schema_name	Schema of *cat_table_name*. If no schema is specified, the current schema is used.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.
rem_table_name	Name of a column removal definition table. The table must have the columns described in "CREATE_COL_REM Procedure" on page 46-25. You can use CREATE_COL_REM to create the table. See Usage Notes.
rem_schema_name	Schema of *rem_table_name*. If no schema is specified, the current schema is used.

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about numerical and categorical data.
2. Columns that have no significant splits are not binned. You can remove the unbinned columns from the mining data by specifying a column removal definition table. If you do not specify a column removal definition table, the unbinned columns remain in the mining data.
3. See *Oracle Data Mining Concepts* to learn more about decision trees in Oracle Data Mining

Examples

In this example, INSERT_BIN_SUPER computes the bin boundaries for predictors of cust_credit_limit and inserts the transformations in transformation definition tables. One predictor is numerical, the other is categorical. (INSERT_BIN_SUPER determines that the cust_postal_code column is not a significant predictor.) STACK procedures create transformation lists from the contents of the definition tables.

The SQL expressions that compute the transformations are shown in the views MINING_DATA_STACK_NUM and MINING_DATA_STACK_CAT. The views are for display purposes only; they cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
     SELECT cust_id, cust_year_of_birth, cust_marital_status,
            cust_postal_code, cust_credit_limit
     FROM sh.customers;

INSERT_CLIP_TRIM_TAIL Procedure

This procedure replaces numeric outliers with nulls and inserts the transformation definitions in a transformation definition table.

INSERT_CLIP_TRIM_TAIL computes the boundaries of the data based on a specified percentage. It removes the values that fall outside the boundaries (tail values) from the data. If you wish to replace the tail values instead of removing them, use the INSERT_CLIP_WINSOR_TAIL Procedure.

INSERT_CLIP_TRIM_TAIL clips all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL (
    clip_table_name     IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    tail_frac           IN NUMBER DEFAULT 0.025,
    exclude_list        IN COLUMN_LIST DEFAULT NULL,
    clip_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–25 INSERT_CLIP_TRIM_TAIL Procedure Parameters

Parameter	Description
clip_table_name	Name of the transformation definition table for numerical clipping. You can use the CREATE_CLIP Procedure to create the definition table. The following columns are required: COL VARCHAR2(30) LCUT NUMBER LVAL NUMBER RCUT NUMBER RVAL NUMBER CREATE_CLIP creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_CLIP_TRIM_TAIL.
data_table_name	Name of the table containing the data to be transformed
tail_frac	The percentage of non-null values to be designated as outliers at each end of the data. For example, if *tail_frac* is .01, then 1% of the data at the low end and 1% of the data at the high end will be treated as outliers. If *tail_frac* is greater than or equal to .5, no clipping occurs. The default value of *tail_frac* is 0.025.
exclude_list	List of numerical columns to be excluded from the clipping process. If you do not specify *exclude_list*, all numerical columns in the data are clipped. The format of *exclude_list* is: dbms_data_mining_transform.COLUMN_LIST('col*1*','col*2*', ...'col*n*')
clip_schema_name	Schema of *clip_table_name*. If no schema is specified, the current schema is used.

Table 46–25 (Cont.) INSERT_CLIP_TRIM_TAIL Procedure Parameters

Parameter	Description
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about numerical data.
2. The DBMS_DATA_MINING_TRANSFORM package provides two clipping procedures: INSERT_CLIP_TRIM_TAIL and INSERT_CLIP_WINSOR_TAIL. Both procedures compute the boundaries as follows:
   - Count the number of non-null values, ***n***, and sort them in ascending order
   - Calculate the number of outliers, ***t***, as ***n*tail_frac***
   - Define the lower boundary ***lcut*** as the value at position ***1+floor(t)***
   - Define the upper boundary ***rcut*** as the value at position ***n-floor(t)***

     (The SQL FLOOR function returns the largest integer less than or equal to ***t***.)
   - All values that are <= ***lcut*** or => ***rcut*** are designated as outliers.

   INSERT_CLIP_TRIM_TAIL replaces the outliers with nulls, effectively removing them from the data.

   INSERT_CLIP_WINSOR_TAIL assigns ***lcut*** to the low outliers and ***rcut*** to the high outliers.

Examples

In this example, INSERT_CLIP_TRIM_TAIL trims 10% of the data in two columns (5% from the high end and 5% from the low end) and inserts the transformations in a transformation definition table. The STACK_CLIP Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the trimming is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
       SELECT cust_id, cust_year_of_birth, cust_credit_limit, cust_city
       FROM sh.customers;

INSERT_CLIP_WINSOR_TAIL Procedure

This procedure replaces numeric outliers with the upper or lower boundary values. It inserts the transformation definitions in a transformation definition table.

INSERT_CLIP_WINSOR_TAIL computes the boundaries of the data based on a specified percentage. It replaces the values that fall outside the boundaries (tail values) with the related boundary value. If you wish to set tail values to null, use the INSERT_CLIP_TRIM_TAIL Procedure.

INSERT_CLIP_WINSOR_TAIL clips all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL (
    clip_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    tail_frac          IN NUMBER DEFAULT 0.025,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    clip_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–26 INSERT_CLIP_WINSOR_TAIL Procedure Parameters

Parameter	Description
clip_table_name	Name of the transformation definition table for numerical clipping. You can use the CREATE_CLIP Procedure to create the definition table. The following columns are required: COL VARCHAR2(30) LCUT NUMBER LVAL NUMBER RCUT NUMBER RVAL NUMBER CREATE_CLIP creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_CLIP_WINSOR_TAIL.
data_table_name	Name of the table containing the data to be transformed

ng_data
```

INSERT_MISS_CAT_MODE Procedure

This procedure replaces missing categorical values with the value that occurs most frequently in the column (the mode). It inserts the transformation definitions in a transformation definition table.

INSERT_MISS_CAT_MODE replaces missing values in all VARCHAR2 and CHAR columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–27 INSERT_MISS_CAT_MODE Procedure Parameters

Parameter	Description
miss_table_name	Name of the transformation definition table for categorical missing value treatment. You can use the CREATE_MISS_CAT Procedure to create the definition table. The following columns are required: COL VARCHAR2(30) VAL VARCHAR2(4000) CREATE_MISS_CAT creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_MISS_CAT_MODE.
data_table_name	Name of the table containing the data to be transformed
exclude_list	List of categorical columns to be excluded from missing value treatment. If you do not specify *exclude_list*, all categorical columns are transformed. The format of *exclude_list* is: dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')
miss_schema_name	Schema of *miss_table_name*. If no schema is specified, the current schema is used.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about categorical data.
2. If you wish to replace categorical missing values with a value other than the mode, you can edit the transformation definition table.

See Also: *Oracle Data Mining User's Guide* for information about default missing value treatment in Oracle Data Mining

Example

In this example, INSERT_MISS_CAT_MODE computes missing value treatment for cust_city and inserts the transformation in a transformation definition table. The STACK_MISS_CAT Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
         SELECT cust_id, cust_year_of_birth, cust_city
         FROM sh.customers;

describe mining_data

INSERT_MISS_NUM_MEAN Procedure

This procedure replaces missing numerical values with the average (the mean) and inserts the transformation definitions in a transformation definition table.

INSERT_MISS_NUM_MEAN replaces missing values in all NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    round_num          IN PLS_INTEGER DEFAULT 6,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–28 INSERT_MISS_NUM_MEAN Procedure Parameters

Parameter	Description
miss_table_name	Name of the transformation definition table for numerical missing value treatment. You can use the CREATE_MISS_NUM Procedure to create the definition table. The following columns are required by INSERT_MISS_NUM_MEAN: COL VARCHAR2(30) VAL NUMBER CREATE_MISS_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_MISS_NUM_MEAN.
data_table_name	Name of the table containing the data to be transformed
exclude_list	List of numerical columns to be excluded from missing value treatment. If you do not specify *exclude_list*, all numerical columns are transformed. The format of *exclude_list* is: dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')
round_num	The number of significant digits to use for the mean. The default number is 6.
miss_schema_name	Schema of *miss_table_name*. If no schema is specified, the current schema is used.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about numerical data.
2. If you wish to replace numerical missing values with a value other than the mean, you can edit the transformation definition table.

See Also: *Oracle Data Mining User's Guide* for information about default missing value treatment in Oracle Data Mining

Example

In this example, INSERT_MISS_NUM_MEAN computes missing value treatment for cust_year_of_birth and inserts the transformation in a transformation definition table. The STACK_MISS_NUM Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_city

```

INSERT_NORM_LIN_MINMAX Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table. INSERT_NORM_LIN_MINMAX computes the minimum and maximum values from the data and sets the value of *shift* and *scale* as follows:

```
shift = min
scale = max - min
```

Normalization is computed as:

```
x_new = (x_old - shift)/scale
```

INSERT_NORM_LIN_MINMAX rounds the value of *scale* to a specified number of significant digits before storing it in the transformation definition table.

INSERT_NORM_LIN_MINMAX normalizes all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX (
     norm_table_name     IN VARCHAR2,
     data_table_name     IN VARCHAR2,
     exclude_list        IN COLUMN_LIST DEFAULT NULL,
     round_num           IN PLS_INTEGER DEFAULT 6,
     norm_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–29 INSERT_NORM_LIN_MINMAX Procedure Parameters

Parameter	Description

norm_table_name	Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The following columns are required:
	`COL VARCHAR2(30)`
	`SHIFT NUMBER`
	`SCALE NUMBER`
	CREATE_NORM_LIN creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_NORM_LIN_MINMAX.

data_table_name	Name of the table containing the data to be transformed
exclude_list	List of numerical columns to be excluded from normalization. If you do not specify *exclude_list*, all numerical columns are transformed. The format of *exclude_list* is: `dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')`
round_num	The number of significant digits to use for the minimum and maximum. The default number is 6.
norm_schema_name	Schema of *norm_table_name*. If no schema is specified, the current schema is used.

Table 46–29 (Cont.) INSERT_NORM_LIN_MINMAX Procedure Parameters

Parameter	Description
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.

Usage Notes

See *Oracle Data Mining User's Guide* for details about numerical data.

Examples

In this example, INSERT_NORM_LIN_MINMAX normalizes the cust_year_of_birth column and inserts the transformation in a transformation definition table. The STACK_NORM_LIN Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

SELECT "CUST_ID","CUST_GENDER",("CUST_YEAR_OF_BIRTH"-1910)/77 "CUST_YEAR_OF_BIRT
H" FROM mining_data
```

INSERT_NORM_LIN_SCALE Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table. INSERT_NORM_LIN_SCALE computes the minimum and maximum values from the data and sets the value of *shift* and *scale* as follows:

```
shift = 0
scale = max(abs(max), abs(min))
```

Normalization is computed as:

```
x_new = (x_old)/scale
```

INSERT_NORM_LIN_SCALE rounds the value of *scale* to a specified number of significant digits before storing it in the transformation definition table.

INSERT_NORM_LIN_SCALE normalizes all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE (
     norm_table_name     IN VARCHAR2,
     data_table_name     IN VARCHAR2,
     exclude_list        IN COLUMN_LIST DEFAULT NULL,
     round_num           IN PLS_INTEGER DEFAULT 6,
     norm_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–30 INSERT_NORM_LIN_SCALE Procedure Parameters

Parameter	Description

norm_table_name	Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The following columns are required:
	`COL VARCHAR2(30)`
	`SHIFT NUMBER`
	`SCALE NUMBER`
	CREATE_NORM_LIN creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_NORM_LIN_SCALE.

data_table_name	Name of the table containing the data to be transformed
exclude_list	List of numerical columns to be excluded from normalization. If you do not specify *exclude_list*, all numerical columns are transformed. The format of *exclude_list* is: `dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')`
round_num	The number of significant digits to use for *scale*. The default number is 6.
norm_schema_name	Schema of *norm_table_name*. If no schema is specified, the current schema is used.

Table 46–30 (Cont.) INSERT_NORM_LIN_SCALE Procedure Parameters

Parameter	Description
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.

Usage Notes

See *Oracle Data Mining User's Guide* for details about numerical data.

Examples

In this example, INSERT_NORM_LIN_SCALE normalizes the cust_year_of_birth column and inserts the transformation in a transformation definition table. The STACK_NORM_LIN Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
      SELECT cust_id, cust_gender, cust_year_of_birth
      FROM sh.customers;

DESCRIBE mining_data
 Name                              Null?    Type
 --------------------------------- -------- ------------------

```

INSERT_NORM_LIN_ZSCORE Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table. INSERT_NORM_LIN_ZSCORE computes the mean and the standard deviation from the data and sets the value of *shift* and *scale* as follows:

```
shift = mean
scale = stddev
```

Normalization is computed as:

```
x_new = (x_old - shift)/scale
```

INSERT_NORM_LIN_ZSCORE rounds the value of *scale* to a specified number of significant digits before storing it in the transformation definition table.

INSERT_NORM_LIN_ZSCORE normalizes all the NUMBER and FLOAT columns in the data unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE (
     norm_table_name     IN VARCHAR2,
     data_table_name     IN VARCHAR2,
     exclude_list        IN COLUMN_LIST DEFAULT NULL,
     round_num           IN PLS_INTEGER DEFAULT 6,
     norm_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–31 INSERT_NORM_LIN_ZSCORE Procedure Parameters

Parameter	Description

norm_table_name	Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The following columns are required:
	`COL VARCHAR2(30)`
	`SHIFT NUMBER`
	`SCALE NUMBER`
	CREATE_NORM_LIN creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_NORM_LIN_ZSCORE.

data_table_name	Name of the table containing the data to be transformed
exclude_list	List of numerical columns to be excluded from normalization. If you do not specify *exclude_list*, all numerical columns are transformed. The format of *exclude_list* is: `dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')`
round_num	The number of significant digits to use for *scale*. The default number is 6.
norm_schema_name	Schema of *norm_table_name*. If no schema is specified, the current schema is used.

Table 46–31 (Cont.) INSERT_NORM_LIN_ZSCORE Procedure Parameters

Parameter	Description
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.

Usage Notes

See *Oracle Data Mining User's Guide* for details about numerical data.

Examples

In this example, INSERT_NORM_LIN_ZSCORE normalizes the cust_year_of_birth column and inserts the transformation in a transformation definition table. The STACK_NORM_LIN Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```

SET_EXPRESSION Procedure

This procedure appends a row to a VARCHAR2 array that stores a SQL expression. The array can be used for specifying a transformation expression that is too long to be used with the SET_TRANSFORM Procedure.

The GET_EXPRESSION Function returns a row in the array.

When you use SET_EXPRESSION to build a transformation expression, you must build a corresponding reverse transformation expression, create a transformation record, and add the transformation record to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.SET_EXPRESSION (
           expression    IN OUT NOCOPY EXPRESSION_REC,
           chunk                       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–32 SET_EXPRESSION Procedure Parameters

Parameter	Description
expression	An expression record (EXPRESSION_REC) that specifies a transformation expression or a reverse transformation expression for an attribute. Each expression record includes a VARCHAR2 array and index fields for specifying upper and lower boundaries within the array. There are two EXPRESSION_REC fields within a transformation record (TRANSFORM_REC): one for the transformation expression; the other for the reverse transformation expression. See Table 46–1 for a description of the EXPRESSION_REC type.
chunk	A VARCHAR2 chunk (row) to be appended to *expression*.

Notes

1. You can pass NULL in the *chunk* argument to SET_EXPRESSION to clear the previous chunk. The default value of *chunk* is NULL.
2. See "About Transformation Lists" on page 46-7.
3. See "Operational Notes" on page 46-6.

Examples

In this example, two calls to SET_EXPRESSION construct a transformation expression and two calls construct the reverse transformation.

> **Note:** This example is for illustration purposes only. It shows how SET_EXPRESSION appends the text provided in *chunk* to the text that already exists in *expression*. The SET_EXPRESSION procedure is meant for constructing very long transformation expressions that cannot be specified in a VARCHAR2 argument to SET_TRANSFORM.
>
> Similarly while transformation lists are intended for embedding in a model, the transformation list v_xlst is shown in an external view for illustration purposes.

```
CREATE OR REPLACE VIEW mining_data AS
       SELECT cust_id, cust_year_of_birth, cust_postal_code, cust_credit_limit
       FROM sh.customers;

DECLARE
        v_expr dbms_data_mining_transform.EXPRESSION_REC;

```

SET_TRANSFORM Procedure

This procedure appends the transformation instructions for an attribute to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.SET_TRANSFORM (
          xform_list               IN OUT NOCOPY TRANSFORM_LIST,
          attribute_name           VARCHAR2,
          attribute_subname        VARCHAR2,
          expression               VARCHAR2,
          reverse_expression       VARCHAR2,
          attribute_spec           VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–33 SET_TRANSFORM Procedure Parameters

Parameter	Description
`xform_list`	A transformation list. See Table 46–1for a description of the `TRANSFORM_LIST` object type.
`attribute_name`	Name of the attribute to be transformed
`attribute_subname`	Name of the nested attribute if *`attribute_name`* is a nested column, otherwise `NULL`.
`expression`	A SQL expression that specifies the transformation of the attribute.
`reverse_expression`	A SQL expression that reverses the transformation for readability in model details and in the target of a supervised model (if the attribute is a target)
`attribute_spec`	One or more keywords that identify special treatment for the attribute during model build. Values are: ■ `NOPREP` — When ADP is on, prevents automatic transformation of the attribute. If ADP is not on, this value has no effect. ■ `TEXT` — Causes the attribute to be treated as unstructured text data ■ `FORCE_IN` — Forces the inclusion of the attribute in the model build. Applies only to GLM models with feature selection enabled (`ftr_selection_enable` = yes). Feature selection is disabled by default. If the model is not using GLM with feature selection, this value has no effect. See "Specifying Transformation Instructions for an Attribute" in *Oracle Data Mining User's Guide* for more information about `attribute_spec`.

Usage Notes

1. See "Operational Notes" on page 46-6. The following sections are especially relevant:
   - "About Transformation Lists" on page 46-7
   - "Nested Data Transformations" on page 46-10

2. As shown in the following example, you can eliminate an attribute by specifying a null transformation expression and reverse expression. You can also use the STACK interface to remove a column (CREATE_COL_REM Procedure and STACK_COL_REM Procedure).

Examples

This example uses SET_TRANSFORM to append transformations to cust_stack for the data set cust_info and displays one row of the transformed data.

SET_TRANSFORM divides the country_id column by 10, removes the cust_year_of_birth column, and multiplies the nested attribute custprods.mouse pad by 10. (See "DESCRIBE_STACK Procedure" on page 46-32 for the definition of cust_info.)

```
describe cust_info
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 CUST_ID                                   NOT NULL NUMBER
 COUNTRY_ID                                NOT NULL NUMBER
 CUST_YEAR_OF_BIRTH                        NOT NULL NUMBER(4)
 CUSTPRODS                                          SYS.DM_NESTED_NUMERICALS

DECLARE
  cust_stack   dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
     'country_id', NULL, 'country_id/10', 'country_id*10');
  dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
      'cust_year_of_birth', NULL, NULL, NULL);
  dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
      'custprods', 'Mouse Pad', 'value*100', 'value/100');
  dbms_data_mining_transform.XFORM_STACK (cust_stack,
     'cust_info', 'xform_cust_view');
END;
/

select * from xform_cust_view where cust_id = 100004;

CUST_ID  COUNTRY_ID  CUSTPRODS(ATTRIBUTE_NAME, VALUE)

                     ('External 8X CD-ROM', 1),
                     DM_NESTED_NUMERICAL('Keyboard Wrist Rest', 1))
```

STACK_BIN_CAT Procedure

This procedure adds categorical binning transformations to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_CAT (
     bin_table_name     IN            VARCHAR2,
     xform_list         IN OUT NOCOPY TRANSFORM_LIST,
     literal_flag       IN            BOOLEAN  DEFAULT FALSE,
     bin_schema_name    IN            VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–34 STACK_BIN_CAT Procedure Parameters

Parameter	Description
bin_table_name	Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_BIN_CAT. To populate the table, you can use one of the INSERT procedures for categorical binning or you can write your own SQL. See Table 46–4, " Columns in a Transformation Definition Table for Categorical Binning"
xform_list	A transformation list. See Table 46–1 for a description of the TRANSFORM_LIST object type.
literal_flag	Indicates whether the values in the bin column in the transformation definition table are valid SQL literals. When *literal_flag* is FALSE (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set *literal_flag* to TRUE if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See "INSERT_BIN_NUM_EQWIDTH Procedure" on page 46-44 for an example.
bin_schema_name	Schema of *bin_table_name*. If no schema is specified, the current schema is used.

Usage Notes

See "Operational Notes" on page 46-6. The following sections are especially relevant:

- "About Transformation Lists" on page 46-7
- "About Stacking" on page 46-9
- "Nested Data Transformations" on page 46-10

Examples

This example shows how a binning transformation for the categorical column cust_postal_code could be added to a stack called mining_data_stack.

Note: This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.

```
CREATE or REPLACE VIEW mining_data AS
    SELECT cust_id, cust_postal_code, cust_credit_limit
       FROM sh.customers
       WHERE cust_id BETWEEN 100050 AND 100100;
BEGIN
   dbms_data_mining_transform.CREATE_BIN_CAT ('bin_cat_tbl');
   dbms_data_mining_transform.INSERT_BIN_CAT_FREQ (
        bin_table_name   => 'bin_cat_tbl',
        data_table_name  => 'mining_data',
        bin_num          =>  3);
  END;
/
DECLARE
  MINING_DATA_STACK   dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.STACK_BIN_CAT (
    bin_table_name       => 'bin_cat_tbl',
    xform_list           =>  mining_data_stack);
  dbms_data_mining_transform.XFORM_STACK (
    xform_list           =>  mining_data_stack,
    data_table_name      => 'mining_data',
    xform_view_name      => 'mining_data_stack_view');
  END;
/
-- Before transformation
column cust_postal_code format a16
SELECT * from mining_data
              WHERE cust_id BETWEEN 100050 AND 100053
              ORDER BY cust_id;

    100052 69499                       5000
    100053 45704                       7000

-- After transformation
SELECT * FROM mining_data_stack_view
              WHERE cust_id BETWEEN 100050 AND 100053
              ORDER BY cust_id;

  CUST_ID CUST_POSTAL_CODE CUST_CREDIT_LIMIT
---------- ---------------- -----------------
    100050 4                           1500
    100051 1                           9000
    100052 4                           5000
    100053 4                           7000
```

STACK_BIN_NUM Procedure

This procedure adds numerical binning transformations to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_NUM (
     bin_table_name     IN             VARCHAR2,
     xform_list         IN OUT  NOCOPY TRANSFORM_LIST,
     literal_flag       IN             BOOLEAN  DEFAULT FALSE,
     bin_schema_name    IN             VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–35 STACK_BIN_NUM Procedure Parameters

Parameter	Description
bin_table_name	Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_BIN_NUM. To populate the table, you can use one of the INSERT procedures for numerical binning or you can write your own SQL. See Table 46–6, " Columns in a Transformation Definition Table for Numerical Binning".
xform_list	A transformation list. See Table 46–1 for a description of the TRANSFORM_LIST object type.
literal_flag	Indicates whether the values in the bin column in the transformation definition table are valid SQL literals. When *literal_flag* is FALSE (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set *literal_flag* to TRUE if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See "INSERT_BIN_NUM_EQWIDTH Procedure" on page 46-44 for an example.
bin_schema_name	Schema of *bin_table_name*. If no schema is specified, the current schema is used.

Usage Notes

See "Operational Notes" on page 46-6. The following sections are especially relevant:

- "About Transformation Lists" on page 46-7
- "About Stacking" on page 46-9
- "Nested Data Transformations" on page 46-10

Examples

This example shows how a binning transformation for the numerical column cust_credit_limit could be added to a stack called mining_data_stack.

Note: This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_postal_code, cust_credit_limit
      FROM sh.customers
      WHERE cust_id BETWEEN 100050 and 100100;
BEGIN
  dbms_data_mining_transform.create_bin_num ('bin_num_tbl');
  dbms_data_mining_transform.insert_bin_num_qtile (
  bin_table_name    => 'bin_num_tbl',
  data_table_name   => 'mining_data',
  bin_num           => 5,
  exclude_list      =>  dbms_data_mining_transform.COLUMN_LIST('cust_id'));
END;
/
DECLARE
   MINING_DATA_STACK   dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
   dbms_data_mining_transform.STACK_BIN_CAT (
      bin_table_name    => 'bin_num_tbl',
      xform_list        =>  mining_data_stack);
   dbms_data_mining_transform.XFORM_STACK (
      xform_list        =>  mining_data_stack,
      data_table_name   => 'mining_data',
      xform_view_name   => 'mining_data_stack_view');
END;
/

```

STACK_CLIP Procedure

This procedure adds clipping transformations to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_CLIP (
          clip_table_name     IN            VARCHAR2,
          xform_list          IN OUT NOCOPY TRANSFORM_LIST,
          clip_schema_name    IN            VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–36 STACK_CLIP Procedure Parameters

Parameter	Description
clip_table_name	Name of the transformation definition table for clipping.You can use the CREATE_CLIP Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_CLIP. To populate the table, you can use one of the INSERT procedures for clipping or you can write your own SQL. See Table 46–8, " Columns in a Transformation Definition Table for Clipping or Winsorizing"
xform_list	A transformation list. See Table 46–1 for a description of the TRANSFORM_LIST object type.
clip_schema_name	Schema of *clip_table_name*. If no schema is specified, the current schema is used.

Usage Notes

See "Operational Notes" on page 46-6. The following sections are especially relevant:

- "About Transformation Lists" on page 46-7
- "About Stacking" on page 46-9
- "Nested Data Transformations" on page 46-10

Examples

This example shows how a clipping transformation for the numerical column cust_credit_limit could be added to a stack called mining_data_stack.

> **Note:** This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.

```

```

STACK_COL_REM Procedure

This procedure adds column removal transformations to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_COL_REM (
     rem_table_name     IN            VARCHAR2,
     xform_list         IN OUT NOCOPY TRANSFORM_LIST,
     rem_schema_name    IN            VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–37 STACK_COL_REM Procedure Parameters

Parameter	Description
rem_table_name	Name of the transformation definition table for column removal. You can use the CREATE_COL_REM Procedure to create the definition table. See Table 46–10, " Columns in a Transformation Definition Table for Column Removal".
	The table must be populated with column names before you call STACK_COL_REM. The INSERT_BIN_SUPER Procedure and the INSERT_AUTOBIN_NUM_EQWIDTH Procedure can optionally be used to populate the table. You can also use SQL INSERT statements.
xform_list	A transformation list. See Table 46–1 for a description of the TRANSFORM_LIST object type.
rem_schema_name	Schema of *rem_table_name*. If no schema is specified, the current schema is used.

Usage Notes

See "Operational Notes" on page 46-6. The following sections are especially relevant:

- "About Transformation Lists" on page 46-7
- "About Stacking" on page 46-9
- "Nested Data Transformations" on page 46-10

Examples

This example shows how the column cust_credit_limit could be removed in a transformation list called mining_data_stack.

> **Note:** This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.

```
CREATE OR REPLACE VIEW mining_data AS
     SELECT cust_id, country_id, cust_postal_code, cust_credit_limit
        FROM sh.customers;
```

```
BEGIN
    dbms_data_mining_transform.create_col_rem ('rem_tbl');
END;
/

INSERT into rem_tbl VALUES (upper('cust_postal_code'), null);

DECLARE
  MINING_DATA_STACK   dbms_data_mining_transform.TRANSFORM_LIST;

```

STACK_MISS_CAT Procedure

This procedure adds categorical missing value transformations to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_MISS_CAT (
     miss_table_name     IN       VARCHAR2,
     xform_list          IN OUT   NOCOPY TRANSFORM_LIST,
     miss_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–38 STACK_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the transformation definition table for categorical missing value treatment. You can use the CREATE_MISS_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_MISS_CAT. To populate the table, you can use the INSERT_MISS_CAT_MODE Procedure or you can write your own SQL. See Table 46–12, " Columns in a Transformation Definition Table for Categorical Missing Value Treatment".
xform_list	A transformation list. See Table 46–1 for a description of the TRANSFORM_LIST object type.
miss_schema_name	Schema of *miss_table_name*. If no schema is specified, the current schema is used.

Usage Notes

See "Operational Notes" on page 46-6. The following sections are especially relevant:

- "About Transformation Lists" on page 46-7
- "About Stacking" on page 46-9
- "Nested Data Transformations" on page 46-10

Examples

This example shows how the missing values in the column cust_marital_status could be replaced with the mode in a transformation list called mining_data_stack.

> **Note:** This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.

```
CREATE OR REPLACE VIEW mining_data AS
      SELECT cust_id, country_id, cust_marital_status
         FROM sh.customers
         where cust_id BETWEEN 1 AND 10;
```

```
BEGIN
  dbms_data_mining_transform.create_miss_cat ('miss_cat_tbl');
  dbms_data_mining_transform.insert_miss_cat_mode ('miss_cat_tbl', 'mining_data');
END;
/

DECLARE

     10       52790    widow
```

STACK_MISS_NUM Procedure

This procedure adds numeric missing value transformations to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_MISS_NUM (
     miss_table_name     IN       VARCHAR2,
     xform_list          IN OUT   NOCOPY TRANSFORM_LIST,
     miss_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–39 STACK_MISS_NUM Procedure Parameters

Parameter	Description
miss_table_name	Name of the transformation definition table for numerical missing value treatment. You can use the CREATE_MISS_NUM Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_MISS_NUM. To populate the table, you can use the INSERT_MISS_NUM_MEAN Procedure or you can write your own SQL. See Table 46–14, " Columns in a Transformation Definition Table for Numerical Missing Value Treatment".
xform_list	A transformation list. See Table 46–1 for a description of the TRANSFORM_LIST object type.
miss_schema_name	Schema of *miss_table_name*. If no schema is specified, the current schema is used.

Usage Notes

See "Operational Notes" on page 46-6. The following sections are especially relevant:

- "About Transformation Lists" on page 46-7
- "About Stacking" on page 46-9
- "Nested Data Transformations" on page 46-10

Examples

This example shows how the missing values in the column cust_credit_limit could be replaced with the mean in a transformation list called mining_data_stack.

> **Note:** This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.

STACK_NORM_LIN Procedure

This procedure adds linear normalization transformations to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_NORM_LIN (
     norm_table_name     IN       VARCHAR2,
     xform_list          IN OUT   NOCOPY TRANSFORM_LIST,
     norm_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–40 STACK_NORM_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_NORM_LIN.To populate the table, you can use one of the INSERT procedures for normalization or you can write your own SQL. See Table 46–16, " Columns in a Transformation Definition Table for Linear Normalization".
xform_list	A transformation list. See Table 46–1 for a description of the TRANSFORM_LIST object type.
norm_schema_name	Schema of *norm_table_name*. If no schema is specified, the current schema is used.

Usage Notes

See "Operational Notes" on page 46-6. The following sections are especially relevant:

- "About Transformation Lists" on page 46-7
- "About Stacking" on page 46-9
- "Nested Data Transformations" on page 46-10

Examples

This example shows how the column cust_credit_limit could be normalized in a transformation list called mining_data_stack.

> **Note:** This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.

```
CREATE OR REPLACE VIEW mining_data AS
       SELECT cust_id, country_id, cust_postal_code, cust_credit_limit
          FROM sh.customers;
BEGIN
```

```
   dbms_data_mining_transform.create_norm_lin ('norm_lin_tbl');
   dbms_data_mining_transform.insert_norm_lin_minmax (
       norm_table_name   => 'norm_lin_tbl',
       data_table_name   => 'mining_data',
       exclude_list      =>  dbms_data_mining_transform.COLUMN_LIST('cust_id',
                                                            'country_id'));
END;
/

XFORM_BIN_CAT Procedure

This procedure creates a view that implements the categorical binning transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT (
     bin_table_name       IN VARCHAR2,
     data_table_name      IN VARCHAR2,
     xform_view_name      IN VARCHAR2,
     literal_flag         IN BOOLEAN DEFAULT FALSE,
     bin_schema_name      IN VARCHAR2 DEFAULT NULL,
     data_schema_name     IN VARCHAR2 DEFAULT NULL,
     xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–41 XFORM_BIN_CAT Procedure Parameters

Parameter	Description
bin_table_name	Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_BIN_CAT. To populate the table, you can use one of the INSERT procedures for categorical binning or you can write your own SQL. See Table 46–4, " Columns in a Transformation Definition Table for Categorical Binning".
data_table_name	Name of the table containing the data to be transformed.
xform_view_name	Name of the view to be created. The view presents columns in *data_table_name* with the transformations specified in *bin_table_name*.
literal_flag	Indicates whether the values in the bin column in the transformation definition table are valid SQL literals. When *literal_flag* is FALSE (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set *literal_flag* to TRUE if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See "INSERT_BIN_NUM_EQWIDTH Procedure" on page 46-44 for an example.
bin_schema_name	Schema of *bin_table_name*. If no schema is specified, the current schema is used.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.
xform_schema_name	Schema of *xform_view_name*. If no schema is specified, the current schema is used.

Usage Notes

See "Operational Notes" on page 46-6.

Examples

This example creates a view that bins the `cust_postal_code` column. The data source consists of three columns from `sh.customer`.

```
describe mining_data
 Name                                      Null?    Type
 ----------------------------------------- -------- ------------------------
 CUST_ID                                   NOT NULL NUMBER
 CUST_POSTAL_CODE                          NOT NULL VARCHAR2(10)
 CUST_CREDIT_LIMIT                                  NUMBER

SELECT * FROM mining_data WHERE cust_id between 104066 and 104069;

  CUST_ID CUST_POSTAL_CODE    CUST_CREDIT_LIMIT
--------- -------------------- -----------------
   104066 69776                         7000
   104067 52602                         9000

```

XFORM_BIN_NUM Procedure

This procedure creates a view that implements the numerical binning transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM (
     bin_table_name     IN VARCHAR2,
     data_table_name    IN VARCHAR2,
     xform_view_name    IN VARCHAR2,
     literal_flag       IN BOOLEAN DEFAULT FALSE,
     bin_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name   IN VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–42 XFORM_BIN_NUM Procedure Parameters

Parameter	Description
bin_table_name	Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_BIN_NUM. To populate the table, you can use one of the INSERT procedures for numerical binning or you can write your own SQL. See " Columns in a Transformation Definition Table for Numerical Binning" on page 46-21.
data_table_name	Name of the table containing the data to be transformed
xform_view_name	Name of the view to be created. The view presents columns in *data_table_name* with the transformations specified in *bin_table_name*.
literal_flag	Indicates whether the values in the bin column in the transformation definition table are valid SQL literals. When *literal_flag* is FALSE (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set *literal_flag* to TRUE if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See "INSERT_BIN_NUM_EQWIDTH Procedure" on page 46-44 for an example.
bin_schema_name	Schema of *bin_table_name*. If no schema is specified, the current schema is used.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.
xform_schema_name	Schema of *xform_view_name*. If no schema is specified, the current schema is used.

Usage Notes

See "Operational Notes" on page 46-6.

Examples

This example creates a view that bins the `cust_credit_limit` column. The data source consists of three columns from `sh.customer`.

```
describe mining_data
 Name                                      Null?    Type

```

XFORM_CLIP Procedure

This procedure creates a view that implements the clipping transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP (
    clip_table_name       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    xform_view_name       IN VARCHAR2,
    clip_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2,DEFAULT NULL,
    xform_schema_name     IN VARCHAR2,DEFAULT NULL);
```

Parameters

Table 46–43 XFORM_CLIP Procedure Parameters

Parameter	Description
clip_table_name	Name of the transformation definition table for clipping. You can use the CREATE_CLIP Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_CLIP. To populate the table, you can use one of the INSERT procedures for clipping you can write your own SQL. See Table 46–8, " Columns in a Transformation Definition Table for Clipping or Winsorizing".
data_table_name	Name of the table containing the data to be transformed
xform_view_name	Name of the view to be created. The view presents columns in *data_table_name* with the transformations specified in *clip_table_name*.
clip_schema_name	Schema of *clip_table_name*. If no schema is specified, the current schema is used.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.
xform_schema_name	Schema of *xform_view_name*. If no schema is specified, the current schema is used.

Examples

This example creates a view that clips the cust_credit_limit column. The data source consists of three columns from sh.customer.

```
describe mining_data
 Name                           Null?    Type
 ------------------------------ -------- -------------------------
 CUST_ID                        NOT NULL NUMBER

--------------------------------------------------------------------------------
SELECT "CUST_ID","CUST_POSTAL_CODE",CASE WHEN "CUST_CREDIT_LIMIT" < 1500 THEN NU
LL WHEN "CUST_CREDIT_LIMIT" > 11000 THEN NULL ELSE "CUST_CREDIT_LIMIT" END "CUST
_CREDIT_LIMIT" FROM mining_data
```

XFORM_COL_REM Procedure

This procedure creates a view that implements the column removal transformations specified in a definition table. Only the columns that are specified in the definition table are removed; the remaining columns from the data table are present in the view.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_COL_REM (
     rem_table_name     IN       VARCHAR2,
     data_table_name    IN       VARCHAR2,
     xform_view_name    IN       VARCHAR2,
     rem_schema_name    IN       VARCHAR2 DEFAULT NULL,
     data_schema_name   IN       VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–44 XFORM_COL_REM Procedure Parameters

Parameter	Description
rem_table_name	Name of the transformation definition table for column removal. You can use the CREATE_COL_REM Procedure to create the definition table. See Table 46–10, " Columns in a Transformation Definition Table for Column Removal".
	The table must be populated with column names before you call XFORM_COL_REM. The INSERT_BIN_SUPER Procedure and the INSERT_AUTOBIN_NUM_EQWIDTH Procedure can optionally be used to populate the table. You can also use SQL INSERT statements.
data_table_name	Name of the table containing the data to be transformed
xform_view_name	Name of the view to be created. The view presents the columns in *data_table_name* that are not specified in *rem_table_name*.
rem_schema_name	Schema of *rem_table_name*. If no schema is specified, the current schema is used.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.
xform_schema_name	Schema of *xform_view_name*. If no schema is specified, the current schema is used.

Usage Notes

See "Operational Notes" on page 46-6.

Examples

This example creates a view that includes all but one column from the table customers in the current schema.

```
describe customers
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 CUST_ID                                   NOT NULL NUMBER
 CUST_MARITAL_STATUS                                VARCHAR2(20)
 OCCUPATION                                         VARCHAR2(21)
 AGE                                                NUMBER
```

```
 YRS_RESIDENCE                                      NUMBER

BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('colrem_xtbl');
END;
 /
INSERT INTO colrem_xtbl VALUES('CUST_MARITAL_STATUS', null);

BEGIN
   DBMS_DATA_MINING_TRANSFORM.XFORM_COL_REM (
     rem_table_name        => 'colrem_xtbl',
     data_table_name       => 'customers',
     xform_view_name       => 'colrem_view');
END;
/
describe colrem_view

 Name                                      Null?    Type

 CUST_ID                                   NOT NULL NUMBER
 OCCUPATION                                         VARCHAR2(21)
 AGE                                                NUMBER
 YRS_RESIDENCE                                      NUMBER
```

XFORM_EXPR_NUM Procedure

This procedure creates a view that implements the specified numeric transformations. Only the columns that you specify are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_NUM (
     expr_pattern       IN       VARCHAR2,
     data_table_name    IN       VARCHAR2,
     xform_view_name    IN       VARCHAR2,
     exclude_list       IN       COLUMN_LIST DEFAULT NULL,
     include_list       IN       COLUMN_LIST DEFAULT NULL,
     col_pattern        IN       VARCHAR2 DEFAULT ':col',
     data_schema_name   IN       VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–45 XFORM_EXPR_NUM Procedure Parameters

Parameter	Description
expr_pattern	A numeric transformation expression
data_table_name	Name of the table containing the data to be transformed
xform_view_name	Name of the view to be created. The view presents columns in *data_table_name* with the transformations specified in *expr_pattern* and *col_pattern*.
exclude_list	List of numerical columns to exclude. If NULL, no numerical columns are excluded. The format of *exclude_list* is: `dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')`
include_list	List of numeric columns to include. If NULL, all numeric columns are included. The format of *include_list* is: `dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')`
col_pattern	The value within *expr_pattern* that will be replaced with a column name. The value of *col_pattern* is case-sensitive. The default value of *col_pattern* is ':col'
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.
xform_schema_name	Schema of *xform_view_name*. If no schema is specified, the current schema is used.

Usage Notes

1. The XFORM_EXPR_NUM procedure constructs numeric transformation expressions from the specified expression pattern (*expr_pattern*) by replacing every occurrence of the specified column pattern (*col_pattern*) with an actual column name.

XFORM_EXPR_NUM uses the SQL REPLACE function to construct the transformation expressions.

```
REPLACE (expr_pattern,col_pattern,'"column_name"') || '"column_name"'
```

If there is a column match, then the replacement is made in the transformation expression; if there is not a match, then the column is used without transformation.

> **See:** *Oracle Database SQL Language Reference* for information about the REPLACE function

2. Because of the include and exclude list parameters, the XFORM_EXPR_NUM and XFORM_EXPR_STR procedures allow you to easily specify individual columns for transformation within large data sets. The other XFORM_* procedures support an exclude list only. In these procedures, you must enumerate every column that you do not want to transform.
3. See "Operational Notes" on page 46-6

Examples

This example creates a view that transforms the datatype of numeric columns.

```
describe customers
 Name                              Null?    Type
 --------------------------------- -------- ------------------------
 CUST_ID                           NOT NULL NUMBER
 CUST_MARITAL_STATUS                        VARCHAR2(20)
 OCCUPATION                                 VARCHAR2(21)
 AGE                                        NUMBER
 YRS_RESIDENCE                              NUMBER

BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_NUM(
    expr_pattern         => 'to_char(:col)',
    data_table_name      => 'customers',
    xform_view_name      => 'cust_nonum_view',
    exclude_list         => dbms_data_mining_transform.COLUMN_LIST( 'cust_id'),
    include_list         => null,
    col_pattern          => ':col');
END;
/
describe cust_nonum_view
 Name                              Null?    Type
 --------------------------------- -------- ------------------------
 CUST_ID                           NOT NULL NUMBER
 CUST_MARITAL_STATUS                        VARCHAR2(20)
 OCCUPATION                                 VARCHAR2(21)
 AGE                                        VARCHAR2(40)
 YRS_RESIDENCE                              VARCHAR2(40)
```

XFORM_EXPR_STR Procedure

This procedure creates a view that implements the specified categorical transformations. Only the columns that you specify are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_STR (
     expr_pattern       IN       VARCHAR2,
     data_table_name    IN       VARCHAR2,
     xform_view_name    IN       VARCHAR2,
     exclude_list       IN       COLUMN_LIST DEFAULT NULL,
     include_list       IN       COLUMN_LIST DEFAULT NULL,
     col_pattern        IN       VARCHAR2 DEFAULT ':col',
     data_schema_name   IN       VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–46 XFORM_EXPR_STR Procedure Parameters

Parameter	Description
expr_pattern	A character transformation expression
data_table_name	Name of the table containing the data to be transformed
xform_view_name	Name of the view to be created. The view presents columns in *data_table_name* with the transformations specified in *expr_pattern* and *col_pattern*.
exclude_list	List of categorical columns to exclude. If NULL, no categorical columns are excluded. The format of *exclude_list* is: `dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')`
include_list	List of character columns to include. If NULL, all character columns are included. The format of *include_list* is: `dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')`
col_pattern	The value within *expr_pattern* that will be replaced with a column name. The value of *col_pattern* is case-sensitive. The default value of *col_pattern* is ':col'
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.
xform_schema_name	Schema of *xform_view_name*. If no schema is specified, the current schema is used.

Usage Notes

1. The XFORM_EXPR_STR procedure constructs character transformation expressions from the specified expression pattern (*expr_pattern*) by replacing every

occurrence of the specified column pattern (*col_pattern*) with an actual column name.

XFORM_EXPR_STR uses the SQL REPLACE function to construct the transformation expressions.

```
REPLACE (expr_pattern,col_pattern,'"column_name"') || '"column_name"'
```

If there is a column match, then the replacement is made in the transformation expression; if there is not a match, then the column is used without transformation.

> **See:** *Oracle Database SQL Language Reference* for information about the REPLACE function

2. Because of the include and exclude list parameters, the XFORM_EXPR_STR and XFORM_EXPR_NUM procedures allow you to easily specify individual columns for transformation within large data sets. The other XFORM_* procedures support an exclude list only. In these procedures, you must enumerate every column that you do not want to transform.
3. See "Operational Notes" on page 46-6

Examples

This example creates a view that transforms character columns to upper case.

```
describe customers
 Name                                    Null?    Type
 ----------------------------------- -------- ------------------------
 CUST_ID                                 NOT NULL NUMBER
 CUST_MARITAL_STATUS                              VARCHAR2(20)
 OCCUPATION                                       VARCHAR2(21)
 AGE                                              NUMBER

```

XFORM_MISS_CAT Procedure

This procedure creates a view that implements the categorical missing value treatment transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT (
    miss_table_name       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    xform_view_name       IN VARCHAR2,
    miss_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    xform_schema_name     IN VARCHAR2 DEFAULT NULL;
```

Parameters

Table 46–47 XFORM_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the transformation definition table for categorical missing value treatment. You can use the CREATE_MISS_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_MISS_CAT. To populate the table, you can use the INSERT_MISS_CAT_MODE Procedure or you can write your own SQL. See Table 46–12, " Columns in a Transformation Definition Table for Categorical Missing Value Treatment".
data_table_name	Name of the table containing the data to be transformed
xform_view_name	Name of the view to be created. The view presents columns in *data_table_name* with the transformations specified in *miss_table_name*.
miss_schema_name	Schema of *miss_table_name*. If no schema is specified, the current schema is used.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.
xform_schema_name	Schema of *xform_view_name*. If no schema is specified, the current schema is used.

Usage Notes

See "Operational Notes" on page 46-6.

Examples

This example creates a view that replaces missing categorical values with the mode.

```
SELECT * FROM geog;

REG_ID REGION
------ ------------------------------
     1 NE
     2 SW
     3 SE
     4 SW
```

```
     5
     6 NE
     7 NW
     8 NW
     9
    10
    11 SE
    12 SE
    13 NW
    14 SE
    15 SE

SELECT STATS_MODE(region) FROM geog;

STATS_MODE(REGION)
------------------------------
SE

BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT('misscat_xtbl');
  DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE (
    miss_table_name         => 'misscat_xtbl',
    data_table_name         => 'geog' );
END;
/

SELECT col, val FROM misscat_xtbl;

COL        VAL
---------- ----------
REGION     SE

BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT (
     miss_table_name        => 'misscat_xtbl',
     data_table_name        => 'geog',
     xform_view_name        => 'geogxf_view');
END;
/

SELECT * FROM geogxf_view;

REG_ID REGION
------ ------------------------------
     1 NE
     2 SW
     3 SE
     4 SW
     5 SE

    13 NW
    14 SE
    15 SE
```

XFORM_MISS_NUM Procedure

This procedure creates a view that implements the numerical missing value treatment transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM (
    miss_table_name       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    xform_view_name       IN VARCHAR2,
    miss_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    xform_schema_name     IN VARCHAR2 DEFAULT NULL;
```

Parameters

Table 46–48 XFORM_MISS_NUM Procedure Parameters

Parameter	Description
miss_table_name	Name of the transformation definition table for numerical missing value treatment. You can use the CREATE_MISS_NUM Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_MISS_NUM. To populate the table, you can use the INSERT_MISS_NUM_MEAN Procedure or you can write your own SQL. See Table 46–14, " Columns in a Transformation Definition Table for Numerical Missing Value Treatment".
data_table_name	Name of the table containing the data to be transformed
xform_view_name	Name of the view to be created. The view presents columns in *data_table_name* with the transformations specified in *miss_table_name*.
miss_schema_name	Schema of *miss_table_name*. If no schema is specified, the current schema is used.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.
xform_schema_name	Schema of *xform_view_name*. If no schema is specified, the current schema is used.

Usage Notes

See "Operational Notes" on page 46-6.

Examples

This example creates a view that replaces missing numerical values with the mean.

```
SELECT * FROM items;

ITEM_ID       QTY
---------- ------
aa            200
bb            200
cc            250
dd
```

```
ee
ff            100
gg            250
hh            200
ii
jj            200

SELECT AVG(qty) FROM items;

AVG(QTY)
--------
     200

BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('missnum_xtbl');
  DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (
     miss_table_name          => 'missnum_xtbl',
     data_table_name         => 'items' );
END;
/

SELECT col, val FROM missnum_xtbl;

COL           VAL
----------- ------
QTY           200

BEGIN
    DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM (
        miss_table_name        => 'missnum_xtbl',
        data_table_name        => 'items',
        xform_view_name        => 'items_view');
END;
/

SELECT * FROM items_view;

ITEM_ID       QTY
---------- ------
aa            200
bb            200
cc            250
dd            200
ee            200
ff            100
gg            250
hh            200
ii            200
jj            200
```

XFORM_NORM_LIN Procedure

This procedure creates a view that implements the linear normalization transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN (
     norm_table_name      IN VARCHAR2,
     data_table_name      IN VARCHAR2,
     xform_view_name      IN VARCHAR2,
     norm_schema_name     IN VARCHAR2 DEFAULT NULL,
     data_schema_name     IN VARCHAR2 DEFAULT NULL,
     xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–49 XFORM_NORM_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_NORM_LIN. To populate the table, you can use one of the INSERT procedures for normalization or you can write your own SQL. See Table 46–12, " Columns in a Transformation Definition Table for Categorical Missing Value Treatment".
data_table_name	Name of the table containing the data to be transformed
xform_view_name	Name of the view to be created. The view presents columns in *data_table_name* with the transformations specified in *miss_table_name*.
norm_schema_name	Schema of *miss_table_name*. If no schema is specified, the current schema is used.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.
xform_schema_name	Schema of *xform_view_name*. If no schema is specified, the current schema is used.

Usage Notes

See "Operational Notes" on page 46-6.

Examples

This example creates a view that normalizes the cust_year_of_birth and cust_credit_limit columns. The data source consists of three columns from sh.customer.

```
CREATE OR REPLACE VIEW mining_data AS
     SELECT cust_id, cust_year_of_birth, cust_credit_limit
     FROM sh.customers;

describe mining_data
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
```

```
 CUST_ID                                   NOT NULL NUMBER
 CUST_YEAR_OF_BIRTH                        NOT NULL NUMBER(4)
 CUST_CREDIT_LIMIT                                  NUMBER

SELECT * FROM mining_data WHERE cust_id > 104495
  ORDER BY cust_year_of_birth;

 CUST_ID CUST_YEAR_OF_BIRTH CUST_CREDIT_LIMIT
-------- ------------------ -----------------
  104496               1947              3000
  104498               1954             10000
  104500               1962             15000
  104499               1970              3000
  104497               1976              3000

BEGIN
  dbms_data_mining_transform.CREATE_NORM_LIN(
       norm_table_name=> 'normx_tbl');
 dbms_data_mining_transform.INSERT_NORM_LIN_MINMAX(
      norm_table_name => 'normx_tbl',
      data_table_name => 'mining_data',
      exclude_list => dbms_data_mining_transform.COLUMN_LIST( 'cust_id'),
      round_num  => 3);
END;
/

SELECT col, shift, scale FROM normx_tbl;

COL                             SHIFT    SCALE
------------------------------ -------- --------
CUST_YEAR_OF_BIRTH                1910       77
CUST_CREDIT_LIMIT                 1500    13500

BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN (
     norm_table_name => 'normx_tbl',
     data_table_name => 'mining_data',
     xform_view_name => 'norm_view');
END;
/

SELECT * FROM norm_view WHERE cust_id > 104495
  ORDER BY cust_year_of_birth;

 CUST_ID CUST_YEAR_OF_BIRTH CUST_CREDIT_LIMIT
-------- ------------------ -----------------
  104496           .4805195          .1111111
  104498           .5714286          .6296296
  104500           .6753247                 1
  104499           .7792208          .1111111
  104497           .8571429          .1111111

set long 2000
SQL> SELECT text FROM user_views WHERE view_name IN 'NORM_VIEW';

TEXT
--------------------------------------------------------------------------------
SELECT "CUST_ID",("CUST_YEAR_OF_BIRTH"-1910)/77 "CUST_YEAR_OF_BIRTH",("CUST
_CREDIT_LIMIT"-1500)/13500 "CUST_CREDIT_LIMIT" FROM mining_data
```

XFORM_STACK Procedure

This procedure creates a view that implements the transformations specified by the stack. Only the columns and nested attributes that are specified in the stack are transformed. Any remaining columns and nested attributes from the data table appear in the view without changes.

To create a list of objects that describe the transformed columns, use the DESCRIBE_STACK Procedure.

See Also:

"Overview" on page 46-3

Oracle Data Mining User's Guide for more information about data mining attributes

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_STACK (
     xform_list         IN     TRANSFORM_list,
     data_table_name    IN     VARCHAR2,
     xform_view_name    IN     VARCHAR2,
     data_schema_name   IN     VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN     VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–50 XFORM_STACK Procedure Parameters

Parameter	Description
xform_list	The transformation list. See Table 46–1 for a description of the TRANSFORM_LIST object type.
data_table_name	Name of the table containing the data to be transformed
xform_view_name	Name of the view to be created. The view applies the transformations in *xform_list* to *data_table_name*.
data_schema_name	Schema of *data_table_name*. If no schema is specified, the current schema is used.
xform_schema_name	Schema of *xform_view_name*. If no schema is specified, the current schema is used.

Usage Notes

See "Operational Notes" on page 46-6. The following sections are especially relevant:

- "About Transformation Lists" on page 46-7
- "About Stacking" on page 46-9
- "Nested Data Transformations" on page 46-10

Examples

This example applies a transformation list to the view dmuser.cust_info and shows how the data is transformed.The CREATE statement for cust_info is shown in "DESCRIBE_STACK Procedure" on page 46-32.

```
BEGIN
```

```
  dbms_data_mining_transform.CREATE_BIN_NUM ('birth_yr_bins');
  dbms_data_mining_transform.INSERT_BIN_NUM_QTILE (
        bin_table_name   => 'birth_yr_bins',
        data_table_name  =>  'cust_info',
        bin_num          =>   6,
        exclude_list     =>  dbms_data_mining_transform.column_list(
                                 'cust_id','country_id'));
END;
/
SELECT * FROM birth_yr_bins;

COL                  ATT      VAL BIN
-------------------- ----- ------ ----------

DBMS_DATAPUMP

The DBMS_DATAPUMP package is used to move all, or part of, a database between databases, including both data and metadata.

> **See Also:** *Oracle Database Utilities* for more information on the concepts behind the DBMS_DATAPUMP API, how it works, and how it is implemented in the Data Pump Export and Import utilities

This chapter contains the following topics:

Using DBMS_DATAPUMP

This section contains topics that relate to using the `DBMS_DATAPUMP` package.

Overview

The support and functionality provided by `DBMS_DATAPUMP` is as follows:

- The source and target databases can have different hardware, operating systems, character sets, time zones, and versions.
- All object types and datatypes existing in Oracle Database 11*g* and higher are supported.
- Data and metadata can be transferred between databases without using any intermediary files.
- A subset of a database can be moved based upon object type and names of objects.
- Schema names, data file names, tablespace names, and data can be transformed at import time.
- Previously aborted export and import jobs can be restarted without duplicating or omitting any data or metadata from the original job.
- The resources applied to an export or import job can be modified.
- Data in an Oracle proprietary format can be unloaded and loaded.

Security Model

Security for the DBMS_DATAPUMP package is implemented through roles.

Roles

The DATAPUMP_EXP_FULL_DATABASE and DATAPUMP_IMP_FULL_DATABASE roles allow privileged users to take full advantage of the API. The Data Pump API will use these roles to determine whether privileged application roles should be assigned to the processes comprising the job.

DATAPUMP_EXP_FULL_DATABASE

The DATAPUMP_EXP_FULL_DATABASE role affects only Export operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Export objects (for example, TABLESPACE definitions) that unprivileged users cannot reference

Although the SYS schema does not have the DATAPUMP_EXP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the DATAPUMP_EXP_FULL_DATABASE role will also grant access to the SYS schema.

DATAPUMP_IMP_FULL_DATABASE

The DATAPUMP_IMP_FULL_DATABASE role affects only Import and SQL_FILE operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Import objects (for example, DIRECTORY definitions) that unprivileged users cannot create

Although the SYS schema does not have the DATAPUMP_IMP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the DATAPUMP_IMP_FULL_DATABASE role will also grant access to the SYS schema.

Constants

There are several public constants defined for use with the DBMS_DATAPUMP.GET_STATUS procedure. All such constants are defined as part of the DBMS_DATAPUMP package. Any references to these constants must be prefixed by DBMS_DATAPUMP. and followed by the symbols in the following lists:

Mask Bit Definitions

The following mask bit definitions are used for controlling the return of data through the DBMS_DATAPUMP.GET_STATUS procedure.

- KU$_STATUS_WIP CONSTANT BINARY_INTEGER := 1;
- KU$_STATUS_JOB_DESC CONSTANT BINARY_INTEGER := 2;
- KU$_STATUS_JOB_STATUS CONSTANT BINARY_INTEGER := 4;
- KU$_STATUS_JOB_ERROR CONSTANT BINARY_INTEGER := 8;

Dump File Type Definitions

The following definitions are used for identifying types of dump files returned through the DBMS_DATAPUMP.GET_STATUS procedure.

- KU$_DUMPFILE_TYPE_DISK CONSTANT BINARY_INTEGER := 0;
- KU$_DUMPFILE_TYPE_TEMPLATE CONSTANT BINARY_INTEGER := 3;

Data Structures

The DBMS_DATAPUMP package defines OBJECT types. The types described in this section are defined in the SYS schema for use by the GET_STATUS function. *The way in which these types are defined and used may be different than what you are accustomed to. Be sure to read this section carefully.*

The collection of types defined for use with the GET_STATUS procedure are version-specific and include version information in the names of the types. Once introduced, these types will always be provided and supported in future versions of Oracle Database and will not change. However, in future releases of Oracle Database, new versions of these types might be created that provide new or different information. The new versions of these types will have different version information embedded in the type names.

For example, in Oracle Database 12*c*, Release 1 (12.1), there is a sys.ku$_Status1210 type, and in the next Oracle Database release, there could be a sys.ku$_Status1310 type defined. Both types could be used with the GET_STATUS procedure.

Public synonyms have been defined for each of the types used with the GET_STATUS procedure. This makes it easier to use the types and means that you do not have to be concerned with changes to the actual type names or schemas where they reside. Oracle recommends that you use these synonyms whenever possible.

For each of the types, there is a version-specific synonym and a generic synonym. For example, the version-specific synonym ku$_Status1210 is defined for the sys.ku$_Status1210 type.

The generic synonym always describes the latest version of that type. For example, in Oracle Database 12*c*, Release 1 (12.1), the generic synonym ku$_Status is defined as ku$_Status1210. In a future release, there might be a ku$_Status1310 synonym for sys.ku$Status1310. Because the ku$_Status generic synonym always points to the latest definition, it would then point to ku$_Status1310 rather than to ku$_Status1210.

The choice of whether to use version-specific synonyms or generic synonyms makes a significant difference in how you work. Using version-specific names protects your code from changes in future releases of Oracle Database because those types will continue to exist and be supported. However, access to new information will require code changes to use new synonym names for each of the types. Using the generic names implies that you always want the latest definition of the types and are prepared to deal with changes in different releases of Oracle Database.

When the version of Oracle Database that you are using changes, any C code that accesses types through generic synonym names will need to be recompiled.

Note: Languages other than PL/SQL must ensure that their type definitions are properly aligned with the version-specific definitions.

See Also: GET_STATUS Procedure on page 47-30 for additional information about how types are used

Data Structures - Object Types

The DBMS_DATAPUMP package defines the following kinds of OBJECT types:

- Worker Status Types
- Log Entry and Error Types
- Job Status Types
- Job Description Types
- Status Types

Worker Status Types

The worker status types describe what each worker process in a job is doing. The schema, object name, and object type of an object being processed will be provided. For workers processing user data, the partition name for a partitioned table (if any), the number of bytes processed in the partition, and the number of rows processed in the partition are also returned. Workers processing metadata provide status on the last object that was processed. No status for idle threads is returned.

The percent_done refers to the amount completed for the current data item being processed. It is not updated for metadata objects.

The worker status types are defined as follows:

```
CREATE TYPE sys.ku$_WorkerStatus1010 AS OBJECT
       (
               worker_number     NUMBER,       -- Worker process identifier
               process_name      VARCHAR2(30), -- Worker process name
               state             VARCHAR2(30), -- Worker process state
               schema            VARCHAR2(30), -- Schema name
               name              VARCHAR2(4000),-- Object name
               object_type       VARCHAR2(200),-- Object type
               partition         VARCHAR2(30), -- Partition name
               completed_objects NUMBER,       -- Completed number of objects
               total_objects     NUMBER,       -- Total number of objects
               completed_rows    NUMBER,       -- Number of rows completed
               completed_bytes   NUMBER,       -- Number of bytes completed
               percent_done      NUMBER        -- Percent done current object
       )

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus1010
  FOR sys.ku$_WorkerStatus1010;

CREATE TYPE sys.ku$_WorkerStatus1020 AS OBJECT
       (
               worker_number     NUMBER,       -- Worker process identifier
               process_name      VARCHAR2(30), -- Worker process name
               state             VARCHAR2(30), -- Worker process state
               schema            VARCHAR2(30), -- Schema name
               name              VARCHAR2(4000),-- Object name
               object_type       VARCHAR2(200),-- Object type
               partition         VARCHAR2(30), -- Partition name
               completed_objects NUMBER,       -- Completed number of objects
               total_objects     NUMBER,       -- Total number of objects
               completed_rows    NUMBER,       -- Number of rows completed
               completed_bytes   NUMBER,       -- Number of bytes completed
               percent_done      NUMBER,       -- Percent done current object
               degree            NUMBER        -- Degree of parallelism
```

```
        )

                completed_objects NUMBER,       -- Completed number of objects
                total_objects     NUMBER,       -- Total number of objects
                completed_rows    NUMBER,       -- Number of rows completed
                completed_bytes   NUMBER,       -- Number of bytes completed
                percent_done      NUMBER,       -- Percent done current object
                degree            NUMBER,       -- Degree of parallelism
                instance_id       NUMBER        -- Instance ID where running
        )

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus1120
  FOR sys.ku$_WorkerStatus1120;

CREATE TYPE sys.ku$_WorkerStatus1210 AS OBJECT
        (
                worker_number     NUMBER,       -- Worker process identifier
                process_name      VARCHAR2(30), -- Worker process name
                state             VARCHAR2(30), -- Worker process state
                schema            VARCHAR2(30), -- Schema name
                name              VARCHAR2(4000),-- Object name
                object_type       VARCHAR2(200),-- Object type
                partition         VARCHAR2(30), -- Partition name
                completed_objects NUMBER,       -- Completed number of objects
                total_objects     NUMBER,       -- Total number of objects
                completed_rows    NUMBER,       -- Number of rows completed
                completed_bytes   NUMBER,       -- Number of bytes completed
                percent_done      NUMBER,       -- Percent done current object
                degree            NUMBER,       -- Degree of parallelism
                instance_id       NUMBER,       -- Instance ID where running
                instance_name     VARCHAR2(60), -- Instance Name where running
                host_name         VARCHAR2(64)  -- Host name where running
        )

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus1210
  FOR sys.ku$_WorkerStatus1210;

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus FOR ku$_WorkerStatus1210;

CREATE TYPE sys.ku$_WorkerStatusList1010 AS TABLE OF sys.ku$_WorkerStatus1010
CREATE TYPE sys.ku$_WorkerStatusList1020 AS TABLE OF sys.ku$_WorkerStatus1020
CREATE TYPE sys.ku$_WorkerStatusList1120 AS TABLE OF sys.ku$_WorkerStatus1120
CREATE TYPE sys.ku$_WorkerStatusList1210 AS TABLE OF sys.ku$_WorkerStatus1210

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1010
  FOR sys.ku$_WorkerStatusList1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1020
  FOR sys.ku$_WorkerStatusList1020;
```

```
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1120
  FOR sys.ku$_WorkerStatusList1120;
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1210
  FOR sys.ku$_WorkerStatusList1210;

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList
  FOR ku$_WorkerStatusList1210;
```

Log Entry and Error Types

These types provide informational and error text to attached clients and the log stream. The `ku$LogLine.errorNumber` type is set to `NULL` for informational messages but is specified for error messages. Each log entry may contain several lines of text messages.

The log entry and error types are defined as follows:

```
CREATE TYPE sys.ku$_LogLine1010 AS OBJECT (
              logLineNumber   NUMBER,
              errorNumber     NUMBER,
              LogText         VARCHAR2(2000))

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1010 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1020 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine FOR ku$_LogLine1010;
CREATE TYPE sys.ku$_LogEntry1010 AS TABLE OF sys.ku$_LogLine1010

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1010 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1020 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry FOR ku$_LogEntry1010;
```

Job Status Types

The job status type returns status about a job. Usually, the status concerns a running job but it could also be about a stopped job when a client attaches. It is typically requested at attach time, when the client explicitly requests status from interactive mode and every N seconds when the client has requested status periodically.

The job status types are defined as follows (`percent_done` applies to data only):

```
CREATE TYPE sys.ku$_JobStatus1010 IS OBJECT
       (
              job_name        VARCHAR2(30),           -- Name of the job
              operation       VARCHAR2(30),           -- Current operation
              job_mode        VARCHAR2(30),           -- Current mode
              bytes_processed NUMBER,                 -- Bytes so far
              total_bytes     NUMBER,                 -- Total bytes for job
              percent_done    NUMBER,                 -- Percent done
              degree          NUMBER,                 -- Of job parallelism
              error_count     NUMBER,                 -- #errors so far
              state           VARCHAR2(30),           -- Current job state
              phase           NUMBER,                 -- Job phase

Job Description Types

The job description type holds all the environmental information about the job such as parameter settings and dump file set members. There are a couple of subordinate types required as well.

The job description types are defined as follows:

```
CREATE TYPE sys.ku$_JobDesc1010 IS OBJECT
        (
                job_name        VARCHAR2(30),           -- The job name
                guid            RAW(16),                -- The job GUID
                operation       VARCHAR2(30),           -- Current operation
                job_mode        VARCHAR2(30),           -- Current mode
                remote_link     VARCHAR2(4000),         -- DB link, if any
                owner           VARCHAR2(30),           -- Job owner
                instance        VARCHAR2(16),           -- The instance name
                db_version      VARCHAR2(30),           -- Version of objects
                creator_privs   VARCHAR2(30),           -- Privs of job
                start_time      DATE,                   -- This job start time
                max_degree      NUMBER,                 -- Max. parallelism
                log_file        VARCHAR2(4000),         -- Log file name
                sql_file        VARCHAR2(4000),         -- SQL file name
                params          ku$_ParamValues1010     -- Parameter list
        )

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1010 FOR sys.ku$_JobDesc1010;

CREATE TYPE sys.ku$_JobDesc1020 IS OBJECT

Status Types

The status type is an aggregate of some the previous types defined and is the return value for the `GET_STATUS` call. The mask attribute indicates which types of information are being returned to the caller. It is created by a client's shadow process from information it retrieves off the status queue or directly from the master table.

For errors, the `ku$_LogEntry` that is returned has already had its log lines ordered for proper output. That is, the original `ku$_LogEntry` objects have been ordered from outermost context to innermost.

The status types are defined as follows:

```
CREATE TYPE sys.ku$_Status1010 IS OBJECT
        (
                mask            NUMBER,           -- Status types present
```

```
                wip             ku$_LogEntry1010, -- Work in progress
                job_description ku$_JobDesc1010,  -- Complete job description
                job_status      ku$_JobStatus1010,-- Detailed job status
                error           ku$_LogEntry1010  -- Multi-level context errors
        )

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1010 FOR sys.ku$_Status1010;

CREATE TYPE sys.ku$_Status1020 IS OBJECT
        (
                mask            NUMBER,           -- Status types present
                wip             ku$_LogEntry1010, -- Work in progress

Summary of DBMS_DATAPUMP Subprograms

Table 47–1 DBMS_DATAPUMP Package Subprograms

Subprogram	Description
ADD_FILE Procedure on page 47-15	Adds dump files to the dump file set for an Export, Import, or SQL_FILE operation. In addition to dump files, other types of files can also be added by using the `FILETYPE` parameter provided with this procedure.
ATTACH Function on page 47-18	Used to gain access to a Data Pump job that is in the Defining, Executing, Idling, or Stopped state
DATA_FILTER Procedures on page 47-20	Specifies restrictions on the rows that are to be retrieved
DATA_REMAP Procedure on page 47-23	Specifies transformations to be applied to column data as it is exported from, or imported into, a database.
DETACH Procedure on page 47-25	Specifies that the user has no further interest in using the handle
GET_DUMPFILE_INFO Procedure on page 47-26	Retrieves information about a specified dump file
GET_STATUS Procedure on page 47-30	Monitors the status of a job or waits for the completion of a job or for more details on API errors
LOG_ENTRY Procedure on page 47-33	Inserts a message into the log file
METADATA_FILTER Procedure on page 47-34	Provides filters that allow you to restrict the items that are included in a job
METADATA_REMAP Procedure on page 47-37	Specifies a remapping to be applied to objects as they are processed in the specified job
METADATA_TRANSFORM Procedure on page 47-40	Specifies transformations to be applied to objects as they are processed in the specified job
OPEN Function on page 47-45	Declares a new job using the Data Pump API, the handle returned being used as a parameter for calls to all other procedures (but not to the `ATTACH` function)
SET_PARALLEL Procedure on page 47-48	Adjusts the degree of parallelism within a job
SET_PARAMETER Procedures on page 47-50	Specifies job-processing options
START_JOB Procedure on page 47-60	Begins or resumes execution of a job
STOP_JOB Procedure on page 47-62	Terminates a job, but optionally, preserves the state of the job
WAIT_FOR_JOB Procedure on page 47-64	Runs a job until it either completes normally or stops for some other reason

ADD_FILE Procedure

This procedure adds files to the dump file set for an Export, Import, or SQL_FILE operation or specifies the log file or the output file for a SQL_FILE operation.

Syntax

```
DBMS_DATAPUMP.ADD_FILE (
   handle     IN NUMBER,
   filename   IN VARCHAR2,
   directory  IN VARCHAR2,
   filesize   IN VARCHAR2 DEFAULT NULL,
   filetype   IN NUMBER DEFAULT DBMS_DATAPUMP.KU$_FILE_TYPE_DUMP_FILE,
   reusefile  IN NUMBER DEFAULT NULL);
```

Parameters

Table 47–2 ADD_FILE Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.
filename	The name of the file being added. filename must be a simple filename without any directory path information. For dump files, the filename can include a substitution variable, %U, which indicates that multiple files may be generated with the specified filename as a template. The %U is expanded in the resulting file names into a two-character, fixed-width, incrementing integer starting at 01. For example, the dump filename of export%U would cause export01, export02, export03, and so on, to be created depending on how many files are needed to perform the export. For filenames containing the % character, the % must be represented as %% to avoid ambiguity. Any % in a filename must be followed by either a % or a U.
directory	The name of a directory object within the database that is used to locate filename. A directory must be specified. See the Data Pump Export chapter in *Oracle Database Utilities* for information about the DIRECTORY command-line parameter.
filesize	The size of the dump file that is being added. It may be specified as the number of bytes, number of kilobytes (if followed by K), number of megabytes (if followed by M), number of gigabytes (if followed by G) or number of terabytes (if followed by T). An Export operation will write no more than the specified number of bytes to the file. Once the file is full, it will be closed. If there is insufficient space on the device to write the specified number of bytes, the Export operation will fail, but it can be restarted. If not specified, filesize will default to an unlimited size. For Import and SQL_FILE operations, filesize is ignored. The minimum value for filesize is ten times the default Data Pump block size, which is 4 kilobytes. A filesize can only be specified for dump files.
filetype	The type of the file to be added. The legal values are as follows and must be preceded by DBMS_DATAPUMP.: ■ KU$_FILE_TYPE_DUMP_FILE (dump file for a job) ■ KU$_FILE_TYPE_LOG_FILE (log file for a job) ■ KU$_FILE_TYPE_SQL_FILE (output for SQL_FILE job)

Table 47–2 (Cont.) ADD_FILE Procedure Parameters

Parameter	Description
reusefile	If 0, a preexisting file will cause an error. If 1, a preexisting file will be overwritten. If NULL, the default action for the file type will be applied (that is, dump files will not be overwritten). This parameter should only be non-NULL for dump files. The reusefile parameter is restricted to export jobs.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- INVALID_STATE. The job is completing, or the job is past the defining state for an import or SQL_FILE job or is past the defining state for LOG and SQL files.
- INVALID_OPERATION. A dump file was specified for a Network Import or ESTIMATE_ONLY export operation.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Adds files to a Data Pump job. Three types of files may be added to jobs: Dump files to contain the data that is being moved, log files to record the messages associated with an operation, and SQL files to record the output of a SQL_FILE operation. Log and SQL files will overwrite previously existing files. Dump files will never overwrite previously existing files. Instead, an error will be generated.
- Import and SQL_FILE operations require that all dump files be specified during the definition phase of the job. For Export operations, dump files can be added at any time. For example, if the user ascertains that the file space is running low during an Export, additional dump files may be added through this API. If the specified dump file already exists for an Export operation and reusefile is not set to 1, an error will be returned.
- For Export operations, the parallelism setting should be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the job will not be able to maximize parallelism to the degree specified by the SET_PARALLEL procedure.
- For Import operations, the parallelism setting should also be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the performance will not be optimal as multiple threads of execution try to access the same dump file.
- If the substitution variable (%U) is included in a filename, multiple dump files may be specified through a single call to ADD_FILE. For Export operations, the new dump files will be created as they are needed. Enough dump files will be created to allow all of the processes specified by the current SET_PARALLEL value to be active. If one of the dump files fills, it will be closed and a new dump file (with a new generated name) will be created to take its place. If multiple ADD_FILEs with substitution variables have been specified for dump files in a job, they will be used to generate dump files in a round robin fashion. For example, if expa%U, expb%U and expc%U were all specified for a job having a parallelism of 6, the initial dump files created would look like: expa01, expb01, expc01, expa02, expb02, and expc02.

- If presented with dump file specifications, `expa%U`, `expb%U` and `expc%U`, an Import or SQL_FILE operation will begin by attempting to open the dump files, `expa01`, `expb01`, and `expc01`. If the dump file containing the master table is not found in this set, the operation will expand its search for dump files by incrementing the substitution variable and looking up the new filenames (for example, `expa02`, `expb02`, and `expc02`). The DataPump API will keep expanding the search until it locates the dump file containing the master table. If the DataPump API determines that the dump file does not exist or is not part of the current dump set at any iteration, the DataPump API will stop incrementing the substitution variable for the dump file specification that was in error. Once the master table is found, the master table will be used to ascertain when all of dump files in the dump file set have been located.

ATTACH Function

This function gains access to a previously-created job.

Syntax

```
DBMS_DATAPUMP.ATTACH(
   job_name    IN VARCHAR2 DEFAULT NULL,
   job_owner    IN VARCHAR2 DEFAULT NULL)
 RETURN NUMBER;
```

Parameters

Table 47–3 ATTACH Function Parameters

Parameter	Description
job_name	The name of the job. The default is the job name owned by the user who is specified in the job_owner parameter (assuming that user has only one job in the Defining, Executing, or Idling states).
job_owner	The user who originally started the job. If NULL, the value defaults to the owner of the current session. To specify a job owner other than yourself, you must have either the DATAPUMP_EXP_FULL_DATABASE role (for export operations) or the DATAPUMP_IMP_FULL_DATABASE role (for import and SQL_FILE operations). Being a privileged user allows you to monitor another user's job, but you cannot restart another user's job.

Return Values

An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB.

Exceptions

- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- OBJECT_NOT_FOUND. The specified job no longer exists or the user specified a job owned by another schema, but the user did not have the DATAPUMP_EXP_FULL_DATABASE or DATAPUMP_IMP_FULL_DATABASE role.
- SUCCESS_WITH_INFO. The function succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- If the job was in the Stopped state, the job is placed into the Idling state. Once the ATTACH succeeds, you can monitor the progress of the job or control the job. The stream of KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR messages returned through the GET_STATUS procedure will be returned to the newly attached job starting at the approximate time of the client's attachment. There will be no repeating of status and error messages that were processed before the client attached to a job.
- If you want to perform a second attach to a job, you must do so from a different session.

- If the ATTACH fails, use a null handle in a subsequent call to GET_STATUS for more information about the failure.

DATA_FILTER Procedures

This procedure specifies restrictions on the rows that are to be retrieved.

Syntax

```
DBMS_DATAPUMP.DATA_FILTER (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN NUMBER,
   table_name  IN VARCHAR2 DEFAULT NULL,
   schema_name IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.DATA_FILTER(
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN VARCHAR2,
   table_name  IN VARCHAR2 DEFAULT NULL,
   schema_name IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.DATA_FILTER(
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN CLOB,
   table_name  IN VARCHAR2 DEFAULT NULL,
   schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–4 DATA_FILTER Procedure Parameters

Parameter	Description
handle	The handle that is returned from the OPEN function
name	The name of the filter
value	The value of the filter
table_name	The name of the table on which the data filter is applied. If no table name is supplied, the filter applies to all tables in the job.
schema_name	The name of the schema that owns the table on which the filter is applied. If no schema name is specified, the filter applies to all schemas in the job. If you supply a schema name you must also supply a table name.

Exceptions

- INVALID_ARGVAL. There can be several reasons for this message:
  - A bad filter name is specified
  - The mode is TRANSPORTABLE, which does not support data filters
  - The specified table does not exist
  - The filter has already been set for the specified values of schema_name and table_name
- INVALID_STATE. The user called DATA_FILTER when the job was not in the Defining state.

- INCONSISTENT_ARGS. The value parameter is missing or its datatype does not match the filter name. Or a schema name was supplied, but not a table name.
- PRIVILEGE_ERROR. A schema name was supplied, but the user did not have the DATAPUMP_EXP_FULL_DATABASE or DATAPUMP_IMP_FULL_DATABASE role.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Each data filter can only appear once in each table (for example, you cannot supply multiple SUBQUERY filters to a table) or once in each job. If different filters using the same name are applied to both a particular table and to the whole job, the filter parameter supplied for the specific table will take precedence.

  With the exception of the INCLUDE_ROWS filter, data filters are not supported on tables having nested tables or domain indexes defined upon them. Data filters are not supported in jobs performed in Transportable Tablespace mode.

  The available data filters are described in Table 47–5.

Table 47–5 Data Filters

Name	Datatype	Operations that Support Filter	Description
INCLUDE_ROWS	NUMBER	EXPORT, IMPORT	If nonzero, this filter specifies that user data for the specified table should be included in the job. The default is 1.
PARTITION_EXPR PARTITION_LIST	TEXT	EXPORT, IMPORT	For Export jobs, these filters specify which partitions are unloaded from the database. For Import jobs, they specify which table partitions are loaded into the database. Partition names are included in the job if their names satisfy the specified expression (for PARTITION_EXPR) or are included in the list (for PARTITION_LIST). Whereas the expression version of the filter offers more flexibility, the list version provides for full validation of the partition names. Double quotation marks around partition names are required only if the partition names contain special characters. PARTITION_EXPR is not supported on jobs across a network link. Default=All partitions are processed
SAMPLE	NUMBER	EXPORT, IMPORT	For Export jobs, specifies a percentage for sampling the data blocks to be moved. This filter allows subsets of large tables to be extracted for testing purposes.

Table 47–5 (Cont.) Data Filters

Name	Datatype	Operations that Support Filter	Description
SUBQUERY	TEXT	EXPORT, IMPORT	Specifies a subquery that is added to the end of the SELECT statement for the table. If you specify a WHERE clause in the subquery, you can restrict the rows that are selected. Specifying an ORDER BY clause orders the rows dumped in the export which improves performance when migrating from heap-organized tables to index-organized tables.

DATA_REMAP Procedure

This procedure specifies transformations to be applied to column data as it is exported from, or imported into, a database.

Syntax

```
DBMS_DATAPUMP.DATA_REMAP(
   handle          IN NUMBER,
   name            IN VARCHAR2,
   table_name      IN VARCHAR2,
   column          IN VARCHAR2,
   remap_function  IN VARCHAR2),
   schema          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–6 DATA_REMAP Procedure Parameters

Parameter	Description
handle	The handle of the current job. The current session must have previously attached to the handle through a call to an OPEN function.
name	The name of the remap
table_name	The table containing the column to be remapped
column	The name of the column to be remapped
remap_function	The meaning of remap_function is dependent upon the value of name. See Table 47–7 for a list of possible names.
schema	The schema containing the column to be remapped. If NULL, the remapping applies to all schemas moved in the job that contain the specified table.

Exceptions

- INVALID_ARGVAL. The mode is transportable (which does not support data modifications) or it has specified that no data to be included in the job. An invalid remap name was supplied.
- INVALID_OPERATION. Data remaps are only supported for Export and Import operations.
- INVALID_STATE. The DATA_REMAP procedure was called after the job started (that is, it was not in the defining state).
- NO_SUCH_JOB. The job handle is no longer valid.

Usage Notes

- The DATA_REMAP procedure is only supported for Export and Import operations. It allows you to manipulate user data being exported or imported. The name of the remap determines the remap operation to be performed.
- For export operations, you might wish to define a data remap to obscure sensitive data such as credit card numbers from a dump file, but leave the remainder of the data so that it can be read. To accomplish this, the remapping should convert each unique source number into a distinct generated number. So that the mapping is

consistent across the dump file set, the same function should be called for every column that contains the credit card number.

- For import operations, you might wish to define a data remap to reset the primary key when data is being merged into an existing table that contains colliding primary keys. A single remapping function should be provided for all columns defining or referencing the primary key to ensure that remapping is consistent.

> **Note:** If the called function uses package state variables, then to ensure that remapping is performed consistently across all tables, the job should be run with a SET_PARALLEL value of 1 and no restart operations should be performed.

The Data Remap functions are listed in Table 47–7.

Table 47–7 Names of Data Remap Functions

Name	Meaning of `remap_function`	Meaning
`COLUMN_FUNCTION`	String having the format: `[schema.]package.function`	The `name` parameter references a PL/SQL package function which is called to modify the data for the specified column. The function accepts a single parameter, which has the same datatype as the remapped column, and returns a value having the same datatype as the remapped column. Note that the default for the schema is the schema of the user performing the export.

DETACH Procedure

This procedure specifies that the user has no further interest in using the handle.

Syntax

```
DBMS_DATAPUMP.DETACH(
   handle  IN NUMBER);
```

Parameters

Table 47–8 DETACH Procedure Parameters

Parameter	Description
handle	The handle of the job. The current session must have previously attached to the handle through a call to either an OPEN or ATTACH function.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Through this call, you specify that you have no further interest in using the handle. Resources associated with a completed job cannot be reclaimed until all users are detached from the job. An implicit detach from a handle is performed when the user's session is exited or aborted. An implicit detach from a handle is also performed upon the expiration of the timeout associated with a STOP_JOB that was applied to the job referenced by the handle. All previously allocated DBMS_DATAPUMP handles are released when an instance is restarted.

GET_DUMPFILE_INFO Procedure

This procedure retrieves information about a specified dump file.

Syntax

```
DBMS_DATAPUMP.GET_DUMPFILE_INFO(
   filename    IN VARCHAR2,
   directory   IN VARCHAR2,
   info_table  OUT ku$_dumpfile_info,
   filetype    OUT NUMBER);
```

Parameters

Table 47–9 GET_DUMPFILE_INFO Procedure Parameters

Parameter	Description
filename	A simple filename with no directory path information
directory	A directory object that specifies where the file can be found
info_table	A PL/SQL table for storing information about the dump file
filetype	The type of file (Data Pump dump file, original Export dump file, external tables dump file, or unknown)

Exceptions

The GET_DUMPFILE_INFO procedure is a utility routine that operates outside the context of any Data Pump job. Exceptions are handled differently for this procedure than for procedures associated in some way with a Data Pump job. A full exception stack should be available directly, without the need to call the GET_STATUS procedure to retrieve the detailed information. The exception for this procedure is as follows:

- NO_DUMPFILE_INFO. Unable to retrieve dump file information as specified.

Usage Notes

You can use the GET_DUMPFILE_INFO procedure to request information about a specific file. If the file is not recognized as any type of dump file, then a filetype of 0 (zero) is returned and the dump file info_table remains empty.

A filetype value of 1 indicates a Data Pump dump file. A filetype value of 2 indicates an original Export dump file. A filetype value of 3 indicates an external tables dump file. In all cases, the dump file info_table will be populated with information retrieved from the dump file header. Rows of this table consist of item code and value pairs, where the item code indicates the type of information and the value column is a VARCHAR2 containing the actual data (converted to a string in some cases). The table is defined as follows:

```
CREATE TYPE sys.ku$_dumpfile_item IS OBJECT (
               item_code       NUMBER,           -- Identifies header item
               value           VARCHAR2(2048)    -- Text string value)/

GRANT EXECUTE ON sys.ku$_dumpfile_item TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_item FOR sys.ku$_dumpfile_item;

CREATE TYPE sys.ku$_dumpfile_info AS TABLE OF sys.ku$_dumpfile_item/
```

```
GRANT EXECUTE ON sys.ku$_dumpfile_info TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_info FOR sys.ku$_dumpfile_info;
```

The item codes, which can easily be extended to provide more information as needed, are currently defined as shown in Table 47–10 (prepended with the package name, DBMS_DATAPUMP.). Assume the following with regard to these item codes:

- Unless otherwise stated, all item codes may be returned only for Oracle Data Pump and external tables dump files (filetypes 1 and 3).
- Unless otherwise stated, all item codes have been available since Oracle Database 10*g* Release 2 (10.2).

Table 47–10 Item Codes For the DBMS_DATAPUMP.GET_DUMPFILE_INFO Procedure

Item Code	Description
KU$_DFHDR_FILE_VERSION	The internal file version of the dump file.
KU$_DFHDR_MASTER_PRESENT	If the Data Pump master table is present in the dump file, then the value for this item code is 1; otherwise the value is 0. Returned only for filetype 1.
KU$_DFHDR_GUID	A unique identifier assigned to the Data Pump export job or the external tables unload job that produced the dump file. For a multifile dump set, each file in the set has the same value for this item code.
KU$_DFHDR_FILE_NUMBER	A numeric identifier assigned to the dump file.Each dump file in a multifile dump set has its own identifier, unique only within the dump set.
KU$_DFHDR_CHARSET_ID	A numeric code that represents the character set in use at the source system when the dump file was created. Returned for all filetypes.
KU$_DFHDR_CREATION_DATE	The date and time that the dump file was created.
KU$_DFHDR_FLAGS	Internal flag values.
KU$_DFHDR_JOB_NAME	The name assigned to the export job that created the dump file. Returned only for filetype 1.
KU$_DFHDR_PLATFORM	The operating system name of the source system on which the dump file was created.
KU$_DFHDR_INSTANCE	The instance name of the source system on which the dump file was created.
KU$_DFHDR_LANGUAGE	The language name that corresponds to the character set of the source system where the export dump file was created.
KU$_DFHDR_BLOCKSIZE	The blocksize, in bytes, of the dump file.
KU$_DFHDR_DIRPATH	If direct path mode was used when the dump file was created, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 2.
KU$_DFHDR_METADATA_COMPRESSED	If the system metadata is stored in the dump file in compressed format, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 1.
KU$_DFHDR_DB_VERSION	The database job version used to create the dump file. Returned for all filetypes.

Table 47–10 (Cont.) Item Codes For the DBMS_DATAPUMP.GET_DUMPFILE_INFO Procedure

Item Code	Description
KU$_DFHDR_MASTER_PIECE_COUNT	The Data Pump master table may be split into multiple pieces and written to multiple dump files in the set, one piece per file. The value returned for this item code indicates the number of dump files that contain pieces of the master table. The value for this item code is only meaningful if the Data Pump master table is present in the dump file, as indicated by the item code KU$_DFHDR_MASTER_PRESENT. Returned only for filetype 1. Only available since Oracle Database 11*g* Release 1 (11.1).
KU$_DFHDR_MASTER_PIECE_NUMBER	The Data Pump master table may be split into multiple pieces and written to multiple dump files in the set, one piece per file. The value returned for this item code indicates which master table piece is contained in the dump file. The value for this item code is only meaningful if the Data Pump master table is present in the dump file, as indicated by the item code KU$_DFHDR_MASTER_PRESENT. Returned only for filetype 1. Only available since Oracle Database 11*g* Release 1 (11.1).
KU$_DFHDR_DATA_COMPRESSED	If the table data is stored in the dump file in compressed format, then the value for this item code is 1, otherwise the value is 0. Only available since Oracle Database 11*g* Release 1 (11.1).
KU$_DFHDR_METADATA_ENCRYPTED	If the system metadata is stored in the dump file in encrypted format, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 1. Only available since Oracle Database 11*g* Release 1 (11.1).
KU$_DFHDR_DATA_ENCRYPTED	If the table data is stored in the dump file in encrypted format, then the value for this item code is 1, otherwise the value is 0. Only available since Oracle Database 11*g* Release 1 (11.1).

Table 47–10 (Cont.) Item Codes For the DBMS_DATAPUMP.GET_DUMPFILE_INFO Procedure

Item Code	Description
KU$_DFHDR_COLUMNS_ENCRYPTED	If encrypted column data is stored in the dump file in encrypted format, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 1. Only available since Oracle Database 11*g* Release 1 (11.1).
KU$_DFHDR_ENCRYPTION_MODE	The encryption mode indicates whether a user-provided password or the Oracle Encryption Wallet was used to encrypt data written to the dump file. The possible values returned for this item code are: ■ KU$_DFHDR_ENCMODE_NONE No data was written to the dump file in encrypted format. ■ KU$_DFHDR_ENCMODE_PASSWORD Data was written to the dump file in encrypted format using a provided password. ■ KU$_DFHDR_ENCMODE_DUAL Data was written to the dump file in encrypted format using both a provided password as well as an Oracle Encryption Wallet. ■ KU$_DFHDR_ENCMODE_TRANS Data was written to the dump file in encrypted format transparently using an Oracle Encryption Wallet. Only available since Oracle Database 11*g* Release 1 (11.1).
KU$_DFHDR_COMPRESSION_ALG	The compression algorithm used when writing system metadata and/or table data to the dump file in compressed format. The possible values returned for this item code are: ■ KU$_DFHDR_CMPALG_NONE No data was written to the dump file in compressed format. ■ KU$_DFHDR_CMPALG_BASIC Data was written to the dump file in compressed format using an internal algorithm. This is the default algorithm used since Oracle Database 10*g* Release 2 (10.2). ■ KU$_DFHDR_CMPALG_LOW Data was written to the dump file in compressed format using the LOW algorithm. ■ KU$_DFHDR_CMPALG_MEDIUM Data was written to the dump file in compressed format using the MEDIUM algorithm. ■ KU$_DFHDR_CMPALG_HIGH Data was written to the dump file in compressed format using the HIGH algorithm. Only available since Oracle Database 12*c* Release 1 (12.1).

GET_STATUS Procedure

This procedure monitors the status of a job or waits for the completion of a job.

Syntax

```
DBMS_DATAPUMP.GET_STATUS(
   handle    IN NUMBER,
   mask      IN BINARY_INTEGER,
   timeout   IN NUMBER DEFAULT NULL,
   job_state OUT VARCHAR2,
   status    OUT ku$_Status);
```

Parameters

Table 47–11 GET_STATUS Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function. A null handle can be used to retrieve error information after OPEN and ATTACH failures.
mask	A bit mask that indicates which of four types of information to return: ■ KU$_STATUS_WIP ■ KU$_STATUS_JOB_DESC ■ KU$_STATUS_JOB_STATUS ■ KU$_STATUS_JOB_ERROR Each status has a numerical value. You can request multiple types of information by adding together different combinations of values. See Data Structures - Object Types on page 47-7.
timeout	Maximum number of seconds to wait before returning to the user. A value of 0 requests an immediate return. A value of -1 requests an infinite wait. If KU$_STATUS_WIP or KU$_STATUS_JOB_ERROR information is requested and becomes available during the timeout period, then the procedure returns before the timeout period is over.
job_state	Current state of the job. If only the job state is needed, it is much more efficient to use this parameter than to retrieve the full ku$_Status structure.
status	A ku$_Status is returned. The ku$_Status mask indicates what kind of information is included. This could be none if only KU$_STATUS_WIP or KU$_STATUS_JOB_ERROR information is requested and the timeout period expires.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_VALUE. The mask or timeout contains an illegal value.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The GET_STATUS procedure is used to monitor the progress of an ongoing job and to receive error notification. You can request various type of information using the mask parameter. The KU$_STATUS_JOB_DESC and KU$_STATUS_JOB_STATUS values are classified as synchronous information because the information resides in the master table. The KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR values are classified as asynchronous because the messages that embody these types of information can be generated at any time by various layers in the Data Pump architecture.

- If synchronous information *only* is requested, the interface will ignore the timeout parameter and simply return the requested information.
- If asynchronous information is requested, the interface will wait a *maximum* of timeout seconds before returning to the client. If a message of the requested asynchronous information type is received, the call will complete prior to timeout seconds. If synchronous information was also requested, it will be returned whenever the procedure returns.
- If the job_state returned by GET_STATUS does not indicate a terminating job, it is possible that the job could still terminate before the next call to GET_STATUS. This would result in an INVALID_HANDLE exception. Alternatively, the job could terminate during the call to GET_STATUS, which would result in a NO_SUCH_JOB exception. Callers should be prepared to handle these cases.

Error Handling

There are two types of error scenarios that need to be handled using the GET_STATUS procedure:

- Errors resulting from other procedure calls: For example, the SET_PARAMETER procedure may produce an INCONSISTENT_ARGS exception. The client should immediately call GET_STATUS with mask=8 (errors) and timeout=0. The returned ku$_Status.error will contain a ku$_LogEntry that describes the inconsistency in more detail.
- Errors resulting from events asynchronous to the client(s): An example might be Table already exists when trying to create a table. The ku$_Status.error will contain a ku$_LogEntry with all error lines (from all processing layers that added context about the error) properly ordered.

After a job has begun, a client's main processing loop will typically consist of a call to GET_STATUS with an infinite timeout (-1) "listening" for KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR messages. If status was requested, then JOB_STATUS information will also be in the request.

When the ku$_Status is interpreted, the following guidelines should be used:

- ku$_Status.ku$_JobStatus.percent_done refers only to the amount of data that has been processed in a job. Metadata is not considered in the calculation. It is determined using the following formulas:
  - EXPORT or network IMPORT--(bytes_processed/estimated_bytes) * 100
  - IMPORT--(bytes_processed/total_expected_bytes) * 100
  - SQL_FILE or estimate-only EXPORT--0.00 if not done or 100.00 if done

  The effects of the QUERY and PARTITION_EXPR data filters are not considered in computing percent_done.

It is expected that the status returned will be transformed by the caller into more user-friendly status. For example, when percent done is not zero, an estimate of completion time could be produced using the following formula:

```
((SYSDATE - start time) / ku$_Status.ku$_JobStatus.percent_done) * 100
```

- The caller should not use `ku$_Status.ku$_JobStatus.percent_done` for determining whether the job has completed. Instead, the caller should only rely on the state of the job as found in `job_state`.

LOG_ENTRY Procedure

This procedure inserts a message into the log file.

Syntax

```
DBMS_DATAPUMP.LOG_ENTRY(
   handle         IN NUMBER,
   message        IN VARCHAR2
   log_file_only  IN NUMBER DEFAULT 0);
```

Parameters

Table 47–12 LOG_ENTRY Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.
message	A text line to be added to the log file
log_file_only	Specified text should be written only to the log file. It should not be returned in GET_STATUS work-in-progress (KU$_STATUS_WIP) messages.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The message is added to the log file. If log_file_only is zero (the default), the message is also broadcast as a KU$_STATUS_WIP message through the GET_STATUS procedure to all users attached to the job.

The LOG_ENTRY procedure allows applications to tailor the log stream to match the abstractions provided by the application. For example, the command-line interface supports INCLUDE and EXCLUDE parameters defined by the user. Identifying these values as calls to the underlying METADATA_FILTER procedure would be confusing to users. Instead, the command-line interface can enter text into the log describing the settings for the INCLUDE and EXCLUDE parameters.

Lines entered in the log stream from LOG_ENTRY are prefixed by the string, ";;; "

METADATA_FILTER Procedure

This procedure provides filters that allow you to restrict the items that are included in a job.

Syntax

```
DBMS_DATAPUMP.METADATA_FILTER(
   handle       IN NUMBER,
   name         IN VARCHAR2,
   value        IN VARCHAR2,
   object_path  IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.METADATA_FILTER(
   handle       IN NUMBER,
   name         IN VARCHAR2,
   value        IN CLOB,
   object_path  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–13 METADATA_FILTER Procedure Parameters

Parameter	Description
handle	The handle returned from the OPEN function
name	The name of the filter. See Table 47–14 for descriptions of the available filters.
value	The value of the filter
object_path	The object path to which the filter applies. If the default is used, the filter applies to all applicable objects. Lists of the object paths supported for each mode are contained in the catalog views for DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, and TABLE_EXPORT_OBJECTS. (Note that the TABLE_EXPORT_OBJECTS view is applicable to both Table and Tablespace mode because their object paths are the same.) For an import operation, object paths reference the mode used to create the dump file rather than the mode being used for the import.

Table 47–14 describes the name, the object type, and the meaning of the filters available with the METADATA_FILTER procedure. The datatype for all the filters is a text expression. All operations support all filters.

Table 47–14 Filters Provided by METADATA_FILTER Procedure

Name	Object Type	Meaning
NAME_EXPR NAME_LIST	Named objects	Defines which object names are included in the job. You use the object type parameter to limit the filter to a particular object type. For Table mode, identifies which tables are to be processed.

Table 47–14 (Cont.) Filters Provided by METADATA_FILTER Procedure

Name	Object Type	Meaning
SCHEMA_EXPR SCHEMA_LIST	Schema objects	Restricts the job to objects whose owning schema name is satisfied by the expression. For Table mode, only a single SCHEMA_EXPR filter is supported. If specified, it must only specify a single schema (for example, 'IN (''SCOTT'')'). For Schema mode, identifies which users are to be processed.
TABLESPACE_EXPR TABLESPACE_LIST	TABLE, CLUSTER, INDEX, ROLLBACK_SEGMENT	Restricts the job to objects stored in a tablespace whose name is satisfied by the expression. For Tablespace mode, identifies which tablespaces are to be processed. If a partition of an object is stored in the tablespace, the entire object is added to the job. For Transportable mode, identifies which tablespaces are to be processed. If a table has a single partition in the tablespace set, all partitions must be in the tablespace set. An index is not included within the tablespace set unless all of its partitions are in the tablespace set. A domain index is not included in the tablespace set unless all of its secondary objects are included in the tablespace set.
INCLUDE_PATH_EXPR INCLUDE_PATH_LIST EXCLUDE_PATH_EXPR EXCLUDE_PATH_LIST	All	Defines which object paths are included in, or excluded from, the job. You use these filters to select only certain object types from the database or dump file set. Objects of paths satisfying the condition are included (INCLUDE_PATH_*) or excluded (EXCLUDE_PATH_*) from the operation. The object_path parameter is not supported for these filters.
EXCLUDE_TABLES	TABLE_EXPORT	Specifies that no tables are to be exported.
VIEWS_AS_TABLES	TABLE_EXPORT	A comma-separated list of views to be exported as tables: [schema_name.]view_name[:table_name] The filter can be called multiple times with multiple values and all values get added to a list. All views on the list are exported as tables.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This exception can indicate any of the following conditions:
  - An object_path was specified for an INCLUDE_PATH_EXPR or EXCLUDE_PATH_EXPR filter.
  - The specified object_path is not supported for the current mode.
  - The SCHEMA_EXPR filter specified multiple schemas for a Table mode job.
- INVALID_STATE. The user called the METADATA_FILTER procedure after the job left the defining state.
- INCONSISTENT_ARGS. The filter value is of the wrong datatype or is missing.
- SUCCESS_WITH_INFO. The procedure succeeded but further information is available through the GET_STATUS procedure.

- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Metadata filters identify a set of objects to be included or excluded from a Data Pump operation. Except for EXCLUDE_PATH_EXPR and INCLUDE_PATH_EXPR, dependent objects of an identified object will be processed along with the identified object. For example, if an index is identified for inclusion by a filter, grants upon that index will also be included by the filter. Likewise, if a table is excluded by a filter, then indexes, constraints, grants and triggers upon the table will also be excluded by the filter.
- Two versions of each filter are supported: SQL expression and List. The SQL expression version of the filters offer maximum flexibility for identifying objects (for example the use of LIKE to support use of wild cards). The names of the expression filters are as follows:
  - NAME_EXPR
  - SCHEMA_EXPR
  - TABLESPACE_EXPR
  - INCLUDE_PATH_EXPR
  - EXCLUDE_PATH_EXPR

  The list version of the filters allow maximum validation of the filter. An error will be reported if one of the elements in the filter is not found within the source database (for Export and network-based jobs) or is not found within the dump file (for file-based Import and SQLFILE jobs). The names of the list filters are as follows:
  - NAME_LIST
  - SCHEMA_LIST
  - TABLESPACE_LIST
  - INCLUDE_PATH_LIST
  - EXCLUDE_PATH_LIST
- Filters allow a user to restrict the items that are included in a job. For example, a user could request a full export, but without Package Specifications or Package Bodies.
- If multiple filters are specified for a object type, they are implicitly 'ANDed' together (that is, objects participating in the job must pass all of the filters applied to their object types).
- The same filter name can be specified multiple times within a job. For example, specifying NAME_EXPR as '!=''EMP''' and NAME_EXPR as '!=''DEPT''' on a Table mode export would produce a file set containing all of the tables except for EMP and DEPT.

METADATA_REMAP Procedure

This procedure specifies a remapping to be applied to objects as they are processed in the specified job.

Syntax

```
DBMS_DATAPUMP.METADATA_REMAP (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   old_value   IN VARCHAR2,
   value       IN VARCHAR2,
   object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–15 METADATA_REMAP Procedure Parameters

Parameter	Description
handle	The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN function.
name	The name of the remap. See Table 47–16 for descriptions of the available remaps.
old_value	Specifies which value in the dump file set should be reset to value
value	The value of the parameter for the remap. This signifies the new value that old_value should be translated into.
object_type	Designates the object type to which the remap applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the remap applies to all applicable objects within the job. The object_type parameter allows a caller to specify different parameters for different object types within a job. Remaps that explicitly specify an object type override remaps that apply to all object types.

Table 47–16 describes the remaps provided by the METADATA_REMAP procedure.

Table 47–16 Remaps Provided by the METADATA_REMAP Procedure

Name	Datatype	Object Type	Meaning
REMAP_SCHEMA	TEXT	Schema objects	Any schema object in the job that matches the object_type parameter and was located in the old_value schema will be moved to the value schema. Privileged users can perform unrestricted schema remaps. Nonprivileged users can perform schema remaps only if their schema is the target schema of the remap. For example, SCOTT can remap his BLAKE's objects to SCOTT, but SCOTT cannot remap SCOTT's objects to BLAKE.

Table 47–16 (Cont.) Remaps Provided by the METADATA_REMAP Procedure

Name	Datatype	Object Type	Meaning
REMAP_TABLESPACE	TEXT	TABLE, INDEX, ROLLBACK_SEGMENT, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG,TABLE_SPACE	Any storage segment in the job that matches the object_type parameter and was located in the old_value tablespace will be relocated to the value tablespace.
REMAP_DATAFILE	TEXT	LIBRARY, TABLESPACE, DIRECTORY	Any data file reference in the job that matches the object_type parameter and referenced the old_value data file will be redefined to use the value data file.
REMAP_TABLE	TEXT	TABLE	Any reference to a table in the job that matches the old_value table name will be replaced with the value table name. The old_value parameter may refer to a partition such as employees.low. This allows names for tables constructed the by PARTITION_OPTIONS=DEPARTITION parameter to be specified by the user.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This message can indicate any of the following:
  - The job's mode does not include the specified object_type.
  - The remap has already been specified for the specified old_value and object_type.
- INVALID_OPERATION. Remaps are only supported for SQL_FILE and Import operations. The job's operation was Export, which does not support the use of metadata remaps.
- INVALID_STATE. The user called METADATA_REMAP after the job had started (that is, the job was not in the defining state).
- INCONSISTENT_ARGS. There was no value supplied or it was of the wrong datatype for the remap.
- PRIVILEGE_ERROR. A nonprivileged user attempted to do a REMAP_SCHEMA to a different user's schema or a REMAP_DATAFILE.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The METADATA_REMAP procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined remappings to the definition of objects as part of the transfer. If you need remaps that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any remappings that you need.

- Transforms for the DataPump API are a subset of the remaps implemented by the `DBMS_METADATA.SET_TRANSFORM_PARAMETER` API. Multiple remaps can be defined for a single job. However, each remap defined must be unique according its parameters. That is, two remaps cannot specify conflicting or redundant remaps.

METADATA_TRANSFORM Procedure

This procedure specifies transformations to be applied to objects as they are processed in the specified job.

Syntax

```
DBMS_DATAPUMP.METADATA_TRANSFORM (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN VARCHAR2,
   object_type IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.METADATA_TRANSFORM (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN NUMBER,
   object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–17 METADATA_TRANSFORM Procedure Parameters

Parameter	Description
handle	The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN function.
name	The name of the transformation. See Table 47–18 for descriptions of the available transforms.
value	The value of the parameter for the transform
object_type	Designates the object type to which the transform applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the transform applies to all applicable objects within the job. The object_type parameter allows a caller to specify different transform parameters for different object types within a job. Transforms that explicitly specify an object type override transforms that apply to all object types.

Table 47–18 describes the transforms provided by the METADATA_TRANSFORM procedure.

Table 47–18 Transforms Provided by the METADATA_TRANFORM Procedure

Name	Datatype	Object Type	Meaning
DISABLE_ARCHIVE_LOGGING	NUMBER	TABLE INDEX	Specifies whether to disable archive logging for specified object types during import. A value of zero (FALSE) is the default. It specifies that archive logging will take place. This is the default behavior if this transform parameter is not specified. A non-zero (TRUE) value disables archive logging for the specified object types before data is loaded during import. If no object type is specified, then archive logging is disabled for both TABLE and INDEX object types. All other object types processed during data pump import are logged. **Note:** If the database is in FORCE LOGGING mode, then the DISABLE_ARCHIVE_LOGGING transform does not disable logging when indexes and tables are created.
INMEMORY	NUMBER	TABLE TABLESPACE MATERIALIZED VIEWS	The INMEMORY transform is related to the In-Memory Column Store (IM column store), an optional area in the SGA that stores whole tables, table partitions, and individual columns in a compressed columnar format. If a non-zero value (TRUE) is specified on import, then Data Pump generates an IM clause that preserves the IM setting those objects had at export time. This is the default. If a value of zero (FALSE) is specified on import, then Data Pump does not include an IM clause for any objects. **Note**: The INMEMORY transform is available only in Oracle Database 12*c* Release 1 (12.1.0.2) or higher.
INMEMORY_CLAUSE	TEXT	TABLE TABLESPACE MATERIALIZED VIEWS	The INMEMORY_CLAUSE transform is related to the In-Memory Column Store (IM column store), an optional area in the SGA that stores whole tables, table partitions, and individual columns in a compressed columnar format. When you specify this transform, Data Pump uses the contents of the string as the IM clause for all objects being imported that have an IM clause in their DDL. This transform is useful when you want to override the IM clause for an object in the dump file. **Note**: The INMEMORY_CLAUSE transform is available only in Oracle Database 12*c* Release (12.1.0.2) or higher.

Table 47–18 (Cont.) Transforms Provided by the METADATA_TRANFORM Procedure

Name	Datatype	Object Type	Meaning
LOB_STORAGE	TEXT	TABLE	Specifies the storage type to use for LOB segments. The options are as follows: ■ SECUREFILE - LOB storage is returned as SECUREFILE ■ BASICFILE - LOB storage is returned as BASICFILE ■ DEFAULT - The keyword (SECUREFILE or BASICFILE) is omitted in the LOB STORE AS clause. ■ NO_CHANGE - LOB segments are created with the same storage they had in the source database. This is the default. Specifying this transform changes the LOB storage for all tables in the job, including tables that provide storage for materialized views.
OID	NUMBER	TYPE TABLE	If zero, inhibits the assignment of the exported OID during type or table creation. Instead, a new OID will be assigned. Use of this transform on Object Tables will cause breakage in REF columns that point to the table. Defaults to 1.
PCTSPACE	NUMBER	TABLE INDEX TABLESPACE	Specifies a percentage multiplier used to alter extent allocations and data file sizes. Used to shrink large tablespaces for testing purposes. Defaults to 100.
SEGMENT_ ATTRIBUTES	NUMBER	TABLE, INDEX	If nonzero (TRUE), emit storage segment parameters. Defaults to 1.
SEGMENT_ CREATION	NUMBER	TABLE	If nonzero (TRUE), the SQL SEGMENT CREATION clause is added to the CREATE TABLE statement. That is, the CREATE TABLE statement will explicitly say either SEGMENT CREATION DEFERRED or SEGMENT CREATION IMMEDIATE. If the value is FALSE, then the SEGMENT CREATION clause is omitted from the CREATE TABLE statement. Set this parameter to FALSE to use the default segment creation attributes for the table(s) being loaded. Defaults to nonzero (TRUE).
STORAGE	NUMBER	TABLE	If nonzero (TRUE), emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is zero.) Defaults to nonzero (TRUE).

Table 47–18 (Cont.) Transforms Provided by the METADATA_TRANFORM Procedure

Name	Datatype	Object Type	Meaning
TABLE_COMPRESSION_CLAUSE	TEXT	TABLE	Specifies a table compression clause (for example, COMPRESS BASIC) to use when the table is created. Specify NONE to omit the table compression clause. The table will have the default compression for the tablespace. Specifying this transform changes the compression type for all tables in the job, including tables that provide storage for materialized views. See *Oracle Database SQL Language Reference* for more information about table compression options and syntax.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This message can indicate any of the following:
  - The mode is transportable, which doesn't support transforms.
  - The job's mode does not include the specified object_type.
  - The transform has already been specified for the specified value and object_type.
- INVALID_OPERATION. Transforms are only supported for SQL_FILE and Import operations. The job's operation was Export which does not support the use of metadata transforms.
- INVALID_STATE. The user called METADATA_TRANSFORM after the job had started (that is, the job was not in the defining state).
- INCONSISTENT_ARGS. There was no value supplied or it was of the wrong datatype for the transform.
- PRIVILEGE_ERROR. A nonprivileged user attempted to do a REMAP_SCHEMA to a different user's schema or a REMAP_DATAFILE.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The METADATA_TRANSFORM procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined transformations to the definition of objects as part of the transfer. If you need transforms that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any transformations that you need.
- Transforms for the DataPump API are a subset of the transforms implemented by the DBMS_METADATA.SET_TRANSFORM_PARAMETER API. Multiple transforms can be defined for a single job. However, each transform defined must be unique

according its parameters. That is, two transforms cannot specify conflicting or redundant transformations.

OPEN Function

This function is used to declare a new job using the Data Pump API. The handle that is returned is used as a parameter for calls to all other procedures (but not to the ATTACH function).

Syntax

```
DBMS_DATAPUMP.OPEN (
   operation    IN VARCHAR2,
   job_mode         IN VARCHAR2,
   remote_link  IN VARCHAR2 DEFAULT NULL,
   job_name     IN VARCHAR2 DEFAULT NULL,
   version      IN VARCHAR2 DEFAULT 'COMPATIBLE')
 RETURN NUMBER;
```

Parameters

Table 47–19 OPEN Function Parameters

Parameter	Meaning
operation	The type of operation to be performed. Table 47–20 contains descriptions of valid operation types.
job_mode	The scope of the operation to be performed. Table 47–21 contains descriptions of valid modes. Specifying NULL generates an error.
remote_link	If the value of this parameter is non-null, it provides the name of a database link to the remote database that will be the source of data and metadata for the current job.
job_name	The name of the job. The name is limited to 30 characters; it will be truncated if more than 30 characters are used. It may consist of printable characters and spaces. It is implicitly qualified by the schema of the user executing the OPEN function and must be unique to that schema (that is, there cannot be other Data Pump jobs using the same name). The name is used to identify the job both within the API and with other database components such as identifying the job in the DBA_RESUMABLE view if the job becomes suspended through lack of resources. If no name is supplied, a system generated name will be provided for the job in the following format: "SYS_<OPERATION>_<MODE>_%N". The default job name is formed where %N expands to a two-digit incrementing integer starting at '01' (for example, "SYS_IMPORT_FULL_03"). The name supplied for the job will also be used to name the master table and other resources associated with the job.

Table 47–19 (Cont.) OPEN Function Parameters

Parameter	Meaning
version	The version of database objects to be extracted. This option is only valid for Export, network Import, and SQL_FILE operations. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows: ■ COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. ■ LATEST - the version of the metadata corresponds to the database version. ■ A specific database version, for example, '11.0.0'. Specify a value of 12 to allow all existing database features, components, and options to be exported from Oracle Database 11*g* release 2 (11.2.0.3) or later into an Oracle Database 12 *c* Release 1 (12.1) (either a multitenant container database (CDB) or a non-CDB).

Table 47–20 describes the valid operation types for the OPEN function.

Table 47–20 Valid Operation Types for the OPEN Function

Operation	Description
EXPORT	Saves data and metadata to a dump file set or obtains an estimate of the size of the data for an operation.
IMPORT	Restores data and metadata from a dump file set or across a database link.
SQL_FILE	Displays the metadata within a dump file set, or from across a network link, as a SQL script. The location of the SQL script is specified through the ADD_FILE procedure.

Table 47–21 describes the valid modes for the OPEN function.

Table 47–21 Valid Modes for the OPEN Function

Mode	Description
FULL	Operates on the full database or full dump file set except for Oracle Database internal schemas. (Some tables from Oracle Database internal schemas may be registered to be exported and imported in full operations in order to provide consistent metadata during import.) The TRANSPORTABLE parameter can be set to ALWAYS during a full database export in order to move data via transportable tablespaces rather than in the Data Pump dump file.
SCHEMA	Operates on a set of selected schemas. Defaults to the schema of the current user. All objects in the selected schemas are processed. In SCHEMA mode, you cannot specify Oracle-internal schemas (for example, SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDPLUGINS, or LBACSYS).
TABLE	Operates on a set of selected tables. Defaults to all of the tables in the current user's schema. Only tables and their dependent objects are processed.

Table 47–21 (Cont.) Valid Modes for the OPEN Function

Mode	Description
TABLESPACE	Operates on a set of selected tablespaces. No defaulting is performed. Tables that have storage in the specified tablespaces are processed in the same manner as in Table mode.
TRANSPORTABLE	Operates on metadata for tables (and their dependent objects) within a set of selected tablespaces to perform a transportable tablespace export/import.

Return Values

- An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, CREATE_JOB_VIEW, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, LOG_ERROR, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB

Exceptions

- INVALID_ARGVAL. An invalid operation or mode was specified. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- JOB_EXISTS. A table already exists with the specified job name.
- PRIVILEGE_ERROR. The user does not have the necessary privileges or roles to use the specified mode.
- INTERNAL_ERROR. The job was created under the wrong schema or the master table was of the wrong format.
- SUCCESS_WITH_INFO. The function succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- When the job is created, a master table is created for the job under the caller's schema within the caller's default tablespace. A handle referencing the job is returned that attaches the current session to the job. Once attached, the handle remains valid until either an explicit or implicit detach occurs. The handle is only valid in the caller's session. Other handles can be attached to the same job from a different session by using the ATTACH function.
- If the call to the OPEN function fails, call the GET_STATUS procedure with a null handle to retrieve additional information about the failure.

SET_PARALLEL Procedure

This procedure adjusts the degree of parallelism within a job.

Syntax

```
DBMS_DATAPUMP.SET_PARALLEL(
   handle      IN NUMBER,
   degree      IN NUMBER);
```

Parameters

Table 47–22 SET_PARALLEL Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.
degree	The maximum number of worker processes that can be used for the job. You use this parameter to adjust the amount of resources used for a job.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_OPERATION. The SET_PARALLEL procedure is only valid for export and import operations.
- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The SET_PARALLEL procedure is only available in the Enterprise Edition of the Oracle database.
- The SET_PARALLEL procedure can be executed by any session attached to a job. The job must be in one of the following states: Defining, Idling, or Executing.
- The effect of decreasing the degree of parallelism may be delayed because ongoing work needs to find an orderly completion point before SET_PARALLEL can take effect.
- Decreasing the parallelism will not result in fewer worker processes associated with the job. It will only decrease the number of worker processes that will be executing at any given time.
- Increasing the parallelism will take effect immediately if there is work that can be performed in parallel.
- The degree of parallelism requested by a user may be decreased based upon settings in the resource manager or through limitations introduced by the PROCESSES or SESSIONS initialization parameters in the init.ora file.
- To parallelize an Export job to a degree of *n*, the user should supply *n* files in the dump file set or specify a substitution variable in a file specification. Otherwise, some of the worker processes will be idle while waiting for files.

- SQL_FILE operations always operate with a degree of 1. Jobs running in the Transportable mode always operate with a degree of 1.

SET_PARAMETER Procedures

This procedure is used to specify job-processing options.

Syntax

```
DBMS_DATAPUMP.SET_PARAMETER(
   handle       IN NUMBER,
   name         IN VARCHAR2,
   value        IN VARCHAR2);

DBMS_DATAPUMP.SET_PARAMETER (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN NUMBER);
```

Parameters

Table 47–23 SET_PARAMETER Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to the OPEN function.
name	The name of the parameter. Table 47–24 describes the valid parameter names.
value	The value for the specified parameter

Table 47–24 describes the valid options for the name parameter of the SET_PARAMETER procedure.

Table 47–24 Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
CLIENT_COMMAND	TEXT	All	An opaque string used to describe the current operation from the client's perspective. The command-line procedures will use this string to store the original command used to invoke the job.
COMPRESSION	TEXT	Export	Allows you to trade off the size of the dump file set versus the time it takes to perform export and import operations. The DATA_ONLY option compresses only user data in the dump file set. The METADATA_ONLY option compresses only metadata in the dump file set. The ALL option compresses both user data and metadata. The NONE option stores the dump file set in an uncompressed format. The METADATA_ONLY and NONE options require a job version of 10.2 or later. All other options require a job version of 11.1 or later. Default=METADATA_ONLY
COMPRESSION_ ALGORITHM	TEXT	Export	Indicates the compression algorithm is to be used when compressing dump file data. The choices are as follows: ■ BASIC--Offers a good combination of compression ratios and speed; the algorithm used is the same as in previous versions of Oracle Data Pump. ■ LOW---Least impact on backup throughput and suited for environments where CPU resources are the limiting factor. ■ MEDIUM---Recommended for most environments. This option, like the BASIC option, provides a good combination of compression ratios and speed, but it uses a different algorithm than BASIC. ■ HIGH--Best suited for exports over slower networks where the limiting factor is network speed. To use this feature, the COMPATIBLE initialization parameter must be set to at least 12.0.0. This feature requires that the Oracle Advanced Compression option be enabled.
DATA_ACCESS_ METHOD	TEXT	Export and Import	Allows you to specify an alternative method to unload data if the default method does not work for some reason. The choices are AUTOMATIC, DIRECT_PATH, or EXTERNAL_ TABLE. Oracle recommends that you use the default option (AUTOMATIC) whenever possible because it allows Data Pump to automatically select the most efficient method.

Table 47–24 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
DATA_OPTIONS	Number	Export and Import	A bitmask to supply special options for processing the job. The possible values are as follows: ■ KU$_DATAOPT_SKIP_CONST_ERR ■ KU$_DATAOPT_XMLTYPE_CLOB ■ KU$_DATAOPT_DISABL_APPEND_HINT Export supports the value KU$_DATAOPT_XMLTYPE_CLOB. This option stores compressed XMLType columns in the dump file in CLOB format rather than as XML documents. **Note**: XMLType stored as CLOB is deprecated as of Oracle Database 12c Release 1 (12.1). Import supports the value KU$_DATAOPT_SKIP_CONST_ERR. This option specifies that if constraint violations occur while data is being imported into user tables, the rows that cause the violations will be rejected and the load will continue. If this option is not set, a constraint error will abort the loading of the entire partition (or table for unpartitioned tables). Setting this option may affect performance, especially for pre-existing tables with unique indexes or constraints. Import also supports the value KU$_DATAOPT_DISABL_APPEND_HINT. This option prevents the append hint from being applied to the data load. Disabling the APPEND hint can be useful if there is a small set of data objects to load that already exist in the database and some other application may be concurrently accessing one or more of the data objects. Use of this parameter requires that the version on the OPEN function be set to 11.1 or later. Default=0

Table 47–24 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
ENCRYPTION	TEXT	Export	Specifies what to encrypt in the dump file set, as follows: ALL enables encryption for all data and metadata in the export operation. DATA_ONLY specifies that only data is written to the dump file set in encrypted format. ENCRYPTED_COLUMNS_ONLY specifies that only encrypted columns are written to the dump file set in encrypted format. METADATA_ONLY specifies that only metadata is written to the dump file set in encrypted format. NONE specifies that no data is written to the dump file set in encrypted format. This parameter requires a job version of 11.1 or later. The default value depends upon the combination of encryption-related parameters that are used. To enable encryption, either ENCRYPTION or ENCRYPTION_PASSWORD or both, must be specified. If only ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to ALL. If neither ENCRYPTION nor ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to NONE. To specify ALL, DATA_ONLY, or METADATA_ONLY, the COMPATIBLE initialization parameter must be set to at least 11.1. **NOTE**: If the data being exported includes SecureFiles that you want to be encrypted, then you must specify ENCRYPTION=ALL to encrypt the entire dump file set. Encryption of the entire dump file set is the only way to achieve encryption security for SecureFiles during a Data Pump export operation.
ENCRYPTION_ ALGORITHM	TEXT	Export	Identifies which cryptographic algorithm should be used to perform encryption. Possible values are AES128, AES192, and AES256. The ENCRYPTION_ALGORITHM parameter requires that you also specify either ENCRYPTION or ENCRYPTION_PASSWORD; otherwise an error is returned. See *Oracle Database Advanced Security Guide* for information about encryption algorithms. This parameter requires a job version of 11.1 or later. Default=AES128

Table 47–24 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
ENCRYPTION_MODE	TEXT	Export	Identifies the types of security used for encryption and decryption. The values are as follows: PASSWORD requires that you provide a password when creating encrypted dump file sets. You will need to provide the same password when you import the dump file set. PASSWORD mode requires that you also specify the ENCRYPTION_PASSWORD parameter. The PASSWORD mode is best suited for cases in which the dump file set will be imported into a different or remote database, but which must remain secure in transit. TRANSPARENT allows an encrypted dump file set to be created without any intervention from a database administrator (DBA), provided the required Oracle Encryption Wallet is available. Therefore, the ENCRYPTION_PASSWORD parameter is not required, and will in fact, cause an error if it is used in TRANSPARENT mode. This encryption mode is best suited for cases in which the dump file set will be imported into the same database from which it was exported. DUAL creates a dump file set that can later be imported using either the Oracle Encryption Wallet or the password that was specified with the ENCRYPTION_PASSWORD parameter. DUAL mode is best suited for cases in which the dump file set will be imported on-site using the Oracle Encryption Wallet, but which may also need to be imported offsite where the Oracle Encryption Wallet is not available. When you use the ENCRYPTION_MODE parameter, you must also use either the ENCRYPTION or ENCRYPTION_PASSWORD parameter. Otherwise, an error is returned. To use DUAL or TRANSPARENT mode, the COMPATIBLE initialization parameter must be set to at least 11.1. The default mode depends on which other encryption-related parameters are used. If only ENCRYPTION is specified, then the default mode is TRANSPARENT. If ENCRYPTION_PASSWORD is specified and the Oracle Encryption Wallet is open, then the default is DUAL. If ENCRYPTION_PASSWORD is specified and the Oracle Encryption Wallet is closed, then the default is PASSWORD.
ENCRYPTION_PASSWORD	TEXT	Export and Import	For export operations, this parameter is required if ENCRYPTION_MODE is set to either PASSWORD or DUAL. It is also required for transportable export/import operations (job mode=FULL and TRANSPORTABLE=ALWAYS) when the database includes either encrypted tablespaces or tables with encrypted columns.

Table 47–24 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
ESTIMATE	TEXT	Export and Import	Specifies that the estimate method for the size of the tables should be performed before starting the job. If BLOCKS, a size estimate for the user tables is calculated using the count of blocks allocated to the user tables. If STATISTICS, a size estimate for the user tables is calculated using the statistics associated with each table. If no statistics are available for a table, the size of the table is estimated using BLOCKS. The ESTIMATE parameter cannot be used in Transportable Tablespace mode. Default=BLOCKS
ESTIMATE_ONLY	NUMBER	Export	Specifies that only the estimation portion of an export job should be performed. This option is useful for estimating the size of dump files when the size of the export is unknown.
FLASHBACK_SCN	NUMBER	Export and network Import	System change number (SCN) to serve as transactionally consistent point for reading user data. If neither FLASHBACK_SCN nor FLASHBACK_TIME is specified, there will be no transactional consistency between partitions, except for logical standby databases and Streams targets. FLASHBACK_SCN is not supported in Transportable mode.
FLASHBACK_TIME	TEXT	Export and network Import	Either the date and time used to determine a consistent point for reading user data or a string of the form TO_TIMESTAMP(...). If neither FLASHBACK_SCN nor FLASHBACK_TIME is specified, there will be no transactional consistency between partitions. FLASHBACK_SCN and FLASHBACK_TIME cannot both be specified for the same job. FLASHBACK_TIME is not supported in Transportable mode.
INCLUDE_METADATA	NUMBER	Export and Import	If nonzero, metadata for objects will be moved in addition to user table data. If zero, metadata for objects will not moved. This parameter converts an Export operation into an unload of user data and an Import operation into a load of user data. INCLUDE_METADATA is not supported in Transportable mode. Default=1
KEEP_MASTER	NUMBER	Export and Import	Specifies whether the master table should be deleted or retained at the end of a Data Pump job that completes successfully. The master table is automatically retained for jobs that do not complete successfully. Default=0.

Table 47–24 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
LOGTIME	TEXT	Export and Import	Specifies that messages displayed during export and import operations be timestamped. Valid options are as follows: ■ NONE--No timestamps on status or log file messages (this is the default) ■ STATUS--Timestamps on status messages only ■ LOGFILE--Timestamps on log file messages only ■ ALL--Timestamps on both status and log file messages
MASTER_ONLY	NUMBER	Import	Indicates whether to import just the master table and then stop the job so that the contents of the master table can be examined. Default=0.
METRICS	NUMBER	Export and Import	Indicates whether additional information about the job should be reported to the Data Pump log file. Default=0.
PARTITION_ OPTIONS	TEXT	Import	Specifies how partitioned tables should be handled during an import operation. The options are as follows: NONE means that partitioning is reproduced on the target database as it existed in the source database. DEPARTITION means that each partition or subpartition that contains storage in the job is reproduced as a separate unpartitioned table. Intermediate partitions that are subpartitioned are not re-created (although their subpartitions are converted into tables). The names of the resulting tables are system-generated from the original table names and partition names unless the name is overridden by the REMAP_TABLE metadata transform. MERGE means that each partitioned table is re-created in the target database as an unpartitioned table. The data from all of the source partitions is merged into a single storage segment. This option is not supported for transportable jobs or when the TRANSPORTABLE parameter is set to ALWAYS. This parameter requires a job version of 11.1 or later. Default=NONE
REUSE_DATAFILES	NUMBER	Import	Specifies whether the import job should reuse existing data files for tablespace creation. Default=0.
SKIP_UNUSABLE_ INDEXES	NUMBER	Import	If nonzero, rows will be inserted into tables having unusable indexes. SKIP_UNUSABLE_INDEXES is not supported in Transportable mode. Default=1
SOURCE_EDITION	TEXT	Export and network Import	The application edition that will be used for determining the objects that will be unloaded for export and for network import.
STREAMS_ CONFIGURATION	NUMBER	Import	Specifies whether to import any Streams metadata that may be present in the export dump file. Default=1.

Table 47–24 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
TABLE_EXISTS_ACTION	TEXT	Import	Specifies the action to be performed when data is loaded into a preexisting table. The possible actions are: TRUNCATE, REPLACE, APPEND, and SKIP. If INCLUDE_METADATA=0, only TRUNCATE and APPEND are supported. If TRUNCATE, rows are removed from a preexisting table before inserting rows from the Import. Note that if TRUNCATE is specified on tables referenced by foreign key constraints, the TRUNCATE will be modified into a REPLACE. If REPLACE, preexisting tables are replaced with new definitions. Before creating the new table, the old table is dropped. If APPEND, new rows are added to the existing rows in the table. If SKIP, the preexisting table is left unchanged. TABLE_EXISTS_ACTION is not supported in Transportable mode. The default is SKIP if metadata is included in the import. The default is APPEND if INCLUDE_METADATA is set to 0.
TABLESPACE_DATAFILE	TEXT	Import	Specifies the full file specification for a data file in the transportable tablespace set. TABLESPACE_DATAFILE is only valid for transportable mode imports. TABLESPACE_DATAFILE can be specified multiple times, but the value specified for each occurrence must be different.
TARGET_EDITION	TEXT	Import	The application edition that will be used for determining where the objects will be loaded for import and for network import.

Table 47–24 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
TRANSPORTABLE	TEXT	Export (and network import or full-mode import)	This option is for export operations done in table mode, and also for full-mode imports and network imports. It allows the data to be moved using transportable tablespaces. In table-mode storage segments in the moved tablespaces that are not associated with the parent schemas (tables) will be reclaimed at import time. If individual partitions are selected in a table-mode job, only the tablespaces referenced by those partitions will be moved. During import, the moved partitions can only be reconstituted as tables by using the PARTITION_OPTIONS=DEPARTITION parameter. Use of the TRANSPORTABLE parameter prohibits the subsequent import of the dump file into a database at a lower version or using different character sets. Additionally, the data files may need to be converted if the target database is on a different platform. In table-mode, the TRANSPORTABLE parameter is not allowed if a network link is supplied on the OPEN call. The possible values for this parameter are as follows: ALWAYS - data is always moved by moving data files. This option is valid only for table mode and full mode. NEVER - data files are never used for copying user data This parameter requires a job version of 11.1 or later This parameter requires a job version of 12.1 or later when the job mode is FULL. Default=NEVER
TTS_FULL_CHECK	NUMBER	Export	If nonzero, verifies that a transportable tablespace set has no dependencies (specifically, IN pointers) on objects outside the set, and vice versa. Only valid for Transportable mode Exports. Default=0
USER_METADATA	NUMBER	Export and network Import	For schema-mode operations, specifies that the metadata to re-create the users' schemas (for example, privilege grants to the exported schemas) should also be part of the operation if set to nonzero. Users must be privileged to explicitly set this parameter. The USER_METADATA parameter cannot be used in Table, Tablespace, or Transportable Tablespace mode. Default=1 if user has DATAPUMP_EXP_FULL_DATABASE role; 0 otherwise.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This exception could be due to any of the following causes:
  - An invalid name was supplied for an input parameter
  - The wrong datatype was used for value
  - A value was not supplied
  - The supplied value was not allowed for the specified parameter name

  - A flashback parameter had been established after a different flashback parameter had already been established
  - A parameter was specified that did not support duplicate definitions
- INVALID_OPERATION. The operation specified is invalid in this context.
- INVALID_STATE. The specified job is not in the Defining state.
- INCONSISTENT_ARGS. Either the specified parameter is not supported for the current operation type or it is not supported for the current mode.
- PRIVILEGE_ERROR. The user does not have the DATAPUMP_EXP_FULL_DATABASE or DATAPUMP_IMP_FULL_DATABASE role required for the specified parameter.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The SET_PARAMETER procedure is used to specify optional features for the current job. See Table 47–24 for a list of supported options.

START_JOB Procedure

This procedure begins or resumes execution of a job.

Syntax

```
DBMS_DATAPUMP.START_JOB (
   handle       IN NUMBER,
   skip_current    IN  NUMBER DEFAULT 0,
   abort_step      IN  NUMBER DEFAULT 0,
   cluster_ok      IN  NUMBER DEFAULT 1,
   service_name    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–25 START_JOB Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.
skip_current	If nonzero, causes actions that were 'in progress' on a previous execution of the job to be skipped when the job restarts. The skip will only be honored for Import jobs. This mechanism allows the user to skip actions that trigger fatal bugs and cause the premature termination of a job. Multiple actions can be skipped on a restart. The log file will identify which actions are skipped. If a domain index was being processed, all pieces of the domain index are skipped even if the error occurred in only a subcomponent of the domain index. A description of the actions skipped is entered into the log file. skip_current is ignored for the initial START_JOB in a job. If zero, no data or metadata is lost upon a restart.
abort_step	Value must be 0. Inserting values other than 0 into this argument will have unintended consequences.
cluster_ok	If = 0, all workers are started on the current instance. Otherwise, workers are started on instances usable by the job.
service_name	If specified, indicates a service name used to constrain the job to specific instances or to a specific resource group.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_STATE. The causes of this exception can be any of the following:
  - No files have been defined for an Export, non-network Import, or SQL_FILE job
  - An ADD_FILE procedure has not been called to define the output for a SQL_FILE job
  - A TABLESPACE_DATAFILE parameter has not been defined for a Transportable Import job
  - A TABLESPACE_EXPR metadata filter has not been defined for a Transportable or Tablespace mode Export or Network job
  - The dump file set on an Import or SQL_FILE job was either incomplete or missing a master table specification

- INVALID_OPERATION. Unable to restore master table from a dump file set.
- INTERNAL_ERROR. An inconsistency was detected when the job was started. Additional information may be available through the GET_STATUS procedure.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- When this procedure is called to request that the corresponding job be started or restarted, the state of the job is changed from either the Defining or Idling state to the Executing state.
- If the SET_PARALLEL procedure was not called prior to the START_JOB procedure, the initial level of parallelism used in the job will be 1. If SET_PARALLEL was called prior to the job starting, the degree specified by the last SET_PARALLEL call determines the parallelism for the job. On restarts, the parallelism is determined by the previous parallel setting for the job, unless it is overridden by another SET_PARALLEL call.
- To restart a stopped job, an ATTACH function must be performed prior to executing the START_JOB procedure.

STOP_JOB Procedure

This procedure terminates a job, but optionally, preserves the state of the job.

Syntax

```
DBMS_DATAPUMP.STOP_JOB (
   handle      IN NUMBER,
   immediate   IN NUMBER DEFAULT 0,
   keep_master IN NUMBER DEFAULT NULL,
   delay       IN NUMBER DEFAULT 60);
```

Parameters

Table 47–26 STOP_JOB Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function. At the end of the procedure, the user is detached from the handle.
immediate	If nonzero, the worker processes are aborted immediately. This halts the job quickly, but parts of the job will have to be rerun if the job is ever restarted. If zero, the worker processes are allowed to complete their current work item (either metadata or table data) before they are terminated. The job is placed in a Stop Pending state while the workers finish their current work.
keep_master	If nonzero, the master table is retained when the job is stopped. If zero, the master table is dropped when the job is stopped. If the master table is dropped, the job will not be restartable. If the master table is dropped during an export job, the created dump files are deleted.
delay	The number of seconds to wait until other attached sessions are forcibly detached. The delay allows other sessions attached to the job to be notified that a stop has been performed. The job keeps running until either all clients have detached or the delay has been satisfied. If no delay is specified, then the default delay is 60 seconds. If a shorter delay is used, clients might not be able to retrieve the final messages for the job through the GET_STATUS procedure.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID STATE. The job is already in the process of being stopped or completed.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- This procedure is used to request that the corresponding job stop executing.
- The termination of a job that is in an Executing state may take several minutes to complete in an orderly fashion.
- For jobs in the Defining, Idling, or Completing states, this procedure is functionally equivalent to the DETACH procedure.

- Once a job is stopped, it can be restarted using the `ATTACH` function and `START_JOB` procedures, provided the master table and the dump file set are left intact.
- If the `KEEP_MASTER` parameter is not specified, and the job is in the Defining state or has a mode of Transportable, the master table is dropped. Otherwise, the master table is retained.

WAIT_FOR_JOB Procedure

This procedure runs a job until it either completes normally or stops for some other reason.

Syntax

```
DBMS_DATAPUMP.WAIT_FOR_JOB (
  handle      IN   NUMBER,
  job_state   OUT  VARCHAR2);
```

Parameters

Table 47–27 WAIT_FOR_JOB Procedure Parameters

Parameter	Description
handle	The handle of the job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function. At the end of the procedure, the user is detached from the handle.
job_state	The state of the job when it has stopped executing; either STOPPED or COMPLETED.

Exceptions

- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS API.
- INVALID_HANDLE. The job handle is no longer valid.

Usage Notes

This procedure provides the simplest mechanism for waiting for the completion of a Data Pump job. The job should be started before calling WAIT_FOR_JOB. When WAIT_FOR_JOB returns, the job will no longer be executing. If the job completed normally, the final status will be COMPLETED. If the job stopped executing because of a STOP_JOB request or an internal error, the final status will be STOPPED.

48

DBMS_DBFS_CONTENT

The DBMS_DBFS_CONTENT package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide

This chapter contains the following topics:

Using DBMS_DBFS_CONTENT

Overview

The DBMS_DBFS_CONTENT package provides an interface that connects the Oracle database to the DBFS client-side.

In the server, the DBMS_DBFS_CONTENT package is backed by the DBMS_DBFS_CONTENT_SPI package, which includes descriptions but not actual implementations of DBFS stores.

See Also:

- Oracle Database SecureFiles and Large Objects Developer's Guide for a description of DBMS_DBFS_CONTENT and the DBFS architecture
- Oracle Database SecureFiles and Large Objects Developer's Guide for conceptual information about the DBMS_DBFS_CONTENT package

Security Model

The DBMS_DBFS_CONTENT package runs under AUTHID CURRENT_USER.

Constants

The DBMS_DBFS_CONTENT package uses the constants shown in the following tables:

Path Name Constants and Types

The following constants are useful for declaring paths and item names. Paths are limited to 1024 characters and item names are limited to 256 characters.

Table 48–1 DBMS_DBFS_CONTENT Constants - Path Names

Constant	Type	Value	Description
NAME_MAX	PLS_INTEGER	256	Maximum length of an absolute path name visible to clients
NAME_T	VARCHAR2(256)	NAME_MAX	Portable alias for string that can represent component names
PATH_MAX	PLS_INTEGER	1024	Maximum length of any individual component of an absolute path name visible to clients
PATH_T	VARCHAR2(1024)	PATH_MAX	Portable alias for string that can represent path names

ContentID Constants

Stores may expose to the user a unique identifier that represents a particular path item in the store. These identifiers are limited to 128 characters.

Table 48–2 DBMS_DBFS_CONTENT Constants - ContentID

Constant	Type	Value	Description
CONTENT_ID_MAX	PLS_INTEGER	128	Maximum length of a store-specific provider-generated contentID that identifies a file-type content item
CONTENT_ID_T	RAW(128)	CONTENT_ID_MAX	Portable alias for raw buffers that can represent contentID values

Path Properties Constants

Every path name in a store is associated with a set of properties. Each property is identified by a string "name", has a string "value" (which might be NULL if unset or undefined or unsupported by a specific store implementation) and a value "typecode" (a numeric discriminant for the actual type of value held in the "value" string.)

Table 48–3 DBMS_DBFS_CONTENT Constants - Properties

Constant	Type	Value	Description
PROPNAME_MAX	PLS_INTEGER	32	Maximum length of a property name
PROPNAME_T	VARCHAR2(32)	PROPNAME_MAX	Portable alias for string that can represent property names
PROPVAL_MAX	PLS_INTEGER	1024	Maximum length of the string value of a property
PROPVAL_T	VARCHAR2(1024)	PATH_MAX	Portable alias for string that can represent property values

Path Name Type Constants

Path items in a store have a item type associated with them. These types represent the kind of entry the item represents in the store.

Table 48–4 DBMS_DBFS_CONTENT Constants - Path Name Types

Constant	Type	Value	Description
TYPE_FILE	PLS_INTEGER	1	A regular file storing content (a logically linear sequence of bytes accessed as a BLOB
TYPE_DIRECTORY	PLS_INTEGER	2	A container of other path name types, including file types
TYPE_LINK	PLS_INTEGER	3	A symbolic link (that is, an uninterpreted string value associated with a path name). Since symbolic links may represent path names that fall outside the scope of any given store (or even the entire aggregation of stores managed by the DBMS_DBFS_CONTENT interface), or may not even represent path names, clients must be careful in creating symbolic links, and stores must be careful in trying to resolve these links internally.
TYPE_REFERENCE	PLS_INTEGER	4	A hard link which is always a valid path name alias to content

Store Feature Constants

The DBFS content API allows different store providers (and different stores) to describe themselves through a *feature set* (a bitmask indicating which features they support and which ones they do not).

Table 48–5 DBMS_DBFS_CONTENT Constants - Store Features

Constant	Type	Value	Description
FEATURE_FOLDERS	PLS_INTEGER	1	Set if the store supports folders (or directories) as part of hierarchical path names
FEATURE_FOIAT	PLS_INTEGER	2	Set if implicit folder operations within the store (performed as part of a client-requested operation) runs inside autonomous transactions.In general, the use of autonomous transactions is a compromise between (a) simplicity in the implementation and client-controlled transaction scope for all operations, at the cost of greatly reduced concurrency (FEATURE_FOIAT not set), versus (b) more complex implementation and smaller client-controlled transaction scope, at the benefit of greatly increased concurrency (FEATURE_FOIAT set).
FEATURE_NOWAIT	PLS_INTEGER	4	Set if the store allows nowait gets of path elements. The default behavior is to wait for row locks; if nowait gets are implemented, the get operation raises an ORA-54 exception if the path element is already locked by another transaction.
FEATURE_ACLS	PLS_INTEGER	8	Set if the store supports Access Control Lists (ACLs) and internal authorization or checking based on these ACLs. ACLs are standard properties but a store may do nothing more than store and retrieve the ACLs without interpreting them in any way.
FEATURE_LINKS	PLS_INTEGER	16	Set if the store supports symbolic links, and if certain types of symbolic links (specifically non-absolute path names) can be internally resolved by the store itself
FEATURE_LINK_DEREF	PLS_INTEGER	32	Set if the store supports symbolic links, and if certain types of symbolic links (specifically non-absolute path names) can be internally resolved by the store itself
FEATURE_REFERENCES	PLS_INTEGER	64	Set if the store supports hard links

Table 48–5 (Cont.) DBMS_DBFS_CONTENT Constants - Store Features

Constant	Type	Value	Description
FEATURE_LOCKING	PLS_INTEGER	128	Set if the store supports user-level locks (read-only, write-only, read-write) that can be applied on various items of the store, and if the store uses these lock settings to control various types of access to the locked items. User-level locks are orthogonal to transaction locks and persist beyond the scope of any specific transaction, session, or connection — this implies that the store itself may not be able to clean up after dangling locks, and client-applications need to perform any garbage collection.
FEATURE_LOCK_ HIERARCHY	PLS_INTEGER	256	Set if the store allows a user-lock to control access to the entire sub-tree under the locked path name.
FEATURE_LOCK_CONVERT	PLS_INTEGER	512	Set if the store supports upgrade or downgrade of locks from one mode to another
FEATURE_VERSIONING	PLS_INTEGER	1024	Set if the store supports at least a linear versioning and version management. Different versions of the same path name are identified by monotonic version numbers, with a version-nonqualified path name representing the latest version.
FEATURE_VERSION_PATH	PLS_INTEGER	2048	Set if the store supports a hierarchical namespace for different versions of a path name
FEATURE_SOFT_DELETES	PLS_INTEGER	4096	Set if the store supports a "soft-delete", that is, the ability to delete a path name and make it invisible to normal operations, but retain the ability to restore the path name later (as long as it has not been overwritten by a new create operation). The store also supports purging soft-deleted path names (making them truly deleted), and navigation modes that show soft-deleted items.
FEATURE_HASHING	PLS_INTEGER	8192	Set if the store automatically computes and maintains some type of a secure hash of the contents of a path name (typically a TYPE_FILE path).
FEATURE_HASH_LOOKUP	PLS_INTEGER	16384	Set if the store allows "content-based addressing", that is, the ability to locate a content item based, not on its path name, but on its content hash.

Table 48–5 (Cont.) DBMS_DBFS_CONTENT Constants - Store Features

Constant	Type	Value	Description

FEATURE_FILTERING	PLS_INTEGER	32768	Set if the store allows clients to pass a filter function (a PL/SQL function conforming to the signature below) that returns a logical boolean indicating if a given store item satisfies a selection predicate. Stores that support filtering may be able to more efficiently perform item listing, directory navigation, and deletions by embedding the filtering logic inside their implementation. If filtering is not supported, clients can retrieve more items than necessary and perform the filtering checks themselves, albeit less efficiently.
			
			A filter predicate is a function with the following signature:
			
			`function filterFunction(`
			` path IN VARCHAR2,`
			` store_name IN VARCHAR2,`
			` opcode IN INTEGER,`
			` item_type IN INTEGER,`
			` properties IN DBMS_DBFS_`
			`CONTENT_PROPERTIES_T,`
			` content IN BLOB)`
			`  RETURN INTEGER;`
			
			Any PL/SQL function conforming to this signature can examine the contents and properties of a store item, and determine if the item satisfies the selection criterion for the current operation. Any nonzero return value results in the DBMS_DBFS_CONTENT interface processing the item as part of the current operation; a return value that is zero or NULL results in the item being skipped from processing.

FEATURE_SEARCHING	PLS_INTEGER	65536	Set if the store allows clients to pass a text-search filter query to locate type_file path names based on their content. Stores that support searching may use indexes to accelerate such searches; otherwise, clients need to build their own indexes, or else search a potentially larger set of items to locate the ones of interest for the current search.
FEATURE_ASOF	PLS_INTEGER	131072	Set if the store allows clients to use a flashback timestamp in query operations (non-mutating GETPATH Procedures and LIST Function).

Table 48–5 (Cont.) DBMS_DBFS_CONTENT Constants - Store Features

Constant	Type	Value	Description
FEATURE_PROVIDER_PROPS	PLS_INTEGER	262144	Set if the store allows per-operation properties (that control the behavior of the store with regard to the current operation, as opposed to properties associated with individual items).
FEATURE_SNAPSHOTS	PLS_INTEGER	524288	Set if the store allows the use of named, read-only snapshots of its contents. It is up to the provider to implement snapshots using any suitable means (including creating immediate copies of the content, or using copy-on-write) and managing dependencies between snapshots and its parent content view.
FEATURE_CLONES	PLS_INTEGER	1048576	Set if the store allows the use of named, writable clones of its contents. It is up to the provider to implement clones using any suitable means (including creating immediate copies of the content, or using copy-on-write) and managing dependencies between clones and its parent content view.
FEATURE_LOCATOR	PLS_INTEGER	2097152	Set if the store allows direct access to file contents through a LOB locator. Stores that internally manipulate the file contents, perhaps by shredding or reassembling them in separate pieces, performing other transformations, and so on, cannot transparently give out a LOB locator to clients. The file contents of these stores should be accessed using the buffer-based interfaces.
FEATURE_CONTENT_ID	PLS_INTEGER	4194304	Set if the store allows a "pathless", contentID-based access to files (there is no notion of a directory, link, or reference in this model)
FEATURE_LAZY_PATH	PLS_INTEGER	8388608	Set if the store allows a lazy binding of a path name to file content elements that are otherwise identified by a contentID; this feature makes sense only in conjunction with FEATURE_CONTENT_ID

Lock Type Constants

Stores that support locking should implement 3 types of locks: LOCK_READ_ONLY, LOCK_WRITE_ONLY, and LOCK_READ_WRITE.

Table 48–6 DBMS_DBFS_CONTENT Constants - Lock Types

Constant	Type	Value	Description
LOCK_READ_ONLY	PLS_INTEGER	1	Locks as read-only
LOCK_WRITE_ONLY	PLS_INTEGER	2	Locks as write-only
LOCK_READ_WRITE	PLS_INTEGER	3	Locks as read-write

Standard Property Constants

Standard properties are well-defined, mandatory properties associated with all content path names that all stores should support (in the manner described by the content interface), with some exceptions. For example, a read-only store need not implement a `modification_time` or `creation_time`.

All standard properties informally use the `STD` namespace, which clients and stores should avoid using.

Table 48–7 DBMS_DBFS_CONTENT Constants - Standard Properties

Constant	Type	Value	Description
STD_ACCESS_TIME	VARCHAR2(32)	'std:access_time'	TYPECODE_TIMESTAMP in UTC: The time of last access of a path name's contents
STD_ACL	VARCHAR2(32)	'std:acl'	TYPECODE_VARCHAR2: The access control list (in standard ACL syntax) associated with the path name
STD_CANONICAL_PATH	VARCHAR2(32)	'std:canonical_path'	TYPECODE_VARCHAR2: The canonical store-specific path name of an item.
STD_CHANGE_TIME	VARCHAR2(32)	'std:change_time'	TYPECODE_TIMESTAMP in UTC: The time of last change to the metadata of a path name
STD_CHILDREN	VARCHAR2(32)	'std:children'	TYPECODE_NUMBER: The number of child directories/folders a directory/folder path has (this property should be available in providers that support the FEATURE_FOLDERS feature)
STD_CONTENT_TYPE	VARCHAR2 (32)	'std:content_type'	TYPECODE_NUMBER: The client-supplied mime-type(s) (in standard RFC syntax) describing the (typically type_file) path name. The content type is not necessarily interpreted by the store.
STD_CREATION_TIME	VARCHAR2(32)	'std:creation_time'	TYPECODE_TIMESTAMP in UTC: The time at which the item was created (once set, this value never changes for the lifetime of the path name)
STD_DELETED	VARCHAR2(32)	'std:deleted'	TYPECODE_NUMBER as a BOOLEAN: Set to a nonzero number if the path name has been soft-deleted but not yet purged.

Table 48–7 (Cont.) DBMS_DBFS_CONTENT Constants - Standard Properties

Constant	Type	Value	Description
STD_GUID	VARCHAR2(32)	'std:guid'	TYPECODE_NUMBER: A store-specific unique identifier for a path name. Clients must not depend on the GUID being unique across different stores, but a given (*store-name*, *store-specific-path name*) has a stable and unique GUID for its lifetime.
STD_LENGTH	VARCHAR2(32)	'std:length'	TYPECODE_NUMBER: The length of the content (BLOB) of a TYPE_FILE/TYPE_REFERENCE path, or the length of the referent of a TYPE_LINK symbolic link. Directories do not have a well-defined length and stores are free to set this property to zero, NULL, or any other value.
STD_MODIFICATION_TIME	VARCHAR2(32)	'std:modification_time'	TYPECODE_TIMESTAMP in UTC: The time of last change to the data associated with a path name. Change to the content of a TYPE_FILE/TYPE_REFERENCE path, the referent of the TYPE_LINK path, and addition or deletion of immediate children in a TYPE_DIRECTORY path, all constitute data changes.
STD_OWNER	VARCHAR2(32)	'std:owner'	TYPECODE_VARCHAR2: A client-supplied (or implicit) owner name for the path name. The owner name may be used (along with the current "principal") for access checks by stores that support ACLs, locking, or both.
STD_PARENT_GUID	VARCHAR2(32)	'std:parent_guid'	TYPECODE_NUMBER: A store-specific unique identifier for the parent of a path name. Clients must not depend on the GUID being unique across different stores, but a given (*store-name*, *store-specific-path name*) has a stable and unique GUID for its lifetime. STD_PARENT_GUID(path name) == STD_GUID(parent(path name))
STD_REFERENT	VARCHAR2(32)	'std:referent'	TYPECODE_VARCHAR2: The content of the symbolic link of a TYPE_LINK path; NULL otherwise. As mentioned, the STD_REFERENT can be an arbitrary string and must not necessarily be interpreted as path name by clients (or such interpretation should be done with great care).

Optional Property Constants

Optional properties are well-defined properties (not mandatory) associated with all content path names that all stores are free to support (but only in the manner described by the DBFS content API).

All optional properties informally use the `opt:` namespace, which clients and stores should avoid using.

Table 48–8 DBMS_DBFS_CONTENT Constants - Optional Properties

Constant	Type	Value	Description
OPT_HASH_TYPE	VARCHAR2(32)	'opt:hash_type'	TYPECODE_NUMBER: The type of hash provided in the opt_hash_value property; see DBMS_CRYPTO for possible options.
OPT_HASH_VALUE	VARCHAR2(32)	'opt:hash_value'	TYPECODE_NUMBER: The hash value of type OPT_HASH_TYPE describing the content of the path name.
OPT_LOCK_COUNT	VARCHAR2(32)	'opt:lock_count'	TYPECODE_NUMBER: The number of (compatible) locks placed on a path name. If different principals are allowed to place compatible (read) locks on a path, the opt_locker must specify all lockers (with repeats so that lock counts can be correctly maintained).
OPT_LOCK_DATA	VARCHAR2(32)	'opt:lock_data'	TYPECODE_NUMBER: The client-supplied user-data associated with a user-lock, uninterpreted by the store.
OPT_LOCKER	VARCHAR2(32)	'opt:locker'	TYPECODE_NUMBER: One or more implicit or client-specified principals that applied a user-lock on a path name.
OPT_LOCK_STATUS	VARCHAR2(32)	'opt:lock_status'	TYPECODE_NUMBER: One of the LOCK_READ_ONLY, LOCK_WRITE_ONLY, LOCK_READ_WRITE values describing the type of lock currently applied on a path name.
OPT_VERSION	VARCHAR2(32)	'opt:version'	TYPECODE_NUMBER: A sequence number for linear versioning of a path name.
OPT_VERSION_PATH	VARCHAR2(32)	'opt:version_path'	TYPECODE_NUMBER: A version-path name for hierarchical versioning of a path name.
OPT_CONTENT_ID	VARCHAR2(32)	'opt:content_id'	TYPECODE_NUMBER: A provider-generated store-specific unique contentID in the form of a string for a file content element (that may optionally not be associated with a path; see FEATURE_CONTENT_ID and FEATURE_LAZY_PATH).

Property Access Flag Constants

Content interface methods to get or set properties can use combinations of property access flags to fetch properties from different name spaces in a single interface call.

Table 48–9 DBMS_DBFS_CONTENT Constants - Property Access Flags

Constant	Type	Value	Description
PROP_NONE	PLS_INTEGER	0	None: used when the client is not interested in any properties, and is invoking the content access method for other reasons (path name existence or lockability validation, data access, and so on)
PROP_STD	PLS_INTEGER	1	Mandatory: used when the client is interested in the standard properties; all standard properties are retrieved if this flag is specified.
PROP_OPT	PLS_INTEGER	2	Optional: used when the client is interested in the optional properties; all optional properties are retrieved if this flag is specified.
PROP_USR	PLS_INTEGER	3	User-defined: used when the client is interested in the user-defined properties; all user-defined properties are retrieved if this flag is specified.
PROP_ALL	PLS_INTEGER	PROP_STD + PROP_ OPT + PROP_ USR;	All: an alias for the combination of all standard, optional, and user-defined properties
PROP_DATA	PLS_INTEGER	8	Content: used when the client is interested only in data access, and does not care about properties
PROP_SPC	PLS_INTEGER	16	Specific: used when the client is interested in a mix-and-match of different subsets of various property name spaces; the names of the specific properties to fetch are passed into the content interface method call as arguments, and only these property values are fetched and returned to the client. This is useful in cases where there are a very large number of properties potentially accessible, but the client is interested in only a small number of them (and knows the names of these "interesting" properties beforehand). PROP_SPC is applicable only to the various GETPATH operations. Other operations that specify properties ignore PROP_SPC specifications.

Operation Code Constants

All of the operations in the DBFS content API are represented as abstract opcodes.

Clients can use these opcodes to directly and explicitly by invoking the CHECKACCESS Function to verify if a particular operation can be invoked by a given principal on a particular path name.

Table 48–10 DBMS_DBFS_CONTENT Constants - Operation Codes

Constant	Type	Value	Description
OP_CREATE	PLS_INTEGER	1	Create a path item
OP_CREATEFILE	PLS_INTEGER	OP_CREATE	Create a file
OP_CREATELINK	PLS_INTEGER	OP_CREATE	Create a soft link
OP_CREATEREFERENCE	PLS_INTEGER	OP_CREATE	Create a reference (hard link)
OP_DELETE	PLS_INTEGER	2	Soft-deletion, purge, and restore operations are all represented by OP_DELETE
OP_DELETEFILE	PLS_INTEGER	OP_DELETE	Delete a file
OP_DELETEDIRECTORY	PLS_INTEGER	OP_DELETE	Delete a directory
OP_RESTORE	PLS_INTEGER	OP_DELETE	Restore a soft-deleted path item
OP_PURGE	PLS_INTEGER	OP_DELETE	Purge a soft-deleted path item
OP_READ	PLS_INTEGER	3	Read from a path item
OP_GET	PLS_INTEGER	OP_READ	Get a path item for either read or update operations
OP_WRITE	PLS_INTEGER	4	Write a path item
OP_PUT	PLS_INTEGER	OP_WRITE	Put (write) to a path item
OP_RENAME	PLS_INTEGER	5	Rename a path item
OP_RENAMEFROM	PLS_INTEGER	OP_RENAME	Operations performed on the source of a rename
OP_RENAMETO	PLS_INTEGER	OP_RENAME	Operations performed on the destination of a rename
OP_SETPATH	PLS_INTEGER	OP_RENAME	Set a path item name
OP_LIST	PLS_INTEGER	6	Perform a path listing
OP_SEARCH	PLS_INTEGER	7	Perform a search
OP_LOCK	PLS_INTEGER	8	Lock a path item
OP_UNLOCK	PLS_INTEGER	9	Unlock a path item
OP_ACL	PLS_INTEGER	10	An implicit operation invoked during an OP_CREATE or OP_PUT that specifies a STD_ACL property; the operation tests to see if the principal is allowed to set or change the ACL of a store item

Table 48–10 (Cont.) DBMS_DBFS_CONTENT Constants - Operation Codes

Constant	Type	Value	Description
OP_STORE	PLS_INTEGER	11	A catch-all category for miscellaneous store operations that do not fall under any of the other operational interfaces

Exceptions

DBFS content API operations can raise any one of these top-level exceptions.

Table 48–11 DBMS_DBFS_CONTENT Exceptions

Exception	Code	Description
PATH_EXISTS	64000	A specified path name already exists
INVALID_PARENT	64001	Parent of a specified path name does not exist
INVALID_PATH	64002	Specified path name does not exist, or is not valid
UNSUPPORTED_OPERATION	64003	An operation unsupported by a store was invoked
INVALID_ARGUMENTS	64004	An operation was invoked with invalid arguments
INVALID_ACCESS	64005	Access control checks failed for the current operation
LOCK_CONFLICT	64006	Current operation failed lock conflict check
INVALID_STORE	64007	An invalid store name was specified
INVALID_MOUNT	64008	An invalid mount point was specified
INVALID_PROVIDER	64009	An invalid provider-package was specified
READONLY_PATH	64010	A mutating operation was invoked on a read-only mount or store

Operational Notes

Implementation

Since the interconnection of the DBMS_DBFS_CONTENT interface and the provider SPI is a 1-to-many pluggable architecture, the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

There are no explicit `INIT` or `FINI` methods to indicate when the `DBMS_DBFS_CONTENT` interface plugs or unplugs a particular provider SPI. Provider SPIs must be willing to auto-initialize themselves at any SPI entry-point.

All operations performed by a store provider are "stateless" in that they are complete operations unto themselves. If state is necessary to be maintained for some reason, then the state must be maintained in data structures such as auxiliary tables that can be queried as needed.

Path Names

All path names used in the provider SPI are store-qualified in pair form (`store_name`, `pathname`) where the path name is rooted within the store namespace.

Stores and their providers that support contentID-based access (see `FEATURE_CONTENT_ID` in DBMS_DBFS_CONTENT Constants - Store Features) also support a form of addressing that is not based on path names. Content items are identified by an explicit store name, a `NULL` path name, and possibly a contentID specified as a parameter or by way of the `OPT_CONTENT_ID` (see DBMS_DBFS_CONTENT Constants - Optional Properties) property.

Not all operations are supported with contentID-based access, and applications should depend only on the simplest create or delete functionality being available.

This table lists other operations and provides links to related discussions.

Other DBMS_DBFS_CONTENT Operations

Table 48–12 Other DBMS_DBFS_CONTENT Operations

Other Operations	See ...
Creation	*Oracle Database SecureFiles and Large Objects Developer's Guide* for further information on creation operations
Deletion	*Oracle Database SecureFiles and Large Objects Developer's Guide* for further information on deletion operations

Other Operations	See ...
Access Check	*Oracle Database SecureFiles and Large Objects Developer's Guide* for further information on Access Check operations

Data Structures

The DBMS_DBFS_CONTENT package defines RECORD types and TABLE types.

RECORD Types

- FEATURE_T Record Type
- MOUNT_T Record Type
- PATH_ITEM_T Record Type
- PROP_ITEM_T Record Type
- PROPERTY_T Record Type
- STORE_T Record Type

TABLE Types

- FEATURES_T Table Type
- MOUNTS_T Table Type
- PATH_ITEMS_T Table Type
- PROP_ITEMS_T Table Type
- PROPERTIES_T Table Type
- STORES_T Table Type

Usage Notes

There is an approximate correspondence between DBMS_DBFS_CONTENT_PROPERTY_T and PROPERTY_T — the former is a SQL object type that describes the full property tuple, while the latter is a PL/SQL record type that describes only the property value component.

Likewise, there is an approximate correspondence between DBMS_DBFS_CONTENT_PROPERTIES_T and PROPERTIES_T — the former is a SQL nested table type, while the latter is a PL/SQL hash table type.

Dynamic SQL calling conventions force the use of SQL types, but PL/SQL code may be implemented more conveniently in terms of the hash-table types.

The DBMS_DBFS_CONTENT interface provides convenient utility functions to convert between DBMS_DBFS_CONTENT_PROPERTIES_T and PROPERTIES_T (see propertiesT2H and propertiesH2T).

Clients can query the DBMS_DBFS_CONTENT interface for the list of available stores, determine which store is to handle access to a given path name, and determine the feature set for the store.

FEATURE_T Record Type

This type describes a store mount point and its properties.

Syntax

```
TYPE feature_t IS RECORD (
   feature_name    VARCHAR2(32),
   feature_mask    INTEGER,
   feature_state   VARCHAR2(3));
```

Fields

Table 48–13 MOUNT_T Fields

Field	Description
feature_name	Name of feature
feature_mask	Value used to mask off all other bits other than this feature in the feature value
feature_state	'YES' or 'NO' depending on whether the feature is supported on this store

MOUNT_T Record Type

This type describes a store mount point and its properties.

Syntax

```
TYPE mount_t IS RECORD (
   store_name          VARCHAR2(32),
   store_id            NUMBER,
   provider_name       VARCHAR2(32),
   provider_pkg        VARCHAR2(32),
   provider_id         NUMBER,
   provider_version    VARCHAR2(32),
   store_features      INTEGER,
   store_guid          NUMBER,
   store_mount         NAME_T,
   mount_properties    DBMS_DBFS_CONTENT_PROPERTIES_T);
```

Fields

Table 48–14 MOUNT_T Fields

Field	Description
store_name	Name of store
store_id	ID of store
provider_name	Name of the content store
provider_pkg	PL/SQL package name for the content store
provider_id	Unique identifier for the content store
provider_version	Version number for the content store
respos_features	Features supported by this content store
store_guid	Unique ID for this instance of the store
store_mount	Location at which this store instance is mounted
mount_properties	Properties for this mount point (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)

PATH_ITEM_T Record Type

A PATH_ITEM_T is a tuple describing a (store, mount) qualified path in a store, with all standard and optional properties associated with it.

Syntax

```
TYPE path_item_t IS RECORD (
   store                   NAME_T,
   mount                   NAME_T,
   pathname                PATH_T,
   pathtype                VARCHAR2(32),
   filedata                BLOB,
   std_access_time         TIMESTAMP,
   std_acl                 VARCHAR2(1024),
   std_change_time         TIMESTAMP,
   std_children            NUMBER,
   std_content_type        VARCHAR2(1024),
   std_creation_time       TIMESTAMP,
   std_deleted             INTEGER,
   std_guid                INTEGER,
   std_modification_time   TIMESTAMP,
   std_owner               VARCHAR2(32),
   std_parent_guid         INTEGER,
   std_referent            VARCHAR2(1024),
   opt_hash_type           VARCHAR2(32),
   opt_hash_value          VARCHAR2(128),
   opt_lock_count          INTEGER,
   opt_lock_data           VARCHAR2(128),
   opt_locker              VARCHAR2(128),
   opt_lock_status         INTEGER,
   opt_version             INTEGER,
   opt_version_path        PATH_T,
   opt_content_id          CONTENT_ID_T);
```

Fields

Table 48–15 PATH_ITEM_T Fields

Field	Description
store	Name of store
mount	Location at which instance of store is mounted
pathname	Name of path to item
pathtype	Type of object path (see DBMS_DBFS_CONTENT Constants - Path Name Types)
filedata	BLOB locator that can be used to access data in the path item
std_access_time	Time of last access of a pathname's contents
std_acl	Access Control List (in standard ACL syntax)
std_change_time	Time of last change to the metadata of a path name
std_children	Number of child directories or folders a directory or folder path (this property should be available in providers that support the feature_folders feature).

Table 48–15 (Cont.) PATH_ITEM_T Fields

Field	Description
std_content_type	One or more client-supplied mime-types (in standard RFC syntax) describing the path name which is typically of type_file. The content type s not necessarily interpreted by the store.
std_creation_time	Time at which the item was created. Once set, this value remains the same for the lifetime of the path name.
std_deleted	Set to a nonzero number if the path name has been soft-deleted but not yet purged (see DBMS_DBFS_CONTENT Constants - Store Features)
std_guid	Store-specific unique identifier for a path name. Clients must not depend on the GUID being unique across different stores, but a given *store-name*, *store-specific-pathname* has a stable and unique GUID for its lifetime.
std_modification_time	Time of last change to the data associated with a path name. Changes to the content of a type_file or type_reference path, the referent of the type_link path, and addition or deletion of immediate children in a type_directory path, all constitute data changes.
std_owner	Client-supplied (or implicit) owner name for the path name
std_parent_guid	Store-specific unique identifier for the parent of a path name. Clients must not depend on the GUID being unique across different stores, but a given *store-name*, *store-specific-pathname* has a stable and unique GUID for its lifetime. std_parent_guid(pathname) == std_guid(parent(pathname))
std_referent	Content of the symbolic link of a type_link path, otherwise NULL. As mentioned before, the std_referent can be an arbitrary string and must not necessarily be interpreted as pathname by clients (or such interpretation should be done with great care).
opt_hash_type	Type of hash provided in the opt_hash_value property (see DBMS_CRYPTO for possible options)
opt_hash_value	Hash value of type opt_hash_type describing the content of the path name
opt_lock_count	Number of compatible locks placed on a path name. If different principals are allowed to place compatible (read) locks on a path, the opt_locker must specify all lockers with repeats so that lock counts can be correctly maintained.
opt_lock_data	Client-supplied user-data associated with a user-lock, uninterpreted by the store
opt_locker	One or more implicit or client-specified principals that applied a user-lock on a path name
opt_lock_status	One of the lock_read_only, lock_write_only, lock_read_write values describing the type of lock currently applied on a path name
opt_version	Sequence number for linear versioning of a path name
opt_version_path	Version path name for hierarchical versioning of a path name
opt_content_id	Stringified provider-generated store-specific unique contentID for a file element (that may optionally not be associated with a path (see FEATURE_CONTENT_ID and FEATURE_LAZY_PATH in DBMS_DBFS_CONTENT Constants - Store Features)

PROP_ITEM_T Record Type

A PROP_ITEM_T is a tuple describing a (store, mount) qualified path in a store, with all user-defined properties associated with it, expanded out into individual (name, value, type) tuples.

Syntax

```
TYPE prop_item_t IS RECORD (
   store               NAME_T,
   mount                    NAME_T,
   pathname                 PATH_T,
   property_name            PROPNAME_T,
   property_value           PROPVAL_T,
   property_type            INTEGER);
```

Fields

Table 48–16 PROP_ITEM_T Fields

Field	Description
store	Name of store
mount	Location at which instance of store is mounted
pathname	Name of path to item
property_name	Name of the property
property_value	Value of the property
property_type	PL/SQL typecode for the property value

PROPERTY_T Record Type

This type describes a single (`value`, `typecode`) property value tuple; the property name is implied (see PROPERTIES_T Table Type).

Syntax

```
TYPE property_t  IS RECORD (
   propvalue    PROPVAL_T,
   typecode     INTEGER);
```

Fields

Table 48–17 PROPERTY_T Fields

Field	Description
`propvalue`	Value of property
`typecode`	Typecode

STORE_T Record Type

This type describes a store registered with and managed by the DBMS_DBFS_CONTENT interface.

Syntax

```
TYPE store_t IS RECORD (
   store_name          VARCHAR2(32),
   store_id            NUMBER,
   provider_name       VARCHAR2(32),
   provider_pkg        VARCHAR2(32),
   provider_id         NUMBER,
   provider_version    VARCHAR2(32),
   store_features      INTEGER,
   store_guid          NUMBER);
```

Fields

Table 48–18 STORET_T Fields

Field	Description
store_name	Name of store
store_name	ID of store
provider_name	Name of the content store
provider_pkg	PL/SQL package name for the content store
provider_id	Unique identifier for the content store
provider_version	Version number for the content store
respos_features	Features supported by this content store
store_guid	Unique ID for this instance of the store

FEATURES_T Table Type

A table type of FEATURE_T Record Type.

Syntax

```
TYPE features_t IS TABLE OF feature_t;
```

MOUNTS_T Table Type

A table type of MOUNT_T Record Type.

Syntax

```
TYPE mounts_t IS TABLE OF mount_t;
```

PATH_ITEMS_T Table Type

A table type of PATH_ITEM_T Record Type

Syntax

```
TYPE path_items_t IS TABLE OF path_item_t;
```

PROP_ITEMS_T Table Type

A table type of PATH_ITEM_T Record Type.

Syntax

```
TYPE prop_items_t IS TABLE OF prop_item_t;
```

PROPERTIES_T Table Type

This is a name-indexed hash table of property tuples. The implicit hash-table association between the index and the value allows the client to build up the full `DBMS_DBFS_CONTENT_PROPERTY_T` tuples for a `PROPERTIES_T`.

Syntax

```
TYPE properties_t IS TABLE OF property_t INDEX BY propname_t;
```

STORES_T Table Type

This type describes a store registered with and managed by the DBMS_DBFS_CONTENT interface.

Syntax

```
TYPE stores_t IS TABLE OF store_t;
```

Summary of DBMS_DBFS_CONTENT Subprograms

Table 48–19 DBMS_DBFS_CONTENT Package Subprograms

Subprogram	Description
CHECKACCESS Function on page 48-37	Reports if the user (`principal`) can perform the specified operation on the given path
CHECKSPI Functions and Procedures on page 48-38	Checks if a user-provided package implements all of the `DBMS_DBFS_CONTENT_SPI` subprograms with the proper signatures, and reports on the conformance.
CREATEDIRECTORY Procedures on page 48-39	Creates a directory
CREATEFILE Procedures on page 48-40	Creates a file
CREATELINK Procedures on page 48-41	Creates a new reference to the source file system element
CREATEREFERENCE Procedures on page 48-42	Creates a physical link to an already existing file system element
DECODEFEATURES Function on page 48-43	Given a feature bit set integer value, returns a `FEATURES_T` table of the feature bits as `FEATURE_T` records
DELETECONTENT Procedure on page 48-44	Deletes the file specified by the given contentID
DELETEDIRECTORY Procedure on page 48-45	Deletes a directory
DELETEFILE Procedure on page 48-43	Deletes a file
FEATURENAME Function on page 48-47	Given a feature bit, returns a `VARCHAR2` of that feature's name
FLUSHSTATS Function on page 48-48	Flushes `DBMS_DBFS_CONTENT` statistics to disk
GETDEFAULTACL Procedure on page 48-49	Returns the ACL parameter of the default context
GETDEFAULTASOF Procedure on page 48-50	Returns the `asof` parameter of the default context
GETTDEFAULTCONTEXT Procedure on page 48-51	Returns the default context
GETDEFAULTOWNER Procedure on page 48-52	Returns the `owner` parameter of the default context
GETDEFAULTPRINCIPAL Procedure on page 48-53	Returns the `principal` parameter of the default context
GETFEATURESBYMOUNT Function on page 48-54	Returns features of a store by mount point
GETFEATURESBYNAME Function on page 48-55	Returns features of a store by store name
GETFEATURESBYPATH Function on page 48-56	Returns features of a store by path
GETPATHBYMOUNTID Function on page 48-60	Returns the full absolute path name

Table 48–19 (Cont.) DBMS_DBFS_CONTENT Package Subprograms

Subprogram	Description
GETPATH Procedures on page 48-60	Returns existing path items (such as files and directories)
GETPATHBYSTOREID Function on page 48-61	If the underlying GUID is found in the underlying store, returns the store-qualified path name
GETPATHNOWAIT Procedures on page 48-62	Implies that the operation is for an update, and, if implemented, allows providers to return an exception (ORA-00054) rather than wait for row locks.
GETSTOREBYMOUNT Function on page 48-64	Returns a store by way of its mount point
GETSTOREBYNAME Function on page 48-65	Returns a store by way of its name
GETSTOREBYPATH Function on page 48-66	Returns a store by way of its path
GETSTATS Procedure on page 48-67	Returns information about DBMS_DBFS_CONTENT statistics collection
GETTRACE Function on page 48-68	Returns whether or not DBMS_DBFS_CONTENT tracing is turned on
GETVERSION Function on page 48-69	Returns the version of the DBMS_DBFS_CONTENT interface in a standardized format associated with a store
LIST Function on page 48-70	Lists the path items in the specified path meeting the specified filter and other criteria
LISTALLCONTENT Function on page 48-72	Lists all path items in all mounts
LISTALLPROPERTIES Function on page 48-71	Returns a table of all properties for all path items in all mounts
LISTMOUNTS Function on page 48-73	Lists all available mount points, their backing stores, and the store features
LISTSTORES Function on page 48-74	Lists all available stores and their features
LOCKPATH Procedure on page 48-75	Applies user-level locks to the given valid path name
MOUNTSTORE Procedure on page 48-76	Mounts a previously registered store and binds it to the mount point
NORMALIZEPATH Functions on page 48-77	Converts a store-specific or full-absolute path name into normalized form
PROPANY Functions on page 48-78	Provides constructors that take one of a variety of types and return a PROPERTY_T
PROPERTIESH2T Function on page 48-79	Converts a PROPERTY_T hash to a DBMS_DBFS_CONTENT_PROPERTIES_T table
PROPERTIEST2H Function on page 48-80	Converts a DBMS_DBFS_CONTENT_PROPERTIES_T table to a PROPERTY_T hash
PROPNUMBER Function on page 48-81	Is a constructor that takes a NUMBER and returns a PROPERTY_T
PROPRAW Function on page 48-82	Is a constructor that takes a RAW and returns a PROPERTY_T
PROPTIMESTAMP Function on page 48-83	Is a constructor that takes a TIMESTAMP and returns a PROPERTY_T

Table 48–19 (Cont.) DBMS_DBFS_CONTENT Package Subprograms

Subprogram	Description
PROPVARCHAR2 Function on page 48-84	Is a constructor that takes a `VARCAHR2` and returns a `PROPERTY_T`
PURGEALL Procedure on page 48-85	Purges all soft-deleted entries matching the path and optional filter criteria
PURGEPATH Procedure on page 48-86	Purges any soft-deleted versions of the given path item
PUTPATH Procedures on page 48-87	Creates a new path item
REGISTERSTORE Procedure on page 48-89	Registers a new store
RENAMEPATH Procedures on page 48-90	Renames or moves a path
RESTOREALL Procedure on page 48-91	Restores all soft-deleted path items meeting the path and filter criteria
RESTOREPATH Procedure on page 48-92	Restores all soft-deleted path items that match the given path and filter criteria
SETDEFAULTACL Procedure on page 48-93	Sets the ACL parameter of the default context
SETDEFAULTASOF Procedure on page 48-94	Sets the "as of" parameter of the default context
SETDEFAULTCONTEXT Procedure on page 48-95	Sets the default context
SETDEFAULTOWNER Procedure on page 48-96	Sets the "owner" parameter of the default context
SETDEFAULTPRINCIPAL Procedure on page 48-97	Sets the "principal" parameter of the default context
SETPATH Procedures on page 48-98	Assigns a path name to a path item represented by contentID
SETSTATS Procedure on page 48-99	Enables and disables statistics collection
SETTRACE Procedure on page 48-100	Sets `DBMS_DBFS_CONTENT` tracing on or off
SPACEUSAGE Procedure on page 48-101	Queries file system space usage statistics
TRACE Procedure on page 48-102	Returns a `CLOB` that contains the evaluation results
TRACEENABLED Function on page 48-103	Determines if the current trace "severity" set by the SETTRACE Procedure is at least as high as the given trace level
UNLOCKPATH Procedure on page 48-104	Unlocks path items that were previously locked with the LOCKPATH Procedure
UNMOUNTSTORE Procedure on page 48-105	Unmounts a registered store
UNREGISTERSTORE Procedure on page 48-106	Unregisters a store

CHECKACCESS Function

This function reports if the user (`principal`) can perform the specified operation on the given path. This enables verifying the validity of an operation without attempting to perform the operation. If `CHECKACCESS` returns 0, then the subprogram invoked to implement that operation should fail with an error.

Syntax

```
DBMS_DBFS_CONTENT.CHECKACCESS (
   path           IN     VARCHAR2,
   pathtype       IN     INTEGER,
   operation      IN     VARCHAR2,
   principal      IN     VARCHAR2,
   store_name     IN     VARCHAR2  DEFAULT NULL)
  RETURN  BOOLEAN;
```

Parameters

Table 48–20 CHECKACCESS Procedure Parameters

Parameter	Description
`path`	Name of path to check for access
`pathtype`	Type of object `path` represents (see DBMS_DBFS_CONTENT Constants - Path Name Types)
`operation`	Operation to be checked (see DBMS_DBFS_CONTENT Constants - Optional Properties)
`principal`	File system user for whom the access check is made
`store_name`	Name of store

Usage Notes

Whether or not the user invokes this function, a store that supports access control internally performs these checks to guarantee security.

CHECKSPI Functions and Procedures

Given the name of a putative DBMS_DBFS_CONTENT_SPI conforming package, this function or procedure checks whether the package implements all of the provider subprograms with the proper signatures, and reports on the conformance.

Syntax

```
DBMS_DBFS_CONTENT.CHECKSPI (
   package_name        IN              VARCHAR2)
  RETURN  CLOB;

DBMS_DBFS_CONTENT.CHECKSPI (
   schema_name         IN              VARCHAR2,
   package_name        IN              VARCHAR2)
  return  clob;

DBMS_DBFS_CONTENT.CHECKSPI (
   package_name        IN              VARCHAR2,
   chk                 IN OUT NOCOPY   CLOB);

DBMS_DBFS_CONTENT.CHECKSPI (
   schema_name         in              VARCHAR2,
   package_name        in              VARCHAR2,
   chk                 in out nocopy   CLOB);
```

Parameters

Table 48–21 CHECKSPI Procedure Parameters

Parameter	Description
package_name	Name of package
schema_name	Name of schema
chk	CLOB that contains the evaluation results

Usage Notes

- The functional form returns a cached temporary LOB of session duration with the results of the analysis. The caller is expected to manage the lifetime of this LOB, as needed.
- The procedural form generates the results of the analysis into the chk LOB parameter; if the value passed in is NULL, the results are written to the foreground trace file provided that DBMS_DBFS_CONTENT interface tracing is enabled. If neither tracing is enabled nor a valid LOB passed in, the checker does not provide any useful indication of the analysis (other than raise exceptions if it encounters a serious error).
- If schema_name is NULL, standard name resolution rules (current schema, private synonym, public synonym) are used to try and locate a suitable package to analyze.

CREATEDIRECTORY Procedures

This procedure creates a directory.

Syntax

```
DBMS_DBFS_CONTENT.CREATEDIRECTORY (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   prop_flags  IN              INTEGER     DEFAULT PROP_STD,
   recurse     IN              BOOLEAN     DEFAULT FALSE,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.CREATEDIRECTORY (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   prop_flags  IN              INTEGER     DEFAULT PROP_STD,
   recurse     IN              BOOLEAN     DEFAULT FALSE,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–22 CREATEDIRECTORY Procedure Parameters

Parameter	Description
`path`	Name of path to the directory
`properties`	One or more properties and their values to be set, returned, or both, depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`prop_flags`	Determines which properties are set, returned, or both. Default is `PROP_STD`. Specify properties to be returned by setting `PROP_SPC` (see DBMS_DBFS_CONTENT Constants - Property Access Flags), and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
`recurse`	If 0, do not execute recursively; otherwise, recursively create the directories above the given directory
`store_name`	Name of store
`principal`	File system user for whom the access check is made

CREATEFILE Procedures

This procedure creates a file.

Syntax

```
DBMS_DBFS_CONTENT.CREATEFILE (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   content     IN OUT NOCOPY   BLOB,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD + PROP_DATA),
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.CREATEFILE (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   content     IN OUT NOCOPY   BLOB,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD + PROP_DATA),
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–23 CREATEFILE Procedure Parameters

Parameter	Description
`path`	Name of path to the file
`properties`	One or more properties and their values to be set, returned, or both, depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`content`	`BLOB` holding data with which to populate the file (optional)
`prop_flags`	Determines which properties are set, returned, or both. Default is `PROP_STD`. Specify properties to be returned by setting `prop_spec`, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
`store_name`	Name of store
`principal`	File system user for whom the access check is made

CREATELINK Procedures

This procedure creates a new link element `srcPath` with the value of `dstPath`. The value of `dstPath` is not validated or interpreted in any way by this procedure. This is analogous to a UNIX file system symbolic link.

Syntax

```
DBMS_DBFS_CONTENT.CREATELINK (
   srcPath     IN              VARCHAR2,
   dstPath     IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   prop_flags  IN              INTEGER     DEFAULT PROP_STD,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.CREATELINK (
   srcPath     IN              VARCHAR2,
   dstPath     IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   prop_flags  IN              INTEGER     DEFAULT PROP_STD,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–24 CREATELINK Procedure Parameters

Parameter	Description
`srcPath`	File system entry to create.
`dstPath`	Value to associate with `srcPath`.
`properties`	One or more properties and their values to be set, returned depending, or both, on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`prop_flags`	Determines which properties are set, returned, or both. Default is `PROP_STD`. Specify properties to be returned by setting `prop_spec`, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
`store_name`	Name of store
`principal`	File system user for whom the access check is made

CREATEREFERENCE Procedures

This procedure creates a physical link, srcPath, to an already existing file system element, dstPath (such as file or directory). The resulting entry shares the same metadata structures as the value of the dstPath parameter, and so is similar to incrementing a reference count on the file system element. This is analogous to a UNIX file system hard link.

Syntax

```
DBMS_DBFS_CONTENT.CREATEREFERENCE (
   srcPath     IN              VARCHAR2,
   dstPath     IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   prop_flags  IN              INTEGER     DEFAULT PROP_STD,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.CREATEREFERENCE (
   srcPath     IN              VARCHAR2,
   dstPath     IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   prop_flags  IN              INTEGER     DEFAULT PROP_STD,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–25 CREATEREFERENCE Procedure Parameters

Parameter	Description
srcPath	File system entry to create.
dstPath	Path that is the reference to srcPath.
properties	One or more properties and their values to be set, returned, or both, depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
prop_flags	Determines which properties are set, returned. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
store_name	Name of store
principal	File system user for whom the access check is made

DECODEFEATURES Function

Given a feature bit set integer value, this function returns a FEATURES_T table of the feature bits as FEATURE_T records.

Syntax

```
DBMS_DBFS_CONTENT.DECODEFEATURES (
   featureSet          IN      INTEGER)
  RETURN FEATURES_T DETERMINISTIC PIPELINED;
```

Parameters

Table 48–26 DECODEFEATURES Function Parameters

Parameter	Description
featureSet	Feature set

Return Values

FEATURES_T Table Type

DELETECONTENT Procedure

This procedure deletes the file specified by the given contentID.

Syntax

```
DBMS_DBFS_CONTENT.DELETECONTENT (
   store_name     IN     VARCHAR2    DEFAULT NULL,
   contentID      IN     RAW,
   filter         IN     VARCHAR2    DEFAULT NULL,
   soft_delete    IN     BOOLEAN     DEFAULT NULL,
   principal      IN     VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–27 DELETECONTENT Procedure Parameters

Parameter	Description
`store_name`	Name of store
`contentID`	Unique identifier for the file to be deleted
`filter`	A filter, if any, to be applied
`soft_delete`	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see *Oracle Database SecureFiles and Large Objects Developer's Guide*, Deletion Operations).
`principal`	File system user for whom the access check is made

DELETEDIRECTORY Procedure

This procedure deletes a directory. If `recurse` is nonzero, it recursively deletes all elements of the directory. A filter, if supplied, determines which elements of the directory are deleted.

Syntax

```
DBMS_DBFS_CONTENT.DELETEDIRECTORY (
   path           IN     VARCHAR2,
   filter         IN     VARCHAR2    DEFAULT NULL,
   soft_delete    IN     BOOLEAN     DEFAULT NULL,
   recurse        IN     BOOLEAN     DEFAULT FALSE,
   store_name     IN     VARCHAR2    DEFAULT NULL,
   principal      IN     VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–28 DELETEDIRECTORY Procedure Parameters

Parameter	Description
`path`	Name of path to the directory
`filter`	A filter, if any, to be applied
`soft_delete`	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see *Oracle Database SecureFiles and Large Objects Developer's Guide*, Deletion Operations.
`recurse`	If 0, do not execute recursively. Otherwise, recursively delete the directories and files below the given directory.
`store_name`	Name of store
`principal`	File system user for whom the access check is made

DELETEFILE Procedure

This procedure deletes the specified file.

Syntax

```
DBMS_DBFS_CONTENT.DELETEFILE (
   path           IN     VARCHAR2,
   filter         IN     VARCHAR2    DEFAULT NULL,
   soft_delete    IN     BOOLEAN     DEFAULT NULL,
   store_name     IN     VARCHAR2    DEFAULT NULL,
   principal      IN     VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–29 DELETEFILE Procedure Parameters

Parameter	Description
`path`	Name of path to the file
`filter`	A filter, if any, to be applied
`soft_delete`	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see *Oracle Database SecureFiles and Large Objects Developer's Guide*, Deletion Operations).
`store_name`	Name of store
`principal`	File system user for whom the access check is made

FEATURENAME Function

Given a feature bit, this function returns a VARCHAR2 of that feature's name.

Syntax

```
DBMS_DBFS_CONTENT.FEATURENAME (
   featureBit          IN      INTEGER)
  RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 48–30 FEATURENAME Function Parameters

Parameter	Description
featureBit	Bit representation of the feature (see DBMS_DBFS_CONTENT Constants - Store Features)

Return Values

Name of the feature

FLUSHSTATS Function

This procedure flushes `DBMS_DBFS_CONTENT` statistics to disk.

Syntax

```
DBMS_DBFS_CONTENT.FLUSHSTATS;
```

GETDEFAULTACL Procedure

This procedure returns the ACL parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTACL (
   acl    OUT NOCOPY     VARCHAR2);
```

Parameters

Table 48–31 GETDEFAULTACL Procedure Parameters

Parameter	Description
`acl`	ACL for all new elements created (implicitly or explicitly) by the current operation

GETDEFAULTASOF Procedure

This procedure returns the "as of" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTASOF (
  asof    OUT NOCOPY     TIMESTAMP);
```

Parameters

Table 48–32 GETDEFAULTASOF Procedure Parameters

Parameter	Description
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

GETTDEFAULTCONTEXT Procedure

This procedure returns the default context. The information contained in the context can be inserted explicitly by way of arguments to the various method calls, allowing for fine-grained control over individual operations.

Syntax

```
DBMS_DBFS_CONTENT.GETTDEFAULTCONTEXT (
   principal    OUT NOCOPY     VARCHAR2,
   owner        OUT NOCOPY     VARCHAR2,
   acl          OUT NOCOPY     VARCHAR2,
   asof         OUT NOCOPY     TIMESTAMP);
```

Parameters

Table 48–33 GETTDEFAULTCONTEXT Procedure Parameters

Parameter	Description
`principal`	Agent (principal) invoking the current operation
`owner`	Owner for new elements created (implicitly or explicitly) by the current operation
`acl`	ACL for all new elements created (implicitly or explicitly) by the current operation
`asof`	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

GETDEFAULTOWNER Procedure

This procedure returns the "owner" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTOWNER (
   principal    IN     VARCHAR2);
```

Parameters

Table 48–34 GETDEFAULTOWNER Procedure Parameters

Parameter	Description
owner	Owner for new elements created (implicitly or explicitly) by the current operation

GETDEFAULTPRINCIPAL Procedure

This procedure returns the "principal" parameter of the default context. This information contained can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTPRINCIPAL (
   principal    OUT NOCOPY     VARCHAR2);
```

Parameters

Table 48–35 GETDEFAULTPRINCIPAL Procedure Parameters

Parameter	Description
principal	Agent (principal) invoking the current operation

GETFEATURESBYMOUNT Function

This function returns features of a store by mount point.

Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYMOUNT (
   store_mount       IN      VARCHAR2)
  RETURN INTEGER;
```

Parameters

Table 48–36 GETFEATURESBYMOUNT Function Parameters

Parameter	Description
store_mount	Mount point

Return Values

A bit mask of supported features (see FEATURES_T Table Type)

GETFEATURESBYNAME Function

This function returns features of a store by store name.

Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYNAME (
   store_name       IN      VARCHAR2)
  RETURN INTEGER;
```

Parameters

Table 48–37 GETFEATURESBYNAME Function Parameters

Parameter	Description
store_name	Name of store

Return Values

A bit mask of supported features (see FEATURES_T Table Type)

GETFEATURESBYPATH Function

This function returns features of a store by path.

Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYPATH (
   path       IN      PATH_T)
  RETURN INTEGER;
```

Parameters

Table 48–38 GETFEATURESBYPATH Function Parameters

Parameter	Description
path	PATH_T

Return Values

A bit mask of supported features (see FEATURES_T Table Type)

GETPATH Procedures

This procedure returns existing path items (such as files and directories). This includes both data and metadata (properties).

The client can request (using `prop_flags`) that specific properties be returned. File path names can be read either by specifying a `BLOB` locator using the `prop_data` bitmask in `prop_flags` (see DBMS_DBFS_CONTENT Constants - Property Access Flags) or by passing one or more `RAW` buffers.

When `forUpdate` is 0, this procedure also accepts a valid `asof` timestamp parameter as part of `ctx` that can be used by stores to implement "as of" style flashback queries. Mutating versions of the `GETPATH` Procedures do not support these modes of operation.

Syntax

```
DBMS_DBFS_CONTENT.GETPATH (
        path        IN              VARCHAR2,
        properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
        content     OUT    NOCOPY   BLOB,
        item_type   OUT             INTEGER,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        asof        IN              TIMESTAMP   DEFAULT NULL,
        forUpdate   IN              BOOLEAN     DEFAULT FALSE,
        deref       IN              BOOLEAN     DEFAULT FALSE,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (
        path        IN              VARCHAR2,
        properties  IN OUT NOCOPY   PROPERTIES_T,
        content     OUT    NOCOPY   BLOB,
        item_type   OUT             INTEGER,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        asof        IN              TIMESTAMP   DEFAULT NULL,
        forUpdate   IN              BOOLEAN     DEFAULT FALSE,
        deref       IN              BOOLEAN     DEFAULT FALSE,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (
        path        IN              VARCHAR2,
        properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
        amount      IN OUT          NUMBER,
        offset      IN              NUMBER,
        buffers     OUT    NOCOPY   RAW,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        asof        IN              TIMESTAMP   DEFAULT NULL,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (
        path        IN              VARCHAR2,
```

```
        properties  IN OUT NOCOPY   PROPERTIES_T,
        amount      IN OUT          NUMBER,
        offset      IN              NUMBER,
        buffers     OUT    NOCOPY   RAW,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        asof        IN              TIMESTAMP   DEFAULT NULL,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (
        path        IN              VARCHAR2,
        properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
        amount      IN OUT          NUMBER,
        offset      IN              NUMBER,
        buffers     OUT    NOCOPY   DBMS_DBFS_CONTENT_RAW_T,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        asof        IN              TIMESTAMP   DEFAULT NULL,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (
        path        IN              VARCHAR2,
        properties  IN OUT NOCOPY   PROPERTIES_T,
        amount      IN OUT          NUMBER,
        offset      IN              NUMBER,
        buffers     OUT    NOCOPY   DBMS_DBFS_CONTENT_RAW_T,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        asof        IN              TIMESTAMP   DEFAULT NULL,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–39 GETPATH Procedure Parameters

Parameter	Description
path	Name of path to path items
properties	One or more properties and their values to be returned depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see DBMS_DBFS_CONTENT Constants - Path Name Types)
amount	On input, number of bytes to be read. On output, number of bytes read
offset	Byte offset from which to begin reading
buffer	Buffer to which to write
buffers	Buffers to which to write

Table 48–39 (Cont.) GETPATH Procedure Parameters

Parameter	Description
prop_flags	Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
forUpdate	Specifies that a lock should be taken to signify exclusive write access to the path item
deref	If nonzero, attempts to resolve the given path item to actual data provided it is a reference
store_name	Name of store
principal	Agent (principal) invoking the current operation

GETPATHBYMOUNTID Function

If the underlying GUID is found in the underlying store, this function returns the full absolute path name.

Syntax

```
DBMS_DBFS_CONTENT.GETPATHBYMOUNTID (
   store_mount         IN      VARCHAR2,
   guid                IN      INTEGER)
  RETURN VARCHAR2;
```

Parameters

Table 48–40 GETPATHBYMOUNTID Function Parameters

Parameter	Description
`store_mount`	Mount point in which the path item with `guid` resides
`guid`	Unique ID for the path item

Usage Notes

If the GUID is unknown, a `NULL` value is returned. Clients are expected to handle this as appropriate.

Return Values

Path of the path item represented by GUID in `store_mount`

GETPATHBYSTOREID Function

If the underlying GUID is found in the underlying store, this function returns the store-qualified path name.

Syntax

```
DBMS_DBFS_CONTENT.GETPATHBYSTOREID (
   store_name          IN      VARCHAR2,
   guid                IN      INTEGER)
  RETURN VARCHAR2;
```

Parameters

Table 48–41 GETPATHBYSTOREID Function Parameters

Parameter	Description
store_name	Name of store
guid	Unique ID representing the desired path item

Usage Notes

If the GUID is unknown, a NULL value is returned. Clients are expected to handle this as appropriate.

Return Values

Store-qualified path name represented by the GUID

GETPATHNOWAIT Procedures

This procedure implies that the operation is for an update, and, if implemented (see FEATURE_NOWAIT in DBMS_DBFS_CONTENT Constants - Store Features), allows providers to return an exception (ORA-00054) rather than wait for row locks.

Syntax

```
DBMS_DBFS_CONTENT.GETPATHNOWAIT (
        path        IN              VARCHAR2,
        properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
        content     OUT    NOCOPY   BLOB,
        item_type   OUT             INTEGER,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        deref       IN              BOOLEAN     DEFAULT FALSE,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATHNOWAIT (
        path        IN              VARCHAR2,
        properties  IN OUT NOCOPY   PROPERTIES_T,
        content     OUT    NOCOPY   BLOB,
        item_type   OUT             INTEGER,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        deref       IN              BOOLEAN     DEFAULT FALSE,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–42 GETPATHNOWAIT Procedure Parameters

Parameter	Description
path	Name of path to path items
properties	One or more properties and their values to be returned depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see DBMS_DBFS_CONTENT Constants - Path Name Types)
prop_flags	Determines which properties are returned. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
deref	If nonzero, attempts to resolve the given path item to actual data provided it is a reference
store_name	Name of store

Table 48–42 (Cont.) GETPATHNOWAIT Procedure Parameters

Parameter	Description
`principal`	Agent (principal) invoking the current operation

GETSTOREBYMOUNT Function

This function returns a store by way of its name.

Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYMOUNT (
   store_mount       IN      VARCHAR2)
  RETURN STORE_T;
```

Parameters

Table 48–43 GETSTOREBYMOUNT Function Parameters

Parameter	Description
store_mount	Location at which the store instance is mounted

Return Values

STORE_T Record Type

GETSTOREBYNAME Function

This function returns a store by way of its name.

Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYNAME (
   store_name       IN      VARCHAR2)
  RETURN STORE_T;
```

Parameters

Table 48–44 GETSTOREBYNAME Function Parameters

Parameter	Description
store_name	Name of store

Return Values

STORE_T Record Type

GETSTOREBYPATH Function

This function returns a store by way of its path.

Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYPATH (
   path        IN      PATH_T)
  RETURN STORE_T;
```

Parameters

Table 48–45 GETSTOREBYPATH Function Parameters

Parameter	Description
path	PATH_T s

Return Values

STORE_T Record Type

GETSTATS Procedure

This procedure returns information about DBMS_DBFS_CONTENT statistics collection.

Syntax

```
DBMS_DBFS_CONTENT.GETSTATS (
   enabled         OUT    BOOLEAN,
   flush_time      OUT    INTEGER,
   flush_count     OUT    INTEGER);
```

Parameters

Table 48–46 GETSTATS Procedure Parameters

Parameter	Description
enabled	Whether statistics collection is enabled
flush_time	How often to flush the statistics to disk in centiseconds
flush_count	Number of operations to allow between statistics flushes

GETTRACE Function

This function returns whether DBMS_DBFS_CONTENT tracing is turned on or not.

Syntax

```
DBMS_DBFS_CONTENT.GETTRACE
  RETURN INTEGER.
```

Return Values

Returns 0 if tracing is off, non-zero if tracing is on.

GETVERSION Function

This function marks each version of the DBMS_DBFS_CONTENT interface.

Syntax

```
DBMS_DBFS_CONTENT.GETVERSION (
  RETURN VARCHAR2;
```

Return Values

A string enumerating the version of the DBMS_DBFS_CONTENT interface in standard naming convention: string: *a.b.c* corresponding to *major*, *minor*, and *patch* components.

LIST Function

This function lists the path items in the specified path meeting the specified filter and other criteria.

Syntax

```
DBMS_DBFS_CONTENT.LIST (
   path          IN     VARCHAR2,
   filter        IN     VARCHAR2    DEFAULT NULL,
   recurse       IN     INTEGER     DEFAULT 0,
   asof          IN     TIMESTAMP   DEFAULT NULL,
   store_name    IN     VARCHAR2    DEFAULT NULL,
   principal     IN     VARCHAR2    DEFAULT NULL)
  RETURN  DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;
```

Parameters

Table 48–47 LIST Function Parameters

Parameter	Description
path	Name of path to directories
filter	A filter, if any, to be applied
recurse	If 0, do not execute recursively. Otherwise, recursively list the contents of directories and files below the given directory.
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
store_name	Name of repository
principal	Agent (principal) invoking the current operation

Return Values

DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type

LISTALLPROPERTIES Function

This function returns a table of all properties for all path items in all mounts

Syntax

```
DBMS_DBFS_CONTENT.LISTALLPROPERTIES
  RETURN  PROP_ITEMS_T PIPELINED;
```

Return Values

PROP_ITEMS_T Table Type

LISTALLCONTENT Function

This function lists all path items in all mounts.

Syntax

```
DBMS_DBFS_CONTENT.LISTALLCONTENT
  RETURN  PATH_ITEMS_T PIPELINED;
```

Return Values

PATH_ITEMS_T Table Type

LISTMOUNTS Function

This function lists all available mount points, their backing stores, and the store features.

Syntax

```
DBMS_DBFS_CONTENT.LISTMOUNTS
  RETURN MOUNTS_T PIPELINED;
```

Return Values

MOUNTS_T Table Type

Usage Notes

A single mount results in a single returned row, with its `store_mount` field of the returned records set to `NULL`.

LISTSTORES Function

This function lists all available stores and their features.

Syntax

```
DBMS_DBFS_CONTENT.LISTSTORES
  RETURN STORES_T PIPELINED;
```

Return Values

STORES_T Table Type

Usage Notes

The `store_mount` field of the returned records is set to `NULL` (since mount-points are separate from stores themselves).

LOCKPATH Procedure

This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

Syntax

```
DBMS_DBFS_CONTENT.LOCKPATH (
   path           IN     VARCHAR2,
   lock_type      IN     INTEGER     DEFAULT LOCK_READ_ONLY,
   lock_data      IN     VARCHAR2    DEFAULT NULL,
   store_name     IN     VARCHAR2    DEFAULT NULL,
   principal      IN     VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–48 LOCKPATH Procedure Parameters

Parameter	Description
`path`	Name of path to file items
`lock_type`	One of the available lock types (see DBMS_DBFS_CONTENT Constants - Lock Types)
`lock_data`	Optional user data to be associated with the lock
`store_name`	Name of store
`principal`	Agent (principal) invoking the current operation

MOUNTSTORE Procedure

This procedure mounts a previously registered store and binds it to the mount point.

Syntax

```
DBMS_DBFS_CONTENT.MOUNTSTORE (
   store_mount    in      VARCHAR2   DEFAULT NULL,
   singleton      in      BOOLEAN    DEFAULT FALSE,
   principal      in      VARCHAR2   DEFAULT NULL,
   owner          in      VARCHAR2   DEFAULT NULL,
   acl            in      VARCHAR2   DEFAULT NULL,
   asof           in      TIMESTAMP  DEFAULT NULL,
   read_only      in      BOOLEAN    DEFAULT FALSE);
```

Parameters

Table 48–49 MOUNTSTORE Procedure Parameters

Parameter	Description
`store_mount`	Path name to use to mount this store
`singleton`	Whether the mount is a single backend store on the system
`principal`	Agent (principal) invoking the current operation
`owner`	Owner for new elements created (implicitly or explicitly) by the current operation
`acl`	ACL for all new elements created (implicitly or explicitly) by the current operation
`asof`	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
`read_only`	Whether the mount is read-only

Usage Notes

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for information on mounting a registered store

NORMALIZEPATH Functions

This function converts a store-specific or full-absolute path name into normalized form:

- verifies that the path name is absolute, and so starts with "/"
- collapses multiple consecutive "/" into a single "/"
- strips trailing "/"
- breaks up a store-specific normalized path name into 2 components - parent pathname, trailing component name
- breaks up a full-absolute normalized path name into 3 components - store name, parent pathname, trailing component name

Syntax

```
DBMS_DBFS_CONTENT.NORMALIZEPATH (
   path        IN              VARCHAR2,
   parent      OUT NOCOPY      VARCHAR2,
   tpath       OUT NOCOPY      VARCHAR2)
  RETURN VARCHAR2;

DBMS_DBFS_CONTENT.NORMALIZEPATH (
   path        IN              VARCHAR2,
   store_name  OUT NOCOPY      VARCHAR2,
   parent      OUT NOCOPY      VARCHAR2,
   tpath       OUT NOCOPY      VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 48–50 NORMALIZEPATH Function Parameters

Parameter	Description
path	Name of path to file items
store_name	Name of store
parent	Parent path name
tpath	Name of trailing path item

Return Values

The completely normalized store-specific or full-absolute path name

PROPANY Functions

This function provides constructors that take one of a variety of types and return a PROPERTY_T.

Syntax

```
DBMS_DBFS_CONTENT.PROPANY (
   val      IN      NUMBER)
RETURN PROPERTY_T;

DBMS_DBFS_CONTENT.PROPANY (
   val      IN      VARCHAR2)
RETURN PROPERTY_T;

DBMS_DBFS_CONTENT.PROPANY (
   val      IN      TIMESTAMP)
RETURN PROPERTY_T;

DBMS_DBFS_CONTENT.PROPANY (
   val      IN      RAW)
RETURN PROPERTY_T;
```

Parameters

Table 48–51 PROPANY Function Parameters

Parameter	Description
val	Value

Return Values

PROPERTY_T Record Type

PROPERTIESH2T Function

This function converts a PROPERTY_T hash to a DBMS_DBFS_CONTENT_PROPERTIES_T table.

Syntax

```
DBMS_DBFS_CONTENT.PROPERTIEST2H (
   pprops      IN      PROPERTIES_T)
RETURN DBMS_DBFS_CONTENT_PROPERTIES_T;
```

Parameters

Table 48–52 PROPERTIEST2H Function Parameters

Parameter	Description
sprops	A PROPERTIES_T hash

Return Values

DBMS_DBFS_CONTENT_PROPERTIES_T Table Type

PROPERTIEST2H Function

This function converts a DBMS_DBFS_CONTENT_PROPERTIES_T table to a PROPERTY_T hash.

Syntax

```
DBMS_DBFS_CONTENT.PROPERTIEST2H (
   sprops      IN      DBMS_DBFS_CONTENT_PROPERTIES_T)
RETURN properties_t;
```

Parameters

Table 48–53 PROPERTIEST2H Function Parameters

Parameter	Description
sprops	A DBMS_DBFS_CONTENT_PROPERTIES_T table

Return Values

PROPERTIES_T Table Type

PROPNUMBER Function

This function is a constructor that takes a number and returns a `PROPERTY_T`.

Syntax

```
DBMS_DBFS_CONTENT.PROPNUMBER (
   val      IN      NUMBER)
RETURN PROPERTY_T;
```

Parameters

Table 48–54 PROPNUMBER Function Parameters

Parameter	Description
`val`	Value

Return Values

PROPERTY_T Record Type

PROPRAW Function

This function is a constructor that takes a `RAW` and returns a `PROPERTY_T`.

Syntax

```
DBMS_DBFS_CONTENT.PROPRAW (
   val       IN      RAW)
RETURN PROPERTY_T;
```

Parameters

Table 48–55 PROPRAW Function Parameters

Parameter	Description
`val`	Value

Return Values

PROPERTY_T Record Type

PROPTIMESTAMP Function

This function is a constructor that takes a `TIMESTAMP` and returns a `PROPERTY_T`.

Syntax

```
DBMS_DBFS_CONTENT.PROPTIMESTAMP (
   val      IN      TIMESTAMP)
RETURN PROPERTY_T;
```

Parameters

Table 48–56 PROPTIMESTAMP Function Parameters

Parameter	Description
`val`	Value

Return Values

PROPERTY_T Record Type

PROPVARCHAR2 Function

This function is a constructor that takes a VARCHAR2 and returns a `PROPERTY_T`.

Syntax

```
DBMS_DBFS_CONTENT.PROPVARCHAR2 (
   val      IN      VARCHAR2)
RETURN PROPERTY_T;
```

Parameters

Table 48–57 PROPNUMBER Function Parameters

Parameter	Description
`val`	Value

Return Values

PROPERTY_T Record Type

PURGEALL Procedure

This procedure purges all soft-deleted entries matching the path and optional filter criteria.

Syntax

```
DBMS_DBFS_CONTENT.PURGEALL (
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2    DEFAULT NULL,
   store_name     IN      VARCHAR2    DEFAULT NULL,
   principal      IN      VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–58 PURGEALL Procedure Parameters

Parameter	Description
`path`	Name of path to file items
`filter`	A filter, if any, to be applied based on specified criteria
`store_name`	Name of store
`principal`	Agent (principal) invoking the current operation

PURGEPATH Procedure

This procedure purges any soft-deleted versions of the given path item.

Syntax

```
DBMS_DBFS_CONTENT.PURGEPATH (
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2    DEFAULT NULL,
   store_name     IN      VARCHAR2    DEFAULT NULL,
   principal      IN      VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–59 PURGEPATH Procedure Parameters

Parameter	Description
path	Name of path to file items
filter	A filter, if any, to be applied
store_name	Name of store
principal	Agent (principal) invoking the current operation

PUTPATH Procedures

This procedure creates a new path item.

Syntax

```
DBMS_DBFS_CONTENT.PUTPATH (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   content     IN OUT NOCOPY   BLOB,
   item_type   OUT             INTEGER,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                    PROP_OPT +
                                                    PROP_DATA),
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   content     IN OUT NOCOPY   BLOB,
   item_type   OUT             INTEGER,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                    PROP_OPT +
                                                    PROP_DATA),
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   amount      IN              NUMBER,
   offset      IN              NUMBER,
   buffer      IN              RAW,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                    PROP_OPT),
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   amount      IN              NUMBER,
   offset      IN              NUMBER,
   buffer      IN              RAW,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                    PROP_OPT),
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   written     OUT             NUMBER,
   offset      IN              NUMBER,
   buffers     IN             DBMS_DBFS_CONTENT_RAW_T,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                    PROP_OPT),
   store_name  IN              VARCHAR2    DEFAULT NULL,
```

```
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   written     OUT             NUMBER,
   offset      IN              NUMBER,
   buffers     IN              DBMS_DBFS_CONTENT_RAW_T,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                    PROP_OPT),
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–60 PUTPATH Procedure Parameters

Parameter	Description
path	Name of path to file items
properties	One or more properties and their values to be set depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see DBMS_DBFS_CONTENT Constants - Path Name Types)
amount	Number of bytes to be read
offset	Byte offset from which to begin reading
buffer	Buffer to which to write
buffers	Buffers to which to write
prop_flags	Determines which properties are set. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
store_name	Name of store
principal	Agent (principal) invoking the current operation

REGISTERSTORE Procedure

This procedure registers a new store backed by a provider that uses a store provider (conforming to the DBMS_DBFS_CONTENT_SPI package signature). This method is to be used primarily by store providers after they have created a new store.

Syntax

```
DBMS_DBFS_CONTENT.REGISTERSTORE (
   store_name          IN      VARCHAR2,
   provider_name       IN      VARCHAR2,
   provider_package    IN      VARCHAR2);
```

Parameters

Table 48–61 REGISTERSTORE Procedure Parameters

Parameter	Description
store_name	Name of store, must be unique
provider_name	Name of provider
provider_package	Store provider

RENAMEPATH Procedures

This procedure renames or moves a path. This operation can be performed across directory hierarchies and mount-points as long as it is within the same store.

Note: See *Oracle Database SecureFiles and Large Objects Developer's Guide* for Rename and Move operations

Syntax

```
DBMS_DBFS_CONTENT.RENAMEPATH (
   oldPath     IN              VARCHAR2,
   newPath     IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.RENAMEPATH (
   oldPath     IN              VARCHAR2,
   newPath     IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–62 RENAMEPATH Procedure Parameters

Parameter	Description
oldPath	Name of path prior to renaming
newPath	Name of path after renaming
properties	One or more properties and their values to be set depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
store_name	Name of store, must be unique
principal	Agent (principal) invoking the current operation

RESTOREALL Procedure

This procedure restores all soft-deleted path items meeting the path and optional filter criteria.

Syntax

```
DBMS_DBFS_CONTENT.RESTOREALL (
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2    DEFAULT NULL,
   store_name     IN      VARCHAR2    DEFAULT NULL,
   principal      IN      VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–63 RESTOREALL Procedure Parameters

Parameter	Description
`path`	Name of path to file items
`filter`	A filter, if any, to be applied
`store_name`	Name of store
`principal`	Agent (principal) invoking the current operation

RESTOREPATH Procedure

This procedure restores all soft-deleted path items that match the given path and optional filter criteria.

Syntax

```
DBMS_DBFS_CONTENT.RESTOREPATH (
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2    DEFAULT NULL,
   store_name     IN      VARCHAR2    DEFAULT NULL,
   principal      IN      VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–64 RESTOREPATH Procedure Parameters

Parameter	Description
`path`	Name of path to file items
`filter`	A filter, if any, to be applied
`store_name`	Name of store
`principal`	Agent (principal) invoking the current operation

SETDEFAULTACL Procedure

This procedure sets the ACL parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTACL (
   acl    IN     VARCHAR2);
```

Parameters

Table 48–65 SETDEFAULTACL Procedure Parameters

Parameter	Description
acl	ACL for all new elements created (implicitly or explicitly) by the current operation

Usage Notes

- NULL by default, this parameter be can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

SETDEFAULTASOF Procedure

This procedure sets the "as of" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTASOF (
  asof    IN     TIMESTAMP);
```

Parameters

Table 48–66 SETDEFAULTASOF Procedure Parameters

Parameter	Description
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

Usage Notes

- NULL by default, this parameter be can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

SETDEFAULTCONTEXT Procedure

This procedure sets the default context. The information contained in the context can be inserted explicitly by way of arguments to the various method calls, allowing for fine-grained control over individual operations.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTCONTEXT (
   principal    IN     VARCHAR2,
   owner        IN     VARCHAR2,
   acl          IN     VARCHAR2,
   asof         IN     TIMESTAMP);
```

Parameters

Table 48–67 SETDEFAULTCONTEXT Procedure Parameters

Parameter	Description
`principal`	Agent (principal) invoking the current operation
`owner`	Owner for new elements created (implicitly or explicitly) by the current operation
`acl`	ACL for all new elements created (implicitly or explicitly) by the current operation
`asof`	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

Usage Notes

- All of the context parameters are `NULL` by default, and be can be cleared by setting them to `NULL`.
- The context parameters, once set, remain as defaults for the duration of the session, and are inherited by all operations for which the defaults are not explicitly overridden.

SETDEFAULTOWNER Procedure

This procedure sets the "owner" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTOWNER (
   principal    IN     VARCHAR2);
```

Parameters

Table 48–68 SETDEFAULTOWNER Procedure Parameters

Parameter	Description
owner	Owner for new elements created (implicitly or explicitly) by the current operation

Usage Notes

- NULL by default, this parameter be can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

SETDEFAULTPRINCIPAL Procedure

This procedure sets the "principal" parameter of the default context. This information contained can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTPRINCIPAL (
   principal    IN     VARCHAR2);
```

Parameters

Table 48–69 SETDEFAULTPRINCIPAL Procedure Parameters

Parameter	Description
principal	Agent (principal) invoking the current operation

Usage Notes

- NULL by default, this parameter be can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

SETPATH Procedures

This procedure assigns a path name to a path item represented by contentID.

Stores and their providers that support contentID-based access and lazy path name binding also support the `SETPATH Procedure` that associates an existing `contentID` with a new path.

> **Note:** See *Oracle Database SecureFiles and Large Objects Developer's Guide* for Rename and Move operations

Syntax

```
DBMS_DBFS_CONTENT.SETPATH (
   store_name  IN              VARCHAR2,
   contentID   IN              RAW,
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.SETPATH (
   store_name  IN              VARCHAR2,
   contentID   IN              RAW,
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–70 SETPATH Procedure Parameters

Parameter	Description
`store_name`	Name of the store
`contentID`	Unique identifier for the item to be associated
`path`	Name of path to path item
`properties`	One or more properties and their values to be set depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`principal`	Agent (principal) invoking the current operation

SETSTATS Procedure

This procedure enables and disables statistics collection. The client can optionally control the flush settings by specifying non-NULL values for the time, count or both parameters.

Syntax

```
DBMS_DBFS_CONTENT.SETSTATS (
   enable          IN    BOOLEAN,
   flush_time      IN    INTEGER,
   flush_count     IN    INTEGER);
```

Parameters

Table 48–71 SETSTATS Procedure Parameters

Parameter	Description
enable	If TRUE, enable statistics collection. If FALSE, disable statistics collection.
flush_time	How often to flush the statistics to disk in centiseconds
flush_count	Number of operations to allow between statistics flushes

Usage Notes

The SETSTATS Procedure buffers statistics in-memory for a maximum of flush_time centiseconds or a maximum of flush_count operations (whichever limit is reached first), or both, at which time the buffers are implicitly flushed to disk.

SETTRACE Procedure

This procedure sets the DBMS_DBFS_CONTENT tracing severity to the given level, 0 being "off".

Syntax

```
DBMS_DBFS_CONTENT.SETTRACE
     trclvl      IN         INTEGER);
```

Parameters

Table 48–72 SETTRACE Procedure Parameters

Parameter	Description
trclvl	Level of the tracing, higher values implying more tracing

SPACEUSAGE Procedure

This procedure queries file system space usage statistics. Providers are expected to support this subprogram for their stores (and to make a best effort determination of space usage, especially if the store consists of multiple tables, indexes, LOBs, and so on).

Syntax

```
DBMS_DBFS_CONTENT.SPACEUSAGE (
   path          IN        VARCHAR2,
   blksize       OUT       INTEGER,
   tbytes        OUT       INTEGER,
   fbytes        OUT       INTEGER,
   nfile         OUT       INTEGER,
   ndir          OUT       INTEGER,
   nlink         OUT       INTEGER,
   nref          OUT       INTEGER,
   store_name    IN        VARCHAR2 DEFAULT NULL);
```

Parameters

Table 48–73 SPACEUSAGE Procedure Parameters

Parameter	Description
path	Name of path to file items
blksize	Natural tablespace blocksize that holds the store. If multiple tablespaces with different blocksizes are used, any valid blocksize is acceptable.
tbytes	Total size of the store in bytes computed over all segments that comprise the store
fbytes	Free or unused size of the store in bytes computed over all segments that comprise the store
nfile	Number of currently available files in the store
ndir	Number of currently available directories in the store
nlink	Number of currently available links in the store
nref	Number of currently available references in the store
store_name	Name of store

Usage Notes

- A space usage query on the top-level root directory returns a combined summary of the space usage of all available distinct stores under it (if the same store is mounted multiple times, is still counted only once).
- Since database objects are dynamically expandable, it is not easy to estimate the division between "free" space and "used" space.

TRACE Procedure

This procedure outputs tracing to the current foreground trace file.

Syntax

```
DBMS_DBFS_CONTENT.TRACE
   sev         IN              INTEGER,
   msg0        IN              VARCHAR2,
   msg1        IN              VARCHAR     DEFAULT '',
   msg2        IN              VARCHAR     DEFAULT '',
   msg3        IN              VARCHAR     DEFAULT '',
   msg4        IN              VARCHAR     DEFAULT '',
   msg5        IN              VARCHAR     DEFAULT '',
   msg6        IN              VARCHAR     DEFAULT '',
   msg7        IN              VARCHAR     DEFAULT '',
   msg8        IN              VARCHAR     DEFAULT '',
   msg9        IN              VARCHAR     DEFAULT '',
   msg10       IN              VARCHAR     DEFAULT '');
```

Parameters

Table 48–74 TRACE Procedure Parameters

Parameter	Description
sev	Severity at which trace message is output
msg*	One or more message strings to be output. If more than one message is specified, all are output.

Usage Notes

- Trace information is written to the foreground trace file, with varying levels of detail as specified by the trace level arguments.
- The global trace level consists of 2 components: "severity" and "detail". These can be thought of as additive bitmasks.

  The "severity" allows the separation of top level as compared to low-level tracing of different components, and allows the amount of tracing to be increased as needed. There are no semantics associated with different levels, and users are free to set trace at any severity they choose, although a good rule of thumb would use severity "1" for top level API entry and exit traces, "2" for internal operations, and "3" or greater for very low-level traces.

  The "detail" controls how much additional information: timestamps, short-stack, etc. is dumped along with each trace record.

TRACEENABLED Function

This function determines if the current trace "severity" set by the SETTRACE Procedure is at least as high as the given trace level.

Syntax

```
DBMS_DBFS_CONTENT.TRACEENABLED(
   sev          IN              INTEGER)
  RETURN  INTEGER;
```

Parameters

Table 48–75 TRACEENABLED Procedure Parameters

Parameter	Description
sev	Severity at which trace message is output

Return Values

Returns 0 if the requested severity level is lower than the currently set trace severity level; 1 otherwise.

UNLOCKPATH Procedure

This procedure unlocks path items that were previously locked with the LOCKPATH Procedure.

Syntax

```
DBMS_DBFS_CONTENT.UNLOCKPATH (
   path           IN     VARCHAR2,
   store_name     IN     VARCHAR2    DEFAULT NULL,
   principal      IN     VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48–76 UNLOCKPATH Procedure Parameters

Parameter	Description
path	Name of path to file items
store_name	Name of store
principal	Agent (principal) invoking the current operation

UNMOUNTSTORE Procedure

This procedure unmounts a registered store, either by name or by mount point.

Syntax

```
DBMS_DBFS_CONTENT.UNMOUNTSTORE (
   store_name        IN      VARCHAR2   DEFAULT NULL,
   store_mount       IN      VARCHAR2   DEFAULT NULL,
   ignore_unknown    IN      BOOLEAN    DEFAULT FALSE);
```

Parameters

Table 48–77 UNMOUNTSTORE Procedure Parameters

Parameter	Description
store_name	Name of store
store_mount	Location at which the store instance is mounted
ignore_unknown	If TRUE, attempts to unregister unknown stores will not raise an exception.

Usage Notes

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for further information on unmounting a previously unmounted store

UNREGISTERSTORE Procedure

This procedure unregisters a previously registered store (invalidating all mount points associated with it).

Syntax

```
DBMS_DBFS_CONTENT.UNREGISTERSTORE (
   store_name          IN      VARCHAR2,
   ignore_unknown      IN      BOOLEAN DEFAULT FALSE);
```

Parameters

Table 48–78 UNREGISTERSTORE Procedure Parameters

Parameter	Description
store_name	Name of store
ignore_unknown	If TRUE, attempts to unregister unknown stores will not raise an exception.

Usage Notes

- Once unregistered all access to the store (and its mount points) are not guaranteed to work
- If the ignore_unknown argument is TRUE, attempts to unregister unknown stores do not raise an exception.

49

DBMS_DBFS_CONTENT_SPI

The DBMS_DBFS_CONTENT_SPI package is a specification for DBMS_DBFS_CONTENT store providers, which must be implemented. Application designers can create PL/SQL packages conforming to this specification to extend DBMS_DBFS_CONTENT to use custom store providers.

See Also:

- *Oracle Database SecureFiles and Large Objects Developer's Guide*

This chapter contains the following topics:

Using DBMS_DBFS_CONTENT_SPI

Overview

The DBMS_DBFS_CONTENT_SPI package describes an internal contract between the implementation of the DBMS_DBFS_CONTENT interface and individual store providers, and whichever package contains their code.

Since PL/SQL does not allow a compile-time, declarative type-conformation between package signatures, store providers should informally conform to the SPI, which is to say, they should implement the SPI by means of a package that contains all of the methods specified in package DBMS_DBFS_CONTENT_SPI, with the same method signatures and semantics.

Obviously, these provider packages can implement other methods and expose other interfaces, however, these interfaces are not to be used by the DBMS_DBFS_CONTENT interface itself.

Since the provider SPI is merely a contract specification, there is no package body for DBMS_DBFS_CONTENT_SPI, and it is not possible to actually invoke any methods using this package.

The SPI references various elements (constants, types, exceptions) defined by the DBMS_DBFS_CONTENT interface.

Additionally, there is an almost one-to-one correspondence between the client API exported by the DBMS_DBFS_CONTENT interface and the provider interface that the DBMS_DBFS_CONTENT interface itself expects to work against.

The main distinction in the method naming conventions is that all path name references are always store-qualified. That is, the notion of mount-points and full-absolute path names have been normalized and converted to store-qualified path names by the DBMS_DBFS_CONTENT interface before it invokes any of the provider SPI methods.

Since the interconnection of the DBMS_DBFS_CONTENT interface and the provider SPI is a 1-to-many pluggable architecture, and the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

Security Model

Implementations of the `DBMS_DBFS_CONTENT_SPI` package should be created as `AUTHID CURRENT_USER`.

Operational Notes

Implementation

Since the interconnection of the DBMS_DBFS_CONTENT interface and the provider SPI is a 1-to-many pluggable architecture, the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

There are no explicit `INIT` or `FINI` methods to indicate when the `DBMS_DBFS_CONTENT` interface plugs or unplugs a particular provider SPI. Provider SPIs must be willing to auto-initialize themselves at any SPI entry-point.

All operations performed by a store provider are "stateless" in that they are complete operations unto themselves. If state is necessary to be maintained for some reason, then the state must be maintained in data structures such as auxiliary tables that can be queried as needed.

Path Names

All path names used in the provider SPI are store-qualified in pair form (`store_name`, `pathname`) where the path name is rooted within the store namespace.

Stores and their providers that support contentID-based access (see `FEATURE_CONTENT_ID` in DBMS_DBFS_CONTENT Constants - Store Features) also support a form of addressing that is not based on path names. Content items are identified by an explicit store name, a `NULL` path name, and possibly a contentID specified as a parameter or by way of the `OPT_CONTENT_ID` (see DBMS_DBFS_CONTENT Constants - Optional Properties) property.

Not all operations are supported with contentID-based access, and applications should depend only on the simplest create or delete functionality being available.

Other DBMS_DBFS_CONTENT Operations

This table lists other operations and provides links to related discussions.

Table 49–1 Other DBMS_DBFS_CONTENT Operations

Other Operations	See ...
Creation	*Oracle Database SecureFiles and Large Objects Developer's Guide* for further information on creation operations
Deletion	*Oracle Database SecureFiles and Large Objects Developer's Guide* for further information on deletion operations

Summary of DBMS_DBFS_CONTENT_SPI Subprograms

Table 49–2 DBMS_DBFS_CONTENT_SPI Package Subprograms

Subprogram	Description
CHECKACCESS Function on page 49-9	Reports if the user (`principal`) can perform the specified operation on the given path
CREATEDIRECTORY Procedure on page 49-10	Creates a directory
CREATEFILE Procedure on page 49-11	Creates a file
CREATELINK Procedure on page 49-12	Creates a physical link to an already existing file system element
CREATEREFERENCE Procedure on page 49-13	Creates a new reference to the source file system element
DELETECONTENT Procedure on page 49-14	Deletes the file specified by the given contentID
DELETEDIRECTORY Procedure on page 49-15	Deletes a directory
DELETEFILE Procedure on page 49-16	Deletes a file
GETFEATURES Function on page 49-17	Returns the features of a store
GETPATH Procedures on page 49-18	Returns existing path items (such as files and directories)
GETPATHBYSTOREID Function on page 49-20	If the underlying GUID is found in the underlying store, returns the store-qualified path name
GETPATHNOWAIT Procedure on page 49-21	Implies that the operation is for an update, and, if implemented, allows providers to return an exception (`ORA-00054`) rather than wait for row locks.
GETSTOREID Function on page 49-22	Returns the ID of a store
GETVERSION Function on page 49-23	Returns the version associated with a store
LIST Function on page 49-24	Lists the contents of a directory path name
LOCKPATH Procedure on page 49-25	Applies user-level locks to the given valid path name
PURGEALL Procedure on page 49-26	Purges all soft-deleted entries matching the path and optional filter criteria
PURGEPATH Procedure on page 49-27	Purges any soft-deleted versions of the given path item
PUTPATH Procedures on page 49-28	Creates a new path item
RENAMEPATH Procedure on page 49-30	Renames or moves a path
RESTOREALL Procedure on page 49-31	Restores all soft-deleted path items meeting the path and filter criteria

Table 49–2 (Cont.) DBMS_DBFS_CONTENT_SPI Package Subprograms

Subprogram	Description
RESTOREPATH Procedure on page 49-32	Restores all soft-deleted path items that match the given path and filter criteria
SEARCH Function on page 49-33	Searches for path items matching the given path and filter criteria
SETPATH Procedure on page 49-34	Assigns a path name to a path item represented by contentID
SPACEUSAGE Procedure on page 49-35	Queries file system space usage statistics
UNLOCKPATH Procedure on page 49-36	Unlocks path items that were previously locked with the LOCKPATH Procedure

CHECKACCESS Function

This function reports if the user (`principal`) can perform the specified operation on the given path. This enables verifying the validity of an operation without attempting to perform the operation. If `CHECKACCESS` returns 0, then the subprogram invoked to implement that operation should fail with an error.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CHECKACCESS (
   store_name     IN     VARCHAR2  DEFAULT NULL,
   path           IN     VARCHAR2,
   pathtype       IN     INTEGER,
   operation      IN     VARCHAR2,
   principal      IN     VARCHAR2)
  RETURN  INTEGER;
```

Parameters

Table 49–3 CHECKACCESS Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to check for access
`pathtype`	Type of object `path` represents (see DBMS_DBFS_CONTENT Constants - Path Name Types)
`operation`	Operation to be checked (see DBMS_DBFS_CONTENT Constants - Optional Properties)
`principal`	File system user for whom the access check is made

Usage Notes

Whether or not the user invokes this function, a store that supports access control internally performs these checks to guarantee security.

CREATEDIRECTORY Procedure

This procedure creates a directory.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATEDIRECTORY (
   store_name  IN              VARCHAR2,
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   prop_flags  IN              INTEGER,
   recurse     IN              INTEGER,
   ctx         IN              DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–4 CREATEDIRECTORY Procedure Parameters

Parameter	Description
store_name	Name of store
path	Name of path to the directory
properties	One or more properties and their values to be set, returned, or both, depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
prop_flags	Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting PROP_SPC (see DBMS_DBFS_CONTENT Constants - Property Access Flags), and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
recurse	If 0, do not execute recursively; otherwise, recursively create the directories above the given directory
ctx	Context with which to create the directory (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

CREATEFILE Procedure

This procedure creates a file.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATEFILE (
   store_name     IN              VARCHAR2,
   path           IN              VARCHAR2,
   properties     IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   content        IN OUT NOCOPY   BLOB,
   prop_flags     IN              INTEGER,
   ctx            IN              DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–5 CREATEFILE Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to the file
`properties`	One or more properties and their values to be set, returned or both depending, or both on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`content`	`BLOB` holding data with which to populate the file (optional)
`prop_flags`	Determines which properties are set, returned, or both. Default is `PROP_STD`. Specify properties to be returned by setting `prop_spec`, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
`ctx`	Context with which to create the file (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

CREATELINK Procedure

This procedure creates a physical link to an already existing file system element (such as file or directory). The resulting entry shares the same metadata structures as the value of the `srcPath` parameter, and so is similar to incrementing a reference count on the file system element. This is analogous to a UNIX file system hard link.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATELINK (
   store_name    IN              VARCHAR2,
   srcPath       IN              VARCHAR2,
   dstPath       IN              VARCHAR2,
   properties    IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   prop_flags    IN              INTEGER,
   ctx           IN              DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–6 CREATELINK Procedure Parameters

Parameter	Description
`store_name`	Name of store
`srcPath`	File system entry with which to link
`dstPath`	Path of the new link element to be created
`properties`	One or more properties and their values to be set, returned, or both, depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`prop_flags`	Determines which properties are set, returned, or both. Default is `PROP_STD`. Specify properties to be returned by setting `prop_spec`, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
`ctx`	Context with which to create the link (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

CREATEREFERENCE Procedure

This procedure creates a new reference to the source file system element (such as a file, or directory). The resulting reference points to the source element but does not directly share metadata with the source element. This is analogous to a UNIX file system symbolic link.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATEREFERENCE (
   srcPath       IN              VARCHAR2,
   dstPath       IN              VARCHAR2,
   properties    IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   prop_flags    IN              INTEGER,
   store_name    IN              VARCHAR2,
   ctx           IN              DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–7 CREATEREFERENCE Procedure Parameters

Parameter	Description
store_name	Name of store
srcPath	File system entry with which to link
dstPath	Path of the new link element to be created
properties	One or more properties and their values to be set, returned, or both, depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
prop_flags	Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
ctx	Context with which to create the reference (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

DELETECONTENT Procedure

This procedure deletes the file specified by the given contentID.

Syntax

```
DBMS_DBFS_CONTENT_SPI.DELETECONTENT (
   store_name     IN     VARCHAR2,
   contentID      IN     RAW,
   filter         IN     VARCHAR2,
   soft_delete    IN     INTEGER,
   ctx            IN     DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–8 DELETECONTENT Procedure Parameters

Parameter	Description
`store_name`	Name of store
`contentID`	Unique identifier for the file to be deleted
`filter`	A filter, if any, to be applied
`soft_delete`	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see *Oracle Database SecureFiles and Large Objects Developer's Guide*, Deletion Operations).
`ctx`	Context with which to delete the file (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

DELETEDIRECTORY Procedure

This procedure deletes a directory. If `recurse` is nonzero, it recursively deletes all elements of the directory. A filter, if supplied, determines which elements of the directory are deleted.

Syntax

```
DBMS_DBFS_CONTENT_SPI.DELETEDIRECTORY (
   store_name     IN     VARCHAR2,
   path           IN     VARCHAR2,
   filter         IN     VARCHAR2,
   soft_delete    IN     INTEGER,
   recurse        IN     INTEGER,
   ctx            IN     DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–9 DELETEDIRECTORY Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to the directory
`filter`	A filter, if any, to be applied
`soft_delete`	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see *Oracle Database SecureFiles and Large Objects Developer's Guide*, Deletion Operations).
`recurse`	If 0, do not execute recursively. Otherwise, recursively delete the directories and files below the given directory.
`ctx`	Context with which to delete the directory (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

DELETEFILE Procedure

This procedure deletes the specified file.

Syntax

```
DBMS_DBFS_CONTENT_SPI.DELETEFILE (
   store_name     IN     VARCHAR2,
   path           IN     VARCHAR2,
   filter         IN     VARCHAR2,
   soft_delete    IN     BOOLEAN,
   ctx            IN     DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–10 DELETEFILE Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to the file
`filter`	A filter, if any, to be applied
`soft_delete`	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see *Oracle Database SecureFiles and Large Objects Developer's Guide*, Deletion Operations).
`ctx`	Context with which to delete the file (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

GETFEATURES Function

This function returns the features of a store.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETFEATURES (
   store_name          IN      VARCHAR2)
  RETURN  INTEGER;
```

Parameters

Table 49–11 GETFEATURES Function Parameters

Parameter	Description
store_name	Name of store

Return Values

DBMS_DBFS_CONTENT.FEATURE_* features supported by the Store Provider

GETPATH Procedures

This procedure returns existing path items (such as files and directories). This includes both data and metadata (properties).

The client can request (using `prop_flags`) that specific properties be returned. File path names can be read either by specifying a `BLOB` locator using the `prop_data` bitmask in `prop_flags` (see DBMS_DBFS_CONTENT Constants - Property Access Flags) or by passing one or more `RAW` buffers.

When `forUpdate` is 0, this procedure also accepts a valid "as of" timestamp parameter as part of `ctx` that can be used by stores to implement "as of" style flashback queries. Mutating versions of the `GETPATH` Procedures do not support these modes of operation.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETPATH (
   store_name  IN              VARCHAR2,
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   content     OUT    NOCOPY   BLOB,
   item_type   OUT             INTEGER,
   prop_flags  IN              INTEGER,
   forUpdate   IN              INTEGER,
   deref       IN              INTEGER,
   ctx         IN              DBMS_DBFS_CONTENT_CONTEXT_T);

DBMS_DBFS_CONTENT_SPI.GETPATH (
   store_name  IN              VARCHAR2,
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   amount      IN OUT          NUMBER,
   offset      IN              NUMBER,
   buffer      OUT    NOCOPY   RAW,
   prop_flags  IN              INTEGER,
   ctx         IN              DBMS_DBFS_CONTENT_CONTEXT_T);

DBMS_DBFS_CONTENT_SPI.GETPATH (
   store_name  IN              VARCHAR2,
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   amount      IN OUT          NUMBER,
   offset      IN              NUMBER,
   buffers     OUT    NOCOPY   DBMS_DBFS_CONTENT_RAW_T,
   prop_flags  IN              INTEGER,
   ctx         IN              DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–12 GETPATH Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to path items
`properties`	One or more properties and their values to be returned depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)

Table 49–12 (Cont.) GETPATH Procedure Parameters

Parameter	Description
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see DBMS_DBFS_CONTENT Constants - Path Name Types)
amount	On input, number of bytes to be read. On output, number of bytes read
offset	Byte offset from which to begin reading
buffer	Buffer to which to write
buffers	Buffers to which to write
prop_flags	Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
forUpdate	Specifies that a lock should be taken to signify exclusive write access to the path item
deref	If nonzero, attempts to resolve the given path item to actual data provided it is a reference (symbolic link)
ctx	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

GETPATHBYSTOREID Function

If the underlying GUID is found in the underlying store, this function returns the store-qualified path name.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETPATHBYSTOREID (
   store_name          IN      VARCHAR2,
   guid                IN      INTEGER)
  RETURN VARCHAR2;
```

Parameters

Table 49–13 GETPATHBYSTOREID Function Parameters

Parameter	Description
store_name	Name of store
guid	Unique ID representing the desired path item

Return Values

Store-qualified path name represented by the GUID

Usage Notes

If the STD_GUID is unknown, a NULL value is returned. Clients are expected to handle this as appropriate.

GETPATHNOWAIT Procedure

This procedure implies that the operation is for an update, and, if implemented (see FEATURE_NOWAIT in DBMS_DBFS_CONTENT Constants - Store Features), allows providers to return an exception (ORA-00054) rather than wait for row locks.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETPATHNOWAIT (
   store_name  IN              VARCHAR2,
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   content     OUT    NOCOPY   BLOB,
   item_type   OUT             INTEGER,
   prop_flags  IN              INTEGER,
   deref       IN              INTEGER,
   ctx         IN              DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–14 GETPATHNOWAIT Procedure Parameters

Parameter	Description
store_name	Name of store
path	Name of path to path items
properties	One or more properties and their values to be returned depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see DBMS_DBFS_CONTENT Constants - Path Name Types)
prop_flags	Determines which properties are returned. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
deref	If nonzero, attempts to resolve the given path item to actual data provided it is a reference (symbolic link)
ctx	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

GETSTOREID Function

This function returns the ID of a store.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETSTOREID (
   store_name          IN      VARCHAR2)
  RETURN  NUMBER;
```

Parameters

Table 49–15 GETSTOREID Function Parameters

Parameter	Description
store_name	Name of store

Return Values

ID of the Store

Usage Notes

A store ID identifies a provider-specific store, across registrations and mounts, but independent of changes to the store contents. For this reason, changes to the store table or tables should be reflected in the store ID, but re-initialization of the same store table or tables should preserve the store ID.

GETVERSION Function

This function returns the version associated with a store.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETVERSION (
   store_name          IN      VARCHAR2)
  RETURN  VARCHAR2;
```

Parameters

Table 49–16 GETVERSION Function Parameters

Parameter	Description
store_name	Name of store

Return Values

A "version" (either specific to a provider package, or to an individual store) based on a standard *a.b.c* naming convention (for *major*, *minor*, and *patch* components)

LIST Function

This function lists the contents of a directory path name.

The invoker of the subprogram has the option to investigate recursively into sub-directories, to make soft-deleted items visible, to use a flashback "as of" a specified timestamp, and to filter items within the store based on list predicates.

Syntax

```
DBMS_DBFS_CONTENT_SPI.LIST (
   store_name    IN     VARCHAR2,
   path          IN     VARCHAR2,
   filter        IN     VARCHAR2,
   recurse       IN     INTEGER,
   ctx           IN     DBMS_DBFS_CONTENT_CONTEXT_T)
  RETURN  DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;
```

Parameters

Table 49–17 LIST Function Parameters

Parameter	Description
`store_name`	Name of repository
`path`	Name of path to directories
`filter`	A filter, if any, to be applied
`recurse`	If 0, do not execute recursively. Otherwise, recursively list the contents of directories and files below the given directory.
`ctx`	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

Return Values

Path items found that match the path, filter and criteria for executing recursively (see DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type)

Usage Notes

This function returns only list items; the client is expected to explicitly use one of the GETPATH Procedures to access the properties or content associated with an item.

LOCKPATH Procedure

This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

Syntax

```
DBMS_DBFS_CONTENT_SPI.LOCKPATH (
   store_name     IN     VARCHAR2,
   path           IN     VARCHAR2,
   lock_type      IN     INTEGER,
   lock_data      IN     VARCHAR2,
   ctx            IN     DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–18 LOCKPATH Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Path name of items to be locked
`lock_type`	One of the available lock types (see DBMS_DBFS_CONTENT Constants - Lock Types)
`lock_data`	Optional user data to be associated with the lock
`ctx`	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

Usage Notes

- It is the responsibility of the store and its providers (assuming it supports user-defined lock checking) to ensure that lock and unlock operations are performed in a consistent manner.
- The status of locked items is available by means of various optional properties (see `OPT_LOCK*` in DBMS_DBFS_CONTENT Constants - Optional Properties).

PURGEALL Procedure

This procedure purges all soft-deleted entries matching the path and optional filter criteria.

Syntax

```
DBMS_DBFS_CONTENT_SPI.PURGEALL (
   store_name     IN      VARCHAR2,
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2,
   ctx            IN      DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–19 PURGEALL Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to file items
`filter`	A filter, if any, to be applied based on specified criteria
`ctx`	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

PURGEPATH Procedure

This procedure purges any soft-deleted versions of the given path item.

Syntax

```
DBMS_DBFS_CONTENT_SPI.PURGEPATH (
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2,
   store_name     IN      VARCHAR2,
   ctx            IN      DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–20 PURGEPATH Procedure Parameters

Parameter	Description
store_name	Name of store
path	Name of path to file items
filter	A filter, if any, to be applied
ctx	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

PUTPATH Procedures

This procedure creates a new path item.

Syntax

```
DBMS_DBFS_CONTENT_SPI.PUTPATH (
   store_name    IN              VARCHAR2,
   path          IN              VARCHAR2,
   properties    IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   content       IN OUT NOCOPY   BLOB,
   item_type     OUT             INTEGER,
   prop_flags    IN              INTEGER,
   ctx           IN              DBMS_DBFS_CONTENT_CONTEXT_T);

DBMS_DBFS_CONTENT_SPI.PUTPATH (
   store_name    IN              VARCHAR2,
   path          IN              VARCHAR2,
   properties    IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   amount        IN              NUMBER,
   offset        IN              NUMBER,
   buffer        IN              RAW,
   prop_flags    IN              INTEGER,
   ctx           IN              DBMS_DBFS_CONTENT_CONTEXT_T);

DBMS_DBFS_CONTENT_SPI.PUTPATH (
   store_name    IN              VARCHAR2,
   path          IN              VARCHAR2,
   properties    IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   written       OUT             NUMBER,
   offset        IN              NUMBER,
   buffers       IN              DBMS_DBFS_CONTENT_RAW_T,
   prop_flags    IN              INTEGER,
   ctx           IN              DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–21 PUTPATH Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Path name of item to be put
`properties`	One or more properties and their values to be set depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`content`	`BLOB` holding data which populates the file (optional)
`item_type`	Type of the path item specified (see DBMS_DBFS_CONTENT Constants - Path Name Types)
`amount`	Number of bytes to be read
`written`	Number of bytes written
`offset`	Byte offset from which to begin reading
`buffer`	Buffer to which to write
`buffers`	Buffers to which to write

Table 49–21 (Cont.) PUTPATH Procedure Parameters

Parameter	Description
prop_flags	Determines which properties are set. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
ctx	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

Usage Notes

- All path names allow their metadata (properties) to be read and modified. On completion of the call, the client can access specific properties using prop_flags (see DBMS_DBFS_CONTENT Constants - Property Access Flags).
- On completion of the call, the client can request a new BLOB locator that can be used to continue data access using the prop_data bitmask in prop_flags (see DBMS_DBFS_CONTENT Constants - Property Access Flags).
- Files can also be written without using BLOB locators, by explicitly specifying logical offsets or buffer-amounts, and a suitably sized buffer.

RENAMEPATH Procedure

This procedure renames or moves a path. This operation can be performed across directory hierarchies and mount-points as long as it is within the same store.

Note: See *Oracle Database SecureFiles and Large Objects Developer's Guide* for further information on Rename and Move operations

Syntax

```
DBMS_DBFS_CONTENT_SPI.RENAMEPATH (
   store_name    IN              VARCHAR2,
   oldPath       IN              VARCHAR2,
   newPath       IN              VARCHAR2,
   properties    IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   ctx           IN              DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–22 RENAMEPATH Procedure Parameters

Parameter	Description
`store_name`	Name of store, must be unique
`oldPath`	Name of path prior to renaming
`newPath`	Name of path after renaming
`properties`	One or more properties and their values to be set depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`ctx`	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

RESTOREALL Procedure

This procedure restores all soft-deleted path items meeting the path and optional filter criteria.

Syntax

```
DBMS_DBFS_CONTENT_SPI.RESTOREALL (
   store_name     IN      VARCHAR2,
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2,
   ctx            IN      DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–23 RESTOREALL Procedure Parameters

Parameter	Description
store_name	Name of store
path	Name of path to path items
filter	A filter, if any, to be applied
ctx	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

RESTOREPATH Procedure

This procedure restores all soft-deleted path items that match the given path and optional filter criteria.

Syntax

```
DBMS_DBFS_CONTENT_SPI.RESTOREPATH (
   store_name     IN      VARCHAR2,
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2,
   ctx            IN      DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–24 RESTOREPATH Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to path items
`filter`	A filter, if any, to be applied
`ctx`	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

SEARCH Function

This function searches for path items matching the given path and filter criteria.

Syntax

```
DBMS_DBFS_CONTENT_SPI.SEARCH (
   store_name     IN      VARCHAR2,
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2,
   recurse        IN      INTEGER,
   ctx            IN      DBMS_DBFS_CONTENT_CONTEXT_T)
 RETURN  DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;
```

Parameters

Table 49–25 LIST Function Parameters

Parameter	Description
store_name	Name of store
path	Name of path to the path items
filter	A filter, if any, to be applied
recurse	If 0, do not execute recursively. Otherwise, recursively search the contents of directories and files below the given directory.
ctx	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

Return Values

Path items matching the given path and filter criteria (see DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type)

SETPATH Procedure

This procedure assigns a path name to a path item represented by contentID.

Stores and their providers that support contentID-based access and lazy path name binding also support the `SETPATH Procedure` that associates an existing `contentID` with a new path.

> **Note:** See *Oracle Database SecureFiles and Large Objects Developer's Guide* for further information on Rename and Move operations

Syntax

```
DBMS_DBFS_CONTENT_SPI.SETPATH (
   store_name    IN              VARCHAR2,
   contentID     IN              RAW,
   path          IN              VARCHAR2,
   properties    IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   ctx           IN              DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–26 SETPATH Procedure Parameters

Parameter	Description
`store_name`	Name of the store
`contentID`	Unique identifier for the item to be associated
`path`	Name of path to path item
`properties`	One or more properties and their values to be set depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`ctx`	Context with which to access the path items (seE DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

SPACEUSAGE Procedure

This procedure queries file system space usage statistics. Providers are expected to support this subprogram for their stores and to make a best effort determination of space usage, especially if the store consists of multiple tables, indexes, LOBs, and so on.

Syntax

```
DBMS_DBFS_CONTENT_SPI.SPACEUSAGE (
   store_name    IN        VARCHAR2,
   blksize       OUT       INTEGER,
   tbytes        OUT       INTEGER,
   fbytes        OUT       INTEGER,
   nfile         OUT       INTEGER,
   ndir          OUT       INTEGER,
   nlink         OUT       INTEGER,
   nref          OUT       INTEGER);
```

Parameters

Table 49–27 SPACEUSAGE Procedure Parameters

Parameter	Description
store_name	Name of store
blksize	Natural tablespace blocksize that holds the store. If multiple tablespaces with different blocksizes are used, any valid blocksize is acceptable.
tbytes	Total size of the store in bytes computed over all segments that comprise the store
fbytes	Free or unused size of the store in bytes computed over all segments that comprise the store
nfile	Number of currently available files in the store
ndir	Number of currently available directories in the store
nlink	Number of currently available links in the store
nref	Number of currently available references in the store

Usage Notes

- A space usage query on the top-level root directory returns a combined summary of the space usage of all available distinct stores under it (if the same store is mounted multiple times, it is still counted only once).
- Since database objects are dynamically expandable, it is not easy to estimate the division between "free" space and "used" space.

UNLOCKPATH Procedure

This procedure unlocks path items that were previously locked with the LOCKPATH Procedure.

Syntax

```
DBMS_DBFS_CONTENT_SPI.UNLOCKPATH (
   store_name     IN     VARCHAR2,
   path           IN     VARCHAR2,
   ctx            IN     DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49–28 UNLOCKPATH Procedure Parameters

Parameter	Description
store_name	Name of store
path	Name of path to the path items
ctx	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

50

DBMS_DBFS_HS

The Oracle Database File System Hierarchical Store is implemented in the `DBMS_DBFS_HS` package. This package provides users the ability to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management for their database tables.

See Also:

- *Oracle Database SecureFiles and Large Objects Developer's Guide*

This chapter contains the following topics:

Using DBMS_DBFS_HS

Overview

The DBMS_DBFS_HS package is a service provider underneath the DBMS_DBFS_CONTENT package that enables use of tape or Amazon S3 Web service as storage for data.

The data on tape or Amazon S3 Web service is part of the Oracle Database and can be accessed through all standard interfaces, but only through the database. The package allows users to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management of their content.

The package initially stores all content files in level-1 cache. As the level-1 cache fills up, content files are moved to level-2 cache and then to an external storage device using bulk writes.

Security Model

The DBMS_DBFS_HS package runs with invoker's rights.

Constants

The DBMS_DBFS_HS package uses the constants shown in following tables:

- DBMS_DBFS_HS Constants - Used by the CREATESTORE Procedure
- DBMS_DBFS_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function
- DBMS_DBFS_HS Constants - Used by the REGISTERSTORECOMMAND Function
- DBMS_DBFS_HS Constants - Failure/Success/Error

Table 50–1 DBMS_DBFS_HS Constants - Used by the CREATESTORE Procedure

Constant	Type	Value	Description
STORETYPE_TAPE	VARCHAR2(50)	'HS_TAPE'	Use tape as a storage tier
STORETYPE_ AMAZONS3	VARCHAR2(50)	'HS_S3'	Use Amazon S3 Web service as a storage tier

Table 50–2 DBMS_DBFS_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function

Constant	Type	Value	Description
PROPNAME_BUCKET	VARCHAR2(50)	'BUCKET'	Specifies the AWS bucket to be used as a storage tier by the Hierarchical Store. Restrictions on bucket name are: 1) Bucket names can only contain lowercase letters, numbers, periods (.) and dashes(-). Note that underscores (_) are invalid. 2) Bucket names must start with a number or letter. 3) Bucket names cannot be in an IP address style (192.168.5.4). 4) Bucket names must be between 3 and 63 characters long. 5) Bucket names should not end with a dash. 6) Dashes cannot appear next to periods. For example, my-.bucket.com is invalid.
PROPNAME_ CACHESIZE	VARCHAR2(50)	'CACHE_SIZE'	Specifies the cumulative cache size used for the Hierarchical Store. This property is set by the CREATESTORE Procedure and can be modified by the RECONFIGCACHE Procedure. It cannot be modified by the SETSTOREPROPERTY Procedure, though its value can be queried by the GETSTOREPROPERTY Function.

Table 50–2 (Cont.) DBMS_DBFS_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function

Constant	Type	Value	Description
PROPNAME_ COMPRESSLEVEL	VARCHAR2(50)	'COMPRESSION_ LEVEL'	Use to enable compression of files stored in the DBFS hierarchical store. It specifies the compression level to be used for compressing the files
PROPNAME_ ENABLECLEANUPOND ELETE	VARCHAR2(50)	'ENABLE_ CLEANUP_ON_ DELETE'	If this property is set to 'TRUE', whenever the user invokes the DELETEFILE Procedure in the DBMS_DBFS_CONTENT interface on a file residing in the DBMS_DBFS_ HS store, the DBMS_DBFS_HS removes the file on the external storage that contains this user file, provided that the file has no other useful data.By default, the property is set to 'TRUE' for STORETYPE_AMAZONS3 and 'FALSE' for STORETYPE_TAPE.
PROPNAME_ HTTPPROXY	VARCHAR2(50)	'HTTP_PROXY'	Specifies the DNS name of the HTTP proxy, if any, that is needed to access the Amazon S3 storage service
PROPNAME_ LICENSEID	VARCHAR2(50)	'LICENSE_ID'	Specifies the license ID associated with the library libosbws11.so.
PROPNAME_ LOBCACHE_QUOTA	VARCHAR2(50)	'LOBCACHE_ QUOTA'	Specifies fraction of the cache_size which is allocated for level 1 cache. The default value of this parameter is NULL which means that 0.8 (= 80%) of the cache_size is used for level 1 cache. This property cannot be modified by the SETSTOREPROPERTY Procedurethough its value can be queried by the GETSTOREPROPERTY Function. Its value is set by CREATESTORE Procedure and can be modified by the RECONFIGCACHE Procedure.
PROPNAME_ MEDIAPOOL	VARCHAR2(50)	'MEDIA_POOL'	Specifies the media pool number to use for storing the content
PROPVAL_COMPLVL_ NONE	VARCHAR2(50)	'NONE'	Indicates no compression
PROPVAL_COMPLVL_ LOW	VARCHAR2(50)	'LOW'	Use to set the compression level to LOW. This is expected to have the best performance while still providing a good compression ratio.
PROPVAL_COMPLVL_ MEDIUM	VARCHAR2(50)	'MEDIUM'	Use to set the compression level to MEDIUM. This compression level is expected to provide better compression ratio than LOW but the time required for compression will be higher than compression level LOW.

Table 50–2 (Cont.) DBMS_DBFS_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function

Constant	Type	Value	Description
PROPVAL_COMPLVL_HIGH	VARCHAR2(50)	'HIGH'	Use to set the compression level to HIGH. This compression level is expected to provide the best compression ratio but compression time will in general be highest among the 3 compression levels.
PROPNAME_OPTTARBALLSIZE	VARCHAR2(50)	'OPTIMAL_TARBALL_SIZE'	Specifies optimal_tarball_size as the maximum possible size of an archive file. Multiple content files are bundled together into one archive file and then the archive file is transferred to tape or Amazon S3. This is because creating one file on tape or Amazon S3 for every content file in the store is a prohibitively expensive operation. This property cannot be modified by the SETSTOREPROPERTY Procedurethough its value can be queried by the GETSTOREPROPERTY Function. Its value is set by CREATESTORE Procedure and can be modified by the RECONFIGCACHE Procedure.
PROPNAME_READCHUNKSIZE	VARCHAR2(50)	'READ_CHUNK_SIZE'	Specifies the size used by the SBT protocol to transfer data from tape or S3.This chunk is allocated in memory per transaction for retrieval of content files from an archive store, so the value of this property should be conservative. The default size of 1MB is typically good for most users.
PROPNAME_S3HOST	VARCHAR2(50)	'S3_HOST'	Specifies the HOST name of the Amazon S3 storage service. It must be s3.amazonaws.com.
PROPNAME_SBT_LIBRARY	VARCHAR2(50)	'SBT_LIBRARY'	Specifies the path of the shared library used by RMAN to communicate with Amazon S3. It is named libosbws11.so and is available in rdbms/lib directory.
PROPNAME_STREAMABLE	VARCHAR2(50)	'STREAMABLE'	Indicates whether buffer-based PUT or GET should be done on this store. Valid values for are TRUE and FALSE. The default value of this property is TRUE.

Table 50–2 (Cont.) DBMS_DBFS_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function

Constant	Type	Value	Description
PROPNAME_WALLET	VARCHAR2(50)	'WALLET'	The value of this property should be of the form: LOCATION=file:*filename* CREDENTIAL_ALIAS=*access/secret_alias* PROXY_AUTH_ALIAS=*proxyusername/password alias* Defines the Oracle Wallet which contains the credentials of the Amazon S3 account associated with the store under consideration. LOCATION: The directory path that contains the Oracle wallet. The format is file:*directory-path* The format of wallet_path in Windows is, for example: file:c:\WINNT\Profiles*username*\WALLETS In UNIX or Linux it is, for example: file:/home/*username*/wallets When the package is executed in the Oracle database server, the wallet is accessed from the database server. PASSWORD: Defines the wallet password. If auto-login is enabled in wallet (this can be changed using the OWM utility), this parameter does not have to be specified. By default, the mkstore utility enables auto-login. CREDENTIAL_ALIAS: Defines the credential alias for ACCESS_KEY and SECRET_KEY
PROPNAME_WRITECHUNKSIZ	VARCHAR2(50)	'WRITE_CHUNK_SIZE'	Specifies the size used by the SBT protocol to transfer data to tape or S3. This chunk is allocated in memory per transaction for PUT of Content Files to an archive store so the value should be conservative. The default size of 1MB is typically good for most users.

Table 50–3 DBMS_DBFS_HS Constants - Used by the REGISTERSTORECOMMAND Function

Constant	Type	Value	Description
BEFORE_PUT	NUMBER	'1'	Specified operation must be performed before writing a SECUREFILE to the remote store

Table 50–3 (Cont.) DBMS_DBFS_HS Constants - Used by the REGISTERSTORECOMMAND Function

Constant	Type	Value	Description
BEFORE_GET	NUMBER	'2'	Specified operation must be performed before a retrieval operation such as reading a SECUREFILE from the remote device

Table 50–4 DBMS_DBFS_HS Constants - Failure/Success/Error

Constant	Type	Value	Description
FAIL	NUMBER	'0'	Procedure or function did not execute successfully
SUCCESS	NUMBER	'1'	Procedure or function completed successfully
ERROR	NUMBER	'2'	Procedure or function returned an error

Operational Notes

When the DBMS_DBFS_HS package is executed in the Oracle database server, the wallet is accessed from the database server.

Summary of DBMS_DBFS_HS Subprograms

Table 50–5 DBMS_DBFS_HS Package Subprograms

Subprogram	Description
CLEANUPUNUSEDBACKUPFILES Procedure on page 50-12	Removes files created on the external storage device that hold no currently used data
CREATEBUCKET Procedure on page 50-13	Creates an AWS bucket, associated with a store of type `STORETYPE_AMAZONS3` into which the Hierarchical Store can then move data
CREATESTORE Procedure on page 50-14	Creates a new hierarchical store
DEREGSTORECOMMAND Function on page 50-16	Removes a command that had been previously associated with a store through the RECONFIGCACHE Procedure
DROPSTORE Procedure on page 50-16	Deletes a previously created hierarchical store
FLUSHCACHE Procedure on page 50-18	Flushes (writes out) dirty contents from the level-1 cache.
GETSTOREPROPERTY Function on page 50-19	Retrieves the values of a property of a store
RECONFIGCACHE Procedure on page 50-20	Reconfigures the parameters of the database cache used by the store
REGISTERSTORECOMMAND Procedure on page 50-21	Registers commands for a store with the Hierarchical Store to be sent to the Media Manager for the external storage device associated with the store
SENDCOMMAND Procedures on page 50-22	Sends a command to be executed on the external storage device's Media Manager
SETSTOREPROPERTY Procedure on page 50-23	Stores properties of a store in the database
STOREPUSH Procedure on page 50-26	Pushes locally staged data to the remote storage

CLEANUPUNUSEDBACKUPFILES Procedure

This procedure removes files created on the external storage device that hold no currently used data in them.

Syntax

```
DBMS_DBFS_HS.CLEANUPUNUSEDBACKUPFILES (
   store_name     IN     VARCHAR2);
```

Parameters

Table 50–6 CLEANUPUNUSEDBACKUPFILES Procedure Parameters

Parameter	Description
store_name	Name of store

Usage Notes

- The action of removing files from external storage device can not be rolled back.
- This method can be executed periodically to clear space on the external storage device. Asynchronously deleting content from the external storage device is useful because it has minimal impact on the OLTP performance. The periodic scheduling can be accomplished using the DBMS_SCHEDULER package.

CREATEBUCKET Procedure

This procedure creates an AWS bucket, associated with a store of type STORETYPE_AMAZONS3 into which the Hierarchical Store can then move data.

Syntax

```
DBMS_DBFS_HS.CREATEBUCKET  (
   store_name    IN     VARCHAR2);
```

Parameters

Table 50–7 CREATEBUCKET Procedure Parameters

Parameter	Description
store_name	Name of store

Usage Notes

- The PROPNAME_BUCKET property of the store should be set before this subprogram is called.
- Once this procedure has successfully created a bucket in Amazon S3, the bucket can only be deleted using out-of-band methods, such as logging-in to S3 and deleting data (directories, files, and other items) for the bucket.

CREATESTORE Procedure

This procedure creates a new hierarchical store `store_name` of type `STORE_TYPE` (`STORETYPE_TAPE` or `STORETYPE_AMAZONS3`) in schema `schema_name` (defaulting to current schema) under the ownership of the invoking session user.

Syntax

```
DBMS_DBFS_HS.CREATESTORE  (
   store_name              IN     VARCHAR2,
   store_type              IN     VARCHAR2,
   tbl_name                IN     VARCHAR2,
   tbs_name                IN     VARCHAR2,
   cache_size              IN     NUMBER,
   lob_cache_quota         IN     NUMBER DEFAULT NULL,
   optimal_tarball_size    IN     NUMBER DEFAULT NULL,
   schema_name             IN     VARCHAR2 DEFAULT NULL);
```

Parameters

Table 50–8 CREATESTORE Procedure Parameters

Parameter	Description
`store_name`	Name of store
`store_type`	`STORETYPE_TAPE` or `STORETYPE_AMAZONS3`
`tbl_name`	Table for store entries
`tbs_name`	Tablespace for the store
`cache_size`	Amount of space used by the store to cache content in given tablespace
`lob_cache_quota`	Fraction of the cache_size which is allocated for level 1 cache. The default value of this parameter is `NULL` which means that 0.8 (= 80%) of the `cache_size` is used for level 1 cache.
`optimal_tarball_size`	Maximum possible size of the archive file. Multiple content files are bundled together into one archive file, and then the archive file is transferred to tape or Amazon S3. This is because creating one file on tape or Amazon S3 for every content file in the store is a prohibitively expensive operation. The value of is set by default to 10GB for tape and to 100MB for Amazon S3.
`schema_name`	Schema for the store

Usage Notes

`CREATESTORE()` sets certain properties of the store to default values. The user can use the methods `SETSTOREPROPERTY()` and `RECONFIGCACHE()` to appropriately change the property values and to set other properties of the store.

- Store names must be unique for an owner. The same store names can be used for different stores owned by different owners.
- Once a table space has been specified to store the store's content in a database, it cannot be changed later.

- This subprogram will execute like a DDL statement, performing an automatic `COMMIT` before and after execution.
- Stores using `DBMS_DBFS_HS` must not use singleton mount. This means that the singleton parameter should be `FALSE` and the `store_mount` parameter should have a non-`NULL` value in a call to the `DBMS_DBFS_CONTENT.MOUNTSTORE` procedure.

DEREGSTORECOMMAND Function

This procedure removes a command that had been previously associated with a store through the REGISTERSTORECOMMAND Procedure.

Syntax

```
DBMS_DBFS_HS.DEREGSTORECOMMAND (
   store_name      IN     VARCHAR2,
   message         IN     VARCHAR2);
```

Parameters

Table 50–9 DEREGSTORECOMMAND Procedure Parameters

Parameter	Description
store_name	Name of store
message	Message to be deregistered

Usage Notes

If this subprogram successfully executes, its actions cannot be rolled back by the user. If the user wants to restore the previous state, the user must call the REGISTERSTORECOMMAND Procedure.

DROPSTORE Procedure

This procedure deletes a previously created hierarchical store specified by name and owned by the invoking session user.

Syntax

```
DBMS_DBFS_HS.DROPSTORE  (
   store_name   IN     VARCHAR2,
   opt_flags    IN     INTEGER DEFAULT 0);
```

Parameters

Table 50–10 DROPSTORE Procedure Parameters

Parameter	Description
store_name	Name of store owned by the invoking session user
opt_flags	User can specify optional flags. If DISABLE_CLEANUPBACKUPFILES is specified as one of the optional flags, the call to the CLEANUPUNUSEDBACKUPFILES Procedure is not issued. By default, when this flag is not set, the procedure implicitly cleans-up all unused backup files.

Usage Notes

- The procedure executes like a DDL in that it auto-commits before and after its execution.
- If CLEANUPBACKUPFILES is disabled during the procedure, the user must resort to out-of-band techniques to cleanup unused backup files. No further invocations of CLEANUPBACKFILES for a dropped store are possible through hierarchical store.
- This subprogram will un-register the store from DBMS_DBFS_CONTENT package. All files in the given store are deleted from the store (Tape or Amazon S3 Web service). The database table holding the store's entries in the database, is also dropped by this subprogram.

FLUSHCACHE Procedure

This procedure flushes out dirty contents from level-1 cache, which can be locked, to level-2 cache, thereby freeing-up space in level 1 cache.

Syntax

```
DBMS_DBFS_HS.FLUSHCACHE  (
   store_name    IN     VARCHAR2);
```

Parameters

Table 50–11 FLUSHCACHE Procedure Parameters

Parameter	Description
store_name	Name of store

GETSTOREPROPERTY Function

This function retrieves the values of a property.

Syntax

```
DBMS_DBFS_HS.GETSTOREPROPERTY  (
   store_name      IN     VARCHAR2,
   property_name   IN     VARCHAR2,
   noexcp          IN     BOOLEAN DEFAULT FALSE) RETURN VARCHAR2;
```

Parameters

Table 50–12 GETSTOREPROPERTY Function Parameters

Parameter	Description
store_name	Name of store
property_name	Name of property
noexcp	If set to FALSE, raises an exception if the property does not exist in the database. If noexcp is set to TRUE, returns NULL if the property does not exist.

Return Values

The values of a property.

Usage Notes

The specified store must already have been created.

RECONFIGCACHE Procedure

This procedure reconfigures the parameters of the database cache being used by the store.

Syntax

```
DBMS_DBFS_HS.RECONFIGCACHE (
   store_name              IN    VARCHAR2,
   cache_size              IN    NUMBER DEFAULT NULL,
   lobcache_quota          IN    NUMBER DEFAULT NULL,
   optimal_tarball_size    IN    NUMBER DEFAULT NULL);
```

Parameters

Table 50–13 RECONFIGCACHE Procedure Parameters

Parameter	Description
`store_name`	Name of store
`cache_size`	Cumulative cache size used for the Hierarchical Store
`lobcache_quota`	Fraction of the cache size that are assigned to level 1 cache
`optimal_tarball_size`	Maximum possible size of an archive file. Since creating one file for every content file in the store is a prohibitively expensive operation, multiple content files are bundled together into one archive file for transfer to tape or Amazon S3.

Usage Notes

- The specified store must already have been created before reconfiguration.
- The Hierarchical Store uses a level 1 cache and a level 2 cache. The level 1 cache subsumes most of the working set and the level 2 cache is used to perform bulk writes to the backend device.
- If any of the last 3 parameters is `NULL`, its value specified during store creation is used. If the parameter was `NULL` when the call to the CREATESTORE Procedure was issued, the `DBMS_DBFS_HS` package assigns a default value.

  The `DBMS_DBFS_HS` package optimistically tries to allocate more than 1 tarball's worth of size for level 2 cache to facilitate concurrency, though a minimum of 1 tarball size is necessary for level 2 cache.

  The values for cumulative cache size and LOB cache quota decide allocation of space for the two caches. If values are not provided, a user might see an `INSUFFICIENT_CACHE` exception. In that case, it is better to revise the cache parameters in order to have a working store.
- If this subprogram successfully executes, its actions cannot be rolled back by the user. In that case, the user should call `RECONFIGCACHE` again with new or modified parameters.

REGISTERSTORECOMMAND Procedure

This procedure registers commands for a store with the Hierarchical Store. These commands are sent to the Media Manager for the external storage device associated with the store.

Syntax

```
DBMS_DBFS_HS.REGISTERSTORECOMMAND (
   store_name      IN     VARCHAR2,
   message         IN     VARCHAR2,
   flags           IN     NUMBER);
```

Parameters

Table 50–14 REGISTERSTORECOMMAND Procedure Parameters

Parameter	Description
store_name	Name of store
message	Message to be sent to the Media Manager of the external store
flags	Valid values: ■ BEFORE_PUT CONSTANT NUMBER := 1; ■ BEFORE_GET CONSTANT NUMBER := 2;

Usage Notes

- These commands are sent before the next read or write of content. When the Hierarchical Store wants to push (or get) data to (or from) the storage device, it begins a session (to communicate with the device). After beginning the session, it sends all registered commands for the to the relevant device before writing (or getting) any data.
- If this method successfully executes, its actions cannot be rolled back by the user. To restore the previous state the user must call the DEREGSTORECOMMAND Function.

SENDCOMMAND Procedures

This procedure sends a command to be executed on the external storage device's Media Manager.

Syntax

```
DBMS_DBFS_HS.SENDCOMMAND (
   store_name    IN       VARCHAR2,
   message       IN       VARCHAR2);
```

Parameters

Table 50–15 SENDCOMMAND Procedure Parameters

Parameter	Description
`store_name`	Name of store
`message`	Message string to be executed

SETSTOREPROPERTY Procedure

This procedure stores properties of a store in the database as name-value pairs.

Syntax

```
DBMS_DBFS_HS.SETSTOREPROPERTY  (
   store_name      IN     VARCHAR2,
   property_name   IN     VARCHAR2,
   property_value  IN     VARCHAR2);
```

Parameters

Table 50–16 SETSTOREPROPERTY Procedure Parameters

Parameter	Description
store_name	Name of store
property_name	For a store using Tape device, there are three properties whose values must be set by the user, and four properties that have default values. Stores of type STORETYPE_AMAZONS3 have properties with default values. The various options for both types of stores are detailed under property_value.
property_value	**Stores using a Tape Device** The values for the following properties must be set by the user: ■ PROPNAME_SBTLIBRARY - This should point to the shared library used by RMAN to communicate with the external tape device. It is usually named libobk.so. ■ PROPNAME_MEDIAPOOL - Media pool number for storing content ■ PROPNAME_CACHE_SIZE - Amount of space, in bytes, used for the cache of this store The following properties, which have default values assigned to them when a store is created, benefit from tuning: ■ PROPNAME_READCHUNKSIZE and PROPNAME_WRITECHUNKSIZE - These are the sizes used by the SBT protocol to transfer data to and from the tapes. These chunks are allocated in memory per transaction, so the values should be conservative. The default size is 1MB. ■ PROPNAME_STREAMABLE – Indicates whether DBFS_LINKs can perform read operations (for example SELECT or DBMS_LOB.READ) directly from the store, or if the data must be copied back into the database before it can be read ■ PROPNAME_ENABLECLEANUPONDELETE - Indicates if DBMS_DBFS_HS should delete unused files on the external storage. Valid values for this property are 'FALSE' for STORETYPE_TAPE. ■ PROPNAME_COMPRESSLEVEL - Describes how files written to Tape should be compressed. It can be set to PROPVAL_COMPLVL_NONE, PROPVAL_COMPLVL_LOW, PROPVAL_COMPLVL_MEDIUM or PROPVAL_COMPLVL_HIGH. By default it is set to PROPVAL_COMPLVL_NONE.

Table 50–16 (Cont.) SETSTOREPROPERTY Procedure Parameters

Parameter	Description
(cont) property_value	**Stores of type STORETYPE_AMAZONS3** It is mandatory that the following properties have assigned values, and default values are provided: ■ PROPNAME_SBTLIBRARY - Specifies the path of the shared library used by RMAN to communicate with Amazon S3. It is named libosbws11.so and is available in rdbms/lib directory. ■ PROPNAME_S3HOST - Defines the HOST name of the Amazon S3 storage service. It must be s3.amazonaws.com. ■ PROPNAME_BUCKET - Defines the AWS bucket used as a storage tier by the Hierarchical Store. Restrictions on bucket names are: -- Bucket names can only contain lowercase letters, numbers, periods (.) and dashes (-). Use of an underscore (_) is invalid. -- Bucket names must start with a number or letter -- Bucket names cannot be in an IP address style ("192.168.5.4") -- Bucket names must be between 3 and 63 characters in length -- Bucket names should not end with a dash -- Dashes cannot appear next to periods. For example, "my-.bucket.com" is invalid. ■ PROPNAME_LICENSEID - Specifies the license ID associated with the library libosbws11.so. ■ PROPNAME_WALLET - Has the form: 'LOCATION=file:<filename> CREDENTIAL_ALIAS=<access/secret_alias> PROXY_AUTH_ALIAS=<proxyusername/password alias>' -- LOCATION - Directory path that contains the Oracle wallet. The format is file:*directory-path*. See Examples for variations in format. -- PASSWORD - Defines the wallet password. If auto-login is enabled in the wallet (this can be changed using the user's own utility), and does not have to be specified. By default, the mkstore utility enables auto-login. -- CREDENTIAL_ALIAS - Defines the credential alias for ACCESS_KEY and SECRET_KEY -- PROXY_AUTH_ALIAS - Defines authentication credentials for the proxy server, if applicable.

Table 50–16 (Cont.) SETSTOREPROPERTY Procedure Parameters

Parameter	Description
(property_value (contd.)	The following properties are optional: ■ PROPNAME_HTTPPROXY - Defines the DNS name of the HTTP proxy, if any, that is needed to access the Amazon S3 storage service. ■ PROPNAME_STREAMABLE – Indicates whether buffer-based PUT or GET operation should be done on this store. Valid values for this property are TRUE (default) and FALSE. ■ PROPNAME_ENABLECLEANUPONDELETE - Indicates if DBMS_DBFS_HS should delete unused files on the external storage device. Default values for this property are FALSE for STORETYPE_TAPE and TRUE for STORETYPE_AMAZONS3. ■ PROPNAME_COMPRESSLEVEL - Describes how files written to tape should be compressed. It can be set to PROPVAL_COMPLVL_NONE, PROPVAL_COMPLVL_LOW, PROPVAL_COMPLVL_MEDIUM or PROPVAL_COMPLVL_HIGH. By default it is set to PROPVAL_COMPLVL_NONE.

Usage Notes

- The specified store must already have been created.
- If this subprogram successfully executes, its actions cannot be rolled back by the user.
- The same property can be set multiple times to the same or different values using this subprogram
- Regarding PROPNAME_ENABLECLEANUPONDELETE behavior, a job is created for each store by the DBMS_DBFS_HS to remove the unused files from the external storage. By default, the job is enabled for STORETYPE_AMAZONS3 and is disabled for STORETYPE_TAPE. If the ENABLECLEANUPONDELETE property is set to TRUE, the job is enabled; if the property is set to FALSE, the job is disabled. If enabled, the job runs at an interval of one hour by default. The DBMS_SCHEDULER package can be used to modify the schedule. The name of the job can be obtained by querying USER_DBFS_HS_FIXED_PROPERTIES for prop_name = 'DELJOB_NAME'.

Examples

Format

The format of wallet_path in Windows is, for example:

```
file:c:\WINNT\Profiles\<username>\WALLETS
```

The format of wallet_path in UNIX or Linux is, for example:

```
file:/home/username/wallets
```

STOREPUSH Procedure

This procedure pushes locally staged data to the remote storage.

Syntax

```
DBMS_DBFS_HS.STOREPUSH (
   store_name   IN        VARCHAR2,
   path         IN        VARCHAR2 DEFAULT NULL);
```

Parameters

Table 50–17 STOREPUSH Procedure Parameters

Parameter	Description
store_name	Name of store whose content the client writes from local cache to the external store
path	A non-mount qualified (without mount point) path within the store. By default, its value is NULL which corresponds to the root path of the store.

Usage Notes

- The Hierarchical Store caches the content files locally in database tables. When enough content is amassed in the cache to make it efficient to write to the external storage device (or the cache is completely filled), the Hierarchical Store creates a tarball out of the local content and writes these tarballs as files on the external device. The size of the tarball created by the Hierarchical Store is controlled by the store property PROPNAME_OPTTARBALLSIZE.
- When the amount of free space in the cache is such that the caching of a content file will push the space used above cache_size, the Hierarchical Store will internally call STOREPUSH. The STOREPUSH Procedure creates tarball(s) out of the existing dirty or modified content files in the cache and writes them out to the external device. A STOREPUSH call is not guaranteed to write all the dirty content from local cache to the external storage, since some files may be locked by other sessions.
- STOREPUSH has a built-in ability feature allowing it to automatically resume operation. If a STOREPUSH call is interrupted (say by a network outage) after it has transferred some tarballs to the external device, it can be restarted after the outage and will then resume transferring data from the point it was interrupted. In other words, work done before the outage is not lost. STOREPUSH can safely be restarted and the effect is such as if the outage never occurred.
- If this method successfully executes, its actions cannot be rolled back by the user.
- By default, when path is NULL, all files in the store are candidates for STOREPUSH. If path has a valid input value, all files which are under the namespace of given path are written from the local cache to the external store. If a given path is an existing file, it is pushed out again to the remote store.

51

DBMS_DBFS_SFS

The DBMS_DBFS_SFS package provides an interface to operate a SecureFile-based store (SFS) for the content interface described in the DBMS_DBFS_CONTENT package.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

This chapter contains the following topics:

Using DBMS_DBFS_SFS

Overview

The DBMS_DBFS_SFS package is a sample implementation of a package that implements and extends the DBMS_DBFS_CONTENT_SPI interface. It provides a POSIX-compliant file system stored in the RDBMS.

Security Model

The DBMS_DBFS_SFS package runs with AUTHID CURRENT_USER.

Constants

The DBMS_DBFS_SFS package uses the constants shown in following tables:

- DBMS_DBFS_SFS Constants - Compression Levels
- DBMS_DBFS_SFS Constants - Used by the encryption Parameter
- DBMS_DBFS_SFS Constants - Used by the npartitions Parameter
- DBMS_DBFS_SFS Constants - Used by the partition_key Parameter

Table 51–1 DBMS_DBFS_SFS Constants - Compression Levels

Constant	Type	Value	Description
COMPRESSION_DEFAULT	VARCHAR2(32)	''	Use the default SecureFile compression level
COMPRESSION_LOW	VARCHAR2(32)	'LOW'	Use compression level 'LOW'
COMPRESSION_MEDIUM	VARCHAR2(32)	'MEDIUM'	Use compression level 'MEDIUM'
COMPRESSION_HIGH	VARCHAR2(32)	'HIGH'	Use compression level 'HIGH'

Table 51–2 DBMS_DBFS_SFS Constants - Used by the encryption Parameter

Constant	Type	Value	Description
ENCRYPTION_DEFAULT	VARCHAR2(32)	''	Use the default SecureFile encryption algorithm
ENCRYPTION_3DES168	VARCHAR2(32)	'3DES168'	Use encryption 3DES 168 bit
ENCRYPTION_AES128	VARCHAR2(32)	'AES128'	Use encryption AES 128 bit
ENCRYPTION_AES192	VARCHAR2(32)	'AES192'	Use encryption AES 192 bit
ENCRYPTION_AES256	VARCHAR2(32)	'AES256'	Use encryption AES 256 bit

Table 51–3 DBMS_DBFS_SFS Constants - Used by the npartitions Parameter

Constant	Type	Value	Description
DEFAULT_PARTITIONS	INTEGER	16	Default to 16 partitions

Table 51–4 DBMS_DBFS_SFS Constants - Used by the partition_key Parameter

Constant	Type	Value	Description
PARTITION_BY_ITEM	INTEGER	1	Use a hash of the item name for the partition key
PARTITION_BY_PATH	INTEGER	2	Use a hash of the path name for the partition key
PARTITION_BY_GUID	INTEGER	3	Use a hash of the GUID as the partition key

Summary of DBMS_DBFS_SFS Subprograms

Table 51–5 DBMS_DBFS_SFS Package Subprograms

Subprogram	Description
CREATEFILESYSTEM Procedure on page 51-7	Creates a file system store
CREATESTORE Procedure on page 51-9	Creates a new DBFS SFS store
DROPFILESYSTEM Procedures on page 51-10	Drops the DBFS SFS store
INITFS Procedure on page 51-11	Initializes a POSIX file system store

CREATEFILESYSTEM Procedure

This procedure creates a file system store.

Syntax

```
DBMS_DBFS_SFS.CREATEFILESYSTEM (
   store_name          IN     VARCHAR2,
   schema_name         IN     VARCHAR2    DEFAULT NULL,
   tbl_name            IN     VARCHAR2    DEFAULT NULL,
   tbl_tbs             IN     VARCHAR2    DEFAULT NULL,
   lob_tbs             IN     VARCHAR2    DEFAULT NULL,
   use_bf              IN     BOOLEAN     DEFAULT FALSE,
   properties          IN     DBMS_DBFS_CONTENT_PROPERTIES_T DEFAULT NULL,
   create_only         IN     BOOLEAN     FALSE,
   use_objects         IN     BOOLEAN     DEFAULT FALSE,
   with_grants         IN     BOOLEAN     DEFAULT FALSE,
   do_dedup            IN     BOOLEAN     DEFAULT FALSE,
   do_compress         IN     BOOLEAN     DEFAULT FALSE
   compression         IN     VARCHAR2    DEFAULT COMPRESSION_DEFAULT,
   do_encrypt          IN     BOOLEAN     DEFAULT FALSE,
   encryption          IN     VARCHAR2    DEFAULT ENCRYPTION_DEFAULT,
   do_partition        IN     BOOLEAN     DEFAULT FALSE,
   npartitions         IN     NUMBER      DEFAULTDEFAULT_PARTITIONS,
   partition_key       IN     NUMBER      DEFAULT PARTITION_BY_ITEM,
   partition_guidi     IN     BOOLEAN     DEFAULT FALSE,
   partition_pathi     IN     BOOLEAN     DEFAULT FALSE,
   partition_prop      IN     BOOLEAN     DEFAULT TRUE);
```

Parameters

Table 51–6 CREATEFILESYSTEM Procedure Parameters

Parameter	Description
store_name	Name of store
schema_name	Schema for the store, defaulting to the current schema
tbl_name	Table for store entries. If not specified, an internally generated name is used.
tbl_tb	Tablespace for the store, defaulting to the schema's default tablespace
lob_tbs	Tablespace in which to create the LOB segment. It defaults to the user's default tablespace.
use_bf	If TRUE, a BasicFile LOB is used; otherwise a SecureFile LOB is used.
properties	Table of (name, value, typecode) tuples used to configure the store properties. Currently no such properties are defined or used.
create_only	If TRUE, the file system is created, but not registered with the current user
use_objects	If TRUE, a single base-table with an object-type column (using a nested table) is created to backup the new file system. Otherwise, a pair of (parent, child) tables is used to backup the file system. In both cases, the object type nested table or the child table is used only for user-defined properties.

Table 51–6 (Cont.) CREATEFILESYSTEM Procedure Parameters

Parameter	Description
with_grants	If TRUE, DML and query access permissions are granted to the DBFS_ROLE as part of creating the file system. Otherwise, explicit grants (or existing permissions) are required to access the file system.
do_dedup	If TRUE, do deduplication the underlying SecureFile column
do_compress	If TRUE, do compression the underlying SecureFile column
compression	Compression algorithm to use (see DBMS_DBFS_SFS Constants - Compression Levels)
do_encrypt	If TRUE, encrypt the underlying SecureFile column
encryption	encryption algorithm to use (see DBMS_DBFS_SFS Constants - Used by the encryption Parameter)
do_partition	If TRUE, partition the table used for storage
npartitions	Number of partitions to create for the table (see DBMS_DBFS_SFS Constants - Used by the npartitions Parameter).
partition_key	How to partition the table: by item name, by path name, or by GUID (see DBMS_DBFS_SFS Constants - Used by the partition_key Parameter).
partition_guidi	If TRUE, build an index on GUID
partition_pathi	If TRUE, build an index on path name
partition_prop	If TRUE, partition the properties table

Usage Notes

The procedure executes like a DDL in that it auto-commits before and after its execution.

CREATESTORE Procedure

This procedure creates a new DBFS SFS store owned by the invoking session user.

Syntax

```
DBMS_DBFS_SFS.CREATESTORE  (
   store_name     IN     VARCHAR2,
   tbl_name       IN     VARCHAR2  DEFAULT NULL,
   tbs_name       in     VARCHAR2  DEFAULT NULL,
   use_bf         in     BOOLEAN   DEFAULT FALSE,
   stgopts        in     VARCHAR2 DEFAULT '');
```

Parameters

Table 51–7 CREATESTORE Procedure Parameters

Parameter	Description
store_name	Name of store
store_type	STORETYPE_TAPE or STORETYPE_AMAZONS3
tbl_name	Placeholder for the store content cached in database
tbs_name	Named tablespace
use_bf	If TRUE, a BasicFile LOB is used; otherwise a SecureFile LOB is used.
stgopts	Currently non-operational, reserved for future use

DROPFILESYSTEM Procedures

This procedure drops the DBFS SFS store, purging all dictionary information associated with the store, and dropping the underlying file system table.

Syntax

```
DBMS_DBFS_SFS.DROPFILESYSTEM  (
   schema_name    IN      VARCHAR2 DEFAULT NULL,
   tbl_name       IN      INTEGER);

DBMS_DBFS_SFS.DROPFILESYSTEM  (
   store_name     IN      VARCHAR2);
```

Parameters

Table 51–8 DROPFILESYSTEM Procedure Parameters

Parameter	Description
schema_name	Name of schema
tbl_name	Name of tablespace
store_name	Name of store path

Usage Notes

- If the specified store table is registered by the current user, it will be unregistered from the content interface described in the DBMS_DBFS_CONTENT package and the POSIX metadata tables.
- Subsequent to unregistration, an attempt will be made to store table(s). This operation may fail if other users are currently using this store table.
- The user attempting a drop of the tables underlying the store must actually have the privileges to complete the drop operation (either as the owner of the tables, or as a sufficiently privileged user for cross-schema operations).
- The procedure executes like a DDL in that it auto-commits before and after its execution.

INITFS Procedure

This procedure initialize a POSIX file system store. The table associated with the POSIX file system store `store_name` is truncated and reinitialized with a single "root" directory entry.

Syntax

```
DBMS_DBFS_SFS.INITFS (
   store_name     IN      VARCHAR2);
```

Parameters

Table 51–9 INITFS Procedure Parameters

Parameter	Description
`store_name`	Name of store

Usage Notes

The procedure executes like a DDL in that it auto-commits before and after its execution.

52

DBMS_DB_VERSION

The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

> **See Also:** *PL/SQL Users Guide and Reference* regarding conditional compilation

This package contains the following topics

- Using DBMS_DB_VERSION
  - Overview
  - Constants
  - Examples

Using DBMS_DB_VERSION

Overview

The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

The package for the Oracle Database 11g Release 1 version is shown below.

```
PACKAGE DBMS_DB_VERSION IS
   VERSION CONSTANT PLS_INTEGER := 11; -- RDBMS version number
   RELEASE CONSTANT PLS_INTEGER := 1;  -- RDBMS release number
   ver_le_9_1    CONSTANT BOOLEAN := FALSE;
   ver_le_9_2    CONSTANT BOOLEAN := FALSE;
   ver_le_9      CONSTANT BOOLEAN := FALSE;
   ver_le_10_1   CONSTANT BOOLEAN := FALSE;
   ver_le_10_2   CONSTANT BOOLEAN := FALSE;
   ver_le_10     CONSTANT BOOLEAN := FALSE;
   ver_le_11_1   CONSTANT BOOLEAN := TRUE;
   ver_le_11     CONSTANT BOOLEAN := TRUE;
END DBMS_DB_VERSION;
```

The boolean constants follow a naming convention. Each constant gives a name for a boolean expression. For example:

- VER_LE_9_1 represents version <= 9 and release <= 1
- VER_LE_10_2 represents version <= 10 and release <= 2
- VER_LE_10 represents version <= 10

A typical usage of these boolean constants is:

```
$IF DBMS_DB_VERSION.VER_LE_10 $THEN
   version 10 and earlier code
$ELSIF DBMS_DB_VERSION.VER_LE_11 $THEN
   version 11 code
$ELSE
   version 12 and later code
$END
```

This code structure will protect any reference to the code for hypothetical version 12. It also prevents the controlling package constant DBMS_DB_VERSION.VER_LE_11 from being referenced when the program is compiled under version 10. A similar observation applies to version 11. This scheme works even though the static constant VER_LE_11 is not defined in version 10 database because conditional compilation protects the $ELSIF from evaluation if DBMS_DB_VERSION.VER_LE_10 is TRUE.

Constants

The DBMS_DB_VERSION package contains different constants for different Oracle Database releases. The Oracle Database 11g Release 1 version of the DBMS_DB_VERSION package uses the constants shown in Table 52–1.

Table 52–1 DBMS_DB_VERSION Constants

Name	Type	Value	Description
VERSION	PLS_INTEGER	10	Current version
RELEASE	PLS_INTEGER	2	Current release
VER_LE_9	BOOLEAN	FALSE	Version <= 9
VER_LE_9_1	BOOLEAN	FALSE	Version <= 9 and release <= 1
VER_LE_9_2	BOOLEAN	FALSE	Version <= 9 and release <= 2
VER_LE_10	BOOLEAN	TRUE	Version <= 10
VER_LE_10_1	BOOLEAN	FALSE	Version <= 10 and release <= 1
VER_LE_10_2	BOOLEAN	TRUE	Version <=10 and release <= 2
VER_LE_11	BOOLEAN	FALSE	Version <= 11
VER_LE_11_1	BOOLEAN	TRUE	Version <=11 and release <= 1

Examples

This example uses conditional compilation to guard new features.

```
CREATE OR REPLACE PROCEDURE whetstone IS

 -- Notice that conditional compilation constructs
 -- can interrupt a regular PL/SQL statement.
 -- You can locate a conditional compilation directive anywhere
 -- there is whitespace in the regular statement.

 SUBTYPE my_real IS
    $IF DBMS_DB_VERSION.VER_LE_9 $THEN NUMBER
                                 $ELSE BINARY_DOUBLE
    $END;

 t  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 0.499975
                                                     $ELSE 0.499975d
                        $END;

 t2 CONSTANT my_real := $if DBMS_DB_VERSION.VER_LE_9 $THEN 2.0
                                                     $ELSE 2.0d
                        $END;

 x  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
                                                     $ELSE 1.0d
                        $END;

 y  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
                                                     $ELSE 1.0d
                        $END;

 z  MY_REAL;

 PROCEDURE P(x IN my_real, y IN my_real, z OUT NOCOPY my_real) IS
   x1 my_real;
   y1 my_real;
 BEGIN
   x1 := x;
   y1 := y;
   x1 := t * (x1 + y1);
   y1 := t * (x1 + y1);
   z := (x1 + y1)/t2;
 END P;
BEGIN
 P(x, y, z);
 DBMS_OUTPUT.PUT_LINE ('z = '|| z);
END whetstone;
/
```

53

DBMS_DEBUG

DBMS_DEBUG is a PL/SQL interface to the PL/SQL debugger layer, Probe, in the Oracle server.

This API is primarily intended to implement server-side debuggers and it provides a way to debug server-side PL/SQL program units.

> **Note:** The term *program unit* refers to a PL/SQL program of any type (procedure, function, package, package body, trigger, anonymous block, object type, or object type body).

This chapter contains the following topics:

Using DBMS_DEBUG

Overview

To debug server-side code, you must have two database sessions: one session to run the code in debug mode (the target session), and a second session to supervise the target session (the debug session).

The target session becomes available for debugging by making initializing calls with DBMS_DEBUG. This marks the session so that the PL/SQL interpreter runs in debug mode and generates debug events. As debug events are generated, they are posted from the session. In most cases, debug events require return notification: the interpreter pauses awaiting a reply.

Meanwhile, the debug session must also initialize itself using DBMS_DEBUG: This tells it which target session to supervise. The debug session may then call entry points in DBMS_DEBUG to read events that were posted from the target session and to communicate with the target session.

The following subprograms are run in the target session (the session that is to be debugged):

- SYNCHRONIZE Function
- DEBUG_ON Procedure
- DEBUG_OFF Procedure

DBMS_DEBUG does not provide an interface to the PL/SQL compiler, but it does depend on debug information optionally generated by the compiler. Without debug information, it is not possible to examine or modify the values of parameters or variables.

Constants

A breakpoint status may have the following value:

- `breakpoint_status_unused`—breakpoint is not in use

Otherwise, the status is a mask of the following values:

- `breakpoint_status_active`—a line breakpoint
- `breakpoint_status_disabled`—breakpoint is currently disabled
- `breakpoint_status_remote`—a shadow breakpoint (a local representation of a remote breakpoint)

Variables

The DBMS_DEBUG uses the variables shown in Table 53–1.

Table 53–1 DBMS_DEBUG Variables

Variable	Description
default_timeout	The timeout value (used by both sessions).The smallest possible timeout is 1 second. If this value is set to 0, then a large value (3600) is used.

Exceptions

These values are returned by the various functions called in the debug session (SYNCHRONIZE, CONTINUE, SET_BREAKPOINT, and so on). If PL/SQL exceptions worked across client/server and server/server boundaries, then these would all be exceptions rather than error codes.

Value	Description
success	Normal termination

Statuses returned by GET_VALUE and SET_VALUE:

Status	Description
error_bogus_frame	No such entrypoint on the stack
error_no_debug_info	Program was compiled without debug symbols
error_no_such_object	No such variable or parameter
error_unknown_type	Debug information is unreadable
error_indexed_table	Returned by GET_VALUE if the object is a table, but no index was provided
error_illegal_index	No such element exists in the collection
error_nullcollection	Table is atomically NULL
error_nullvalue	Value is NULL

Statuses returned by SET_VALUE:

Status	Description
error_illegal_value	Constraint violation
error_illegal_null	Constraint violation
error_value_malformed	Unable to decipher the given value
error_other	Some other error
error_name_incomplete	Name did not resolve to a scalar

Statuses returned by the breakpoint functions:

Status	Description
error_no_such_breakpt	No such breakpoint
error_idle_breakpt	Cannot enable or disable an unused breakpoint
error_bad_handle	Unable to set breakpoint in given program (nonexistent or security violation)

General error codes (returned by many of the DBMS_DEBUG subprograms):

Status	Description
error_unimplemented	Functionality is not yet implemented

Status	Description
error_deferred	No program running; operation deferred
error_exception	An exception was raised in the DBMS_DEBUG or Probe packages on the server
error_communication	Some error other than a timeout occurred
error_timeout	Timout occurred

Exception	Description
illegal_init	DEBUG_ON was called prior to INITIALIZE

The following exceptions are raised by procedure SELF_CHECK:

Exception	Description
pipe_creation_failure	Could not create a pipe
pipe_send_failure	Could not write data to the pipe
pipe_receive_failure	Could not read data from the pipe
pipe_datatype_mismatch	Datatype in the pipe was wrong
pipe_data_error	Data got garbled in the pipe

Operational Notes

There are two ways to ensure that debug information is generated: through a session switch, or through individual recompilation.

To set the session switch, enter the following statement:

```
ALTER SESSION SET PLSQL_DEBUG = true;
```

This instructs the compiler to generate debug information for the remainder of the session. It does not recompile any existing PL/SQL.

To generate debug information for existing PL/SQL code, use one of the following statements (the second recompiles a package or type body):

```
ALTER [PROCEDURE | FUNCTION | PACKAGE | TRIGGER | TYPE] <name> COMPILE DEBUG;
ALTER [PACKAGE | TYPE] <name> COMPILE DEBUG BODY;
```

Figure 53–1 and Figure 53–2 illustrate the flow of operations in the session to be debugged and in the debugging session.

Figure 53–1 Target Session

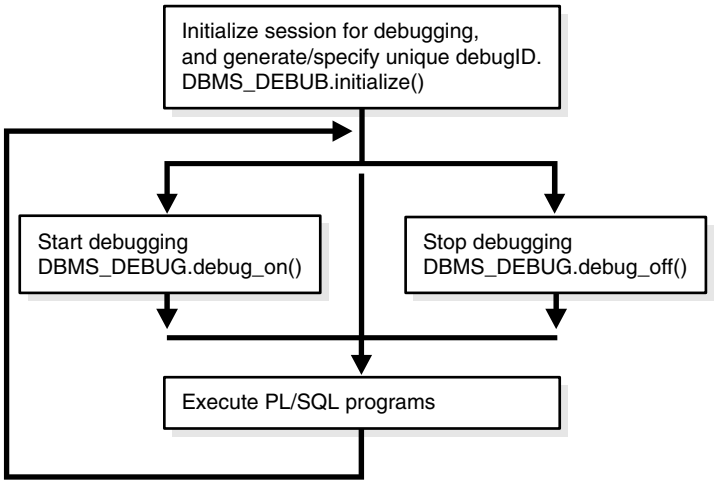

Figure 53–2 Debug Session

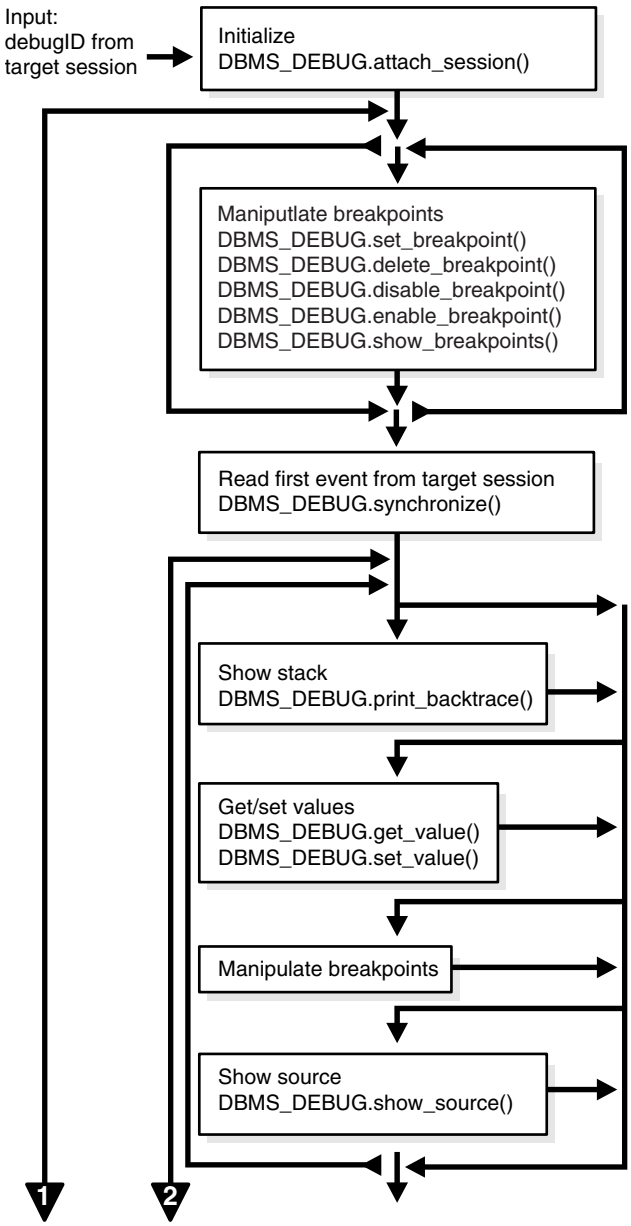

Figure 53–3 Debug Session (Cont.)

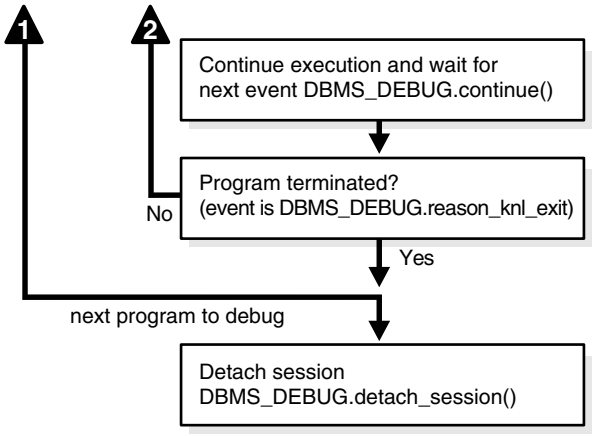

Control of the Interpreter

The interpreter pauses execution at the following times:

1. At startup of the interpreter so any deferred breakpoints may be installed prior to execution.
2. At any line containing an enabled breakpoint.
3. At any line where an *interesting* event occurs. The set of interesting events is specified by the flags passed to `DBMS_DEBUG.CONTINUE` in the `breakflags` parameter.

Session Termination

There is no event for session termination. Therefore, it is the responsibility of the debug session to check and make sure that the target session has not ended. A call to `DBMS_DEBUG.SYNCHRONIZE` after the target session has ended causes the debug session to hang until it times out.

Deferred Operations

The diagram suggests that it is possible to set breakpoints prior to having a target session. This is true. In this case, Probe caches the breakpoint request and transmits it to the target session at first synchronization. However, if a breakpoint request is deferred in this fashion, then:

- `SET_BREAKPOINT` does not set the breakpoint number (it can be obtained later from `SHOW_BREAKPOINTS` if necessary).
- `SET_BREAKPOINT` does not validate the breakpoint request. If the requested source line does not exist, then an error silently occurs at synchronization, and no breakpoint is set.

Diagnostic Output

To debug Probe, there are *diagnostics* parameters to some of the calls in `DBMS_DEBUG`. These parameters specify whether to place diagnostic output in the RDBMS tracefile. If output to the RDBMS tracefile is disabled, these parameters have no effect.

Common and Debug Session Sections

- Common Section

- Target Session
- Debug Session Section

Common Section

The following subprograms may be called in either the target or the debug session:

- PROBE_VERSION Procedure
- SELF_CHECK Procedure
- SET_TIMEOUT Function

Target Session

The following subprograms may be called only in the target session:

- INITIALIZE Function
- DEBUG_ON Procedure
- SET_TIMEOUT_BEHAVIOUR Procedure
- GET_TIMEOUT_BEHAVIOUR Function

Debug Session Section

The following subprograms should be run in the debug session only:

- ATTACH_SESSION Procedure
- SYNCHRONIZE Function
- SHOW_FRAME_SOURCE Procedure
- SHOW_SOURCE Procedures
- GET_MORE_SOURCE Procedure
- PRINT_BACKTRACE Procedure
- CONTINUE Function
- SET_BREAKPOINT Function
- DELETE_BREAKPOINT Function
- SET_OER_BREAKPOINT Function
- DELETE_OER_BREAKPOINT Function
- ENABLE_BREAKPOINT Function
- DISABLE_BREAKPOINT Function
- SHOW_BREAKPOINTS Procedures
- SET_VALUE Functionn
- GET_VALUE Function
- TARGET_PROGRAM_RUNNING Procedure
- DETACH_SESSION Procedure
- GET_RUNTIME_INFO Function
- PRINT_INSTANTIATIONS Procedure
- PING Procedure
- GET_LINE_MAP Function

- GET_RUNTIME_INFO Function
- GET_INDEXES Function
- EXECUTE Procedure

OER Breakpoints

Exceptions that are declared in PL/SQL programs are known as user-defined exceptions. In addition, there are Oracle Errors (OERs) that are returned from the Oracle kernel. To tie the two mechanisms together, PL/SQL provides the `exception_init` pragma that turns a user-defined exception into an OER, so that a PL/SQL handler may be used for it, and so that the PL/SQL engine can return OERs to the Oracle kernel. As of the current release, the only information available about an OER is its number. If two user-defined exceptions are exception_init'd to the same OER, they are indistinguishable.

Namespaces

Program units on the server reside in different namespaces. When setting a breakpoint, specify the desired namespace.

1. `Namespace_cursor` contains cursors (anonymous blocks).
2. `Namespace_pgkspec_or_toplevel` contains:
   - Package specifications.
   - Procedures and functions that are not nested inside other packages, procedures, or functions.
   - Object types.
3. `Namespace_pkg_body` contains package bodies and type bodies.
4. `Namespace_trigger` contains triggers.

Libunit Types

These values are used to disambiguate among objects in a given namespace. These constants are used in `PROGRAM_INFO` when Probe is giving a stack backtrace.

- `LibunitType_cursor`
- `LibunitType_procedure`
- `LibunitType_function`
- `LibunitType_package`
- `LibunitType_package_body`
- `LibunitType_trigger`
- `LibunitType_Unknown`

Breakflags

These are values to use for the `breakflags` parameter to `CONTINUE`, in order to tell Probe what events are of interest to the client. These flags may be combined.

Value	Description
`break_next_line`	Break at next source line (step over calls)

Value	Description
break_any_call	Break at next source line (step into calls)
break_any_return	Break after returning from current entrypoint (skip over any entrypoints called from the current routine)
break_return	Break the next time an entrypoint gets ready to return. (This includes entrypoints called from the current one. If interpreter is running Proc1, which calls Proc2, then break_return stops at the end of Proc2.)
break_exception	Break when an exception is raised
break_handler	Break when an exception handler is executed
abort_execution	Stop execution and force an 'exit' event as soon as DBMS_DEBUG.CONTINUE is called.

Information Flags

These are flags which may be passed as the info_requested parameter to SYNCHRONIZE, CONTINUE, and GET_RUNTIME_INFO.

Flag	Description
info_getStackDepth	Get the current depth of the stack
info_getBreakpoint	Get the breakpoint number
info_getLineinfo	Get program unit information

Reasons for Suspension

After CONTINUE is run, the program either runs to completion or breaks on some line.

Reason	Description
reason_none	-
reason_interpreter_starting	Interpreter is starting
reason_breakpoint	Hit a breakpoint
reason_enter	Procedure entry
reason_return	Procedure is about to return
reason_finish	Procedure is finished
reason_line	Reached a new line
reason_interrupt	An interrupt occurred
reason_exception	An exception was raised
reason_exit	Interpreter is exiting (old form)
reason_knl_exit	Kernel is exiting
reason_handler	Start exception-handler
reason_timeout	A timeout occurred
reason_instantiate	Instantiation block
reason_abort	Interpreter is aborting

Data Structures

The DBMS_DEBUG package defines RECORD types and TABLE types.

RECORD Types

- BREAKPOINT_INFO Record Type
- PROGRAM_INFO Record Type
- RUNTIME_INFO Record Type

TABLE Types

- BACKTRACE_TABLE Table Type
- BREAKPOINT_TABLE Table Type
- INDEX_TABLE Table Type
- VC2_TABLE Table Type

BREAKPOINT_INFO Record Type

This type gives information about a breakpoint, such as its current status and the program unit in which it was placed.

Syntax

```
TYPE breakpoint_info IS RECORD (
   name        VARCHAR2(30),
   owner       VARCHAR2(30),
   dblink      VARCHAR2(30),
   line#       BINARY_INTEGER,
   libunittype BINARY_INTEGER,
   status      BINARY_INTEGER);
```

Fields

Table 53–2 BREAKPOINT_INFO Fields

Field	Description
`name`	Name of the program unit
`owner`	Owner of the program unit
`dblink`	Database link, if remote
`line#`	Line number
`libunittype`	`NULL`, unless this is a nested procedure or function
`status`	See Constants on page 53-4 for values of `breakpoint_status_*`

PROGRAM_INFO Record Type

This type specifies a program location. It is a line number in a program unit. This is used for stack backtraces and for setting and examining breakpoints. The read-only fields are currently ignored by Probe for breakpoint operations. They are set by Probe only for stack backtraces.

Syntax

```
TYPE program_info IS RECORD(
    -- The following fields are used when setting a breakpoint
    namespace        BINARY_INTEGER,
    name             VARCHAR2(30),
    owner            VARCHAR2(30),
    dblink           VARCHAR2(30),
    line#            BINARY_INTEGER,
    -- Read-only fields (set by Probe when doing a stack backtrace)
    libunittype      BINARY_INTEGER,
    entrypointname   VARCHAR2(30));
```

Fields

Table 53–3 PROGRAM_INFO Fields

Field	Description
`namespace`	See Namespaces on page 53-12
`name`	Name of the program unit
`owner`	Owner of the program unit
`dblink`	Database link, if remote
`line#`	Line number
`libunittype`	`A read-only field, NULL`, unless this is a nested procedure or function
`entrypointname`	A read-only field, to disambiguate among objects that share the same namespace (for example, procedure and package specifications). See the Libunit Types on page 53-12 for more information.

RUNTIME_INFO Record Type

This type gives context information about the running program.

Syntax

```
TYPE runtime_info IS RECORD(
    line#            BINARY_INTEGER,
    terminated       binary_integer,
    breakpoint       binary_integer,
    stackdepth       BINARY_INTEGER,
    interpreterdepth BINARY_INTEGER,
    reason           BINARY_INTEGER,
    program          program_info);
```

Fields

Table 53–4 RUNTIME_INFO Fields

Field	Description
`line#`	Duplicate of `program.line#`
`terminated`	Whether the program has terminated
`breakpoint`	Breakpoint number
`stackdepth`	Number of frames on the stack
`interpreterdepth`	[A reserved field]
`reason`	Reason for suspension
`program`	Source location

BACKTRACE_TABLE Table Type

This type is used by `PRINT_BACKTRACE`.

Syntax

```
TYPE backtrace_table IS TABLE OF program_info INDEX BY BINARY_INTEGER;
```

BREAKPOINT_TABLE Table Type

This type is used by SHOW_BREAKPOINTS.

Syntax

```
TYPE breakpoint_table IS TABLE OF breakpoint_info INDEX BY BINARY_INTEGER;
```

INDEX_TABLE Table Type

This type is used by `GET_INDEXES` to return the available indexes for an indexed table.

Syntax

```
TYPE index_table IS table of BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

VC2_TABLE Table Type

This type is used by SHOW_SOURCE.

Syntax

```
TYPE vc2_table IS TABLE OF VARCHAR2(90) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_DEBUG Subprograms

Table 53–5 DBMS_DEBUG Package Subprograms

Subprogram	Description
ATTACH_SESSION Procedure on page 53-24	Notifies the debug session about the target debugID
CONTINUE Function on page 53-25	Continues execution of the target program
DEBUG_OFF Procedure on page 26	Turns debug-mode off
DEBUG_ON Procedure on page 53-27	Turns debug-mode on
DELETE_BREAKPOINT Function on page 53-28	Deletes a breakpoint
DELETE_OER_ BREAKPOINT Function on page 53-29	Deletes an OER breakpoint
DETACH_SESSION Procedure on page 53-30	Stops debugging the target program
DISABLE_BREAKPOINT Function on page 53-31	Disables a breakpoint
ENABLE_BREAKPOINT Function on page 53-32	Activates an existing breakpoint
EXECUTE Procedure on page 53-33	Executes SQL or PL/SQL in the target session
GET_INDEXES Function on page 53-35	Returns the set of indexes for an indexed table
GET_MORE_SOURCE Procedure on page 53-36	Provides additional source in the event of buffer overflow when using SHOW_SOURCE
GET_LINE_MAP Function on page 53-37	Returns information about line numbers in a program unit
GET_RUNTIME_INFO Function on page 53-38	Returns information about the current program
GET_TIMEOUT_ BEHAVIOUR Function on page 53-39	Returns the current timeout behavior
GET_VALUE Function on page 53-40	Gets a value from the currently-running program
INITIALIZE Function on page 53-42	Sets debugID in target session
PING Procedure on page 53-44	Pings the target session to prevent it from timing out
PRINT_BACKTRACE Procedure on page 53-45	Prints a stack backtrace
PRINT_INSTANTIATIONS Procedure on page 53-46	Prints a stack backtrace
PROBE_VERSION Procedure on page 53-47	Returns the version number of `DBMS_DEBUG` on the server

Table 53–5 (Cont.) DBMS_DEBUG Package Subprograms

Subprogram	Description
SELF_CHECK Procedure on page 53-48	Performs an internal consistency check
SET_BREAKPOINT Function on page 53-49	Sets a breakpoint in a program unit
SET_OER_BREAKPOINT Function on page 53-50	Sets an OER breakpoint
SET_TIMEOUT Function on page 53-51	Sets the timeout value
SET_TIMEOUT_ BEHAVIOUR Procedure on page 53-52	Tells Probe what to do with the target session when a timeout occurs
SET_VALUE Function on page 53-53	Sets a value in the currently-running program
SHOW_BREAKPOINTS Procedures on page 53-55	Returns a listing of the current breakpoints
SHOW_FRAME_SOURCE Procedure on page 53-56	Fetches the frame source
SHOW_SOURCE Procedures on page 53-57	Fetches program source
SYNCHRONIZE Function on page 53-59	Waits for program to start running
TARGET_PROGRAM_ RUNNING Procedure on page 53-60	Returns `TRUE` if the target session is currently executing a stored procedure, or `FALSE` if it is not

ATTACH_SESSION Procedure

This procedure notifies the debug session about the target program.

Syntax

```
DBMS_DEBUG.ATTACH_SESSION (
   debug_session_id  IN VARCHAR2,
   diagnostics       IN BINARY_INTEGER := 0);
```

Parameters

Table 53–6 ATTACH_SESSION Procedure Parameters

Parameter	Description
debug_session_id	Debug ID from a call to INITIALIZE in target session
diagnostics	Generate diagnostic output if nonzero

CONTINUE Function

This function passes the given breakflags (a mask of the events that are of interest) to Probe in the target process. It tells Probe to continue execution of the target process, and it waits until the target process runs to completion or signals an event.

If `info_requested` is not `NULL`, then calls `GET_RUNTIME_INFO`.

Syntax

```
DBMS_DEBUG.CONTINUE (
   run_info       IN OUT runtime_info,
   breakflags     IN     BINARY_INTEGER,
   info_requested IN     BINARY_INTEGER := NULL)
  RETURN BINARY_INTEGER;
```

Parameters

Table 53–7 CONTINUE Function Parameters

Parameter	Description
`run_info`	Information about the state of the program
`breakflags`	Mask of events that are of interest (see "Breakflags" on page 53-12)
`info_requested`	Which information should be returned in `run_info` when the program stops (see "Information Flags" on page 53-13)

Return Values

Table 53–8 CONTINUE Function Return Values

Return	Description
`success`	
`error_timeout`	Timed out before the program started running
`error_communication`	Other communication error

DEBUG_OFF Procedure

Caution: There must be a debug session waiting if immediate is `TRUE`.

This procedure notifies the target session that debugging should no longer take place in that session. It is not necessary to call this function before ending the session.

Syntax

```
DBMS_DEBUG.DEBUG_OFF;
```

Usage Notes

The server does not handle this entrypoint specially. Therefore, it attempts to debug this entrypoint.

DEBUG_ON Procedure

This procedure marks the target session so that all PL/SQL is run in debug mode. This must be done before any debugging can take place.

Syntax

```
DBMS_DEBUG.DEBUG_ON (
   no_client_side_plsql_engine BOOLEAN := TRUE,
   immediate                   BOOLEAN := FALSE);
```

Parameters

Table 53–9 DEBUG_ON Procedure Parameters

Parameter	Description
no_client_side_plsql_engine	Should be left to its default value unless the debugging session is taking place from a client-side PL/SQL engine
immediate	If this is TRUE, then the interpreter immediately switches itself into debug-mode, instead of continuing in regular mode for the duration of the call.

DELETE_BREAKPOINT Function

This function deletes a breakpoint.

Syntax

```
DBMS_DEBUG.DELETE_BREAKPOINT (
   breakpoint IN BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 53–10 DELETE_BREAKPOINT Function Parameters

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT

Return Values

Table 53–11 DELETE_BREAKPOINT Function Return Values

Return	Description
success	
error_no_such_breakpt	No such breakpoint exists
error_idle_breakpt	Cannot delete an unused breakpoint
error_stale_breakpt	The program unit was redefined since the breakpoint was set

DELETE_OER_BREAKPOINT Function

This function deletes an OER breakpoint.

Syntax

```
DBMS_DEBUG.DELETE_OER_BREAKPOINT (
   oer  IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 53–12 DELETE_OER_BREAKPOINT Function Parameters

Parameter	Description
oer	The OER (positive 4-byte number) to delete

DETACH_SESSION Procedure

This procedure stops debugging the target program. This procedure may be called at any time, but it does not notify the target session that the debug session is detaching itself, and it does not terminate execution of the target session. Therefore, care should be taken to ensure that the target session does not hang itself.

Syntax

```
DBMS_DEBUG.DETACH_SESSION;
```

DISABLE_BREAKPOINT Function

This function makes an existing breakpoint inactive but leaves it in place.

Syntax

```
DBMS_DEBUG.DISABLE_BREAKPOINT (
   breakpoint IN BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 53–13 DISABLE_BREAKPOINT Function Parameters

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT

Return Values

Table 53–14 DISABLE_BREAKPOINT Function Return Values

Returns	Description
success	
error_no_such_breakpt	No such breakpoint exists
error_idle_breakpt	Cannot disable an unused breakpoint

ENABLE_BREAKPOINT Function

This function is the reverse of disabling. This enables a previously disabled breakpoint.

Syntax

```
DBMS_DEBUG.ENABLE_BREAKPOINT (
   breakpoint IN BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 53–15 ENABLE_BREAKPOINT Function Parameters

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT

Return Values

Table 53–16 ENABLE_BREAKPOINT Function Return Values

Return	Description
success	Success
error_no_such_breakpt	No such breakpoint exists
error_idle_breakpt	Cannot enable an unused breakpoint

EXECUTE Procedure

This procedure executes SQL or PL/SQL code in the target session. The target session is assumed to be waiting at a breakpoint (or other event). The call to DBMS_DEBUG.EXECUTE occurs in the debug session, which then asks the target session to execute the code.

Syntax

```
DBMS_DEBUG.EXECUTE (
   what         IN VARCHAR2,
   frame#       IN BINARY_INTEGER,
   bind_results IN BINARY_INTEGER,
   results      IN OUT NOCOPY dbms_debug_vc2coll,
   errm         IN OUT NOCOPY VARCHAR2);
```

Parameters

Table 53–17 EXECUTE Procedure Parameters

Parameter	Description
what	SQL or PL/SQL source to execute
frame#	The context in which to execute the code. Only -1 (global context) is supported at this time.
bind_results	Whether the source wants to bind to results in order to return values from the target session: 0 = No 1 = Yes
results	Collection in which to place results, if bind_results is not 0
errm	Error message, if an error occurred; otherwise, NULL

Examples

Example 1

This example executes a SQL statement. It returns no results.

```
DECLARE
   coll sys.dbms_debug_vc2coll; -- results (unused)
   errm VARCHAR2(100);
BEGIN
   dbms_debug.execute('insert into emp(ename,empno,deptno) ' ||
                      'values(''LJE'', 1, 1)',
                      -1, 0, coll, errm);
END;
```

Example 2

This example executes a PL/SQL block, and it returns no results. The block is an autonomous transaction, which means that the value inserted into the table becomes visible in the debug session.

```
DECLARE
   coll sys.dbms_debug_vc2coll;
   errm VARCHAR2(100);
BEGIN
```

```
   dbms_debug.execute(
       'DECLARE PRAGMA autonomous_transaction; ' ||
       'BEGIN ' ||
       '   insert into emp(ename, empno, deptno) ' ||
       '   values(''LJE'', 1, 1); ' ||
       ' COMMIT; ' ||
       'END;',
       -1, 0, coll, errm);
END;
```

Example 3

This example executes a PL/SQL block, and it returns some results.

```
DECLARE
   coll sys.dbms_debug_vc2coll;
   errm VARCHAR2(100);
BEGIN
   dbms_debug.execute(
      'DECLARE ' ||
      '   pp SYS.dbms_debug_vc2coll := SYS.dbms_debug_vc2coll(); ' ||
      '   x  PLS_INTEGER; ' ||
      '   i  PLS_INTEGER := 1; ' ||
      'BEGIN ' ||
      '   SELECT COUNT(*) INTO x FROM emp; ' ||
      '   pp.EXTEND(x * 6); ' ||
      '   FOR c IN (SELECT * FROM emp) LOOP ' ||
      '      pp(i) := ''Ename: '' || c.ename; i := i+1; ' ||
      '      pp(i) := ''Empno: '' || c.empno; i := i+1; ' ||
      '      pp(i) := ''Job:   '' || c.job;   i := i+1; ' ||
      '      pp(i) := ''Mgr:   '' || c.mgr;   i := i+1; ' ||
      '      pp(i) := ''Sal:   '' || c.sal;   i := i+1; ' ||
      '      pp(i) := null;                   i := i+1; ' ||
      '   END LOOP; ' ||
      '   :1 := pp;' ||
      'END;',
       -1, 1, coll, errm);
   each := coll.FIRST;
   WHILE (each IS NOT NULL) LOOP
      dosomething(coll(each));
      each := coll.NEXT(each);
   END LOOP;
END;
```

GET_INDEXES Function

Given a name of a variable or parameter, this function returns the set of its indexes, if it is an indexed table. An error is returned if it is not an indexed table.

Syntax

```
DBMS_DEBUG.GET_INDEXES (
   varname   IN  VARCHAR2,
   frame#    IN  BINARY_INTEGER,
   handle    IN  program_info,
   entries   OUT index_table)
RETURN BINARY_INTEGER;
```

Parameters

Table 53–18 GET_INDEXES Function Parameters

Parameter	Description
varname	Name of the variable to get index information about
frame#	Number of frame in which the variable or parameter resides; NULL for a package variable
handle	Package description, if object is a package variable
entries	1-based table of the indexes: if non-NULL, then entries(1) contains the first index of the table, entries(2) contains the second index, and so on.

Return Values

Table 53–19 GET_INDEXES Function Return Values

Return	Description
error_no_such_object	One of the following: - The package does not exist - The package is not instantiated - The user does not have privileges to debug the package - The object does not exist in the package

GET_MORE_SOURCE Procedure

When source does not fit in the buffer provided by that version of the SHOW_SOURCE Procedures which produce a formatted buffer, this procedure provides additional source.

Syntax

```
DBMS_DEBUG.GET_MORE_SOURCE (
   buffer          IN OUT VARCHAR2,
   buflen          IN BINARY_INTEGER,
   piece#          IN BINARY_INTEGER);
```

Parameters

Table 53–20 GET_MORE_SOURCE Procedure Parameters

Parameter	Description
buffer	The buffer
buflen	The length of the buffer
piece#	A value between 2 and the value returned in the parameter pieces from the call to the relevant version of the SHOW_SOURCE Procedures

Usage Notes

This procedure should be called only after the version of SHOW_SOURCE that returns a formatted buffer.

GET_LINE_MAP Function

This function finds line and entrypoint information about a program so that a debugger can determine the source lines at which it is possible to place breakpoints.

Syntax

```
DBMS_DEBUG.GET_LINE_MAP (
   program                IN   program_info,
   maxline                OUT  BINARY_INTEGER,
   number_of_entry_points OUT  BINARY_INTEGER,
   linemap                OUT  RAW)
  RETURN BINARY_INTEGER;
```

Parameters

Table 53–21 GET_LINE_MAP Function Parameters

Parameter	Description
program	A top-level program unit (procedure / package / function / package body, and so on). Its Namespace, Name, and Owner fields must be initialized, the remaining fields are ignored.
maxline	The largest source code line number in 'program'
number_of_entry_points	The number of subprograms in 'program'
linemap	A bitmap representing the executable lines of 'program'. If line number N is executable, bit number N MOD 8 will be set to 1 at linemap position N / 8. The length of returned linemap is either maxline divided by 8 (plus one if maxline MOD 8 is not zero) or 32767 in the unlikely case of maxline being larger than 32767 * 8.

Return Values

Table 53–22 GET_LINE_MAP Function Return Values

Return	Description
success	A successful completion
error_no_debug_info	The program unit exists, but has no debug info
error_bad_handle	No such program unit exists

GET_RUNTIME_INFO Function

This function returns information about the current program. It is only needed if the `info_requested` parameter to `SYNCHRONIZE` or `CONTINUE` was set to `0`.

Note: This is currently only used by client-side PL/SQL.

Syntax

```
DBMS_DEBUG.GET_RUNTIME_INFO (
   info_requested  IN  BINARY_INTEGER,
   run_info        OUT runtime_info)
  RETURN BINARY_INTEGER;
```

Parameters

Table 53–23 GET_RUNTIME_INFO Function Parameters

Parameter	Description
`info_requested`	Which information should be returned in `run_info` when the program stops (see "Information Flags" on page 53-13)
`run_info`	Information about the state of the program

GET_TIMEOUT_BEHAVIOUR Function

This procedure returns the current timeout behavior. This call is made in the target session.

Syntax

```
DBMS_DEBUG.GET_TIMEOUT_BEHAVIOUR
 RETURN BINARY_INTEGER;
```

Parameters

Table 53–24 GET_TIMEOUT_BEHAVIOUR Function Parameters

Parameter	Description
oer	The OER (a 4-byte positive number)

Return Values

Table 53–25 GET_TIMEOUT_BEHAVIOUR Function Return Values

Return	Description
success	A successful completion

Information Flags

```
info_getOerInfo CONSTANT PLS_INTEGER:= 32;
```

Usage Notes

Less functionality is supported on OER breakpoints than on code breakpoints. In particular, note that:

- No "breakpoint number" is returned - the number of the OER is used instead. Thus it is impossible to set duplicate breakpoints on a given OER (it is a no-op).
- It is not possible to disable an OER breakpoint (although clients are free to simulate this by deleting it).
- OER breakpoints are deleted using `delete_oer_breakpoint`.

GET_VALUE Function

This function gets a value from the currently-running program. There are two overloaded GET_VALUE functions.

Syntax

```
DBMS_DEBUG.GET_VALUE (
   variable_name  IN  VARCHAR2,
   frame#         IN  BINARY_INTEGER,
   scalar_value   OUT VARCHAR2,
   format         IN  VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 53–26 GET_VALUE Function Parameters

Parameter	Description
variable_name	Name of the variable or parameter
frame#	Frame in which it lives; 0 means the current procedure
scalar_value	Value
format	Optional date format to use, if meaningful

Return Values

Table 53–27 GET_VALUE Function Return Values

Return	Description
success	A successful completion
error_bogus_frame	Frame does not exist
error_no_debug_info	Entrypoint has no debug information
error_no_such_object	variable_name does not exist in frame#
error_unknown_type	The type information in the debug information is illegible
error_nullvalue	Value is NULL
error_indexed_table	The object is a table, but no index was provided

This form of GET_VALUE is for fetching package variables. Instead of a frame#, it takes a handle, which describes the package containing the variable.

Syntax

```
DBMS_DEBUG.GET_VALUE (
   variable_name  IN  VARCHAR2,
   handle         IN  program_info,
   scalar_value   OUT VARCHAR2,
   format         IN  VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 53–28 GET_VALUE Function Parameters

Parameter	Description
variable_name	Name of the variable or parameter
handle	Description of the package containing the variable
scalar_value	Value
format	Optional date format to use, if meaningful

Return Values

Table 53–29 GET_VALUE Function Return Values

Return	Description
error_no_such_object	One of the following: - Package does not exist - Package is not instantiated - User does not have privileges to debug the package - Object does not exist in the package
error_indexed_table	The object is a table, but no index was provided

Examples

This example illustrates how to get the value with a given package PACK in schema SCOTT, containing variable VAR:

```
DECLARE
   handle     dbms_debug.program_info;
   resultbuf  VARCHAR2(500);
   retval     BINARY_INTEGER;
BEGIN
   handle.Owner     := 'SCOTT';
   handle.Name      := 'PACK';
   handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
   retval           := dbms_debug.get_value('VAR', handle, resultbuf, NULL);
END;
```

INITIALIZE Function

This function initializes the target session for debugging.

Syntax

```
DBMS_DEBUG.INITIALIZE (
   debug_session_id  IN VARCHAR2       := NULL,
   diagnostics       IN BINARY_INTEGER := 0)
  RETURN VARCHAR2;
```

Parameters

Table 53–30 INITIALIZE Function Parameters

Parameter	Description
debug_session_id	Name of session ID. If NULL, then a unique ID is generated.
diagnostics	Indicates whether to dump diagnostic output to the tracefile: 0 = (default) no diagnostics 1 = print diagnostics

Return Values

The newly-registered debug session ID (debugID)

Usage Notes

You cannot use DBMS_DEBUG and the JDWP-based debugging interface simultaneously. This call will either fail with an ORA-30677 error if the session is currently being debugged with the JDWP-based debugging interface or, if the call succeeds, any further use of the JDWP-based interface to debug this session will be disallowed.

Calls to DBMS_DEBUG will succeed only if either the caller or the specified debug role carries the DEBUG CONNECT SESSION privilege. Failing that, an ORA-1031 error will be raised. Other exceptions are also possible if a debug role is specified but the password does not match, or if the calling user has not been granted the role, or the role is application-enabled and this call does not originate from within the role-enabling package.

The CREATE ANY PROCEDURE privilege does not affect the visibility of routines through the debugger. A privilege DEBUG for each object has been introduced with a corresponding DEBUG ANY PROCEDURE variant. These are required in order to see routines owned by users other than the session's login user.

Authentication of the debug role and the check for DEBUG CONNECT SESSION privilege will be done in the context of the caller to this routine. If the caller is a definer's rights routine or has been called from one, only privileges granted to the defining user, the debug role, or PUBLIC will be used to check for DEBUG CONNECT SESSION. If this call is from within a definer's rights routine, the debug role, if specified, must be one that has been granted to that definer, but it need not also have been granted to the session login user or be enabled in the calling session at the time the call is made.

The checks made by the debugger after this call is made looking for the DEBUG privilege on individual procedures will be done in the context of the session's login user, the roles that were enabled at session level at the moment this call was made

(even if those roles were not available within a definer's rights environment of the call), and the debug role.

PING Procedure

This procedure pings the target session to prevent it from timing out. Use this procedure when execution is suspended in the target session, for example at a breakpoint.

If the `timeout_behaviour` is set to `retry_on_timeout` then this procedure is not necessary.

Syntax

```
DBMS_DEBUG.PING;
```

Exceptions

Oracle will display the `no_target_program` exception if there is no target program or if the target session is not currently waiting for input from the debug session.

Usage Notes

Timeout options for the target session are registered with the target session by calling `set_timeout_behaviour`:

- `retry_on_timeout` - Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
- `continue_on_timeout` - Continue execution, using same event flags.
- `nodebug_on_timeout` - Turn debug-mode OFF (in other words, call debug_off) and then continue execution. No more events will be generated by this target session unless it is re-initialized by calling debug_on.
- `abort_on_timeout` - Continue execution, using the abort_execution flag, which should cause the program to terminate immediately. The session remains in debug-mode.

```
retry_on_timeout CONSTANT BINARY_INTEGER:= 0;

continue_on_timeout CONSTANT BINARY_INTEGER:= 1;

nodebug_on_timeout CONSTANT BINARY_INTEGER:= 2;

abort_on_timeout CONSTANT BINARY_INTEGER:= 3;
```

PRINT_BACKTRACE Procedure

This procedure prints a backtrace listing of the current execution stack. This should only be called if a program is currently running.

There are two overloaded PRINT_BACKTRACE procedures.

Syntax

```
DBMS_DEBUG.PRINT_BACKTRACE (
  listing IN OUT VARCHAR2);

DBMS_DEBUG.PRINT_BACKTRACE (
  backtrace OUT backtrace_table);
```

Parameters

Table 53–31 PRINT_BACKTRACE Procedure Parameters

Parameter	Description
listing	A formatted character buffer with embedded newlines
backtrace	1-based indexed table of backtrace entries. The currently-running procedure is the last entry in the table (that is, the frame numbering is the same as that used by GET_VALUE). Entry 1 is the oldest procedure on the stack.

PRINT_INSTANTIATIONS Procedure

This procedure returns a list of the packages that have been instantiated in the current session.

Syntax

```
DBMS_DEBUG.PRINT_INSTANTIATIONS (
   pkgs   IN OUT NOCOPY backtrace_table,
   flags  IN BINARY_INTEGER);
```

Parameters

Table 53–32 PRINT_INSTANTIATIONS Procedure Parameters

Parameter	Description
pkgs	The instantiated packages
flags	Bitmask of options: ■ 1 - show specs ■ 2 - show bodies ■ 4 - show local instantiations ■ 8 - show remote instantiations (NYI) ■ 16 - do a fast job. The routine does not test whether debug information exists or whether the libunit is shrink-wrapped.

Exceptions

no_target_program - target session is not currently executing

Usage Notes

On return, pkgs contains a program_info for each instantiation. The valid fields are: Namespace, Name, Owner, and LibunitType.

In addition, Line# contains a bitmask of:

- 1 - the libunit contains debug info
- 2 - the libunit is shrink-wrapped

PROBE_VERSION Procedure

This procedure returns the version number of DBMS_DEBUG on the server.

Syntax

```
DBMS_DEBUG.PROBE_VERSION (
   major out BINARY_INTEGER,
   minor out BINARY_INTEGER);
```

Parameters

Table 53–33 PROBE_VERSION Procedure Parameters

Parameter	Description
major	Major version number
minor	Minor version number: increments as functionality is added

SELF_CHECK Procedure

This procedure performs an internal consistency check. SELF_CHECK also runs a communications test to ensure that the Probe processes are able to communicate.

If SELF_CHECK does not return successfully, then an incorrect version of DBMS_DEBUG was probably installed on this server. The solution is to install the correct version (pbload.sql loads DBMS_DEBUG and the other relevant packages).

Syntax

```
DBMS_DEBUG.SELF_CHECK (
   timeout IN binary_integer := 60);
```

Parameters

Table 53–34 SELF_CHECK Procedure Parameters

Parameter	Description
timeout	The timeout to use for the communication test. Default is 60 seconds.

Exceptions

Table 53–35 SELF_CHECK Procedure Exceptions

Exception	Description
OER-6516	Probe version is inconsistent
pipe_creation_failure	Could not create a pipe
pipe_send_failure	Could not write data to the pipe
pipe_receive_failure	Could not read data from the pipe
pipe_datatype_mismatch	Datatype in the pipe was wrong
pipe_data_error	Data got garbled in the pipe

All of these exceptions are fatal. They indicate a serious problem with Probe that prevents it from working correctly.

SET_BREAKPOINT Function

This function sets a breakpoint in a program unit, which persists for the current session. Execution pauses if the target program reaches the breakpoint.

Syntax

```
DBMS_DEBUG.SET_BREAKPOINT (
   program     IN  program_info,
   line#       IN  BINARY_INTEGER,
   breakpoint# OUT BINARY_INTEGER,
   fuzzy       IN  BINARY_INTEGER := 0,
   iterations  IN  BINARY_INTEGER := 0)
  RETURN BINARY_INTEGER;
```

Parameters

Table 53–36 SET_BREAKPOINT Function Parameters

Parameter	Description
program	Information about the program unit in which the breakpoint is to be set. (In version 2.1 and later, the namespace, name, owner, and dblink may be set to NULL, in which case the breakpoint is placed in the currently-running program unit.)
line#	Line at which the breakpoint is to be set
breakpoint#	On successful completion, contains the unique breakpoint number by which to refer to the breakpoint
fuzzy	Only applicable if there is no executable code at the specified line: 0 means return error_illegal_line 1 means search forward for an adjacent line at which to place the breakpoint -1 means search backward for an adjacent line at which to place the breakpoint
iterations	Number of times to wait before signalling this breakpoint

Return Values

Note: The fuzzy and iterations parameters are not yet implemented

Table 53–37 SET_BREAKPOINT Function Return Values

Return	Description
success	A successful completion
error_illegal_line	Cannot set a breakpoint at that line
error_bad_handle	No such program unit exists

SET_OER_BREAKPOINT Function

This function sets an OER breakpoint.

Syntax

```
DBMS_DEBUG.SET_OER_BREAKPOINT (
   oer  IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 53–38 SET_OER_BREAKPOINT Function Parameters

Parameter	Description
oer	The OER (positive 4-byte number) to set

Return Values

Table 53–39 SET_OER_BREAKPOINT Function Return Values

Return	Description
success	A successful completion
error_no_such_breakpt	No such OER breakpoint exists

SET_TIMEOUT Function

This function sets the timeout value and returns the new timeout value.

Syntax

```
DBMS_DEBUG.SET_TIMEOUT (
   timeout BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 53–40 SET_TIMEOUT Function Parameters

Parameter	Description
timeout	The timeout to use for communication between the target and debug sessions

SET_TIMEOUT_BEHAVIOUR Procedure

This procedure tells Probe what to do with the target session when a timeout occurs. This call is made in the target session.

Syntax

```
DBMS_DEBUG.SET_TIMEOUT_BEHAVIOUR (
   behaviour IN PLS_INTEGER);
```

Parameters

Table 53–41 SET_TIMEOUT_BEHAVIOUR Procedure Parameters

Parameter	Description
`behaviour - One of the following:`	
`retry_on_timeout`	Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
`continue_on_timeout`	Continue execution, using same event flags
`nodebug_on_timeout`	Turn debug-mode OFF (in other words, call `debug_off`) and continue execution. No more events will be generated by this target session unless it is re-initialized by calling `debug_on`.
`abort_on_timeout`	Continue execution, using the `abort_execution` flag, which should cause the program to terminate immediately. The session remains in debug-mode.

Exceptions

unimplemented - the requested behavior is not recognized

Usage Notes

The default behavior (if this procedure is not called) is `continue_on_timeout`, since it allows a debugger client to reestablish control (at the next event) but does not cause the target session to hang indefinitely.

SET_VALUE Function

This function sets a value in the currently-running program. There are two overloaded SET_VALUE functions.

Syntax

```
DBMS_DEBUG.SET_VALUE (
   frame#               IN binary_integer,
   assignment_statement IN varchar2)
  RETURN BINARY_INTEGER;

DBMS_DEBUG.SET_VALUE (
   handle               IN program_info,
   assignment_statement IN VARCHAR2)
  RETURN BINARY_INTEGER;
```

Parameters

Table 53–42 SET_VALUE Function Parameters

Parameter	Description
frame#	Frame in which the value is to be set; 0 means the currently executing frame.
handle	Description of the package containing the variable
assignment_statement	An assignment statement (which must be legal PL/SQL) to run in order to set the value. For example, 'x := 3;'.
	Only scalar values are supported in this release. The right side of the assignment statement must be a scalar.

Return Values

Table 53–43 SET_VALUE Function Return Values

Return	Description
success	-
error_illegal_value	Not possible to set it to that value
error_illegal_null	Cannot set to NULL because object type specifies it as 'not NULL'
error_value_malformed	Value is not a scalar
error_name_incomplete	The assignment statement does not resolve to a scalar. For example, 'x := 3;', if x is a record.
error_no_such_object	One of the following:
	- Package does not exist
	- Package is not instantiated
	- User does not have privileges to debug the package
	- Object does not exist in the package

Usage Notes

In some cases, the PL/SQL compiler uses temporaries to access package variables, and does not guarantee to update such temporaries. It is possible, although unlikely, that

modification to a package variable using SET_VALUE might not take effect for a line or two.

Examples

To set the value of SCOTT.PACK.var to 6:

```
DECLARE
   handle  dbms_debug.program_info;
   retval  BINARY_INTEGER;
BEGIN
   handle.Owner     := 'SCOTT';
   handle.Name      := 'PACK';
   handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
   retval           := dbms_debug.set_value(handle, 'var := 6;');
END;
```

SHOW_BREAKPOINTS Procedures

There are two overloaded procedures that return a listing of the current breakpoints. There are three overloaded SHOW_BREAKPOINTS procedures.

Syntax

```
DBMS_DEBUG.SHOW_BREAKPOINTS (
   listing    IN OUT VARCHAR2);

DBMS_DEBUG.SHOW_BREAKPOINTS (
   listing    OUT breakpoint_table);

DBMS_DEBUG.SHOW_BREAKPOINTS (
   code_breakpoints  OUT breakpoint_table,
   oer_breakpoints   OUT oer_table);
```

Parameters

Table 53–44 SHOW_BREAKPOINTS Procedure Parameters

Parameter	Description
listing	A formatted buffer (including newlines) of the breakpoints.
	Indexed table of breakpoint entries. The breakpoint number is indicated by the index into the table. Breakpoint numbers start at 1 and are reused when deleted.
code_breakpoints	The indexed table of breakpoint entries, indexed by breakpoint number
oer_breakpoints	The indexed table of OER breakpoints, indexed by OER

SHOW_FRAME_SOURCE Procedure

The procedure gets the source code. There are two overloaded SHOW_SOURCE procedures.

Syntax

```
DBMS_DEBUG.SHOW_FRAME_SOURCE (
   first_line  IN            BINARY_INTEGER,
   last_line   IN            BINARY_INTEGER,
   source      IN OUT NOCOPY vc2_table,
   frame_num   IN            BINARY_INTEGER);
```

Parameters

Table 53–45 SHOW_FRAME_SOURCE Procedure Parameters

Parameter	Description
first_line	Line number of first line to fetch (PL/SQL programs always start at line 1 and have no holes)
last_line	Line number of last line to fetch. No lines are fetched past the end of the program.
source	The resulting table, which may be indexed by line#
frame_num	1-based frame number

Usage Notes

- You use this function only when backtrace shows an anonymous unit is executing at a given frame position and you need to view the source in order to set a breakpoint.
- If frame number is top of the stack and it's an anonymous block then SHOW_SOURCE can also be used.
- If it's a stored PLSQL package/function/procedure then use SQL as described in the Usage Notes to SHOW_SOURCE Procedures.

SHOW_SOURCE Procedures

The procedure gets the source code. There are two overloaded `SHOW_SOURCE` procedures.

Syntax

```
DBMS_DEBUG.SHOW_SOURCE (
   first_line  IN   BINARY_INTEGER,
   last_line   IN   BINARY_INTEGER,
   source      OUT  vc2_table);

DBMS_DEBUG.SHOW_SOURCE (
   first_line   IN     BINARY_INTEGER,
   last_line    IN     BINARY_INTEGER,
   window       IN     BINARY_INTEGER,
   print_arrow  IN     BINARY_INTEGER,
   buffer       IN OUT VARCHAR2,
   buflen       IN     BINARY_INTEGER,
   pieces       OUT    BINARY_INTEGER);
```

Parameters

Table 53–46 SHOW_SOURCE Procedure Parameters

Parameter	Description
`first_line`	Line number of first line to fetch (PL/SQL programs always start at line 1 and have no holes)
`last_line`	Line number of last line to fetch. No lines are fetched past the end of the program.
`source`	The resulting table, which may be indexed by line#
`window`	'Window' of lines (the number of lines around the current source line)
`print_arrow`	Nonzero means to print an arrow before the current line
`buffer`	Buffer in which to place the source listing
`buflen`	Length of buffer
`pieces`	Set to nonzero if not all the source could be placed into the given buffer

Return Values

An indexed table of source-lines. The source lines are stored starting at `first_line`. If any error occurs, then the table is empty.

Usage Notes

The best way to get the source code (for a program that is being run) is to use SQL. For example:

```
DECLARE
    info DBMS_DEBUG.runtime_info;
BEGIN
   -- call DBMS_DEBUG.SYNCHRONIZE, CONTINUE,
   -- or GET_RUNTIME_INFO to fill in 'info'
   SELECT text INTO <buffer> FROM all_source
```

```
   WHERE owner = info.Program.Owner
     AND name  = info.Program.Name
     AND line  = info.Line#;
END;
```

However, this does not work for nonpersistent programs (for example, anonymous blocks and trigger invocation blocks). For nonpersistent programs, call `SHOW_SOURCE`. There are two flavors: one returns an indexed table of source lines, and the other returns a packed (and formatted) buffer.

The second overloading of `SHOW_SOURCE` returns the source in a formatted buffer, complete with line-numbers. It is faster than the indexed table version, but it does not guarantee to fetch all the source.

If the source does not fit in bufferlength (`buflen`), then additional pieces can be retrieved using the `GET_MORE_SOURCE` procedure (`pieces` returns the number of additional pieces that need to be retrieved).

SYNCHRONIZE Function

This function waits until the target program signals an event. If `info_requested` is not `NULL`, then it calls `GET_RUNTIME_INFO`.

Syntax

```
DBMS_DEBUG.SYNCHRONIZE (
   run_info       OUT  runtime_info,
   info_requested IN   BINARY_INTEGER := NULL)
  RETURN BINARY_INTEGER;
```

Parameters

Table 53–47 SYNCHRONIZE Function Parameters

Parameter	Description
`run_info`	Structure in which to write information about the program. By default, this includes information about what program is running and at which line execution has paused.
`info_requested`	Optional bit-field in which to request information other than the default (which is `info_getStackDepth` + `info_getLineInfo`). 0 means that no information is requested at all (see "Information Flags" on page 53-13).

Return Values

Table 53–48 SYNCHRONIZE Function Return Values

Return	Description
`success`	A successful completion
`error_timeout`	Timed out before the program started execution
`error_communication`	Other communication error

TARGET_PROGRAM_RUNNING Procedure

This procedure returns `TRUE` if the target session is currently executing a stored procedure, or `FALSE` if it is not.

Syntax

```
DBMS_DEBUG.TARGET_PROGRAM_RUNNING
  RETURN BOOLEAN;
```

54

DBMS_DDL

This package provides access to some SQL data definition language (DDL) statements from stored procedures. It also provides special administration operations that are not available as Data Definition Language statements (DDLs).

This chapter contains the following topics:

Using DBMS_DDL

This section contains topics which relate to using the `DBMS_DDL` package.

Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only

The following subprograms are deprecated with release Oracle Database 10*g*:

- ALTER_COMPILE Procedure

Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

Operational Notes

The `ALTER_COMPILE` procedure commits the current transaction, performs the operation, and then commits again.

Summary of DBMS_DDL Subprograms

Table 54–1 DBMS_DDL Package Subprograms

Subprogram	Description
ALTER_COMPILE Procedure on page 54-7	Compiles the PL/SQL object
ALTER_TABLE_NOT_ REFERENCEABLE Procedure on page 54-8	Reorganizes object tables
ALTER_TABLE_REFERENCEABLE Procedure on page 54-9	Reorganizes object tables
CREATE_WRAPPED Procedures on page 54-10	Takes as input a single `CREATE OR REPLACE` statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body, generates a `CREATE OR REPLACE` statement with the PL/SQL source text obfuscated and executes the generated statement
IS_TRIGGER_FIRE_ONCE Function on page 54-12	Returns `TRUE` if the specified DML or DDL trigger is set to fire once. Otherwise, returns `FALSE`
SET_TRIGGER_FIRING_PROPERTY Procedures on page 54-13	Sets the specified DML or DDL trigger's firing property
WRAP Functions on page 54-15	Takes as input a `CREATE OR REPLACE` statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a `CREATE OR REPLACE` statement where the text of the PL/SQL unit has been obfuscated

ALTER_COMPILE Procedure

This procedure is equivalent to the following SQL statement:

```
ALTER PROCEDURE|FUNCTION|PACKAGE [<schema>.] <name> COMPILE [BODY]
```

> **Note:** This procedure is deprecated in Oracle Database 10*g* Release 2 (10.2) While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the DDL equivalent in a dynamic SQL statement.

Syntax

```
DBMS_DDL.ALTER_COMPILE (
   type             VARCHAR2,
   schema           VARCHAR2,
   name             VARCHAR2
   reuse_settings   BOOLEAN := FALSE);
```

Parameters

Table 54–2 ALTER_COMPILE Procedure Parameters

Parameter	Description
type	Must be either PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY or TRIGGER
schema	Schema name If NULL, then use current schema (case-sensitive)
name	Name of the object (case-sensitive)
reuse_settings	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

Exceptions

Table 54–3 ALTER_COMPILE Procedure Exceptions

Exception	Description
ORA-20000:	Insufficient privileges or object does not exist
ORA-20001:	Remote object, cannot compile
ORA-20002:	Bad value for object type: should be either PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, or TRIGGER

ALTER_TABLE_NOT_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes not the default referenceable table for the schema `affected_schema`. This is equivalent to SQL

```
ALTER TABLE [<table_schema>.]<table_name> NOT REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_NOT_REFERENCEABLE (
   table_name        IN           VARCHAR2,
   table_schema      IN  DEFAULT  NULL,
   affected_schema   IN  DEFAULT  NULL);
```

Parameters

Table 54–4 ALTER_TABLE_NOT_REFERENCEABLE Procedure Parameters

Parameter	Description
`table_name`	Name of the table to be altered. Cannot be a synonym. Must not be `NULL`. Case sensitive.
`table_schema`	Name of the schema owning the table to be altered. If `NULL` then the current schema is used. Case sensitive.
`affected_schema`	Name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

Usage Notes

This procedure simply reverts for the affected schema to the default table referenceable for `PUBLIC`; that is., it simply undoes the previous `ALTER_TABLE_REFERENCEABLE` call for this specific schema. The affected schema must a particular schema (cannot be `PUBLIC`).

The user that executes this procedure must own the table (that is, the schema is the same as the user), and the affected schema must be the same as the user.

If the user executing this procedure has `ALTER ANY TABLE` and `SELECT ANY TABLE` and `DROP ANY TABLE` privileges, the user doesn't have to own the table and the affected schema can be any valid schema.

ALTER_TABLE_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes the referenceable table for the given schema `affected_schema`. This is equivalent to SQL

```
ALTER TABLE [<table_schema>.]<table_name>  REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_REFERENCEABLE
   table_name       IN  VARCHAR2,
   table_schema     IN  DEFAULT  NULL,
   affected_schema  IN  DEFAULT  NULL);
```

Parameters

Table 54–5 ALTER_TABLE_REFERENCEABLE Procedure Parameters

Parameter	Description
`table_name`	Name of the table to be altered. Cannot be a synonym. Must not be `NULL`. Case sensitive.
`table_schema`	Name of the schema owning the table to be altered. If `NULL` then the current schema is used. Case sensitive.
`affected_schema`	Name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

Usage Notes

When you create an object table, it automatically becomes referenceable, unless you use the `OID AS` clause when creating the table. The `OID AS` clause makes it possible for you to create an object table and to assign to the new table the same EOID as another object table of the same type. After you create a new table using the `OID AS` clause, you end up with two object table with the same `EOID`; the new table is not referenceable, the original one is. All references that used to point to the objects in the original table still reference the same objects in the same original table.

If you execute this procedure on the new table, it makes the new table the referenceable table replacing the original one; thus, those references now point to the objects in the new table instead of the original table.

CREATE_WRAPPED Procedures

The procedure takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body. It then generates a CREATE OR REPLACE statement with the PL/SQL source text obfuscated and executes the generated statement. In effect, this procedure bundles together the operations of wrapping the text and creating the PL/SQL unit.

See Also: WRAP Functions on page 54-15

This procedure has 3 overloads. Each of the three functions provides better performance than using a combination of individual WRAP Functions and DBMS_SQL.PARSE (or EXECUTE IMMEDIATE) calls. The different functionality of each form of syntax is presented with the definition.

Syntax

Is a shortcut for EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(*ddl*):

```
DBMS_DDL.CREATE_WRAPPED (
   ddl     VARCHAR2);
```

Is a shortcut for DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub)):

```
DBMS_DDL.CREATE_WRAPPED(
   ddl     DBMS_SQL.VARCHAR2A,
   lb      PLS_INTEGER,
   ub      PLS_INTEGER);
```

Is a shortcut for DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub)):

```
DBMS_DDL.CREATE_WRAPPED(
   ddl     DBMS_SQL.VARCHAR2S,
   lb      PLS_INTEGER,
   ub      PLS_INTEGER);
```

Parameters

Table 54–6 CREATE_WRAPPED Procedure Parameters

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

Usage Notes

- The CREATE OR REPLACE statement is executed with the privileges of the user invoking DBMS_DDL.CREATE_WRAPPED.
- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name SYS.DBMS_DDL to avoid the possibility that the name DBMS_

DDL is captured by a locally-defined unit or by redefining the DBMS_DDL public synonym.

- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL wrap utility accepts a entire SQL*Plus file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (EXECUTE IMMEDIATE and DBMS_SQL.PARSE). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus "/" termination character), both the CREATE_WRAPPED Procedures and the WRAP Functions require input to be a single unit.

Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception DBMS_DDL.MALFORMED_WRAP_INPUT is raised.

Examples

```
DECLARE
    ddl VARCHAR2(32767);
BEGIN
    ddl := GENERATE_PACKAGE(...);
    SYS.DBMS_DDL.CREATE_WRAPPED(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

IS_TRIGGER_FIRE_ONCE Function

This function returns TRUE if the specified DML or DDL trigger is set to fire once. Otherwise, it returns FALSE.

A fire once trigger fires in a user session but does not fire in the following cases:

- For changes made by a Streams apply process
- For changes made by executing one or more Streams apply errors using the EXECUTE_ERROR or EXECUTE_ALL_ERRORS procedure in the DBMS_APPLY_ADM package
- For changes made by a Logical Standby apply process

Note: Only DML and DDL triggers can be fire once. All other types of triggers always fire.

See Also: "SET_TRIGGER_FIRING_PROPERTY Procedures" on page 54-13

Syntax

```
DBMS_DDL.IS_TRIGGER_FIRE_ONCE
   trig_owner          IN  VARCHAR2,
   trig_name           IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 54–7 IS_TRIGGER_FIRE_ONCE Function Parameters

Parameter	Description
trig_owner	Schema of trigger
trig_name	Name of trigger

SET_TRIGGER_FIRING_PROPERTY Procedures

This procedure sets the specified DML or DDL trigger's firing property whether or not the property is set for the trigger. Use this procedure to control a DML or DDL trigger's firing property for changes:

- Applied by a Streams apply process
- Made by executing one or more Streams apply errors using the `EXECUTE_ERROR` or `EXECUTE_ALL_ERRORS` procedure in the `DBMS_APPLY_ADM` package.
- Applied by a Logical Standby apply process

Syntax

```
DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY (
   trig_owner         IN  VARCHAR2,
   trig_name          IN  VARCHAR2,
   fire_once          IN  BOOLEAN);

DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY (
   trig_owner         IN  VARCHAR2,
   trig_name          IN  VARCHAR2,
   property           IN INTEGER,
   setting            IN BOOLEAN);
```

Parameters

Table 54–8 SET_TRIGGER_FIRING_PROPERTY Procedure Parameters

Parameter	Description
`trig_owner`	Schema of the trigger to set
`trig_name`	Name of the trigger to set
`fire_once`	■ If `TRUE`, the trigger is set to fire once. By default, the `fire_once` parameter is set to `TRUE` for DML and DDL triggers. ■ If `FALSE`, the trigger is set to always fire unless `apply_server_only` property is set to `TRUE`, which overrides `fire_once` property setting.
`property`	■ `DBMS_DDL.fire_once` to set the `fire_once` property of the trigger ■ `DBMS_DDL.apply_server_only` to indicate whether trigger fires only in the context of SQL apply processes maintaining a logical standby database or Streams apply processes
`setting`	Value of property being set

Usage Notes

DML triggers created on a table have their fire-once property set to `TRUE`. In this case, the triggers only fire when the table is modified by an user process, and they are automatically disabled inside Oracle processes maintaining either a logical standby database (SQL Apply) or Oracle processes doing replication (Streams Apply) processes, and thus do not fire when a SQL Apply or a Streams Apply process modifies the table. There are two ways for a user to fire a trigger as a result of SQL Apply or a Streams Apply process making a change to a maintained table: (a) setting the fire-once property of a trigger to `FALSE`, which allows it fire both in the context of a user process or a SQL or Streams Apply process, or (b) by setting the

apply-server-only property to TRUE and thus making the trigger fire only in the context of a SQL Apply or a Streams Apply process and not in the context of a user process.

- FIRE_ONCE=TRUE, APPLY_SERVER_ONLY=FALSE

  This is the default property setting for a DML trigger. The trigger only fires when user process modifies the base table.

- FIRE_ONCE=TRUE or FALSE, APPLY_SERVER_ONLY=TRUE

  The trigger only fires when SQL Apply or Streams Apply process modifies the base table. The trigger does not fire when a user process modifies the base table.Thus the apply-server-only property overrides the fire-once property of a trigger.

Note:

- If you dequeue an error transaction from the error queue and execute it without using the DBMS_APPLY_ADM package, then relevant changes resulting from this execution cause a trigger to fire, regardless of the trigger firing property.
- Only DML and DDL triggers can be fire once. All other types of triggers always fire.

See Also: *Oracle Streams Concepts and Administration* for more information about the apply process and controlling a trigger's firing property

WRAP Functions

This function takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a CREATE OR REPLACE statement where the text of the PL/SQL unit has been obfuscated.

The function has 3 overloads to allow for the different ways in which DDL statements can be generated dynamically and presented to DBMS_SQL or EXECUTE IMMEDIATE. The different functionality of each form of syntax is presented with the definition.

See Also: CREATE_WRAPPED Procedures on page 54-10

Syntax

Provides basic functionality:

```
DBMS_DDL.WRAP(
   ddl      VARCHAR2)
  RETURN VARCHAR2;
```

Provides the same functionality as the first form, but allows for larger inputs. This function is intended to be used with the PARSE Procedures in the DBMS_SQL package and its argument list follows the convention of DBMS_SQL.PARSE:

```
DBMS_DDL.WRAP(
   ddl      DBMS_SQL.VARCHAR2S,
   lb       PLS_INTEGER,
   ub       PLS_INTEGER)
  RETURN DBMS_SQL.VARCHAR2S;
```

Provides the same functionality as the second form and is provided for compatibility with multiple forms of the PARSE Procedures in the DBMS_SQL package:

```
DBMS_DDL.WRAP(
   ddl      DBMS_SQL.VARCHAR2A,
   lb       PLS_INTEGER,
   ub       PLS_INTEGER)
  RETURN DBMS_SQL.VARCHAR2A;
```

Parameters

Table 54–9 WRAP Function Parameters

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

Return Values

A CREATE OR REPLACE statement with the text obfuscated. In the case of the second and third form, the return value is a table of strings that need to be concatenated in order to construct the CREATE OR REPLACE string containing obfuscated source text.

Usage Notes

- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name SYS.DBMS_DDL to avoid the possibility that the name DBMS_DDL is captured by a locally-defined unit or by redefining the DBMS_DDL public synonym.
- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL wrap utility accepts a full SQL file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (EXECUTE IMMEDIATE and DBMS_SQL.PARSE). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus "/" termination character), both the CREATE_WRAPPED Procedures and the WRAP Functions require input to be a single unit.

Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception DBMS_DDL.MALFORMED_WRAP_INPUT is raised.

Examples

```
DECLARE
   ddl VARCHAR2(32767);
BEGIN
   ddl := GENERATE_PACKAGE(...);
EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

55

DBMS_DEFER

DBMS_DEFER is the user interface to a replicated transactional deferred remote procedure call facility. Replicated applications use the calls in this interface to queue procedure calls for later transactional execution at remote nodes.

These procedures are typically called from either after row triggers or application specified update procedures.

Documentation of DBMS_DEFER

For a complete description of this package within the context of Replication, see DBMS_DEFER in the *Oracle Database Advanced Replication Management API Reference.*

56

DBMS_DEFER_QUERY

DBMS_DEFER_QUERY enables you to query the deferred transactions queue data that is not exposed through views.

- Documentation of DBMS_DEFER_QUERY

Documentation of DBMS_DEFER_QUERY

For a complete description of this package within the context of Replication, see DBMS_DEFER_QUERY in the *Oracle Database Advanced Replication Management API Reference*.

57

DBMS_DEFER_SYS

DBMS_DEFER_SYS subprograms manage default replication node lists. This package is the system administrator interface to a replicated transactional deferred remote procedure call facility. Administrators and replication daemons can execute transactions queued for remote nodes using this facility, and administrators can control the nodes to which remote calls are destined.

Documentation of DBMS_DEFER_SYS

For a complete description of this package within the context of Replication, see `DBMS_DEFER_SYS` in the *Oracle Database Advanced Replication Management API Reference.*

58

DBMS_DESCRIBE

You can use the DBMS_DESCRIBE package to get information about a PL/SQL object. When you specify an object name, DBMS_DESCRIBE returns a set of indexed tables with the results. Full name translation is performed and security checking is also checked on the final object.

This chapter contains the following topics:

Using DBMS_DESCRIBE

Overview

This package provides the same functionality as the Oracle Call Interface `OCIDescribeAny` call.

See Also: *Oracle Call Interface Programmer's Guide*

Security Model

This package is available to PUBLIC and performs its own security checking based on the schema object being described.

Types

The DBMS_DESCRIBE package declares two PL/SQL table types, which are used to hold data returned by DESCRIBE_PROCEDURE in its OUT parameters. The types are:

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(30)
    INDEX BY BINARY_INTEGER;

TYPE NUMBER_TABLE IS TABLE OF NUMBER
    INDEX BY BINARY_INTEGER;
```

Exceptions

DBMS_DESCRIBE can raise application errors in the range -20000 to -20004.

Table 58–1 DBMS_DESCRIBE Errors

Error	Description
ORA-20000	ORU 10035: cannot describe a package ('X') only a procedure within a package.
ORA-20001	ORU-10032: procedure 'X' within package 'Y' does not exist.
ORA-20002	ORU-10033: object 'X' is remote, cannot describe; expanded name 'Y'.
ORA-20003	ORU-10036: object 'X' is invalid and cannot be described.
ORA-20004	Syntax error attempting to parse 'X'.

Examples

One use of the DESCRIBE_PROCEDURE procedure is as an external service interface.

For example, consider a client that provides an OBJECT_NAME of SCOTT.ACCOUNT_UPDATE, where ACCOUNT_UPDATE is an overloaded function with specification:

```
TABLE account (accnt_no NUMBER, person_id NUMBER,
               balance NUMBER(7,2))
TABLE person  (person_id number(4), person_nm varchar2(10))

CREATE OR REPLACE PACKAGE ACCOUNT_PKG is
   FUNCTION ACCOUNT_UPDATE (accnt_no    NUMBER,
                            person      person%rowtype,
                            amounts     DBMS_DESCRIBE.NUMBER_TABLE,
                            trans_date  DATE)
                            return       account.balance%type;

   FUNCTION ACCOUNT_UPDATE (accnt_no     NUMBER,
                            person       person%rowtype,
                            amounts      DBMS_DESCRIBE.NUMBER_TABLE,
                            trans_no     NUMBER)
                            return       account.balance%type;
END;
```

This procedure might look similar to the following output:

```
overload position  argument level  datatype length prec scale rad
-------- --------- -------- ------ -------- ------ ---- ----- ---
       1         0                0        2     22    7     2  10
       1         1   ACCNT_NO     0        2      0    0     0   0
       1         2   PERSON       0      250      0    0     0   0
       1         1   PERSON_ID    1        2     22    4     0  10
       1         2   PERSON_NM    1        1     10    0     0   0
       1         3   AMOUNTS      0      251      0    0     0   0
       1         1                1        2     22    0     0   0
       1         4   TRANS_DATE   0       12      0    0     0   0
       2         0                0        2     22    7     2  10
       2         1   ACCNT_NO     0        2     22    0     0   0
       2         2   PERSON       0        2     22    4     0  10
       2         3   AMOUNTS      0      251     22    4     0  10
       2         1                1        2      0    0     0   0
       2         4   TRANS_NO     0        2      0    0     0   0
```

The following PL/SQL procedure has as its parameters all of the PL/SQL datatypes:

```
CREATE OR REPLACE PROCEDURE p1 (
        pvc2    IN     VARCHAR2,
        pvc     OUT    VARCHAR,
        pstr    IN OUT STRING,
        plong   IN     LONG,
        prowid  IN     ROWID,
        pchara  IN     CHARACTER,
        pchar   IN     CHAR,
        praw    IN     RAW,
        plraw   IN     LONG RAW,
        pbinint IN     BINARY_INTEGER,
        pplsint IN     PLS_INTEGER,
        pbool   IN     BOOLEAN,
        pnat    IN     NATURAL,
        ppos    IN     POSITIVE,
```

```
        pposn   IN     POSITIVEN,
        pnatn   IN     NATURALN,
        pnum    IN     NUMBER,
        pintgr  IN     INTEGER,
        pint    IN     INT,
        psmall  IN     SMALLINT,
        pdec    IN     DECIMAL,
        preal   IN     REAL,
        pfloat  IN     FLOAT,
        pnumer  IN     NUMERIC,
        pdp     IN     DOUBLE PRECISION,
        pdate   IN     DATE,
        pmls    IN     MLSLABEL) AS

BEGIN
    NULL;
END;
```

If you describe this procedure using the following:

```
CREATE OR REPLACE PACKAGE describe_it AS

    PROCEDURE desc_proc (name VARCHAR2);

END describe_it;

CREATE OR REPLACE PACKAGE BODY describe_it AS

  PROCEDURE prt_value(val VARCHAR2, isize INTEGER) IS
    n INTEGER;
  BEGIN
    n := isize - LENGTHB(val);
    IF n < 0 THEN
      n := 0;
    END IF;
    DBMS_OUTPUT.PUT(val);
    FOR i in 1..n LOOP
      DBMS_OUTPUT.PUT(' ');
    END LOOP;
  END prt_value;

  PROCEDURE desc_proc (name VARCHAR2) IS

      overload     DBMS_DESCRIBE.NUMBER_TABLE;
      position     DBMS_DESCRIBE.NUMBER_TABLE;
      c_level      DBMS_DESCRIBE.NUMBER_TABLE;
      arg_name     DBMS_DESCRIBE.VARCHAR2_TABLE;
      dty          DBMS_DESCRIBE.NUMBER_TABLE;
      def_val      DBMS_DESCRIBE.NUMBER_TABLE;
      p_mode       DBMS_DESCRIBE.NUMBER_TABLE;
      length       DBMS_DESCRIBE.NUMBER_TABLE;
      precision    DBMS_DESCRIBE.NUMBER_TABLE;
      scale        DBMS_DESCRIBE.NUMBER_TABLE;
      radix        DBMS_DESCRIBE.NUMBER_TABLE;
      spare        DBMS_DESCRIBE.NUMBER_TABLE;
      idx          INTEGER := 0;

  BEGIN
      DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
              name,
              null,
```

```
            null,
            overload,
            position,
            c_level,
            arg_name,
            dty,
            def_val,
            p_mode,
            length,
            precision,
            scale,
            radix,
            spare);

    DBMS_OUTPUT.PUT_LINE('Position    Name        DTY  Mode');
    LOOP
        idx := idx + 1;
        prt_value(TO_CHAR(position(idx)), 12);
        prt_value(arg_name(idx), 12);
        prt_value(TO_CHAR(dty(idx)), 5);
        prt_value(TO_CHAR(p_mode(idx)), 5);
        DBMS_OUTPUT.NEW_LINE;
    END LOOP;
  EXCEPTION
     WHEN NO_DATA_FOUND THEN
        DBMS_OUTPUT.NEW_LINE;
        DBMS_OUTPUT.NEW_LINE;

  END desc_proc;
END describe_it;
```

Then the results list all the numeric codes for the PL/SQL datatypes:

```
Position  Name    Datatype_Code  Mode
1         PVC2      1              0
2         PVC       1              1
3         PSTR      1              2
4         PLONG     8              0
5         PROWID    11             0
6         PCHARA    96             0
7         PCHAR     96             0
8         PRAW      23             0
9         PLRAW     24             0
10        PBININT   3              0
11        PPLSINT   3              0
12        PBOOL     252            0
13        PNAT      3              0
14        PPOS      3              0
15        PPOSN     3              0
16        PNATN     3              0
17        PNUM      2              0
18        PINTGR    2              0
19        PINT      2              0
20        PSMALL    2              0
21        PDEC      2              0
22        PREAL     2              0
23        PFLOAT    2              0
24        PNUMER    2              0
25        PDP       2              0
26        PDATE     12             0
27        PMLS      106            0
```

Summary of DBMS_DESCRIBE Subprograms

Table 58–2 DBMS_DESCRIBE Package Subprograms

Subprogram	Description
DESCRIBE_PROCEDURE Procedure on page 58-11	Provides a brief description of a PL/SQL stored procedure

DESCRIBE_PROCEDURE Procedure

The procedure DESCRIBE_PROCEDURE provides a brief description of a PL/SQL stored procedure. It takes the name of a stored procedure and returns information about each parameter of that procedure.

Syntax

```
DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
   object_name                    IN  VARCHAR2,
   reserved1                      IN  VARCHAR2,
   reserved2                      IN  VARCHAR2,
   overload                       OUT NUMBER_TABLE,
   position                       OUT NUMBER_TABLE,
   level                          OUT NUMBER_TABLE,
   argument_name                  OUT VARCHAR2_TABLE,
   datatype                       OUT NUMBER_TABLE,
   default_value                  OUT NUMBER_TABLE,
   in_out                         OUT NUMBER_TABLE,
   length                         OUT NUMBER_TABLE,
   precision                      OUT NUMBER_TABLE,
   scale                          OUT NUMBER_TABLE,
   radix                          OUT NUMBER_TABLE,
   spare                          OUT NUMBER_TABLE
   include_string_constraints     OUT BOOLEAN DEFAULT FALSE);
```

Parameters

Table 58–3 DBMS_DESCRIBE.DESCRIBE_PROCEDURE Parameters

Parameter	Description
object_name	Name of the procedure being described. The syntax for this parameter follows the rules used for identifiers in SQL. The name can be a synonym. This parameter is required and may not be null. The total length of the name cannot exceed 197 bytes. An incorrectly specified OBJECT_NAME can result in one of the following exceptions: ORA-20000 - A package was specified. You can only specify a stored procedure, stored function, packaged procedure, or packaged function. ORA-20001 - The procedure or function that you specified does not exist within the given package. ORA-20002 - The object that you specified is a remote object. This procedure cannot currently describe remote objects. ORA-20003 - The object that you specified is invalid and cannot be described. ORA-20004 - The object was specified with a syntax error.
reserved1 reserved2	Reserved for future use -- must be set to NULL or the empty string.
overload	A unique number assigned to the procedure's signature. If a procedure is overloaded, then this field holds a different value for each version of the procedure.
position	Position of the argument in the parameter list. Position 0 returns the values for the return type of a function.

Table 58–3 (Cont.) DBMS_DESCRIBE.DESCRIBE_PROCEDURE Parameters

Parameter	Description
level	If the argument is a composite type, such as record, then this parameter returns the level of the datatype. See the *Oracle Call Interface Programmer's Guide* for a description of the ODESSP call for an example.
argument_name	Name of the argument associated with the procedure that you are describing.
datatype	Oracle datatype of the argument being described. The datatypes and their numeric type codes are: 0 placeholder for procedures with no arguments 1 VARCHAR, VARCHAR, STRING 2 NUMBER, INTEGER, SMALLINT, REAL, FLOAT, DECIMAL 3 BINARY_INTEGER, PLS_INTEGER, POSITIVE, NATURAL 8 LONG 11 ROWID 12 DATE 23 RAW 24 LONG RAW 58 OPAQUE TYPE 96 CHAR (ANSI FIXED CHAR), CHARACTER 106 MLSLABEL 121 OBJECT 122 NESTED TABLE 123 VARRAY 178 TIME 179 TIME WITH TIME ZONE 180 TIMESTAMP 181 TIMESTAMP WITH TIME ZONE 231 TIMESTAMP WITH LOCAL TIME ZONE 250 PL/SQL RECORD 251 PL/SQL TABLE 252 PL/SQL BOOLEAN
default_value	1 if the argument being described has a default value; otherwise, the value is 0.
in_out	Describes the mode of the parameter: 0 IN 1 OUT 2 IN OUT
length	For %rowtype formal arguments, the length constraint is returned, otherwise 0 is returned.If the include_string_constraints parameter is set to TRUE, the argument's formal length constraint is passed back if it is of the appropriate type. Those are the string types: 1;8;23;24;96
precision	If the argument being described is of datatype 2 (NUMBER), then this parameter is the precision of that number.
scale	If the argument being described is of datatype 2 (NUMBER), then this parameter is the scale of that number.
radix	If the argument being described is of datatype 2 (NUMBER), then this parameter is the radix of that number.
spare	Reserved for future functionality.
include_string_constraints	The default is FALSE. If the parameter is set to TRUE, the arguments' formal type constraints is passed back if it is of the appropriate type.Those are the string types: 1;8;23;24;96

Return Values

All values from `DESCRIBE_PROCEDURE` are returned in its `OUT` parameters. The datatypes for these are PL/SQL tables, to accommodate a variable number of parameters.

59

DBMS_DG

The DBMS_DG package allows applications to notify the primary database or the fast-start failover target database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover.

> **See Also:** *Oracle Data Guard Broker* for more information about performing a fast-start failover in a broker configuration

This chapter contains the following topics:

Using DBMS_DG

There are conditions detectable by applications running outside of the Oracle database that may warrant the Oracle Data Guard broker to perform a fast-start failover. Because the range of possible conditions is virtually unlimited, it is left to the applications to determine which conditions warrant a fast-start failover.

When such conditions occur, the application calls the `DBMS_DG.INITIATE_FS_FAILOVER` procedure to alert either the primary or fast-start failover target standby database that the application wants a fast-start failover to occur immediately. The database on which the procedure was called then notifies the observer, which immediately initiates a fast-start failover as long as the standby database is in a valid fast-start failover state ("observed" and either "synchronized" or "within lag") to accept a failover.If the configuration is not in a valid fast-start failover state, the `INITIATE_FS_FAILOVER` subprogram returns an ORA error message (it will not signal an exception) to inform the calling application that a fast-start failover could not be performed.

Note: If you are working in a multitenant container database (CDB), then functions within `DBMS_DG` are only executed at the root level. Ensure you are connected at the root level, not at the individual pluggable database (PDB) level.

Security Model

The DBMS_DG package runs with invoker's rights and requires the SYSDBA privilege.

Summary of the DBMS_DG Subprogram

Table 59–1 DBMS_DG Package Subprogram

Subprogram	Description
INITIATE_FS_FAILOVER Procedure on page 59-5	Enables an application to notify either the primary or fast-start failover target standby database that a fast-start failover is necessary when the application encounters conditions that warrant a failover. This procedure can only be called while connected to a primary database or a fast-start failover standby database.

INITIATE_FS_FAILOVER Procedure

Use this procedure to specify a condition string that, when encountered by an application, allows the application to request that a fast-start failover be invoked.

Syntax

```
DBMS_DG.INITIATE_FS_FAILOVER (
     condstr          IN VARCHAR2)
RETURN BINARY_INTEGER;
```

Parameters

Table 59–2 INITIATE_FS_FAILOVER Procedure Parameters

Parameter	Description
condstr	Specifies the condition string for which a fast-start failover should be requested. If no condition string argument is supplied, the default string of "Application Failover Requested" will be logged in the broker log file and in the database alert log of the database on which the procedure was called.

Usage Notes

- This procedure returns a binary integer.
- Query the V$FS_FAILOVER_STATS view to see the time of the last fast-start failover and the reason it was performed.
- This procedure can only be called while connected to a primary database or a fast-start failover standby database.

Errors

Table 59–3 INITIATE_FS_FAILOVER Procedure Errors

Error	Description
ORA-00000: normal, successful completion	The request to initiate a fast-start failover has been posted to the observer.
ORA-16646: fast-start failover is disabled	Either a broker configuration does not exist or fast-start failover has not been enabled.
ORA-16666: unable to initiate fast-start failover on a bystander standby database	DBMS_DG.INITIATE_FS_FAILOVER was invoked on a bystander standby database. That is, it was not invoked on the primary or on the fast-start failover target standby database.
ORA-16817: unsynchronized fast-start failover configuration	DBMS_DG.INITIATE_FS_FAILOVER was invoked in a maximum available fast-start failover configuration when the configuration was not synchronized.
ORA-16819: fast-start failover observer not started	DBMS_DG.INITIATE_FS_FAILOVER was invoked but an observer had not yet been started.
ORA-16820: fast-start failover observer is no longer observing this database	DBMS_DG.INITIATE_FS_FAILOVER was invoked but the configuration detects that the observer may not be running.

Table 59–3 (Cont.) INITIATE_FS_FAILOVER Procedure Errors

Error	Description
ORA-16829: lagging fast-start failover configuration	DBMS_DG.INITIATE_FS_FAILOVER was invoked in a maximum performance fast-start failover configuration when the configuration was not in the user-specified redo lag limit.

Example

In this example, the program attempts to initiate a fast-start failover when fast-start failover is disabled. To use this example, connect as user SYS with SYDDBA privileges.

```
set serveroutput on

declare
status integer;

begin
status := dbms_dg.initiate_fs_failover(''Failover Requested'');

dbms_output.put_line(''Fast-Start Failover is disabled: Expected status =
ORA-16646'');
dbms_output.put_line(''                 Actual Status = ORA-'' || status);

end;
/
exit;
```

60

DBMS_DIMENSION

DBMS_DIMENSION enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition.

> **See Also:** *Oracle Database Data Warehousing Guide* for detailed conceptual and usage information about the DBMS_DIMENSION package

This chapter contains the following topics:

Using DBMS_DIMENSION

This section contains topics which relate to using the `DBMS_DIMENSION` package.

- Security Model

Security Model

Security on this package can be controlled by granting `EXECUTE` to selected users or roles.

A user can validate or describe all the dimensions in his own schema. To validate or describe a dimension in another schema, you must have either an object privilege on the dimension or one of the following system privileges: `CREATE ANY DIMENSION`, `ALTER ANY DIMENSION`, and `DROP ANY DIMENSION`.

Summary of DBMS_DIMENSION Subprograms

Table 60–1 DBMS_DIMENSION Package Subprograms

Subprogram	Description
DESCRIBE_DIMENSION Procedure on page 60-5	Prints out the definition of the input dimension, including dimension owner and name, levels, hierarchies, and attributes
VALIDATE_DIMENSION Procedure on page 60-6	Verifies that the relationships specified in a dimension are correct

DESCRIBE_DIMENSION Procedure

This procedure displays the definition of the dimension, including dimension name, levels, hierarchies, and attributes. It displays the output using the DBMS_OUTPUT package.

Syntax

```
DBMS_DIMENSION.DESCRIBE_DIMENSION (
   dimension  IN VARCHAR2);
```

Parameters

Table 60–2 DESCRIBE_DIMENSION Procedure Parameter

Parameter	Description
dimension	The owner and name of the dimension in the format of owner.name.

VALIDATE_DIMENSION Procedure

This procedure verifies that the relationships specified in a dimension are valid. The rowid for any row that is found to be invalid will be stored in the table DIMENSION_EXCEPTIONS in the user's schema.

Syntax

```
DBMS_DIMENSION.VALIDATE_DIMENSION (
   dimension               IN VARCHAR2,
   incremental             IN BOOLEAN := TRUE,
   check_nulls             IN BOOLEAN := FALSE,
   statement_id            IN VARCHAR2 := NULL );
```

Parameters

Table 60–3 VALIDATE_DIMENSION Procedure Parameters

Parameter	Description
dimension	The owner and name of the dimension in the format of owner.name.
incremental	If TRUE, check only the new rows for tables of this dimension. If FALSE, check all the rows.
check_nulls	If TRUE, then all level columns are verified to be non-null. If FALSE, this check is omitted. Specify FALSE when non-NULLness is guaranteed by other means, such as NOT NULL constraints.
statement_id	A client-supplied unique identifier to associate output rows with specific invocations of the procedure.

61

DBMS_DNFS

The DBMS_DNFS package provides an interface to assists in creating a database using files in the backup set.

See Also: *Oracle Database Administrator's Guide*

This chapter contains the following topics:

- Using DBMS_DNFSZ
  - Security Model
- Using DBMS_DNFS

Using DBMS_DNFS

Security Model

This package has to be executed by users with `SYSDBA` privileges.

Summary of DBMS_DNFS Subprograms

Table 61–1 DBMS_DNFS Package Subprograms

Subprogram	Description
CLONEDB_RENAMEFILE Procedure on page 61-5	Renames datafiles that were pointing to the backup set to the actual file name in cloned database.

CLONEDB_RENAMEFILE Procedure

This procedure is used to rename datafiles that were pointing to the backup set to the actual file name in cloned database. The `srcfile` is the file name that represents the data file in the backup image copy or a read-only storage snapshot. The `destfile` destination file path must point to a NFS volume where cloneDB datafiles will be created. When the procedure is run successfully, the control file record is updated with the new datafile name.

Syntax

```
DBMS_DNFS.CLONEDB_RENAMEFILE (
   srcfile        IN         VARCHAR2,
   destfile       IN         VARCHAR2);
```

Parameters

Table 61–2 CLONEDB_RENAMEFILE Procedure Parameters

Parameter	Description
`srcfile`	Source datafile name in the control file
`destfile`	New datafile name

62

DBMS_DST

The DBMS_DST package provides an interface to apply the Daylight Saving Time (DST) patch to the Timestamp with Time Zone datatype.

See Also:

- *Oracle Database Globalization Support Guide*
- *Oracle Database Reference*

This chapter contains the following topics:

Using DBMS_DST

Overview

The transition period during which Daylight Saving Time comes into effect, or stops being in effect, has the potential for problems, such as data loss, when handling timestamps with time zone data. The `DBMS_DST` package enables working with these transitions in the context of a set of rules.

Security Model

The DBMS_DST package is an invoker's rights package.

> **See Also:** *Oracle Database PL/SQL Language Reference* for more information about using Invoker Rights or Definer Rights

The execute privilege on the package is granted to the EXECUTE_CATALOG_ROLE role. This role is normally granted to selected users to allow EXECUTE privileges for packages and procedures in the data dictionary.

The user that invokes the package must have the following privileges:

- CREATE ANY TABLE
- ALTER ANY TABLE
- DROP ANY TABLE
- SELECT ANY TABLE
- LOCK ANY TABLE
- ALTER ANY INDEX
- ALTER ANY TRIGGER
- UPDATE ANY TABLE
- EXECUTE ANY TYPE

Views

The DBMS_DST package uses the views shown in Table 62–1, " Views used by DBMS_DST", further described in the *Oracle Database Reference*:

Table 62–1 Views used by DBMS_DST

View	Description
DBA_TSTZ_TABLES	Displays information about all tables in the database, which have columns defined on TIMESTAMP WITH TIME ZONE datatypes or object types containing attributes of TIMESTAMP WITH TIME ZONE datatypes. Its columns are the same as those in ALL_TSTZ_TABLES
USER_TSTZ_TABLES	Displays information about the tables owned by the current user, which have columns defined on TIMESTAMP WITH TIME ZONE datatypes or object types containing attributes of TIMESTAMP WITH TIME ZONE datatypes. Its columns (except for OWNER) are the same as those in ALL_TSTZ_TABLES.
ALL_TSTZ_TABLES	Displays information about the tables accessible to the current user, which have columns defined on TIMESTAMP WITH TIME ZONE datatypes or object types containing attributes of TIMESTAMP WITH TIME ZONE datatypes

Summary of DBMS_DST Subprograms

Table 62–2 DBMS_DST Package Subprograms

Subprogram	Description
BEGIN_PREPARE Procedure on page 62-7	Starts a prepare window
BEGIN_UPGRADE Procedure on page 62-8	Starts an upgrade window
CREATE_AFFECTED_TABLE Procedure on page 62-9	Creates a table that has the schema shown in the comments for the FIND_AFFECTED_TABLES Procedure
CREATE_ERROR_TABLE Procedure on page 62-10	Creates a log error table
CREATE_TRIGGER_TABLE Procedure on page 62-11	Creates a table that is used to record active triggers disabled before performing upgrade on the table, having not been enabled due to fatal failure during the upgrading process
END_PREPARE Procedure on page 62-12	Ends a prepare window
END_UPGRADE Procedure on page 62-13	Ends an upgrade window
FIND_AFFECTED_TABLES Procedure on page 62-14	Finds all the tables that have affected TSTZ data due to the new timezone version
UPGRADE_DATABASE Procedure on page 62-15	Upgrades all tables in the database that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type
UPGRADE_SCHEMA Procedure on page 62-17	Upgrades tables in a specified list of schemas that has one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type
UPGRADE_TABLE Procedure on page 62-19	Upgrades a specified list of tables that has one or more columns defined on the TSTZ type or an ADT containing the TSTZ type

BEGIN_PREPARE Procedure

This procedure starts a prepare window. Once a prepare window is started successfully, the database property 'DST_UPGRADE_STATE' is set to 'PREPARE', and the database property 'SECONDARY_TT_VERSION' is set to a new timezone version.

The prepare window lets a DBA investigate data affected by the upgrade, and so judge when it is optimal to perform the upgrade. The prepare window can overlap normal database operation.

Syntax

```
DBMS_DST.BEGIN_PREPARE (
   new_version                IN  BINARY_INTEGER);
```

Parameters

Table 62–3 BEGIN_PREPARE Procedure Parameters

Parameter	Description
new_version	New timezone version to which the database is to be prepared to upgrade

BEGIN_UPGRADE Procedure

This procedure starts an upgrade window. When an upgraded window is started successfully, the TSTZ data in the dictionary tables is upgraded to reflect the new timezone version, and the database property `'DST_UPGRADE_STATE'` is set to `'UPGRADE'`. Once `BEGIN_UPGRADE` has been performed successfully, the user must re-start the database. After a successful restart, the database property `'PRIMARY_TT_VERSION'` is the new timezone version, and `'SECONDARY_TT_VERSION'` is the old timezone version.

The procedure operates atomically, and upgrades all or none of the dictionary tables and the database properties. It must be called in the database in `OPEN MIGRATE` mode.

Syntax

```
DBMS_DST.BEGIN_UPGRADE (
   new_version                IN  BINARY_INTEGER,
   error_on_overlap_time      IN  BOOLEAN := FALSE,
   error_on_nonexisting_time  IN  BOOLEAN := FALSE);
```

Parameters

Table 62–4 BEGIN_UPGRADE Procedure Parameters

Parameter	Description
`new_version`	New timezone version to which the database is to be upgraded
`error_on_overlap_time`	Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is `TRUE`. For more information about boundary cases, see *Oracle Database SQL Language Reference*.
`error_on_nonexisting_time`	Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is `TRUE`.

CREATE_AFFECTED_TABLE Procedure

This procedure creates a table that has the schema shown in the comments for the FIND_AFFECTED_TABLES Procedure.

Syntax

```
DBMS_DST.CREATE_AFFECTED_TABLE (
   table_name      IN  VARCHAR2);
```

Parameters

Table 62–5 CREATE_AFFECTED_TABLE Procedure Parameters

Parameter	Description
table_name	Name of the table created

Usage Notes

This procedures takes a table_name without schema qualification, creating a table within the current user schema.

CREATE_ERROR_TABLE Procedure

This procedure creates a log error table which has the following schema:

```
CREATE TABLE dst$error_table(
   table_owner     VARCHAR2(30),
   table_name      VARCHAR2(30),
   column_name     VARCHAR2(4000),
   rid             ROWID,
   error_number    NUMBER)
```

Syntax

```
DBMS_DST.CREATE_ERROR_TABLE (
   table_name      IN  VARCHAR2);
```

Parameters

Table 62–6 CREATE_ERROR_TABLE Procedure Parameters

Parameter	Description
table_name	Name of the table created

Usage Notes

- This procedures takes a table_name without schema qualification, creating a table within the current user schema.
- The error number is found when upgrading time zone file and timestamp with time zone data. For more information about error handling when upgrading time zone file and timestamp with time zone data, see Oracle Database Globalization Support Guide

CREATE_TRIGGER_TABLE Procedure

This procedure creates a table that has the following schema.

```
CREATE TABLE dst_trigger_table (
trigger_owner  VARCHAR2(30),
trigger_name   VARCHAR2(30));
```

This table is used to record active triggers that are disabled before performing upgrade on the table, having not been enabled due to fatal failure during the upgrading process.

Syntax

```
DBMS_DST.CREATE_TRIGGER_TABLE (
   table_name     IN    VARCHAR2);
```

Parameters

Table 62–7 CREATE_TRIGGER_TABLE Procedure Parameters

Parameter	Description
table_name	Name of table to be created

Usage Notes

This procedures takes a table_name without schema qualification, creating a table within the current user schema.

END_PREPARE Procedure

This procedure ends a prepare window.

Syntax

```
DBMS_DST.BEGIN_PREPARE;
```

END_UPGRADE Procedure

This procedure ends an upgrade window. An upgraded window is ended if all the affected user tables have been upgraded. Otherwise, the `OUT` parameter `num_of_failures` indicates how many tables have not been converted.

Syntax

```
DBMS_DST.END_UPGRADE (
  num_of_failures    OUT  BINARY_INTEGER);
```

Parameters

Table 62–8 END_UPGRADE Procedure Parameters

Parameter	Description
`num_of_failures`	Number of tables that fail to complete

FIND_AFFECTED_TABLES Procedure

This procedure finds all the tables which have affected TSTZ data due to the new timezone version. This procedure can only be invoked during a prepare window. The tables which have affected TSTZ data are recorded into a table indicated by parameter `affected_tables`. If semantic errors must be logged, they are recorded into a table indicated by parameter `log_errors_table`.

Syntax

```
DBMS_DST.FIND_AFFECTED_TABLES (
   affected_tables             IN  VARCHAR2 =: 'sys.dst$affected_tables',
   log_errors                  IN  BOOLEAN := FALSE,
   log_errors_table            IN  VARCHAR2 =: 'sys.dst$error_table');
```

Parameters

Table 62–9 FIND_AFFECTED_TABLES Procedure Parameters

Parameter	Description

`affected_tables`	Name of table with the following schema:
	`CREATE TABLE dst$affected_tables (`
	`table_owner VARCHAR2(30),`
	`table_name VARCHAR2(30),`
	`column_name VARCHAR2(4000),`
	`row_count NUMBER,`
	`error_count NUMBER)`
	The table can be created with the CREATE_AFFECTED_TABLE Procedure.

`log_errors`	Boolean flag indicating whether to log errors during upgrade. If `FALSE`, no error is logged into the `log_errors_table` after aborting conversion of the current table. If `TRUE`, the error is logged to the `log_errors_table`. The default is `FALSE`.

`log_errors_table`	Table name with the following schema:
	`CREATE TABLE dst$error_table (`
	`table_owner VARCHAR2(30),`
	`table_name VARCHAR2(30),`
	`column_name VARCHAR2(4000),`
	`rid ROWID,`
	`error_number NUMBER)`
	The table can be created with the CREATE_ERROR_TABLE Procedure. The `rid` column records the rowids of the offending rows, and the `error_number` column records the corresponding error number.

UPGRADE_DATABASE Procedure

This procedure upgrades all tables in the database, which have one or more columns defined on the TSTZ type or an ADT containing the TSTZ type. This procedure can only be invoked after an upgrade window has been started. Each table is upgraded in an atomic transaction. Note that, a base table and its materialized view log table are upgraded in an atomic transaction.

Syntax

```
DBMS_DST.UPGRADE_DATABASE  (
   num_of_failures             OUT BINARY_INTEGER,
   upgrade_data                IN  BOOLEAN := TRUE,
   parallel                    IN  BOOLEAN := FALSE,
   continue_after_errors       IN  BOOLEAN := TRUE,
   log_errors                  IN  BOOLEAN := FALSE,
   log_errors_table            IN  VARCHAR2 =: 'sys.dst$error_table' ,
   error_on_overlap_time       IN  BOOLEAN := FALSE,
   error_on_nonexisting_time   IN  BOOLEAN := FALSE,
   log_triggers_table          IN  VARCHAR2 := 'sys.dst$trigger_table');
```

Parameters

Table 62–10 UPGRADE_DATABASE Procedure Parameters

Parameter	Description
num_of_failures	Number of tables that fail to complete
upgrade_data	Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE), or to leave it unconverted (FALSE).The default is TRUE.
parallel	Boolean flag indicating whether to convert tables using PDML (Parallel DML) or Serial DML.The default is FALSE.
continue_after_errors	Boolean flag indicating whether to continue after upgrade fails on the current table. The default is TRUE.
log_errors	Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, errors are logged to the log_errors_table. The default is FALSE.
log_errors_table	Table name with the following schema: CREATE TABLE dst$error_table (table_owner VARCHAR2(30), table_name VARCHAR2(30), column_name VARCHAR2(4000), rid ROWID, error_number NUMBER) The table can be created with the CREATE_ERROR_TABLE Procedure. The rid column records the rowids of the offending rows, and the error_number column records the corresponding error number.
error_on_overlap_time	Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is TRUE.

Table 62–10 (Cont.) UPGRADE_DATABASE Procedure Parameters

Parameter	Description
`error_on_nonexisting_time`	Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is `TRUE`.
`log_triggers_table`	Table to log triggers which are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade

UPGRADE_SCHEMA Procedure

This procedure upgrades tables in a specified list of schemas that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type. This procedure can be invoked only after an upgrade window has been started. Each table is upgraded in an atomic transaction. Note that a base table and its materialized view log table are upgraded in an atomic transaction.

Syntax

```
DBMS_DST.UPGRADE_SCHEMA (
   num_of_failures             OUT BINARY_INTEGER,
   schema_list                 IN  VARCHAR2,
   upgrade_data                IN  BOOLEAN := TRUE,
   parallel                    IN  BOOLEAN := FALSE,
   continue_after_errors       IN  BOOLEAN := TRUE,
   log_errors                  IN  BOOLEAN := FALSE,
   log_errors_table            IN  VARCHAR2 =: 'sys.dst$error_table' ,
   error_on_overlap_time       IN  BOOLEAN := FALSE,
   error_on_nonexisting_time   IN  BOOLEAN := FALSE,
   log_triggers_table          IN  VARCHAR2 := 'sys.dst$trigger_table');
```

Parameters

Table 62–11 UPGRADE_SCHEMA Procedure Parameters

Parameter	Description
num_of_failures	Number of tables that fail to complete
schema_list	Schema name list (comma separated strings)
upgrade_data	Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE) or to leave unconverted (FALSE).The default is TRUE.
parallel	Boolean flag indicating whether to convert tables using PDML (Parallel DML) or Serial DML.The default is FALSE.
continue_after_errors	Boolean flag indicating whether to continue after upgrade fails on the current table.The default is TRUE.
log_errors	Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, the error is logged to the log_errors_table. The default is FALSE.

log_errors_table	Table name with the following schema:
	`CREATE TABLE dst$error_table (`
	`table_owner VARCHAR2(30),`
	`table_name VARCHAR2(30),`
	`column_name VARCHAR2(4000),`
	`rid ROWID,`
	`error_number NUMBER)`
	The table can be created with the CREATE_ERROR_TABLE Procedure. The rid column records the rowids of the offending rows, and the error_number column records the corresponding error number.

Table 62–11 (Cont.) UPGRADE_SCHEMA Procedure Parameters

Parameter	Description
error_on_overlap_time	Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is TRUE.
error_on_nonexisting_time	Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is TRUE.
log_triggers_table	Table to log triggers that are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade

UPGRADE_TABLE Procedure

This procedure upgrades a specified list of tables that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type.

Syntax

```
DBMS_DST.UPGRADE_TABLE  (
   num_of_failures             OUT BINARY_INTEGER,
   table_list                  IN  VARCHAR2,
   upgrade_data                IN  BOOLEAN := TRUE,
   parallel                    IN  BOOLEAN := FALSE,
   continue_after_errors       IN  BOOLEAN := TRUE,
   log_errors                  IN  BOOLEAN := FALSE,
   log_errors_table            IN  VARCHAR2 =: 'sys.dst$error_table' ,
   error_on_overlap_time       IN  BOOLEAN := FALSE,
   error_on_nonexisting_time   IN  BOOLEAN := FALSE,
   log_triggers_table          IN  VARCHAR2 := 'sys.dst$trigger_table',
   atomic_upgrade              IN  BOOLEAN := FALSE);
```

Parameters

Table 62–12 UPGRADE_TABLE Procedure Parameters

Parameter	Description
num_of_failures	Number of tables that fail to complete
table_list	Table name list (comma separated strings)
upgrade_data	Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE), or to leave unconverted (FALSE). The default is TRUE.
parallel	Boolean flag indicating whether to convert tables using PDML (Parallel DML), or Serial DML. The default is FALSE.
continue_after_errors	Boolean flag indicating whether to continue after upgrade fails on the current table. The default is TRUE.
log_errors	Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, the error is logged to the log_errors_table. The default is FALSE.

log_errors_table	Table name with the following schema:
	`CREATE TABLE dst$error_table (`
	`table_owner VARCHAR2(30),`
	`table_name VARCHAR2(30),`
	`column_name VARCHAR2(4000),`
	`rid ROWID,`
	`error_number NUMBER)`
	The table can be created with the CREATE_ERROR_TABLE Procedure. The rid parameter records the rowids of the offending rows and the corresponding error number.

Table 62–12 (Cont.) UPGRADE_TABLE Procedure Parameters

Parameter	Description
error_on_overlap_time	Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is TRUE.
error_on_nonexisting_time	Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is TRUE.
log_triggers_table	Table to log triggers that are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade
atomic_upgrade	Boolean flag indicating whether to convert the listed tables atomically (in a single transaction). If FALSE, each table is converted in its own transaction. The default is FALSE.

Usage Notes

This procedure can only be invoked after an upgrade window has been started. The table list has to satisfy the following partial ordering:

1. If a base table has a materialized view log table, the log table must be the next item in the list.
2. If the container table for a materialized view appears in the list, the materialized view's 'non-upgraded' base tables and log tables must appear in the table list and before the container table.

A base table and its materialized view log table need to be upgraded in an atomic transaction by specifying atomic_upgrade to TRUE.

63

DBMS_DISTRIBUTED_TRUST_ADMIN

DBMS_DISTRIBUTED_TRUST_ADMIN procedures maintain the Trusted Servers List. Use these procedures to define whether a server is trusted. If a database is not trusted, Oracle refuses current user database links from the database.

This chapter contains the following topics:

Using DBMS_DISTRIBUTED_TRUST_ADMIN

Overview

Oracle uses local Trusted Servers Lists, along with enterprise domain membership lists stored in the enterprise LDAP directory service, to determine if another database is trusted. The LDAP directory service entries are managed with the Enterprise Security Manager Tool in Oracle Enterprise Manager.

Oracle considers another database to be "trusted" if it meets the following criteria:

1. It is in the same enterprise domain in the directory service as the local database.
2. The enterprise domain is marked as trusted in the directory service.
3. It is not listed as untrusted in the local Trusted Servers List. Current user database links will only be accepted from another database if both databases involved trust each other.

You can list a database server locally in the Trusted Servers List regardless of what is listed in the directory service. However, if you list a database that is not in the same domain as the local database, or if that domain is untrusted, the entry will have no effect.

This functionality is part of the Enterprise User Security feature of the Oracle Advanced Security Option.

Security Model

To execute DBMS_DISTRIBUTED_TRUST_ADMIN, the EXECUTE_CATALOG_ROLE role must be granted to the DBA. To select from the view TRUSTED_SERVERS, the SELECT_CATALOG_ROLE role must be granted to the DBA.

It is important to know whether all servers are trusted or not trusted. Trusting a particular server with the ALLOW_SERVER procedure does not have any effect if the database already trusts all databases, or if that database is already trusted. Similarly, denying a particular server with the DENY_SERVER procedure does not have any effect if the database already does not trust any database or if that database is already untrusted.

The procedures DENY_ALL and ALLOW_ALL delete all entries (in other words, server names) that are explicitly allowed or denied using the ALLOW_SERVER procedure or DENY_SERVER procedure respectively.

Examples

If you have not yet used the package DBMS_DISTRIBUTED_TRUST_ADMIN to change the trust listing, by default you trust all databases in the same enterprise domain if that domain it listed as trusted in the directory service:

```
SELECT * FROM TRUSTED_SERVERS;
TRUST     NAME
--------- --------------------
Trusted   All
```

Because all servers are currently trusted, you can execute the DENY_SERVER Procedure and specify that a particular server is not trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER
                           ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.

SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
--------- ----------------------------------------------
Untrusted SALES.US.AMERICAS.ACME_AUTO.COM
```

By executing the DENY_ALL Procedure, you can choose to not trust any database server:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;

PL/SQL procedure successfully completed.

SELECT * FROM TRUSTED_SERVERS;

TRUST      NAME
--------- ----------------------------------------------
Untrusted All
```

The ALLOW_SERVER Procedure can be used to specify that one particular database is to be trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER
                            ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.

SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
--------- ----------------------------------------------
Trusted   SALES.US.AMERICAS.ACME_AUTO.COM
```

Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms

Table 63–1 DBMS_DISTRIBUTED_TRUST_ADMIN Package Subprograms

Subprogram	Description
ALLOW_ALL Procedure on page 63-7	Empties the list and inserts a row indicating that all servers should be trusted
ALLOW_SERVER Procedure on page 63-8	Enables a specific server to be allowed access even though `deny` all is indicated in the list
DENY_ALL Procedure on page 63-9	Empties the list and inserts a row indicating that all servers should be untrusted
on page 63-10DENY_ SERVER Procedure	Enables a specific server to be denied access even though allow all is indicated in the list

ALLOW_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers that are members of a trusted domain in an enterprise directory service and that are in the same domain are allowed access.

The view TRUSTED_SERVERS will show "TRUSTED ALL" indicating that the database trusts all servers that are currently trusted by the enterprise directory service.

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_ALL;
```

Usage Notes

ALLOW_ALL only applies to servers listed as trusted in the enterprise directory service and in the same enterprise domain.

ALLOW_SERVER Procedure

This procedure ensures that the specified server is considered trusted (even if you have previously specified "`deny all`").

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER (
   server IN VARCHAR2);
```

Parameters

Table 63–2 ALLOW_SERVER Procedure Parameters

Parameter	Description
`server`	Unique, fully-qualified name of the server to be trusted.

Usage Notes

If the Trusted Servers List contains the entry "`deny all`", then this procedure adds a specification indicating that a specific database (for example, `DBx`) is to be trusted.

If the Trusted Servers List contains the entry "`allow all`", and if there is no "`deny DBx`" entry in the list, then executing this procedure causes no change.

If the Trusted Servers List contains the entry "`allow all`", and if there is a "`deny DBx`" entry in the list, then that entry is deleted.

DENY_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers are denied access.

The view TRUSTED_SERVERS will show "UNTRUSTED ALL" indicating that no servers are currently trusted.

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
```

DENY_SERVER Procedure

This procedure ensures that the specified server is considered untrusted (even if you have previously specified `allow all`).

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER (
   server IN VARCHAR2);
```

Parameters

Table 63–3 DENY_SERVER Procedure Parameters

Parameter	Description
`server`	Unique, fully-qualified name of the server to be untrusted.

Usage Notes

If the Trusted Servers List contains the entry `allow all`, then this procedure adds an entry indicating that the specified database (for example, `DBx`) is not to be trusted.

If the Trusted Servers List contains the entry "`deny all`", and if there is no "`allow DBx`" entry in the list, then this procedure causes no change.

If the Trusted Servers List contains the entry "`deny all`", and if there is an "`allow DBx`" entry, then this procedure causes that entry to be deleted.

64

DBMS_EDITIONS_UTILITIES

The `DBMS_EDITIONS_UTILITIES` package provides helper functions for edition-related operations.

The chapter contains the following topics:

Using DBMS_EDITIONS_UTILITIES

Overview

The DBMS_EDITIONS_UTILITIES package implements an interface which provides helper functions for edition-related operations.

Security Model

This package is owned by `SYS` with execute access granted to `PUBLIC`. It runs with invoker's rights, that is, with the security profile of the caller.

Exceptions

Table 64–1 DBMS_EDITIONS_UTILITIES Error Messages

Error	Description
ORA-38817	Insufficient privileges
ORA-942	Missing table

Summary of DBMS_EDITIONS_UTILITIES Subprograms

Table 64–2 DBMS_EDITIONS_UTILITIES Package Subprograms

Subprogram	Description
SET_EDITIONING_VIEWS_READ_ONLY Procedure on page 64-7	Given the schema name and table name, this procedure sets the corresponding editioning views in all editions to `READ ONLY` or `READ/WRITE`
SET_NULL_COLUMN_VALUES_TO_EXPR Procedure on page 64-8	For use only during an edition-based redefinition (EBR) exercise

SET_EDITIONING_VIEWS_READ_ONLY Procedure

Given the schema name and table name, this procedure sets the corresponding editioning views in all editions to READ ONLY or READ/WRITE.

Syntax

```
DBMS_EDITIONS_UTILITIES.SET_EDITIONING_VIEWS_READ_ONLY (
   table_name IN VARCHAR2,
   owner      IN VARCHAR2 DEFAULT NULL,
   read_only  IN BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 64–3 SET_EDITIONING_VIEWS_READ_ONLY Procedure Parameters

Parameter	Description
table_name	Base table of the editioning views
owner	Base table schema. The default (or NULL) is the current schema.
read_only	TRUE to set the views to read-only; FALSE (or NULL) sets the views to READ/WRITE. Default is TRUE.

Usage Notes

The user must have the following privileges:

- Owner of the table, or have the ALTER ANY TABLE system privileges
- USE object privilege on all the editions for which the views are defined

SET_NULL_COLUMN_VALUES_TO_EXPR Procedure

This procedure replaces `NULL` values in a replacement column with the value of an expression. The expression evaluation cost is deferred to future updates and queries. The procedure is intended for use only during an edition-based redefinition (EBR) exercise.

See Also:

- *Oracle Database Development Guide* regarding transforming pre- to post-upgrade representation

Syntax

```
DBMS_EDITIONS_UTILITIES.SET_NULL_COLUMN_VALUES_TO_EXPR;
   table_name    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   expression    IN  VARCHAR2);
```

Parameters

Table 64–4 SET_NULL_COLUMN_VALUES_TO_EXPR Procedure Parameters

Parameter	Description
`table_name`	A potentially schema-qualified table name
`column_name`	Name of the column to be updated
`expression`	An expression composed of columns in the same table, constants, and SQL functions

65

DBMS_EPG

The DBMS_EPG package implements the embedded PL/SQL gateway that enables a Web browser to invoke a PL/SQL stored procedure through an HTTP listener.

This chapter contains the following topics:

Using DBMS_EPG

Overview

The DBMS_EPG package is a platform on which PL/SQL users develop and deploy PL/SQL Web applications. The embedded PL/SQL gateway is an embedded version of the gateway that runs in the XML database HTTP server in the Oracle database. It provides the core features of mod_plsql in the database but does not require the Oracle HTTP server powered by Apache.

In order to make a PL/SQL application accessible from a browser by way of HTTP, a Database Access Descriptor (DAD) must be created and mapped to a virtual path. A DAD is a set of configuration values used for database access and the virtual path mapping makes the application accessible under a virtual path of the XML DB HTTP Server. A DAD is represented as a servlet in XML DB HTTP Server.

Security Model

The XDBADMIN role is required to invoke the configuration interface. It may invoked by the database user "XDB".

The authorization interface can be invoked by any user.

Exceptions

The following table lists the exceptions raised by the DBMS_EPG package.

Table 65–1 DBMS_EPG Exceptions

Exception	Error Code	Description
DAD_NOT_FOUND	20000	Database Access Descriptor (DAD) %s not found. Ensure that the name of the DAD is correct and that it exists.

Data Structures

The DBMS_EPG package defines a TABLE type.

VARCHAR2_TABLE Table Type

This type is used by the procedures GET_ALL_GLOBAL_ATTRIBUTES, GET_ALL_DAD_ATTRIBUTES, GET_ALL_DAD_MAPPINGS, and GET_DAD_LIST to return lists of attribute names, attribute values, virtual paths, and database access descriptors (DAD).

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

Subprogram Groups

The DBMS_EPG consists of two interfaces:

- Configuration Subprograms
- Authorization Subprograms

Configuration Subprograms

The Configuration subprogram group contain the subprogram interfaces to examine and modify the global and database access descriptor (DAD) specific settings of the embedded PL/SQL gateway.

Table 65–2 Configuration Subprogram Group

Subprogram	Description
CREATE_DAD Procedure on page 65-12	Creates a new DAD
DELETE_DAD_ATTRIBUTE Procedure on page 65-14	Deletes a DAD attribute
DELETE_GLOBAL_ATTRIBUTE Procedure on page 65-15	Deletes a global attribute
DROP_DAD Procedure on page 65-16	Drops a DAD
GET_ALL_DAD_ATTRIBUTES Procedure on page 65-17	Retrieves all the attributes of a DAD.
GET_ALL_DAD_MAPPINGS Procedure on page 65-18	Retrieves all virtual paths to which the specified DAD is mapped.
GET_ALL_GLOBAL_ATTRIBUTES Procedure on page 65-19	Retrieves all global attributes and values
GET_DAD_ATTRIBUTE Function on page 65-20	Retrieves the value of a DAD attribute
GET_DAD_LIST Procedure on page 65-21	Retrieves a list of all DADs for an Embedded Gateway instance.
GET_GLOBAL_ATTRIBUTE Function on page 65-22	Retrieves the value of a global attribute
MAP_DAD Procedure on page 65-23	Maps a DAD to the specified virtual path.
SET_DAD_ATTRIBUTE Procedure on page 65-24	Sets the value for a DAD
SET_GLOBAL_ATTRIBUTE Procedure on page 65-26	Sets the value of a global attribute
UNMAP_DAD Procedure on page 65-27	Unmaps a DAD from the specified virtual path

Authorization Subprograms

The Authorization subprogram group contains the subprogram interfaces to authorize and deauthorize the use of a database user's privileges by the embedded PL/SQL gateway through a specific database access descriptor (DAD)

Table 65–3 Authorization Subprogram Group

Subprogram	Description
AUTHORIZE_DAD Procedure on page 65-11	Authorizes a DAD to invoke procedures and access document tables with a database user's privileges
DEAUTHORIZE_DAD Procedure on page 65-13	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges

Summary of DBMS_EPG Subprograms

Table 65–4 DBMS_EPG Package Subprograms

Subprogram	Description
AUTHORIZE_DAD Procedure on page 65-11	authorizes a DAD to invoke procedures and access document tables with a database user's privileges
CREATE_DAD Procedure on page 65-12	Creates a new DAD
DEAUTHORIZE_DAD Procedure on page 65-13	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges
DELETE_DAD_ATTRIBUTE Procedure on page 65-14	Deletes a DAD attribute
DELETE_GLOBAL_ATTRIBUTE Procedure on page 65-15	Deletes a global attribute
DROP_DAD Procedure on page 65-16	Drops a DAD
GET_ALL_DAD_ATTRIBUTES Procedure on page 65-17	Retrieves all the attributes of a DAD.
GET_ALL_DAD_MAPPINGS Procedure on page 65-18	Retrieves all virtual paths to which the specified DAD is mapped.
GET_ALL_GLOBAL_ATTRIBUTES Procedure on page 65-19	Retrieves all global attributes and values
GET_DAD_ATTRIBUTE Function on page 65-20	Retrieves the value of a DAD attribute
GET_DAD_LIST Procedure on page 65-21	Retrieves a list of all DADs for an Embedded Gateway instance.
GET_GLOBAL_ATTRIBUTE Function on page 65-22	Retrieves the value of a global attribute
MAP_DAD Procedure on page 65-23	Maps a DAD to the specified virtual path.
SET_DAD_ATTRIBUTE Procedure on page 65-24	Sets the value for a DAD
SET_GLOBAL_ATTRIBUTE Procedure on page 65-26	Sets the value of a global attribute
UNMAP_DAD Procedure on page 65-27	Unmaps a DAD from the specified virtual path

AUTHORIZE_DAD Procedure

This procedure authorizes a DAD to invoke procedures and access document tables with a database user's privileges. The invoker can always authorize the use of her/his own privileges.

> **See Also:** Authorization Subprograms on page 65-9 for other subprograms in this group

Syntax

```
DBMS_EPG.AUTHORIZE_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 65–5 AUTHORIZE_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to create
user	The user whose privileges to deauthorize. If use, the invoker is assumed.

Usage Notes

- To authorize the use of another user's privileges, the invoker must have the ALTER USER system privilege.
- The DAD must exist but its "database-username" DAD attribute does not have to be set to user to authorize.
- Multiple users can authorize the same DAD and it is up to the DAD's "database-username" setting to decide which user's privileges to use.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

```
DBMS_EPG.AUTHORIZE_DAD('HR');
```

CREATE_DAD Procedure

This procedure creates a new DAD.

> **See Also:** Configuration Subprograms on page 65-8 for other subprograms in this group

Syntax

```
DBMS_EPG.CREATE_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 65–6 CREATE_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to create
path	The virtual path to which to map the DAD

DEAUTHORIZE_DAD Procedure

This procedure deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges. The invoker can always deauthorize the use of his own privileges.

> **See Also:** Authorization Subprograms on page 65-9 for other subprograms in this group

Syntax

```
DBMS_EPG.DEAUTHORIZE_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 65–7 DEAUTHORIZE_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD for which to deauthorize use
user	The user whose privileges to deauthorize. If use, the invoker is assumed.

Usage Notes

To deauthorize the use of another user's privileges, the invoker must have the ALTER USER system privilege.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

```
DBMS_EPG.DEAUTHORIZE_DAD('HR');
```

DELETE_DAD_ATTRIBUTE Procedure

This procedure deletes a DAD attribute.

> **See Also:** Configuration Subprograms on page 65-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DELETE_DAD_ATTRIBUTE (
   dad_name      IN  VARCHAR2,
   attr_name     IN  VARCHAR2);
```

Parameters

Table 65–8 DELETE_DAD_ATTRIBUTE Procedure Parameters

Parameter	Description
dad_name	The name of the DAD for which to delete a DAD attribute
attr_name	The name of the DAD attribute to delete

Exceptions

Raises an error if DAD does not exist

DELETE_GLOBAL_ATTRIBUTE Procedure

This procedure deletes a global attribute.

> **See Also:** Configuration Subprograms on page 65-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DELETE_GLOBAL_ATTRIBUTE (
   attr_name     IN  VARCHAR2);
```

Parameters

Table 65–9 DELETE_GLOBAL_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to delete

DROP_DAD Procedure

This procedure drops a DAD. All the virtual-path mappings of the DAD will be dropped also

> **See Also:** Configuration Subprograms on page 65-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DROP_DAD (
   dadname  IN  VARCHAR2);
```

Parameters

Table 65–10 DROP_DAD Procedure Parameters

Parameter	Description
dad_name	The DAD to drop

Exceptions

Raises an error if the DAD does not exist.

GET_ALL_DAD_ATTRIBUTES Procedure

This procedure retrieves all the attributes of a DAD. The outputs are 2 correlated index-by tables of the name/value pairs.

> **See Also:** Configuration Subprograms on page 65-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_DAD_ATTRIBUTES (
   dad_name      IN          VARCHAR2,
   attr_names    OUT NOCOPY  VARCHAR2_TABLE,
   attr_values   OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 65–11 GET_ALL_DAD_ATTRIBUTES Procedure Parameters

Parameter	Description
dad_names	The name of the DAD
attr_names	The attribute names
attr_values	The attribute values

Exceptions

Raises an error if DAD does not exist.

Usage Notes

If the DAD has no attributes set, then attr_names and attr_values will be set to empty arrays.

GET_ALL_DAD_MAPPINGS Procedure

This procedure retrieves all virtual paths to which the specified DAD is mapped.

See Also: Configuration Subprograms on page 65-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_DAD_MAPPINGS (
   dad_name      IN          VARCHAR2,
   paths         OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 65–12 GET_ALL_DAD_MAPPINGS Procedure Parameters

Parameter	Description
dad_names	The name of the DAD
paths	The virtual paths to which h the DAD is mapped

Exceptions

Raises an error if DAD does not exist.

Usage Notes

If the DAD is not mapped to any virtual path, paths will be set to empty arrays.

GET_ALL_GLOBAL_ATTRIBUTES Procedure

This procedure retrieves all global attributes and values. The outputs are 2 correlated index-by tables of the name/value pairs.

> **See Also:** Configuration Subprograms on page 65-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_GLOBAL_ATTRIBUTES (
   attr_names     OUT   NOCOPY  VARCHAR2_TABLE,
   attr_values    OUT   NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 65–13 GET_ALL_GLOBAL_ATTRIBUTES Procedure Parameters

Parameter	Description
attr_names	The global attribute names
attr_values	The values of the global attributes

Usage Notes

If the gateway instance has no global attributes set, then attr_names and attr_values will be set to empty arrays.

GET_DAD_ATTRIBUTE Function

This procedure retrieves the value of a DAD attribute.

> **See Also:** Configuration Subprograms on page 65-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_DAD_ATTRIBUTE (
   dad_name     IN  VARCHAR2,
   attr_name    IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 65–14 GET_DAD_ATTRIBUTE Function Parameters

Parameter	Description
dad_name	The name of the DAD for which to delete an attribute
attr_name	The name of the attribute to delete

Return values

Returns the DAD attribute value. Returns NULL if attribute is unknown or has not been set.

Exceptions

Raises an error if DAD does not exist.

GET_DAD_LIST Procedure

This procedure retrieves a list of all DADs for an Embedded Gateway instance.

> **See Also:** Configuration Subprograms on page 65-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_DAD_LIST (
   dad_names     OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 65–15 GET_DAD_LIST Procedure Parameters

Parameter	Description
dad_names	The list of all DADs

Usage Notes

If no DADs exist then dad_names will be set to an empty array.

GET_GLOBAL_ATTRIBUTE Function

This function retrieves the value of a global attribute.

> **See Also:** Configuration Subprograms on page 65-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_GLOBAL_ATTRIBUTE (
   attr_name  IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 65–16 GET_GLOBAL_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to retrieve

Return Values

Returns the global attribute value. Returns NULL if attribute has not been set or is not a valid attribute.

MAP_DAD Procedure

This procedure maps a DAD to the specified virtual path. If the virtual path exists already, the old virtual-path mapping will be overridden.

> **See Also:** Configuration Subprograms on page 65-8 for other subprograms in this group

Syntax

```
DBMS_EPG.MAP_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2);
```

Parameters

Table 65–17 MAP_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to map
path	The virtual path to map

Exceptions

Raises and error if the DAD does not exist.

SET_DAD_ATTRIBUTE Procedure

This procedure sets the value for a DAD.

> **See Also:** Configuration Subprograms on page 65-8 for other subprograms in this group

Syntax

```
DBMS_EPG.SET_DAD_ATTRIBUTE (
   dad_name    IN  VARCHAR2,
   attr_name   IN  VARCHAR2,   attr_value  IN  VARCHAR2);
```

Parameters

Table 65–18 SET_DAD_ATTRIBUTE Procedure Parameters

Parameter	Description
dad_name	The name of the DAD for which to set the attribute
attr_name	The name of the attribute to set
attr_value	The attribute value to set

Table 65–19 Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurr-ences	Legal Values
PlsqlAfterProcedure	after-procedure	No	String
PlsqlAlwaysDescribeProcedure	always-describe-procedure	No	Enumeration of On, Off
PlsqlAuthenticationMode	authentication-mode	No	Enumeration of Basic, SingleSignOn, GlobalOwa, CustomOwa, PerPackageOwa
PlsqlBeforeProcedure	before-procedure	No	String
PlsqlBindBucketLengths	bind-bucket-lengths	Yes	Unsigned integer
PlsqlBindBucketWidths	bind-bucket-widths	Yes	Unsigned integer
PlsqlCGIEnvironmentList	cgi-environment-list	Yes	String
PlsqlCompatibilityMode	compatibility-mode	No	Unsigned integer
PlsqlDatabaseUsername	database-username	No	String
PlsqlDefaultPage	default-page	No	String
PlsqlDocumentPath	document-path	No	String
PlsqlDocumentProcedure	document-procedure	No	String
PlsqlDocumentTablename	document-table-name	No	String

Table 65–19 (Cont.) Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurr-ences	Legal Values
PlsqlErrorStyle	error-style	No	Enumeration of ApacheStyle, ModplsqlStyle, DebugStyle
PlsqlExclusionList	exclusion-list	Yes	String
PlsqlFetchBufferSize	fetch-buffer-size	No	Unsigned integer
PlsqlInfoLogging	info-logging	No	Enumeration of InfoDebug
PlsqlOWADebugEnable	owa-debug-enable	No	Enumeration of On, Off
PlsqlMaxRequestsPerSession	max-requests-per-session	No	Unsigned integer
PlsqlNLSLanguage	nls-language	No	String
PlsqlPathAlias	path-alias	No	String
PlsqlPathAliasProcedure	path-alias-procedure	No	String
PlsqlRequestValidationFunction	request-validation-function	No	String
PlsqlSessionCookieName	session-cookie-name	No	String
PlsqlSessionStateManagement	session-state-management	No	Enumeration of StatelessWithResetP kageState, StatelessWithFastRe ackageState, StatelessWithPreserv ackageState
PlsqlTransferMode	transfer-mode	No	Enumeration of Cha Raw
PlsqlUploadAsLongRaw	upload-as-long-raw	No	String

Exceptions

Raises an error if DAD does not exist or the attribute is unknown.

Usage Notes

- If `attr_name` attribute has been set before, then the old value will be overwritten with the new `attr_value` argument.
- The embedded gateway assumes default values when the attributes are not set. The default values of the DAD attributes should be sufficient for most users of the embedded gateway. mod_plsql users should note the following
  - The `PlsqlDatabasePassword` attribute is not needed.
  - The `PlsqlDatabaseConnectString` attribute is not needed because the embedded gateway does not support logon to external databases.

Examples

```
DBMS_EPG.SET_DAD_ATTRIBUTE('HR', 'default-page', 'HRApp.home');
```

SET_GLOBAL_ATTRIBUTE Procedure

This procedure sets the value of a global attribute.

> **See Also:** Configuration Subprograms on page 65-8 for other subprograms in this group

Syntax

```
DBMS_EPG.SET_GLOBAL_ATTRIBUTE (
   attr_name    IN VARCHAR2,
   attr_value   IN VARCHAR2);
```

Parameters

Table 65–20 SET_GLOBAL_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to set
attr_value	The attribute value to set

Table 65–21 Mapping Between mod_plsql and Embedded PL/SQL Gateway Global Attributes

mod_plsql Global Attribute	Embedded PL/SQL Gateway Global Attribute	Allows Multiple Occurr-ences	Legal Values
PlsqlLogLevel	log-level	No	Unsigned integer
PlsqlMaxParameters	max-parameters	No	Unsigned integer

Usage Notes

- The attribute name is case sensitive. The value may or may not be case-sensitive depending on the attribute.
- If attr_name attribute has been set before, then the old value will be overwritten with the new attr_value argument.

Exceptions

Raises an error if the attribute is unknown.

Examples

```
dbms_epg.set_global_attribute('max-parameters', '100');
```

UNMAP_DAD Procedure

This procedure unmaps a DAD from the specified virtual path. If path is `NULL`, the procedure removes all virtual-path mappings for the DAD but keeps the DAD.

> **See Also:** Configuration Subprograms on page 65-8 for other subprograms in this group

Syntax

```
DBMS_EPG.UNMAP_DAD (
   dad_name IN VARCHAR2,
   path     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 65–22 UNMAP_DAD Procedure Parameters

Parameter	Description
`dad_name`	The name of the DAD to unmap
`path`	The virtual path to unmap

Usage Notes

Raises and error if the DAD does not exist.

66

DBMS_ERRLOG

The DBMS_ERRLOG package provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back. This enables you to save time and system resources.

> **See Also:** *Oracle Database Data Warehousing Guide* for more information regarding how to use DBMS_ERRLOG and *Oracle Database SQL Language Reference* for error_logging_clause syntax

This chapter contains the following topics:

Using DBMS_ERRLOG

This section contains topics which relate to using the `DBMS_ERRLOG` package.

Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. The `EXECUTE` privilege is granted publicly. However, to create an error logging table, you need `SELECT` access on the base table or view, the `CREATE TABLE` privilege, as well as tablespace quota for the target tablespace.

Summary of DBMS_ERRLOG Subprograms

Table 66–1 DBMS_ERRLOG Package Subprograms

Subprogram	Description
CREATE_ERROR_LOG Procedure on page 66-5	Creates the error logging table used in DML error logging

CREATE_ERROR_LOG Procedure

This procedure creates the error logging table needed to use the DML error logging capability.

LONG, CLOB, BLOB, BFILE, and ADT datatypes are not supported in the columns.

Syntax

```
DBMS_ERRLOG.CREATE_ERROR_LOG (
   dml_table_name            IN VARCHAR2,
   err_log_table_name        IN VARCHAR2 := NULL,
   err_log_table_owner       IN VARCHAR2 := NULL,
   err_log_table_space       IN VARCHAR2 := NULL,
   skip_unsupported          IN BOOLEAN := FALSE);
```

Parameters

Table 66–2 CREATE_ERROR_LOG Procedure Parameters

Parameter	Description
dml_table_name	The name of the DML table to base the error logging table on. The name can be fully qualified (for example, emp, scott.emp, "EMP", "SCOTT"."EMP"). If a name component is enclosed in double quotes, it will not be upper cased.
err_log_table_name	The name of the error logging table you will create. The default is the first 25 characters in the name of the DML table prefixed with 'ERR$_'. Examples are the following: dml_table_name: 'EMP', err_log_table_name: 'ERR$_EMP' dml_table_name: '"Emp2"', err_log_table_name: 'ERR$_Emp2'
err_log_table_owner	The name of the owner of the error logging table. You can specify the owner in dml_table_name. Otherwise, the schema of the current connected user is used.
err_log_table_space	The tablespace the error logging table will be created in. If not specified, the default tablespace for the user owning the DML error logging table will be used.
skip_unsupported	When set to TRUE, column types that are not supported by error logging will be skipped over and not added to the error logging table. When set to FALSE, an unsupported column type will cause the procedure to terminate. The default is FALSE.

Examples

First, create an error log table for the channels table in the SH schema, using the default name generation.

Then, see all columns of the table channels:

```
SQL> DESC channels
Name                                      Null?    Type
----------------------------              -------  -----
CHANNEL_ID                                NOT NULL CHAR(1)
CHANNEL_DESC                              NOT NULL VARCHAR2(20)
CHANNEL_CLASS                                      VARCHAR2(20)
```

Finally, see all columns of the generated error log table. Note the mandatory control columns that are created by the package:

```
SQL> DESC ERR$_CHANNELS
Name                              Null?    Type
----------------- ----    ----ORA_ERR_NUMBER$
NUMBER
ORA_ERR_MESG$                             VARCHAR2(2000)
ORA_ERR_ROWID$                            ROWID
ORA_ERR_OPTYP$                            VARCHAR2(2)
ORA_ERR_TAG$                              VARCHAR2(2000)
CHANNEL_ID                                VARCHAR2(4000)
CHANNEL_DESC                              VARCHAR2(4000)
CHANNEL_CLASS                             VARCHAR2(4000)
```

See *Oracle Database Administrator's Guide* for more information regarding control columns.

67

DBMS_FGA

The DBMS_FGA package provides fine-grained security functions.

This chapter contains the following topics:

Using DBMS_FGA

Security Model

You must have the AUDIT_ADMIN role and the EXECUTE privilege on the DBMS_FGA package to administer audit policies. Because the audit function can potentially capture all user environment and application context values, policy administration should be executable by privileged users only. The policy event handler module will be executed with the module owner's privilege.

Operational Notes

This package is available for only cost-based optimization. The rule-based optimizer may generate unnecessary audit records since audit monitoring can occur before row filtering. For both the rule-based optimizer and the cost-based optimizer, you can query the `SQL_TEXT` and `SQL_BINDS` columns of the `UNIFIED_AUDIT_TRAIL` view to analyze the SQL text and corresponding bind variables that are issued.

Summary of DBMS_FGA Subprograms

Table 67–1 DBMS_FGA Package Subprograms

Subprogram	Description
ADD_POLICY Procedure on page 67-6	Creates an audit policy using the supplied predicate as the audit condition
DISABLE_POLICY Procedure on page 67-11	Disables an audit policy
DROP_POLICY Procedure on page 67-12	Drops an audit policy
ENABLE_POLICY Procedure on page 67-13	Enables an audit policy

ADD_POLICY Procedure

This procedure creates an audit policy using the supplied predicate as the audit condition.

Syntax

```
DBMS_FGA.ADD_POLICY(
   object_schema      IN  VARCHAR2 DEFAULT NULL,
   object_name        IN  VARCHAR2,
   policy_name        IN  VARCHAR2,
   audit_condition    IN  VARCHAR2 DEFAULT NULL,
   audit_column       IN  VARCHAR2 DEFAULT NULL,
   handler_schema     IN  VARCHAR2 DEFAULT NULL,
   handler_module     IN  VARCHAR2 DEFAULT NULL,
   enable             IN  BOOLEAN DEFAULT TRUE,
   statement_types    IN  VARCHAR2 DEFAULT SELECT,
   audit_trail        IN  BINARY_INTEGER DEFAULT NULL,
   audit_column_opts  IN  BINARY_INTEGER DEFAULT ANY_COLUMNS,
   policy_owner       IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 67–2 ADD_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema of the object to be audited. If NULL, the current log-on user schema is assumed.
object_name	Name of the object to be audited
policy_name	Unique name of the policy
audit_condition	A condition in a row that indicates a monitoring condition. NULL is allowed and acts as TRUE.
audit_column	Columns to be checked for access. These can include OLS hidden columns or object type columns. The default, NULL, causes audit if any column is accessed or affected.
handler_schema	Schema that contains the event handler. The default, NULL, causes the current schema to be used.
handler_module	Function name of the event handler; includes the package name if necessary. This function is invoked only after the first row that matches the audit condition in the query is processed. If the procedure fails with an exception, the user SQL statement will fail as well.
enable	Enables the policy if TRUE, which is the default
statement_types	SQL statement types to which this policy is applicable: INSERT, UPDATE, DELETE, or SELECT only
audit_trail	In an environment that has not yet migrated to unified auditing, the destination (DB or XML) of fine-grained audit records. Also specifies whether to populate the LSQLTEXT and LSQLBIND columns in the FGA_LOG$ system table.
audit_column_opts	Establishes whether a statement is audited when the query references *any* column specified in the audit_column parameter or only when *all* such columns are referenced

Table 67–2 (Cont.) ADD_POLICY Procedure Parameters

Parameter	Description
policy_owner	User who owns the fine-grained auditing policy. However, this setting is not a user-supplied argument. The Oracle Data Pump client uses this setting internally to recreate the fine-grained audit policies appropriately.

Usage Notes

- A table or view can have a maximum of 256 fine-grained audit policies applied to it.
- If object_schema is not specified, then the current log-on user schema is assumed.
- An FGA policy should not be applied to out-of-line columns such as LOB columns.
- Each audit policy is applied to the query individually. However, at most one audit record may be generated for each policy, no matter how many rows being returned satisfy that policy's audit_condition. In other words, whenever any number of rows being returned satisfy an audit condition defined on the table, a single audit record will be generated for each such policy.
- If a table with an FGA policy defined on it receives a Fast Path insert or a vectored update, the hint is automatically disabled before any such operations. Disabling the hint allows auditing to occur according to the policy's terms. (One example of a Fast Path insert is the statement INSERT-WITH-APPEND-hint.)
- The audit_condition must be a boolean expression that can be evaluated using the values in the row being inserted, updated, or deleted. The expression can also use functions, such as the USER or SYS_CONTEXT functions.

  The expression must not combine conditions using operators such as AND and OR. audit_condition can be NULL (or omitted), which is interpreted as TRUE, but it cannot contain the following elements:

  - Subqueries or sequences
  - The following attributes of the USERENV namespace when accessed using the SYS_CONTEXT function:
    * CURRENT_SQL
    * CURRENT_SQL_LENGTH
    * CURRENT_BIND
  - Any use of the pseudo columns LEVEL, PRIOR, or ROWNUM.

  Specifying an audit condition of "1=1" to force auditing of all specified statements ("statement_types") affecting the specified column ("audit_column") is no longer needed to achieve this purpose. A NULL value for audit_condition causes audit to happen even if no rows are processed, so that all actions on a table with this policy are audited.
- The audit_condition is evaluated using the privileges of the user who creates the policy.
- For the audit_condition setting, do not include functions, which execute the auditable statement on the same base table, in the audit_condition setting. For example, suppose you create a function that executes an INSERT statement on the HR.EMPLOYEES table. The policy audit_condition contains this function and it is

for INSERT statements (as set by the statement_types parameter). When the policy is used, the function executes recursively until the system has run out of memory. This can raise the error ORA-1000: maximum open cursors exceeded or ORA-00036: maximum number of recursive SQL levels (50) exceeded.

- Do not issue the DBMS_FGA.ENABLE_POLICY or DBMS_FGA.DISABLE_POLICY statement from a policy function in a condition.
- The audit function (handler_module) is an alerting mechanism for the administrator. The required interface for such a function is as follows:

  ```
  PROCEDURE fname ( object_schema VARCHAR2, object_name VARCHAR2, policy_name
  VARCHAR2 )  AS ...
  ```

  where *fname* is the name of the procedure, *object_schema* is the name of the schema of the table audited, *object_name* is the name of the table to be audited, and *policy_name* is the name of the policy being enforced. The audit function will be executed with the function owner's privilege.
- If you have migrated to unified auditing, then omit the audit_trail parameter because the audit records will automatically be written to the unified audit trail.
- Be aware that sensitive data, such as credit card information, can be recorded in clear text.
- The audit_trail parameter, if used, specifies both where the fine-grained audit trail will be written and whether it is to include the query's SQL Text and SQL Bind variable information (typically in columns named LSQLTEXT and LSQLBIND):
  - If audit_trail includes XML, then fine-grained audit records are written to XML-format operating system files stored in the directory specified by an AUDIT_FILE_DEST statement in SQL. (The default AUDIT_FILE_DEST is $ORACLE_BASE/admin/$DB_UNIQUE_NAME/adump on Unix-based systems, and $ORACLE_BASE\admin\$DB_UNIQUE_NAME\adump on Windows systems.)
  - If audit_trail includes DB instead, then the audit records are written to the SYS.FGA_LOG$ table in the database. However, for read-only databases, Oracle Database writes the fine-grained audit records to XML files, regardless of the audit_trail settings.
  - If audit_trail includes EXTENDED, then the query's SQL Text and SQL Bind variable information are included in the audit trail.
  - For example:
    * Setting audit_trail to DBMS_FGA.DB sends the audit trail to the SYS.FGA_LOG$ table in the database and omits SQL Text and SQL Bind.
    * Setting audit_trail to DBMS_FGA.DB + DBMS_FGA.EXTENDED sends the audit trail to the SYS.FGA_LOG$ table in the database and includes SQL Text and SQL Bind.
    * Setting audit_trail to DBMS_FGA.XML writes the audit trail in XML files sent to the operating system and omits SQL Text and SQL Bind.
    * Setting audit_trail to DBMS_FGA.XML + DBMS_FGA.EXTENDED writes the audit trail in XML files sent to the operating system and includes SQL Text and SQL Bind.

  The audit_trail parameter appears in the ALL_AUDIT_POLICIES view.
- You can change the operating system destination using the following command:

  ```
  ALTER SYSTEM SET AUDIT_FILE_DEST =  New Directory DEFERRED
  ```

- On many platforms, XML audit files are named *process_name_processId*.xml, for example, ora_2111.xml. Alternatively,l on Windows, the XML audit files are named *process_name_ThreadId*.xml (or *process_name_ProcessId*.xml if the process is not running as a thread).
- The audit_column_opts parameter establishes whether a statement is audited
  - when the query references *any* column specified in the audit_column parameter (audit_column_opts = DBMS_FGA.ANY_COLUMNS), or
  - only when *all* such columns are referenced (audit_column_opts = DBMS_FGA.ALL_COLUMNS).

  The default is DBMS_FGA.ANY_COLUMNS.

  The ALL_AUDIT_POLICIES view also shows audit_column_opts.
- When audit_column_opts is set to DBMS_FGA.ALL_COLUMNS, a SQL statement is audited only when all the columns mentioned in audit_column have been explicitly referenced in the statement. And these columns must be referenced in the same SQL-statement or in the sub-select.

  All these columns must refer to a single table/view or alias.

  If a SQL statement selects the columns from different table aliases, the statement will not be audited.
- Every XML audit record contains the elements AUDIT_TYPE and EXTENDED_TIMESTAMP, with the latter printed in UTC zone (with no timezone information). Values retrieved using V$XML_AUDIT_TRAIL view are converted to session timezone and printed.
- For SQL_TEXT and SQL_BIND element values (CLOB type columns), the dynamic view shows only the first 4000 characters. The underlying XML file may have more than 4000 characters for such SQL_TEXT and SQL_BIND values.
- For large numbers of XML audit files, querying V$XML_AUDIT_TRAIL is faster when they are loaded into a database table using SQL*Loader or a similar tool. XML audit files are larger than the equivalent written to OS files when AUDIT_TRAIL=OS.
- Error handling is the same as when AUDIT_TRAIL=OS. If any error occurs in writing an audit record to disk, including the directory identified by AUDIT_FILE_DEST being full, the auditing operation fails. An alert message is logged.
- The policy event handler module will be executed with the module owner's privilege.
- Do not create recursive fine-grained audit handlers. For example, suppose you create a handler that executes an INSERT statement on the HR.EMPLOYEES table. The policy that is associated with this handler is for INSERT statements (as set by the statement_types parameter). When the policy is used, the handler executes recursively until the system has run out of memory. This can raise the error ORA-1000: maximum open cursors exceeded or ORA-00036: maximum number of recursive SQL levels (50) exceeded. See also *Oracle Database Security Guide* with regard to Creating a Fine-Grained Audit Policy.
- The values for the audit_trail parameter (XML and XML+EXTENDED) cause fine-grained auditing records to be written to operating system files in XML format. A dynamic view, V$XML_AUDIT_TRAIL, makes such audit records from XML files available to DBAs through SQL query, providing enhanced usability.

Querying this view causes all XML files (all files with an `.xml` extension) in the `AUDIT_FILE_DEST` directory to be parsed and presented in relational table format.

Audit records stored in operating system files can be more secure than database-stored audit records because access can require file permissions that DBAs do not have. Operating system storage for audit records also offers higher availability, since such records remain available even if the database is temporarily inaccessible.

The `DBA_COMMON_AUDIT_TRAIL` view includes the contents of the `V$XML_AUDIT_TRAIL` dynamic view for standard and fine-grained audit records.

Note that the `V$XML_AUDIT_TRAIL` view is populated only if unified auditing is not enabled. If you have enabled unified auditing, then you can query the `UNIFIED_AUDIT_TRAIL` data dictionary view for the audit trail records.

See Also: *Oracle Database Security Guide* for an example of creating an email alert handler for a fine-grained audit policy

Examples

```
DBMS_FGA.ADD_POLICY (
   object_schema      =>  'scott',
   object_name        =>  'emp',
   policy_name        =>  'mypolicy1',
   audit_condition    =>  'sal < 100',
   audit_column       =>  'comm,sal',
   handler_schema     =>   NULL,
   handler_module     =>   NULL,
   enable             =>   TRUE,
   statement_types    =>  'INSERT, UPDATE',
   audit_column_opts  =>   DBMS_FGA.ANY_COLUMNS,
   policy_owner       =>  'sec_admin);
```

DISABLE_POLICY Procedure

This procedure disables an audit policy.

Syntax

```
DBMS_FGA.DISABLE_POLICY(
   object_schema  IN  VARCHAR2,
   object_name    IN  VARCHAR2,
   policy_name    IN  VARCHAR2);
```

Parameters

Table 67–3 DISABLE_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema of the object to be audited. If NULL, the current log-on user schema is assumed.
object_name	Name of the object to be audited
policy_name	Unique name of the policy

The default value for object_schema is NULL. (If NULL, the current log-on user schema is assumed.)

Examples

```
DBMS_FGA.DISABLE_POLICY (
object_schema   =>  'scott',
object_name     =>  'emp',
policy_name     =>  'mypolicy1');
```

DROP_POLICY Procedure

This procedure drops an audit policy.

Syntax

```
DBMS_FGA.DROP_POLICY(
   object_schema  IN  VARCHAR2,
   object_name    IN  VARCHAR2,
   policy_name    IN  VARCHAR2);
```

Parameters

Table 67–4 DROP_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema of the object to be audited. If NULL, the current log-on user schema is assumed.
object_name	Name of the object to be audited
policy_name	Unique name of the policy

Usage Notes

The DBMS_FGA procedures cause current DML transactions, if any, to commit before the operation unless they are inside a DDL event trigger. With DDL transactions, the DBMS_FGA procedures are part of the DDL transaction. The default value for object_schema is NULL. (If NULL, the current log-on user schema is assumed.)

> **Note:** Oracle Database automatically drops the audit policy if you remove the object specified in the object_name parameter of the DBMS_FGA.ADD_POLICY procedure, or if you drop the user who created the audit policy.

Examples

```
DBMS_FGA.DROP_POLICY (
object_schema   =>  'scott',
object_name     =>  'emp',
policy_name     =>  'mypolicy1');
```

ENABLE_POLICY Procedure

This procedure enables an audit policy.

Syntax

```
DBMS_FGA.ENABLE_POLICY(
   object_schema  IN  VARCHAR2,
   object_name    IN  VARCHAR2,
   policy_name    IN  VARCHAR2,
   enable         IN  BOOLEAN);
```

Parameters

Table 67–5 ENABLE_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema of the object to be audited. If NULL, the current log-on user schema is assumed.
object_name	Name of the object to be audited
policy_name	Unique name of the policy
enable	Defaults to TRUE to enable the policy

Examples

```
DBMS_FGA.ENABLE_POLICY (
object_schema    =>  'scott',
object_name      =>  'emp',
policy_name      =>  'mypolicy1',
enable           =>   TRUE);
```

68

DBMS_FILE_GROUP

The DBMS_FILE_GROUP package, one of a set of Oracle Streams packages, provides administrative interfaces for managing file groups, file group versions, and files. A file group repository is a collection of all of the file groups in a database and can contain multiple versions of a particular file group. You can use this package to create and manage file group repositories.

This chapter contains the following topics:

Using DBMS_FILE_GROUP

This section contains topics which relate to using the `DBMS_FILE_GROUP` package.

Overview

The following terms pertain to the DBMS_FILE_GROUP package:

File

A **file** is a reference to a file stored on hard disk. A file is composed of a file name, a directory object, and a file type. The directory object references the directory in which the file is stored on hard disk. For example, a file might have the following components:

- The file name is expdat.dmp.
- The directory object that contains the file is db_files.
- The file type is DBMS_FILE_GROUP.EXPORT_DUMP_FILE.

Version

A **version** is a collection of related files. For example, a version might consist of a set of data files and a Data Pump export dump file generated by a Data Pump transportable tablespace export. Only one Data Pump export dump file is allowed in a version.

File Group

A **file group** is a collection of versions. A file group can logically group a set of versions. For example, a file group named financial_quarters can keep track of quarterly financial data by logically grouping versions of files related to a tablespace set. The tablespaces containing the data can be exported at the end of each quarter and versioned under names such as Q1FY04, Q2FY04, and so on.

See Also: *Oracle Streams Concepts and Administration*

Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

Constants

The DBMS_FILE_GROUP package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_FILE_GROUP.EXPORT_DUMP_FILE.

Table 68–1 lists the parameters and enumerated constants.

Table 68–1 DBMS_FILE_GROUP Parameters with Enumerated Constants

Parameter	Option	Type	Description
file_type new_file_type	■ DATAFILE ■ EXPORT_DUMP_FILE ■ DATAPUMP_LOG_FILE	VARCHAR2(30)	DATAFILE is a datafile for a database. This constant can be specified as 'DATAFILE'. EXPORT_DUMP_FILE is a Data Pump export dump file. This constant can be specified as 'DUMPSET'. DATAPUMP_LOG_FILE is a Data Pump export log file. This constant can be specified as 'DATAPUMPLOG'.
max_versions retention_days	■ INFINITE	NUMBER	INFINITE specifies no limit. The max_versions or retention_days can increase without reaching a limit.
privilege	System privilege specified in the GRANT_SYSTEM_PRIVILEGE procedure: ■ READ_ANY_FILE_GROUP ■ MANAGE_ANY_FILE_GROUP ■ MANAGE_FILE_GROUP Object privilege specified in the GRANT_OBJECT_PRIVILEGE procedure: ■ READ_ON_FILE_GROUP ■ MANAGE_ON_FILE_GROUP	BINARY_INTEGER	READ_ANY_FILE_GROUP grants the privilege to view information about any file group in any schema in the data dictionary. MANAGE_ANY_FILE_GROUP grants the privilege to create, manage, and drop any file group in any schema. MANAGE_FILE_GROUP grants the privilege to create, manage, and drop file groups in the user's schema. READ_ON_FILE_GROUP grants the privilege to view information about a specific file group in the data dictionary. MANAGE_ON_FILE_GROUP grants the privilege to manage a specific file group in a schema other than the user's schema.

Examples

Oracle Streams Concepts and Administration includes an example of a business that sells books and music over the internet. The business runs weekly reports on the sales data in the `inst1.example.com` database and stores these reports in two HTML files on a computer file system. The `book_sales.htm` file contains the report for book sales, and the `music_sales.htm` file contains the report for music sales.

The business wants to store these weekly reports in a file group repository at the `inst2.example.com` remote database. Every week, the two reports are generated on the `inst1.example.com` database, transferred to the computer system running the `inst2.example.com` database, and added to the repository as a file group version. The file group repository stores all of the file group versions that contain the reports for each week.

See Also: *Oracle Streams Concepts and Administration*

Summary of DBMS_FILE_GROUP Subprograms

Table 68–2 DBMS_FILE_GROUP Package Subprograms

Subprogram	Description
ADD_FILE Procedure on page 68-8	Adds a file to a version of a file group
ALTER_FILE Procedure on page 68-10	Alters a file in a version of a file group
ALTER_FILE_GROUP Procedure on page 68-12	Alters a file group
ALTER_VERSION Procedure on page 68-14	Alters a version of a file group
CREATE_FILE_GROUP Procedure on page 68-16	Creates a file group
CREATE_VERSION Procedure on page 68-18	Creates a version of a file group
DROP_FILE_GROUP Procedure on page 68-19	Drops a file group
DROP_VERSION Procedure on page 68-20	Drops a version of a file group
GRANT_OBJECT_PRIVILEGE Procedure on page 68-21	Grants object privileges on a file group to a user
GRANT_SYSTEM_PRIVILEGE Procedure on page 68-22	Grants system privileges for file group operations to a user
PURGE_FILE_GROUP Procedure on page 68-23	Purges a file group using the file group's retention policy
REMOVE_FILE Procedure on page 68-24	Removes a file from a version of a file group
REVOKE_OBJECT_PRIVILEGE Procedure on page 68-25	Revokes object privileges on a file group from a user
REVOKE_SYSTEM_PRIVILEGE Procedure on page 68-26	Revokes system privileges for file group operations from a user

Note: All subprograms commit unless specified otherwise.

ADD_FILE Procedure

This procedure adds a file to a version of a file group.

See Also: An example that uses this procedure for a file group repository in *Oracle Streams Concepts and Administration*

Syntax

```
DBMS_FILE_GROUP.ADD_FILE(
  file_group_name  IN  VARCHAR2,
  file_name        IN  VARCHAR2,
  file_type        IN  VARCHAR2  DEFAULT NULL,
  file_directory   IN  VARCHAR2  DEFAULT NULL,
  version_name     IN  VARCHAR2  DEFAULT NULL,
  comments         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 68–3 ADD_FILE Procedure Parameters

Parameter	Description
`file_group_name`	The name of the file group that contains the version, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`file_name`	The name of the file being added to the version. Each file name in a version must be unique.

`file_type`	The file type. The following are reserved file types:
	■ If the file is a datafile, then enter the following:
	`'DATAFILE'`
	■ If the file is a Data Pump export dump file, then enter the following:
	`'DUMPSET'`
	Data Pump metadata is populated when a Data Pump export dump file is imported.
	■ If the file is a Data Pump export log file, then enter the following:
	`'DATAPUMPLOG'`
	If the file type is not one of the reserved file types, then either enter a text description of the file type, or specify `NULL` to omit a file type description.
	See "Constants" on page 68-5 for more information about the reserved file types.

`file_directory`	The name of the directory object that corresponds to the directory containing the file. If `NULL`, then the procedure uses the default directory object for the version. If `NULL` and no default directory object exists for the version, then the procedure uses the default directory object for the file group. If `NULL` and no default directory object exists for the version or file group, then the procedure raises an error.

Table 68–3 (Cont.) ADD_FILE Procedure Parameters

Parameter	Description
version_name	The name of the version to which the file is added. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file is added to version 1 of the file group. If NULL, then the procedure uses the version with the latest creation time for the file group.
comments	Comments about the file being added

Usage Notes

To run this procedure with either DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET' specified for the file_type parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have READ privilege on the directory object that contains the Data Pump export dump file

> **See Also:** *Oracle Database Utilities* for more information about Data Pump privileges

ALTER_FILE Procedure

This procedure alters a file in a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_FILE(
  file_group_name     IN  VARCHAR2,
  file_name           IN  VARCHAR2,
  version_name        IN  VARCHAR2  DEFAULT NULL,
  new_file_name       IN  VARCHAR2  DEFAULT NULL,
  new_file_directory  IN  VARCHAR2  DEFAULT NULL,
  new_file_type       IN  VARCHAR2  DEFAULT NULL,
  remove_file_type    IN  VARCHAR2  DEFAULT 'N',
  new_comments        IN  VARCHAR2  DEFAULT NULL,
  remove_comments     IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 68–4 ALTER_FILE Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
file_name	The name of the file being altered in the version
version_name	The name of the version that contains the file being altered. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file in version 1 of the file group is altered. If NULL, then the procedure uses the version with the latest creation time for the file group.
new_file_name	The new name of the file if the file name is being changed. Each file name in a version must be unique. If NULL, then the procedure does not change the file name. **Note:** When a non-NULL new file name is specified, this procedure changes the metadata for the file name in the data dictionary, but it does not change the file name on the hard disk.
new_file_directory	The new name of the directory object that corresponds to the directory containing the file, if the directory object is being changed. If NULL, then the procedure does not change the directory object name. **Note:** When a non-NULL new file directory is specified, this procedure changes the metadata for the file directory in the data dictionary, but it does not change the file directory on the hard disk.

Table 68–4 (Cont.) ALTER_FILE Procedure Parameters

Parameter	Description
new_file_type	The file type. The following are reserved file types: ■ If the file is a datafile, then enter the following: 'DATAFILE' ■ If the file is a Data Pump export dump file, then enter the following: 'DUMPSET' ■ If the file is a Data Pump export log file, then enter the following: 'DATAPUMPLOG' If the file type is not one of the reserved file types, then enter a text description of the file type. If NULL, then the procedure does not change the file type. **See Also:** "Constants" on page 68-5 for more information about the reserved file types.
remove_file_type	If Y, then the procedure removes the file type. If Y and the new_file_type parameter is non-NULL, then the procedure raises an error. If N, then the procedure does not remove the file type.
new_comments	New comments about the file being altered. If non-NULL, then the procedure replaces the existing comments with the specified comments. If NULL, then the procedure does not change the existing comments.
remove_comments	If Y, then the procedure removes the comments for the file. If Y and the new_comments parameter is non-NULL, then the procedure raises an error. If N, then the procedure does not change the existing comments.

Usage Notes

If the file type is changed to DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET', then Data Pump metadata for the file is populated. If the file type is changed from DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET', then Data Pump metadata for the file is purged.

To run this procedure with DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET' specified for the new_file_type parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have READ privilege on the directory object that contains the Data Pump export dump file

> **See Also:** *Oracle Database Utilities* for more information about Data Pump privileges

ALTER_FILE_GROUP Procedure

This procedure alters a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_FILE_GROUP(
  file_group_name           IN  VARCHAR2,
  keep_files                IN  VARCHAR2  DEFAULT NULL,
  min_versions              IN  NUMBER    DEFAULT NULL,
  max_versions              IN  NUMBER    DEFAULT NULL,
  retention_days            IN  NUMBER    DEFAULT NULL,
  new_default_directory     IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory  IN  VARCHAR2  DEFAULT 'N',
  new_comments              IN  VARCHAR2  DEFAULT NULL,
  remove_comments           IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 68–5 ALTER_FILE_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group being altered, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
keep_files	If Y, then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged. If N, then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged. If NULL, then this parameter is not changed. **Note:** If the file group is dropped because of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk.
min_versions	The minimum number of versions to retain. The specified value must be greater than or equal to 1. If NULL, then the procedure does not change the min_versions setting for the file group.
max_versions	The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for min_versions. When the number of versions exceeds the specified max_versions, the oldest version is purged. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of versions. If NULL, then the procedure does not change the max_versions setting for the file group.

Table 68–5 (Cont.) ALTER_FILE_GROUP Procedure Parameters

Parameter	Description
retention_days	The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified retention_days and there are more versions than the number specified in min_versions, the version is purged. The age of a version is calculated by subtracting the creation time from the current time. A decimal value can specify a fraction of a day. For example, 1.25 specifies one day and six hours. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of days a version can exist. If NULL, then the procedure does not change the retention_days setting for the file group.
new_default_directory	The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version. If NULL, then the procedure does not change the default directory.
remove_default_directory	If Y, then the procedure removes the default directory for the file group. If Y and the new_default_directory parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the default directory for the file group.
new_comments	Comments about the file group. If non-NULL, then the new comments replace the existing comments for the file group. If NULL, then the procedure does not change the existing comments.
remove_comments	If Y, then the comments for the file group are removed. If Y and the new_comments parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not change the comments for the file group.

Usage Notes

If min_versions is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set min_versions to at least 2 if a version of the file group must be available at all times.

ALTER_VERSION Procedure

This procedure alters a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_VERSION(
  file_group_name           IN  VARCHAR2,
  version_name              IN  VARCHAR2  DEFAULT NULL,
  new_version_name          IN  VARCHAR2  DEFAULT NULL,
  remove_version_name       IN  VARCHAR2  DEFAULT 'N',
  new_default_directory     IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory  IN  VARCHAR2  DEFAULT 'N',
  new_comments              IN  VARCHAR2  DEFAULT NULL,
  remove_comments           IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 68–6 ALTER_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
version_name	The name of the version being altered. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is altered. If '*' is specified, then the procedure alters all versions, and the new_version_name parameter must be NULL. If NULL, then the procedure uses the version with the latest creation time for the file group.
new_version_name	The new name of the version. Do not specify a schema. The specified version name cannot be a positive integer or an asterisk ('*'). If NULL, then the procedure does not change the version name.
remove_version_name	If Y, then the procedure removes the version name. If the version name is removed, then the version number must be used to manage the version. If Y and the new_version_name parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the version name.
new_default_directory	The default directory object used when files are added to a version if no directory is specified when the files are added. If NULL, then the procedure does not change the default directory.
remove_default_directory	If Y, then the procedure removes the default directory. If Y and the new_default_directory parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the default directory.

Table 68–6 (Cont.) ALTER_VERSION Procedure Parameters

Parameter	Description
new_comments	Comments about the version. If non-NULL, then the new comments replace the existing comments for the version. If NULL, then the procedure does not change the comments.
remove_comments	If Y, then the procedure removes the comments for the version. If Y and the new_comments parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the comments for the version.

CREATE_FILE_GROUP Procedure

This procedure creates a file group.

> **See Also:** An example that uses this procedure for a file group repository in *Oracle Streams Concepts and Administration*

Syntax

```
DBMS_FILE_GROUP.CREATE_FILE_GROUP(
  file_group_name    IN  VARCHAR2,
  keep_files         IN  VARCHAR2  DEFAULT 'Y',
  min_versions       IN  NUMBER    DEFAULT 2,
  max_versions       IN  NUMBER    DEFAULT DBMS_FILE_GROUP.INFINITE,
  retention_days     IN  NUMBER    DEFAULT DBMS_FILE_GROUP.INFINITE,
  default_directory  IN  VARCHAR2  DEFAULT NULL,
  comments           IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 68–7 CREATE_FILE_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
keep_files	If Y, then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged. If N, then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged. **Note:** If the file group is dropped because of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk.
min_versions	The minimum number of versions to retain. The specified value must be greater than or equal to 1.
max_versions	The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for min_versions. When the number of versions exceeds the specified max_versions, the oldest version is purged. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of versions.
retention_days	The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified retention_days and there are more versions than the number specified in min_versions, the version is purged. The age of a version is calculated by subtracting the creation time from the current time. A decimal value can specify a fraction of a day. For example, 1.25 specifies one day and six hours. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of days a version can exist.
default_directory	The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version.

Table 68–7 (Cont.) CREATE_FILE_GROUP Procedure Parameters

Parameter	Description
comments	Comments about the file group being created.

Usage Notes

If min_versions is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set min_versions to at least 2 if a version of the file group must be available at all times.

CREATE_VERSION Procedure

This procedure creates a version of a file group.

This procedure automatically runs the PURGE_FILE_GROUP procedure. Therefore, versions can be purged based on the file group's retention policy.

This procedure is overloaded. One version of the procedure contains the OUT parameter version_out, and the other does not.

See Also:

- PURGE_FILE_GROUP Procedure on page 68-23
- An example that uses this procedure for a file group repository in *Oracle Streams Concepts and Administration*

Syntax

```
DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name    IN  VARCHAR2,
  version_name       IN  VARCHAR2 DEFAULT NULL,
  default_directory  IN  VARCHAR2 DEFAULT NULL,
  comments           IN  VARCHAR2 DEFAULT NULL);

DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name    IN   VARCHAR2,
  version_name       IN   VARCHAR2 DEFAULT NULL,
  default_directory  IN   VARCHAR2 DEFAULT NULL,
  comments           IN   VARCHAR2 DEFAULT NULL,
  version_out        OUT  VARCHAR2);
```

Parameters

Table 68–8 CREATE_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group to which the new version is added, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
version_name	The name of the version being created. Do not specify a schema. The specified version name cannot be a positive integer because, when a version is created, a version number is generated automatically. The specified version name cannot be an asterisk ('*').
default_directory	The default directory object used when files are added to a version if no directory is specified when the files are added.
comments	Comments about the version being created
version_out	If the version_name parameter is set to a non-NULL value, then this parameter contains the specified version name. If the version_name parameter is set to NULL, then this parameter contains the generated version number.

DROP_FILE_GROUP Procedure

This procedure drops a file group.

Syntax

```
DBMS_FILE_GROUP.DROP_FILE_GROUP(
  file_group_name  IN  VARCHAR2,
  keep_files       IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 68–9 DROP_FILE_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group being dropped, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
keep_files	If Y, then the procedure retains the files in the file group on hard disk. If N, then the procedure deletes the files in the file group from hard disk. If NULL, then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have WRITE privilege on the directory object that contains the files.

DROP_VERSION Procedure

This procedure drops a version of a file group.

Syntax

```
DBMS_FILE_GROUP.DROP_VERSION(
  file_group_name  IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  keep_files       IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 68–10 DROP_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
version_name	The name of the version being dropped. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is dropped. If NULL, then the procedure uses the version with the oldest creation time for the file group. If '*', then the procedure drops all versions.
keep_files	If Y, then the procedure retains the files in the version on hard disk. If N, then the procedure deletes the files in the version from hard disk. If NULL, then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have WRITE privilege on the directory object that contains the files.

GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants object privileges on a file group to a user.

Syntax

```
DBMS_FILE_GROUP.GRANT_OBJECT_PRIVILEGE(
  object_name   IN  VARCHAR2,
  privilege     IN  BINARY_INTEGER,
  grantee       IN  VARCHAR2,
  grant_option  IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 68–11 GRANT_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
object_name	The name of the file group on which the privilege is granted, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
privilege	The constant that specifies the privilege. See "Constants" on page 68-5 for valid privileges.
grantee	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
grant_option	If TRUE, then the specified user granted the specified privilege can grant this privilege to others. If FALSE, then the specified user granted the specified privilege cannot grant this privilege to others.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants system privileges for file group operations to a user.

> **Note:** When you grant a privilege on "ANY" object (for example, ALTER_ANY_RULE), and the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE, you give the user access to that type of object in all schemas, except the SYS schema. By default, the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE.
>
> If you want to grant access to an object in the SYS schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the O7_DICTIONARY_ACCESSIBILITY initialization parameter to TRUE. Then privileges granted on "ANY" object allows access to any schema, including SYS. Set the O7_DICTIONARY_ACCESSIBILITY initialization parameter with caution.

Syntax

```
DBMS_FILE_GROUP.GRANT_SYSTEM_PRIVILEGE(
  privilege     IN  BINARY_INTEGER,
  grantee       IN  VARCHAR2,
  grant_option  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 68–12 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The constant that specifies the privilege. See "Constants" on page 68-5 for valid privileges.
grantee	The name of the user or role for which the privilege is granted. The user who runs the procedure cannot be specified.
grant_option	If TRUE, then the specified user granted the specified privilege can grant this privilege to others. If FALSE, then the specified user granted the specified privilege cannot grant this privilege to others.

PURGE_FILE_GROUP Procedure

This procedure purges a file group using the file group's retention policy.

A file group's retention policy is determined by its settings for the `max_versions`, `min_versions`, and `retention_days` parameters. The following versions of a file group are removed when a file group is purged:

- All versions greater than the `max_versions` setting for the file group when versions are ordered in descending order by creation time. Therefore, the older versions are purged before the newer versions.
- All versions older than the `retention_days` setting for the file group unless purging a version would cause the number of versions to drop below the `min_versions` setting for the file group.

A job named `SYS.FGR$AUTOPURGE_JOB` automatically purges all file groups in a database periodically according to the job's schedule. You can adjust this job's schedule using the `DBMS_SCHEDULER` package. Alternatively, you can create a job that runs the `PURGE_FILE_GROUP` procedure periodically.

Syntax

```
DBMS_FILE_GROUP.PURGE_FILE_GROUP(
  file_group_name  IN  VARCHAR2);
```

Parameter

Table 68–13 PURGE_FILE_GROUP Procedure Parameter

Parameter	Description
`file_group_name`	The name of the file group, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default. If `NULL` and this procedure is run by `SYS` user, then the procedure purges all file groups.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files. Files are deleted when a version is purged and the `keep_files` parameter is set to `N` for the version's file group.

REMOVE_FILE Procedure

This procedure removes a file from a version of a file group.

Syntax

```
DBMS_FILE_GROUP.REMOVE_FILE(
  file_group_name  IN  VARCHAR2,
  file_name        IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  keep_file        IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 68–14 REMOVE_FILE Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
file_name	The name of the file being removed from the version
version_name	The name of the version from which the file is removed. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file is removed from version 1 of the file group. If NULL, then the procedure uses the version with the latest creation time for the file group. If '*', then the procedure removes the file from all versions.
keep_file	If Y, then the procedure retains the file on hard disk. If N, then the procedure deletes the file from hard disk. If NULL, then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have WRITE privilege on the directory object that contains the files.

REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes object privileges on a file group from a user.

Syntax

```
DBMS_FILE_GROUP.REVOKE_OBJECT_PRIVILEGE(
  object_name  IN  VARCHAR2,
  privilege    IN  BINARY_INTEGER,
  revokee      IN  VARCHAR2);
```

Parameters

Table 68–15 REVOKE_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
`object_name`	The name of the file group on which the privilege is revoked, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`privilege`	The constant that specifies the privilege. See "Constants" on page 68-5 for valid privileges.
`revokee`	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes system privileges for file group operations from a user.

Syntax

```
DBMS_FILE_GROUP.REVOKE_SYSTEM_PRIVILEGE(
  privilege  IN  BINARY_INTEGER,
  revokee    IN  VARCHAR2);
```

Parameters

Table 68–16 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The constant that specifies the privilege. See "Constants" on page 68-5 for valid privileges.
`revokee`	The name of the user or role from which the privilege is revoked. The user who runs the procedure cannot be specified.

69

DBMS_FILE_TRANSFER

The DBMS_FILE_TRANSFER package provides procedures to copy a binary file within a database or to transfer a binary file between databases.

See Also:

- *Oracle Database Administrator's Guide* for instructions about using file transfer
- *Oracle Streams Concepts and Administration* for applications of file transfer.

This chapter contains the following topic:

Using DBMS_FILE_TRANSFER

Overview

The DBMS_FILE_TRANSFER package provides procedures to copy a binary file within a database or to transfer a binary file between databases. The destination database converts each block when it receives a file from a platform with different endianness. Datafiles can be imported after they are moved to the destination database as part of a transportable operation without RMAN conversion. Both GET and PUT operations will converted the file across platform difference at the destination. However, COPY is a local operation and therefore no conversion is required.

Security Model

The DBMS_FILE_TRANSFER package must be created under SYS (CONNECT INTERNAL). Operations provided by this package are performed under the current calling user, not the package owner (SYS).

To use this interface the following users must have the following privileges:

- The current user at the local database must have READ privilege on the directory object specified in the source_directory_object parameter.
- The connected user at the destination database must have WRITE privilege to the directory object specified in the destination_directory_object parameter.

Operating Notes

Caution: DBMS_FILE_TRANSFER supports online backup. You should therefore be careful in copying or transferring a file that is being modified by the database because this can result in an inconsistent file, and require recovery. To guarantee consistency, bring files offline when the database is in use.

If you want to use DBMS_FILE_TRANSFER for performing backups, note that you are implementing self-managed backups, and should therefore put the files in hot backup mode.

Summary of DBMS_FILE_TRANSFER Subprograms

Table 69–1 DBMS_FILE_TRANSFER Package Subprograms

Subprogram	Description
COPY_FILE Procedure on page 69-7	Reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.
GET_FILE Procedure on page 69-9	Contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM
PUT_FILE Procedure on page 69-11	Reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system

COPY_FILE Procedure

This procedure reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.

You can copy any type of file to and from a local file system. However, you can copy only database files (such as datafiles, tempfiles, controlfiles, and so on) to and from an ASM disk group.

The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.COPY_FILE(
   source_directory_object       IN  VARCHAR2,
   source_file_name              IN  VARCHAR2,
   destination_directory_object  IN  VARCHAR2,
   destination_file_name         IN  VARCHAR2);
```

Parameters

Table 69–2 COPY_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object that designates the source directory. The directory object must already exist. (You create directory objects with the CREATE DIRECTORY command).
source_file_name	The name of the file to copy. This file must exist in the source directory.
destination_directory_object	The directory object that designates the destination directory. The directory object must already exist. If the destination is ASM, the directory object must designate either a disk group name (for example, +diskgroup1) or a directory created for alias names. In the case of a directory, the full path to the directory must be specified (for example: +diskgroup1/dbs/control).
destination_file_name	The name to assign to the file in the destination directory. A file with the same name must not exist in the destination directory. If the destination is ASM: ■ The file is given a fully qualified ASM filename and created in the appropriate directory (depending on the database name and file type) ■ The file type tag assigned to the file is COPY_FILE ■ The value of the destination_file_name argument becomes the file's alias name in the designated destination directory The file name can be followed by an ASM template name in parentheses. The file is then given the attributes specified by the template.

Usage Notes

To run this procedure successfully, the current user must have the following privileges:

- `READ` privilege on the directory object specified in the `source_directory_object` parameter
- `WRITE` privilege on directory object specified in the `destination_directory_object` parameter

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. To monitor the progress of a long file copy, query the `V$SESSION_LONGOPS` dynamic performance view.

> **See Also:** *Oracle Automatic Storage Management Administrator's Guide* for instructions about using file transfer

Examples

```
SQL> create directory DGROUP as '+diskgroup1/dbs/backup';

Directory created.

SQL>  BEGIN
   2    DBMS_FILE_TRANSFER.COPY_FILE('SOURCEDIR','t_xdbtmp.f', 'DGROUP',
                                     't_xdbtmp.f');
   3  END;
   4  /

PL/SQL procedure successfully completed.

SQL> EXIT
$ASMCMD
ASMCMD> ls
DISKGROUP1/
ASMCMD> cd diskgroup1/dbs/backup
ASMCMD> ls
t_xdbtmp.f => +DISKGROUP1/ORCL/TEMPFILE/COPY_FILE.267.546546525
```

GET_FILE Procedure

This procedure contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.GET_FILE
   source_directory_object      IN  VARCHAR2,
   source_file_name             IN  VARCHAR2,
   source_database              IN  VARCHAR2,
   destination_directory_object IN  VARCHAR2,
   destination_file_name        IN  VARCHAR2);
```

Parameters

Table 69–3 GET_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object from which the file is copied at the source site. This directory object must exist at the source site.
source_file_name	The name of the file that is copied in the remote file system. This file must exist in the remote file system in the directory associated with the source directory object.
source_database	The name of a database link to the remote database where the file is located.
destination_directory_object	The directory object into which the file is placed at the destination site. This directory object must exist in the local file system.
destination_file_name	The name of the file copied to the local file system. A file with the same name must not exist in the destination directory in the local file system.

Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The connected user at the source database must have read privilege on the directory object specified in the source_directory_object parameter.
- The current user at the local database must have write privilege on the directory object specified in the destination_directory_object parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. To monitor the progress of a long file transfer, query the V$SESSION_LONGOPS dynamic performance view.

Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE DIRECTORY DSK_FILES AS ''^t_work^'';
GRANT WRITE ON DIRECTORY dsk_files TO "user";

-- asumes that dbs2 link has been created and we are connected to the instance.
-- dbs2 could be a loopback or point to another instance.

BEGIN
-- asm file to an os file
-- get an asm file from dbs1.asm/a1 to dbs2.^t_work^/oa5.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'df' , 'a1' , 'dbs1', 'dsk_files' , 'oa5.dat' );

-- os file to an os file
-- get an os file from dbs1.^t_work^/a2.dat to dbs2.^t_work^/a2back.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'dsk_files' , 'a2.dat' , 'dbs1', 'dsk_files' ,
'a2back.dat' );

END ;
/
```

PUT_FILE Procedure

This procedure reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.PUT_FILE(
   source_directory_object       IN  VARCHAR2,
   source_file_name              IN  VARCHAR2,
   destination_directory_object  IN  VARCHAR2,
   destination_file_name         IN  VARCHAR2,
   destination_database          IN  VARCHAR2);
```

Parameters

Table 69–4 PUT_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object from which the file is copied at the local source site. This directory object must exist at the source site.
source_file_name	The name of the file that is copied from the local file system. This file must exist in the local file system in the directory associated with the source directory object.
destination_directory_object	The directory object into which the file is placed at the destination site. This directory object must exist in the remote file system.
destination_file_name	The name of the file placed in the remote file system. A file with the same name must not exist in the destination directory in the remote file system.
destination_database	The name of a database link to the remote database to which the file is copied.

Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The current user at the local database must have read privilege on the directory object specified in the source_directory_object parameter.
- The connected user at the destination database must have write privilege to the directory object specified in the destination_directory_object parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. To monitor the progress of a long file transfer, query the V$SESSION_LONGOPS dynamic performance view.

Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE OR REPLACE DIRECTORY ft1 AS '+datafile/ft1' ;
GRANT READ,WRITE ON DIRECTORY ft1 TO "user";
CREATE OR REPLACE DIRECTORY ft1_1 AS '+datafile/ft1/ft1_1' ;

CONNECT user;
Enter password: password

-- - put a1.dat to a4.dat (using dbs2 dblink)
-- - level 2 sub dir to parent dir
-- - user has read privs on ft1_1 at dbs1 and write on df in dbs2
BEGIN
 DBMS_FILE_TRANSFER.PUT_FILE ( 'ft1_1' , 'a2.dat' , 'df' , 'a4.dat' ,
                               'dbs2' ) ;
END ;
```

70

DBMS_FLASHBACK

Using DBMS_FLASHBACK, you can flash back to a version of the database at a specified time or a specified system change number (SCN).

> **See Also:** For detailed information about DBMS_FLASHBACK:
>
> - *Oracle Database Development Guide*
> - *Oracle Database SQL Language Reference*.

This chapter contains the following topics:

Using DBMS_FLASHBACK

Overview

DBMS_FLASHBACK provides an interface for the user to view the database at a particular time in the past, with the additional capacity provided by transaction back out features that allow for selective removal of the effects of individual transactions. This is different from a flashback database which moves the database back in time.

When DBMS_FLASHBACK is enabled, the user session uses the Flashback version of the database, and applications can execute against the Flashback version of the database.

You may want to use DBMS_FLASHBACK for the following reasons:

- Self-service repair: If you accidentally delete rows from a table, you can recover the deleted rows.
- Packaged applications such as email and voicemail: You can use Flashback to restore deleted email by re-inserting the deleted message into the current message box.
- Decision support system (DSS) and online analytical processing (OLAP) applications: You can perform data analysis or data modeling to track seasonal demand.

Security Model

To use this package, you must have the `EXECUTE` privilege on it.

Types

The DBMS_FLASHBACK package uses these types:

Table 70–1 DBMS_FLASHBACK

Type	Description
TXNAME_ARRAY	Creates a VARRAY for holding Transaction Names or Identifiers (XIDs)

Exceptions

Table 70–2 DBMS_FLASHBACK Error Messages

Error	Description
ORA-08180	Time specified is too old
ORA-08181	Invalid system change number specified
ORA-08182	User cannot begin read-only or serializable transactions in Flashback mode
ORA-08183	User cannot enable Flashback within an uncommitted transaction
ORA-08184	User cannot enable Flashback within another Flashback session
ORA-08185	SYS cannot enable Flashback mode

Operational Notes

DBMS_FLASHBACK is automatically turned off when the session ends, either by disconnection or by starting another connection.

PL/SQL cursors opened in Flashback mode return rows as of the flashback time or SCN. Different concurrent sessions (connections) in the database can perform Flashback to different wall-clock times or SCNs. DML and DDL operations and distributed operations are not allowed while a session is running in Flashback mode. You can use PL/SQL cursors opened before disabling Flashback to perform DML.

Under Automatic Undo Management (AUM) mode, you can use retention control to control how far back in time to go for the version of the database you need. If you need to perform a Flashback over a 24-hour period, the DBA must set the undo_retention parameter to 24 hours. This way, the system retains enough undo information to regenerate the older versions of the data.

You can set the RETENTION GUARANTEE clause for the undo tablespace to ensure that unexpired undo is not discarded. UNDO_RETENTION is not in itself a guarantee because, if the system is under space pressure, unexpired undo may be overwritten with freshly generated undo. In such cases, RETENTION GUARANTEE prevents this. For more information, see the *Oracle Database Administrator's Guide*.

In a Flashback-enabled session, SYSDATE is not affected; it continues to provide the current time.

DBMS_FLASHBACK can be used within logon triggers to enable Flashback without changing the application code.

Examples

The following example illustrates how Flashback can be used when the deletion of a senior employee triggers the deletion of all the personnel reporting to him. Using the Flashback feature, you can recover and re-insert the missing employees.

```
DROP TABLE employee;
DROP TABLE keep_scn;

REM -- Keep_scn is a temporary table to store scns that we are interested in

CREATE TABLE keep_scn (scn number);
SET ECHO ON
CREATE TABLE employee (
   employee_no   number(5) PRIMARY KEY,
   employee_name varchar2(20),
   employee_mgr  number(5)
      CONSTRAINT mgr_fkey REFERENCES EMPLOYEE ON DELETE CASCADE,
   salary        number,
   hiredate      date
);

REM -- Populate the company with employees
INSERT INTO employee VALUES (1, 'John Doe', null, 1000000, '5-jul-81');
INSERT INTO employee VALUES (10, 'Joe Johnson', 1, 500000, '12-aug-84');
INSERT INTO employee VALUES (20, 'Susie Tiger', 10, 250000, '13-dec-90');
INSERT INTO employee VALUES (100, 'Scott Tiger', 20, 200000, '3-feb-86');
INSERT INTO employee VALUES (200, 'Charles Smith', 100, 150000, '22-mar-88');
INSERT INTO employee VALUES (210, 'Jane Johnson', 100, 100000, '11-apr-87');
INSERT INTO employee VALUES (220, 'Nancy Doe', 100, 100000, '18-sep-93');
INSERT INTO employee VALUES (300, 'Gary Smith', 210, 75000, '4-nov-96');
INSERT INTO employee VALUES (310, 'Bob Smith', 210, 65000, '3-may-95');
COMMIT;

REM -- Show the entire org
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

REM -- Sleep for a short time (approximately 10 to 20  seconds) to avoid
REM -- querying close to table creation

EXECUTE DBMS_LOCK.SLEEP(10);

REM -- Store this snapshot for later access through Flashback
DECLARE
I NUMBER;
BEGIN
I := DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER;
INSERT INTO keep_scn VALUES (I);
COMMIT;
END;
/

REM -- Scott decides to retire but the transaction is done incorrectly
DELETE FROM EMPLOYEE WHERE employee_name = 'Scott Tiger';
COMMIT;
```

```
REM -- notice that all of scott's employees are gone
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM EMPLOYEE
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

REM -- Flashback to see Scott's organization
DECLARE
   restore_scn number;
BEGIN
   SELECT  scn INTO restore_scn FROM keep_scn;
   DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (restore_scn);
END;
/

REM -- Show Scott's org.
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no =
   (SELECT employee_no FROM employee WHERE employee_name = 'Scott Tiger')
ORDER BY LEVEL;

REM -- Restore scott's organization.
DECLARE
   scotts_emp NUMBER;
   scotts_mgr NUMBER;
   CURSOR c1 IS
      SELECT employee_no, employee_name, employee_mgr, salary, hiredate
      FROM employee
      CONNECT BY PRIOR employee_no = employee_mgr
      START WITH employee_no =
         (SELECT employee_no FROM employee WHERE employee_name = 'Scott Tiger');
   c1_rec c1 % ROWTYPE;
BEGIN
   SELECT employee_no, employee_mgr INTO scotts_emp, scotts_mgr FROM employee
   WHERE employee_name = 'Scott Tiger';
   /* Open c1 in flashback mode */
   OPEN c1;
   /* Disable Flashback */
   DBMS_FLASHBACK.DISABLE;
 LOOP
   FETCH c1 INTO c1_rec;
   EXIT WHEN c1%NOTFOUND;
   /*
     Note that all the DML operations inside the loop are performed
     with Flashback disabled
   */
   IF (c1_rec.employee_mgr = scotts_emp) then
      INSERT INTO employee VALUES (c1_rec.employee_no,
         c1_rec.employee_name,
         scotts_mgr,
         c1_rec.salary,
         c1_rec.hiredate);
   ELSE
   IF (c1_rec.employee_no != scotts_emp) THEN
   INSERT INTO employee VALUES (c1_rec.employee_no,
         c1_rec.employee_name,
```

```
         c1_rec.employee_mgr,
         c1_rec.salary,
         c1_rec.hiredate);
      END IF;
    END IF;
 END LOOP;
END;
/

REM -- Show the restored organization.
select lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;
```

Summary of DBMS_FLASHBACK Subprograms

Table 70–3 DBMS_FLASHBACK Package Subprograms

Subprogram	Description
DISABLE Procedure on page 70-12	Disables the Flashback mode for the entire session
ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure on page 70-13	Enables Flashback for the entire session. Takes an SCN as an Oracle number and sets the session snapshot to the specified number. Inside the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN
ENABLE_AT_TIME Procedure on page 70-14	Enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in `query_time`
GET_SYSTEM_CHANGE_NUMBER Function on page 70-15	Returns the current SCN as an Oracle number. You can use the SCN to store specific snapshots
TRANSACTION_BACKOUT Procedures on page 70-16	Provides the mechanism to back out a transaction

DISABLE Procedure

This procedure disables the Flashback mode for the entire session.

Syntax

```
DBMS_FLASHBACK.DISABLE;
```

Examples

The following example queries the salary of an employee, Joe, on August 30, 2000:

```
EXECUTE dbms_flashback.enable_at_time('30-AUG-2000');
SELECT salary FROM emp where name = 'Joe'
EXECUTE dbms_flashback.disable;
```

ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure

This procedure takes an SCN as an input parameter and sets the session snapshot to the specified number. In the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN. It enables Flashback for the entire session.

Syntax

```
DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (
   query_scn IN NUMBER);
```

Parameters

Table 70–4 ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure Parameters

Parameter	Description
query_scn	The system change number (SCN), a version number for the database that is incremented on every transaction commit.

ENABLE_AT_TIME Procedure

This procedure enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in query_time.It enables Flashback for the entire session.

Syntax

```
DBMS_FLASHBACK.ENABLE_AT_TIME (
   query_time   IN TIMESTAMP);
```

Parameters

Table 70–5 ENABLE_AT_TIME Procedure Parameters

Parameter	Description
query_time	This is an input parameter of type TIMESTAMP. A time stamp can be specified in the following ways: ■ Using the TIMESTAMP constructor EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TIMESTAMP '2001-01-09 12:31:00'). Use the Globalization Support (NLS) format and supply a string. The format depends on the Globalization Support settings. ■ Using the TO_TIMESTAMP function: EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TO_TIMESTAMP('12-02-2001 14:35:00', 'DD-MM-YYYY HH24:MI:SS')) You provide the format you want to use. This example shows the TO_TIMESTAMP function for February 12, 2001, 2:35 PM. ■ If the time is omitted from query time, it defaults to the beginning of the day, that is, 12:00 A.M. ■ Note that if the query time contains a time zone, the time zone information is truncated.

GET_SYSTEM_CHANGE_NUMBER Function

This function returns the current SCN as an Oracle number datatype. You can obtain the current change number and store it for later use. This helps you retain specific snapshots.

Syntax

```
DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER
 RETURN NUMBER;
```

TRANSACTION_BACKOUT Procedures

This procedure provides a mechanism to back out a set of transactions. The user can call these procedures with either transaction names or transaction identifiers (XIDS).

The procedure analyzes the transactional dependencies, perform DMLs and generates an extensive report on the operation performed by the subprogram. This procedure does not commit the DMLs performed as part of transaction back out. However it holds all the required locks on rows and tables in the right form, so that no other dependencies can enter the system. To make the changes permanent you must explicitly commit the transaction.

A report is generated in the system tables DBA_FLASHBACK_TRANSACTION_STATE and DBA_FLASHBACK_TRANSACTION_REPORT.

Syntax

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
   numtxns            NUMBER,
   xids               XID_ARRAY,
   options            NUMBER default NOCASCADE,
   timeHint           TIMESTAMP default MINTIME);

DBMS_FLASHBACK.TRANSACTION_BACKOUT
   numtxns            NUMBER,
   xids               XID_ARRAY,
   options            NUMBER default NOCASCADE,
   scnHint            TIMESTAMP default 0   );

DBMS_FLASHBACK.TRANSACTION_BACKOUT
   numtxns           NUMBER,
   txnnames          TXNAME_ARRAY,
   options           NUMBER default NOCASCADE,
   timehint          TIMESTAMP MINTIME );

DBMS_FLASHBACK.TRANSACTION_BACKOUT
   numtxns           NUMBER,
   txnNames         TXNAME_ARRAY,
   options          NUMBER default NOCASCADE,
   scnHint          NUMBER 0);
```

Parameters

Table 70–6 TRANSACTION_BACKOUT Procedure Parameters

Parameter	Description
numtxns	Number of transactions passed as input
xids	List of transaction IDs in the form of an array
txnnames	List of transaction names in the form of an array

Table 70–6 (Cont.) TRANSACTION_BACKOUT Procedure Parameters

Parameter	Description
options	Back out dependent transactions: ■ NOCASCADE - No dependency is expected. If a dependency is found, this raises an error, with the first dependent transaction provided in the report. ■ NOCASCADE_FORCE - The user forcibly backs out the given transactions without considering the dependent transactions. The RDBMS executes the UNDO SQL for the given transactions in reverse order of their commit times. If no constraints break, and the result is satisfactory, the user can either COMMIT the changes or else ROLL BACK. ■ NONCONFLICT_ONLY - This option lets the user back out the changes to the nonconflicting rows of the given transactions. Note that a transaction dependency can happen due to a row conflict through either WAW or primary/unique key constraints. If the user chooses to back out only the nonconflicting rows, this does not cause any problem with database consistency, although transaction atomicity is lost. As this is a recovery operation, the user can correct the data. ■ CASCADE - This completely removes the given transactions including their dependents in a post order fashion (reverse order of commit times).
timehint	Time hint on the start of the transaction
scnhint	SCN hint on the start of the transaction

Usage Notes

Note: For information about restrictions in using TRANSACTION_BACKOUT, see "Using Flashback Transaction" in the *Oracle Database Development Guide*.

- If transaction name is used, a time hint must be provided. The time hint should be a time before the start of all the given transactions to back out.
- If the SCN hint is provided, it must be before the start of the earliest transaction in the specified input set, or this raises an error and terminates. If it is not provided and the transaction has committed within undo retention, the database system is able to determine the start time.

71

DBMS_FLASHBACK_ARCHIVE

The `DBMS_FLASHBACK_ARCHIVE` package contains procedures for performing various tasks such as:

- Disassociation and reassociation of a Flashback Data Archive (FDA) enabled table from/with its underlying FDA
- Tamper-proofing the tables of an application
- Importing of user history

> **Caution:** Importing user-generated history can lead to inaccurate, or unreliable results. This procedure should only be used after consulting with Oracle Support.

- Enabling and disabling of session-level support for valid-time

> **See Also:** *Oracle Database Development Guide* for more information about "Using Flashback Data Archive (Oracle Temporal)"

This chapter contains the following topics:

Using DBMS_FLASHBACK_ARCHIVE

Overview

Flashback Data Archive (FDA) provides strict protection on the internal history tables that it creates and maintains for users.

The read-only semantics prohibit users, including a DBA, from doing updates, deletes, and inserts on the Flashback Data Archive internal history tables. Users are also prevented from issuing any DDL statements on these tables. This strict security enforcement helps meet the requirements of applications in regulatory / compliance environments. Flashback Data Archive supports most common DDL statements, including those that alter the table definition or incur data movement. However, some DDL statements are not supported on Flashback Data Archive-enabled tables. Since most application schemas are modified during application software upgrades, the ability to perform DDL operations on tracked tables is critical.

To support schema evolution during application upgrades and other table maintenance tasks that require use of DDL statements not supported by Flashback Data Archive, the `DBMS_FLASHBACK_ARCHIVE` package provides a set of simple-to-use PL/SQL procedures:

- To disassociate a Flashback Data Archive enabled base table from the underlying FDA
- To reassociate a temporarily disassociated base table with its underlying FDA

After a user has disassociated the base table from its FDA, it's possible to issue any DDL statements on the base table or the history tables in the FDA. Having finished with the schema changes, the user can then reassociate the base table with its FDA so that Flashback Data Archive protection is in operation and automatic tracking and archiving is resumed.

Security Model

Users need the `FLASHBACK_ARCHIVE_ADMINISTER` privilege to import user-generated history, to set context level, and to tamper-proof tables. After a table is disassociated, users can perform DDL and DML statements on the table if they have the necessary privileges. Enabling and disabling session-level Valid Time Temporal flashback needs no additional privileges.

Caution: Oracle cannot endorse compliance history of a table after the table is disassociated. Disassociating a table should only be done after consulting with Oracle Support.

Constants

The DBMS_FLASHBACK_ARCHIVE package uses the constants shown in Table 71–1.

Table 71–1 DBMS_FLASHBACK_ARCHIVE Constants

Constant	Type	Value	Description
NODROP	BINARY_INTEGER	1	Do not drop temporary history table
NOCOMMIT	BINARY_INTEGER	2	Do not commit transaction
NODELETE	BINARY_INTEGER	4	Do not delete data in history table

Summary of DBMS_FLASHBACK_ARCHIVE Subprograms

Table 71–2 DBMS_FLASHBACK_ARCHIVE Package Subprograms

Subprogram	Description
ADD_TABLE_TO_ APPLICATION Procedure on page 71-7	Takes an application name and adds a table to the application as a security table
CREATE_TEMP_HISTORY_ TABLE Procedure on page 71-8	Creates a table called `TEMP_HISTORY` with the correct definition in schema
DISABLE_APPLICATION Procedure on page 71-9	Takes an application name and marks a table in it as a security table
DISABLE_ASOF_VALID_ TIME Procedure on page 71-10	Disables session level valid-time flashback
DISASSOCIATE_FBA Procedure on page 71-11	Disassociates the given table from the flashback data archive
DROP_APPLICATION Procedure on page 71-12	Takes an application name and removes it from the list of applications
ENABLE_APPLICATION Procedure on page 71-13	Takes an application name and enables Flashback Data Archive on all the security tables for this application
ENABLE_AT_VALID_TIME Procedure on page 71-14	Enables session level valid time flashback
EXTEND_MAPPINGS Procedure on page 71-15	Extends time mappings to times in the past
GET_SYS_CONTEXT Function on page 71-16	Gets the context previously selected by the SET_CONTEXT_ LEVEL Procedure
IMPORT_HISTORY Procedure on page 71-17	Imports history from a table called `TEMP_HISTORY` in the given schema
LOCK_DOWN_ APPLICATION Procedure on page 71-18	Takes an application name and makes all the security tables read-only. The group called `SYSTEM` cannot be locked
PURGE_CONTEXT Procedure on page 71-19	Purges the context to be saved selected by the SET_CONTEXT_ LEVEL Procedure
REASSOCIATE_FBA Procedure on page 71-20	Reassociates the given table with the flashback data archive
REGISTER_APPLICATION Procedure on page 71-21	Takes an application name and optionally a Flashback Data Archive, and registers an application for database hardening
REMOVE_TABLE_FROM_ APPLICATION Procedure on page 71-22	Takes an application name and marks a table in it as no longer being a security table
SET_CONTEXT_LEVEL Procedure on page 71-23	Defines how much of the user context is to be saved

ADD_TABLE_TO_APPLICATION Procedure

This procedure takes an application name and adds a table to the application as a security table. If the application is enabled for Flashback Data Archive, then this table will also be enabled for Flashback Data Archive.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.ADD_TABLE_TO_APPLICATION (
   application_name           IN   VARCHAR2,
   table_name                 IN   VARCHAR2,
   schema_name                IN   VARCHAR2 := NULL);
```

Parameters

Table 71–3 ADD_TABLE_TO_APPLICATION Procedure Parameters

Parameter	Description
application_name	Name of the application for which a table has been added as a security table
table_name	Name of the table to add as a security table for the given application
schema_name	Name of the schema containing the desired table. If no schema name is specified, the current schema is used.

CREATE_TEMP_HISTORY_TABLE Procedure

This procedure creates a table called TEMP_HISTORY with the correct definition in schema.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.CREATE_TEMP_HISTORY_TABLE (
   owner_name1      IN   VARCHAR2,
   table_name1      IN   VARCHAR2);
```

Parameters

Table 71–4 CREATE_TEMP_HISTORY_TABLE Procedure Parameters

Parameter	Description
owner_name1	Schema of the Flashback Data Archive-enabled table
table_name1	Name of the Flashback Data Archive-enabled table

DISABLE_APPLICATION Procedure

This procedure takes an application name and disables Flashback Data Archive on all of its security tables.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.DISABLE_APPLICATION (
   application_name           IN   VARCHAR2);
```

Parameters

Table 71–5 DISABLE_APPLICATION Procedure Parameters

Parameter	Description
application_name	Name of the application whose security tables will be disabled for Flashback Data Archive

DISABLE_ASOF_VALID_TIME Procedure

This procedure disables session level valid-time flashback.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.DISABLE_ASOF_VALID_TIME;
```

DISASSOCIATE_FBA Procedure

This procedure disassociates the given table from the flashback data archive.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.DISASSOCIATE_FBA (
   owner_name     IN    VARCHAR2,
   table_name     IN    VARCHAR2);
```

Parameters

Table 71–6 DISASSOCIATE_FBA Procedure Parameters

Parameter	Description
owner_name	Schema of the Flashback Data Archive enabled base table
table_name	Name of the Flashback Data Archive enabled base table

Exceptions

Table 71–7 DISASSOCIATE_FBA Procedure Exceptions

Parameter	Description
ORA-55602	User table is not enabled for Flashback Data Archive
ORA-55634	Cannot acquire the lock on the table for disassociation

DROP_APPLICATION Procedure

This procedure takes an application name and removes it from the list of applications. As part of this procedure, Flashback Data Archive will be disabled on all security-enabled tables and all history data will be lost. The group called `SYSTEM` cannot be dropped.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.DROP_APPLICATION (
   application_name           IN   VARCHAR2);
```

Parameters

Table 71–8 DROP_APPLICATION Procedure Parameters

Parameter	Description
`application_name`	Name of the application for which a table has been added as a security table

ENABLE_APPLICATION Procedure

This procedure takes an application name and enables Flashback Data Archive on all the security tables for this application. Once an application is enabled, every change to an FDA enabled table will be tracked.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.ENABLE_APPLICATION (
   application_name           IN   VARCHAR2);
```

Parameters

Table 71–9 ENABLE_APPLICATION Procedure Parameters

Parameter	Description
application_name	Name of the application for which to enable Flashback Data Archive on all its security tables

ENABLE_AT_VALID_TIME Procedure

This procedure enables session level valid time flashback.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.ENABLE_AT_VALID_TIME (
   level          IN    VARCHAR2,
   query_time     IN    TIMESTAMP DEFAULT SYSTIMESTAMP);
```

Parameters

Table 71–10 ENABLE_AT_VALID_TIME Procedure Parameters

Parameter	Description
`level`	Options: ■ `All` - Sets the visibility of temporal data to the full table, which is the default temporal table visibility ■ `CURRENT` - Sets the visibility of temporal data to currently valid data within the valid time period at the session level ■ `ASOF` - Sets the visibility of temporal data to data valid as of the given time as defined by the timestamp
`query_time`	Used only if level is `ASOF`. Data which is valid at this `query_time` will only be shown.

EXTEND_MAPPINGS Procedure

This procedure extends time mappings to times in the past.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.EXTEND_MAPPINGS;
```

GET_SYS_CONTEXT Function

This function gets the context previously selected by the SET_CONTEXT_LEVEL Procedure.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.GET_SYS_CONTEXT (
   xid            IN   RAW,
   namespace      IN   VARCHAR2,
   parameter      IN   VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 71–11 GET_SYS_CONTEXT Function Parameters

Parameter	Description
`xid`	Transaction identifier is an opaque handle to a transaction obtained from the versions query
`namespace`	Namespace
`parameter`	If undefined, the subprogram returns `NULL`

IMPORT_HISTORY Procedure

This procedure is called after invoking the CREATE_TEMP_HISTORY_TABLE Procedure procedure, and after the TEMP_HISTORY table is populated with user-generated history data.

> **Caution:** Importing user-generated history can lead to inaccurate, or unreliable results. This procedure should only be used after consulting with Oracle Support.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.IMPORT_HISTORY (
   owner_name1          IN   VARCHAR2,
   table_name1          IN   VARCHAR2
   temp_history_name    IN   VARCHAR2 DEFAULT 'TEMP_HISTORY',
   options              IN   BINARY_INTEGER DEFAULT 0);
```

Parameters

Table 71–12 IMPORT_HISTORY Procedure Parameters

Parameter	Description
owner_name1	Schema of the Flashback Data Archive-enabled table
table_name1	Name of the Flashback Data Archive-enabled table
temp_history_name	Optional temporary history table from which we import history data
options	One (or a combination) of constants (NODROP, NOCOMMIT, and NODELETE) to specify if we want to drop, commit changes of, or truncate the temporary history table

Usage Notes

The database function TIMESTAMP_TO_SCN can be used to convert times to SCN when populating the temporary history table.

LOCK_DOWN_APPLICATION Procedure

This procedure takes an application name and makes all the security tables read-only. The group called `SYSTEM` cannot be locked.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.LOCK_DOWN_APPLICATION (
   application_name           IN   VARCHAR2);
```

Parameters

Table 71–13 LOCK_DOWN_APPLICATION Procedure Parameters

Parameter	Description
`application_name`	Name of the application for which a table has been added as a security table

PURGE_CONTEXT Procedure

This procedure purges the context to be saved selected by the SET_CONTEXT_LEVEL Procedure.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.PURGE_CONTEXT;
```

REASSOCIATE_FBA Procedure

This procedure reassociates the given table with the flashback data archive.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.REASSOCIATE_FBA (
   owner_name      VARCHAR2,
   table_name      VARCHAR2);
```

Parameters

Table 71–14 REASSOCIATE_FBA Procedure Parameters

Parameter	Description
owner_name	Schema of the Flashback Data Archive enabled base table
table_name	Name of the Flashback Data Archive enabled base table

Exceptions

Table 71–15 REASSOCIATE_FBA Procedure Exceptions

Parameter	Description
ORA-55602	User table is not enabled for Flashback Data Archive
ORA-55636	Table definition validation failed

Usage Notes

- The procedure will signal an error if the base table and the history table do not have identical data definitions. For example, when columns are added or table is split, the resulting base table and history table need to have the same schema.
- The FDA internal history table schema has some row versions metadata columns. The procedure will signal an error if any metadata column is dropped by users.

REGISTER_APPLICATION Procedure

This procedure takes an application name and optionally a Flashback Data Archive, and registers an application for database hardening. When database hardening is enabled, then all the security tables for that application are enabled for Flashback Data Archive using the given Flashback Data Archive. If no Flashback Data Archive is specified, the default Flashback Data Archive is used.

> **See Also:** Using Flashback Data Archive in *Oracle Database Development Guide* regarding database hardening

Syntax

```
DBMS_FLASHBACK_ARCHIVE.REGISTER_APPLICATION (
   application_name           IN   VARCHAR2,
   flashback_archive_name     IN    VARCHAR2 := NULL);
```

Parameters

Table 71–16 REGISTER_APPLICATION Procedure Parameters

Parameter	Description
`application_name`	Name of the application which is being registered. The application `SYSTEM` is already registered when the package is created and is populated with list of tables needed for database hardening.
`flashback_archive_name`	Name of the Flashback Data Archive in which the historical data for the security tables for given application is stored. If no Flashback Data Archive is specified, the default Flashback Data Archive is used.

REMOVE_TABLE_FROM_APPLICATION Procedure

This procedure takes an application name and marks a table in it as no longer being a security table. If the application is already enabled for Flashback Data Archive, Flashback Data Archive will be disabled for this table.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.REMOVE_TABLE_TO_APPLICATION (
   application_name           IN   VARCHAR2,
   table_name                 IN   VARCHAR2,
   schema_name                IN   VARCHAR2 := NULL);
```

Parameters

Table 71–17 REMOVE_TABLE_FROM_APPLICATION Procedure Parameters

Parameter	Description
application_name	Name of the application for which a table is being removed from the list of security tables
table_name	Name of the table to mark as being no longer a security table for the given application
schema_name	Name of the schema containing the desired table. If no schema name is specified, the current schema is used.

SET_CONTEXT_LEVEL Procedure

This procedure defines how much of the user context is to be saved.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.SET_CONTEXT_LEVEL (
   level          VARCHAR2);
```

Parameters

Table 71–18 SET_CONTEXT_LEVEL Procedure Parameters

Parameter	Description
`level`	Depending on how much of the user context needs to be saved: ■ `ALL` - the entire `SYS_CONTEXT` ■ `TYPICAL` - the user ID, global user ID and the hostname ■ `NONE` - nothing

72

DBMS_GOLDENGATE_AUTH

The DBMS_GOLDENGATE_AUTH package provides subprograms for granting privileges to and revoking privileges from GoldenGate administrators.

This chapter contains the following topic:

- Using DBMS_GOLDENGATE_AUTH
  - Overview
  - Security Model
- Summary of DBMS_GOLDENGATE_AUTH Subprograms

See Also: GRANT_ADMIN_PRIVILEGE Procedure on page 205-6 in the DBMS_XSTREAM_AUTH package

Using DBMS_GOLDENGATE_AUTH

This section contains topics which relate to using the `DBMS_GOLDENGATE_AUTH` package.

Overview

This package provides subprograms for granting privileges to GoldenGate administrators and revoking privileges from GoldenGate administrators. A GoldenGate administrator manages an integrated GoldenGate and XStream Out configuration.

GoldenGate administrators can be used in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

See Also:

- GRANT_ADMIN_PRIVILEGE Procedure on page 205-6 in the DBMS_XSTREAM_AUTH package
- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs

Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

Summary of DBMS_GOLDENGATE_AUTH Subprograms

Table 72–1 DBMS_GOLDENGATE_AUTH Package Subprograms

Subprogram	Description
GRANT_ADMIN_PRIVILEGE Procedure on page 72-6	Either grants the privileges needed by a user to be a GoldenGate administrator directly, or generates a script that grants these privileges
REVOKE_ADMIN_PRIVILEGE Procedure on page 72-10	Either revokes GoldenGate administrator privileges from a user directly, or generates a script that revokes these privileges

Note: All subprograms commit unless specified otherwise.

GRANT_ADMIN_PRIVILEGE Procedure

This procedure grants the privileges needed by a user to be a GoldenGate administrator.

See Also: GRANT_ADMIN_PRIVILEGE Procedure on page 205-6 in the DBMS_XSTREAM_AUTH package

Syntax

```
DBMS_GOLDENGATE_AUTH.GRANT_ADMIN_PRIVILEGE(
   grantee                     IN  VARCHAR2,
   privilege_type              IN  VARCHAR2  DEFAULT '*',
   grant_select_privileges     IN  BOOLEAN   DEFAULT TRUE,
   do_grants                   IN  BOOLEAN   DEFAULT TRUE,
   file_name                   IN  VARCHAR2  DEFAULT NULL,
   directory_name              IN  VARCHAR2  DEFAULT NULL
   grant_optional_privileges   IN  VARCHAR2  DEFAULT NULL,
   container                   IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 72–2 GRANT_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
grantee	The user to whom privileges are granted
privilege_type	Specify one of the following values: ■ CAPTURE Specifying CAPTURE grants the minimum privileges required by the user to administer Oracle GoldenGate integrated extract. ■ APPLY Specifying APPLY grants the minimum privileges required by the user to administer Oracle GoldenGate integrated replicat. ■ * Specifying * grants the minimum privileges required by the user to administer Oracle GoldenGate integrated extract and Oracle GoldenGate integrated replicat.
grant_select_privileges	If TRUE, then the procedure grants a set of privileges, including SELECT_CATALOG_ROLE, to the user. This setting is recommended for GoldenGate administrators. If FALSE, then the procedure does not grant the set of privileges to the user. SELECT_CATALOG_ROLE enables the user to select from the data dictionary.

Table 72–2 (Cont.) GRANT_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
do_grants	If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_GOLDENGATE_PRIVILEGES data dictionary view. If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fails, then the procedure raises an error. If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_GOLDENGATE_PRIVILEGES data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error. Note: It is recommended that do_grants be set to TRUE because many APIs check for the presence of a user in the DBA_GOLDENGATE_PRIVILEGES view, which will not be populated if do_grants is set to FALSE.
file_name	The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file. If NULL, then the procedure does not generate a file.
directory_name	The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.
grant_optional_privileges	A comma-separated list of optional privileges to grant to the grantee. You can specify the following roles and privileges: ■ XDBADMIN ■ DV_XSTREAM_ADMIN ■ DV_GOLDENGATE_ADMIN ■ EXEMPT_ACCESS_POLICY ■ EXEMPT_REDACTION_POLICY
container	If CURRENT, then grants privileges to the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB. If ALL, then grants privileges to the grantee in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root by a common user. If a container name, then grants privileges to the grantee only in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. **Note:** This parameter only applies to CDBs.

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The `RESTRICTED SESSION` system privilege
- `EXECUTE` on the following packages:
  - `DBMS_APPLY_ADM`
  - `DBMS_AQ`
  - `DBMS_AQADM`
  - `DBMS_AQIN`
  - `DBMS_AQELM`
  - `DBMS_CAPTURE_ADM`
  - `DBMS_FLASHBACK`
  - `DBMS_LOCK`
  - `DBMS_PROPAGATION_ADM`
  - `DBMS_RULE_ADM`
  - `DBMS_STREAMS_ADM`
  - `DBMS_STREAMS_ADVISOR_ADM`
  - `DBMS_STREAMS_HANDLER_ADM`
  - `DBMS_STREAMS_MESSAGING`
  - `DBMS_TRANSFORM`
  - `DBMS_XSTREAM_ADM`
- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  - Evaluation contexts
  - Rule sets
  - Rules

  In addition, the grantee can grant these privileges to other users.
- `SELECT_CATALOG_ROLE`
- `SELECT` or `READ` privilege on data dictionary views related to GoldenGate and Oracle Streams
- The ability to allow a remote GoldenGate administrator to perform administrative actions through a database link by connecting to the grantee

  This ability is enabled by running the `GRANT_REMOTE_ADMIN_ACCESS` procedure in this package.

Note: This procedure grants only the privileges necessary to configure and administer a GoldenGate environment. You can grant additional privileges to the grantee if necessary.

See Also: GRANT_ADMIN_PRIVILEGE Procedure on page 205-6 in the DBMS_XSTREAM_AUTH package

REVOKE_ADMIN_PRIVILEGE Procedure

This procedure revokes GoldenGate administrator privileges from a user.

Syntax

```
DBMS_GOLDENGATE_AUTH.REVOKE_ADMIN_PRIVILEGE(
   grantee                     IN  VARCHAR2,
   privilege_type              IN  VARCHAR2  DEFAULT '*',
   revoke_select_privileges    IN  BOOLEAN   DEFAULT FALSE,
   do_revokes                  IN  BOOLEAN   DEFAULT TRUE,
   file_name                   IN  VARCHAR2  DEFAULT NULL,
   directory_name              IN  VARCHAR2  DEFAULT NULL
   revoke_optional_privileges  IN  VARCHAR2  DEFAULT NULL,
   container                   IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 72–3 REVOKE_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
`grantee`	The user from whom privileges are revoked
`privilege_type`	Specify one of the following values: ■ `CAPTURE` Specifying `CAPTURE` revokes the minimum privileges required by the user to administer Oracle GoldenGate integrated extract. ■ `APPLY` Specifying `APPLY` revokes the minimum privileges required by the user to administer Oracle GoldenGate integrated replicat. ■ `*` Specifying `*` revokes the minimum privileges required by the user to administer Oracle GoldenGate integrated extract and Oracle GoldenGate integrated replicat.
`revoke_select_privileges`	If `TRUE`, then the procedure revokes `SELECT_CATALOG_ROLE` from the user. If `FALSE`, then the procedure does not revoke `SELECT_CATALOG_ROLE` to the user. `SELECT_CATALOG_ROLE` enables the user to select from the data dictionary.

Table 72–3 (Cont.) REVOKE_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
do_revokes	If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fails, then the procedure raises an error. A revoke statement fails if the user is not granted the privilege that is being revoked. If FALSE, then the procedure does not revoke the privileges from the specified user directly, and does not remove the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.
file_name	The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then the procedure does not generate a file.
directory_name	The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.
revoke_optional_privileges	A comma-separated list of optional privileges to revoke from the grantee, such as the DV_XSTREAM_ADMIN and DV_GOLDENGATE_ADMIN privileges
container	If CURRENT, then revokes privileges from the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB. If ALL, then revokes privileges from the grantee in all containers in the CDB. To specify ALL, the procedure must be invoked in the root. If a container name, then revokes privileges from the grantee only in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. **Note:** This parameter only applies to CDBs.

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT_ADMIN_PRIVILEGE procedure in this package.

> **See Also:** "GRANT_ADMIN_PRIVILEGE Procedure" on page 72-6

73

DBMS_FREQUENT_ITEMSET

The DBMS_FREQUENT_ITEMSET package enables frequent itemset counting. The two functions are identical except in the input cursor format difference.

This chapter contains the following topics:

Summary of DBMS_FREQUENT_ITEMSET Subprograms

Table 73–1 DBMS_FREQUENT_ITEMSET Package Subprograms

Subprogram	Description
FI_HORIZONTAL Function on page 73-3	Counts all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded
FI_TRANSACTIONAL Function on page 73-5	Counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded

FI_HORIZONTAL Function

The purpose of this table function is to count all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total transactions counted.

In 'HORIZONTAL' row format, each row contains all of the item ids for a single transaction. Since all of the items come together, no transaction id is necessary.

The benefit of this table function is that if an application already has data in horizontal format, the database can skip the step of transforming rows that are in transactional format into horizontal format.

Syntax

```
DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
   tranx_cursor         IN    SYSREFCURSOR,
   support_threshold    IN    NUMBER,
   itemset_length_min   IN    NUMBER,
   itemset_length_max   IN    NUMBER,
   including_items      IN    SYS_REFCURSOR DEFAULT NULL,
   excluding_items      IN    SYS_REFCURSOR DEFAULT NULL)
  RETURN TABLE OF ROW (
     itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
     support        NUMBER,
     length         NUMBER,
     total_tranx    NUMBER);
```

Parameters

Table 73–2 FI_HORIZONTAL Function Parameters

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. There is no limits on the number of returning columns.Each column of cursor represents an item. All columns of the cursor must be of the same datatype. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that are returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that are returned.The default is NULL.

Return Values

Table 73–3 FI_HORIZONTAL Return Values

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER.

Example

Suppose you have a table horiz_table_in.

```
horiz_table_in(iid1 VARCHAR2(30), iid2 VARCHAR2(30), iid3 VARCHAR2(30), iid4
VARCHAR2(30), iid5 VARCHAR2(30));
```

and the data in horiz_table_in looks as follows:

```
('apple', 'banana', NULL, NULL, NULL)
('apple', 'milk', 'banana', NULL, NULL)
('orange', NULL, NULL, NULL, NULL)
```

Suppose you want to find out what combinations of items is frequent with a given support threshold of 30%, requiring itemset containing at least one of ('apple','banana','orange'), but excluding any of ('milk') in any itemset. You use the following query:

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT)itemset, support, length, total_tranx
   FROM table(DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
                CURSOR(SELECT iid1, iid2, iid3, iid4, iid5
                         FROM horiz_table_in),
                0.3,
                2,
                5,
                CURSOR(SELECT * FROM table(FI_VARCHAR_NT
                                    ('apple','banana','orange'))),
                CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk')))));
```

FI_TRANSACTIONAL Function

This procedure counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total number of transactions.

In 'TRANSACTIONAL' row format, each transaction is spread across multiple rows. All the rows of a given transaction have the same transaction id, and each row has a different item id. Combining all of the item ids which share a given transaction id results in a single transaction.

Syntax

```
DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL (
   tranx_cursor         IN    SYSREFCURSOR,
   support_threshold    IN    NUMBER,
   itemset_length_min   IN    NUMBER,
   itemset_length_max   IN    NUMBER,
   including_items      IN    SYS_REFCURSOR DEFAULT NULL,
   excluding_items      IN    SYS_REFCURSOR DEFAULT NULL)
  RETURN TABLE OF ROW (
     itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
     support        NUMBER,
     length         NUMBER,
     total_tranx    NUMBER);
```

Parameters

Table 73–4 FI_TRANSACTIONAL Function Parameters

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. It should return two columns in its returning row, the first column being the transaction id, the second column being the item id. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that will be returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that will returned. The default is NULL.

Return Values

Table 73–5 FI_TRANSACTIONAL Return Values

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER, and will be the same for all returned rows, similar to a reporting aggregate.

Usage Notes

Applications must predefine a nested table type of the input item type and cast the output itemset into this predefined nested table type before further processing, such as loading into a table.

Examples

Suppose that the input table tranx_table_in looks as follows:

```
(1, 'apple')
(1, 'banana')
(2, 'apple')
(2, 'milk')
(2, 'banana')
(3, 'orange')
```

and the user is trying to find itemsets that satisfy a support-threshold of 60% and have the itemset-length greater than 1 (namely, (apple, banana)).

The output of this function would contain the following output row:

```
itemset=('apple','banana'), support=2, length=2, total_tranx=3
```

You need to create a nested table of item type before you submit a query to perform the frequent itemset counting. In this example, since item is of VARCHAR2(30), you must create a nested table of VARCHAR2(30):

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
   FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
                cursor(SELECT tid, iid FROM tranx_table_in),
                0.6,
                2,
                5,
                NULL,
                NULL));
```

Here is another example to illustrate how to include certain items and exclude certain items in the counting.

```
SELECT CAST(itemset as FI_VARCHAR_NT)itemset, support, length, total_tranx
   FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
                CURSOR(SELECT tid, iid FROM tranx_table_in),
```

```
              0.6,
              2,
              5,
             CURSOR(SELECT * FROM table(FI_VARCHAR_NT
                                        ('apple','banana','orange'))),
             CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));
```

Using the including/excluding items parameter, you are able to further optimize the execution by ignoring itemsets that are not expected by application.

You can also use transactional output through collection unnesting:

```
SELECT
  bt.setid, nt.*
FROM
(SELECT cast(Itemset as FI_VARCHAR_NT) itemset, rownum setid
 FROM table(
   DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
     CURSOR(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
     NULL, NULL))) bt,
table(bt.itemset) nt;
```

If you want to use an insert statement to load frequent itemsets into a nested table, it is better to use the `NESTED_TABLE_FAST_INSERT` hint for performance:

```
CREATE TABLE fq_nt (coll FI_VARCHAR_NT) NESTED TABLE coll STORE AS
  coll_nest;
INSERT /*+ NESTED_TABLE_FAST_INSERT */  INTO fq_nt
 SELECT cast(itemset as FI_VARCHAR_NT)
 FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
        NULL, NULL));
```

Note that if you want to use the package inside a PL/SQL cursor, you must cast the return type of the table function:

```
CREATE TYPE fi_res AS OBJECT (
  itemset      FI_VARCHAR_NT,
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER
);
/
CREATE TYPE fi_coll AS TABLE OF fi_res;
/

DECLARE
  cursor freqC is
    SELECT Itemset
    FROM table(
      CAST(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
        NULL, NULL) AS fi_coll));
  coll_nt  FI_VARCHAR_NT;
  num_rows int;
  num_itms int;
BEGIN
  num_rows := 0;
  num_itms := 0;
  OPEN freqC;
  LOOP
```

```
      FETCH freqC INTO coll_nt;
      EXIT WHEN freqC%NOTFOUND;
      num_rows := num_rows + 1;
      num_itms := num_itms + coll_nt.count;
    END LOOP;
  CLOSE freqC;
  DBMS_OUTPUT.PUT_LINE('Totally ' || num_rows || ' rows ' || num_itms || '
items were produced.');
END;
/
```

DBMS_HEAT_MAP

The DBMS_HEAT_MAP package provides an interface to externalize heatmaps at various levels of storage including block, extent, segment, object and tablespace. A second set of subprograms externalize the heatmaps materialized by the background for top N tablespaces.

See Also:

- Heat Map in *Oracle Database VLDB and Partitioning Guide*
- DBMS_ILM
- DBMS_ILM_ADMIN

This chapter contains the following topics:

Using DBMS_HEAT_MAP

Overview

To implement your ILM strategy, you can use Heat Map in Oracle Database to track data access and modification. You can also use Automatic Data Optimization (ADO) to automate the compression and movement of data between different tiers of storage within the database.

The Heat Map tracks modification times at the block level, and multiple access statistics at the segment level. Objects in the `SYSTEM` and `SYSAUX` tablespaces are not tracked. `DBMS_HEAT_MAP` gives you access to the Heat Map statistics at various levels - block, extent, segment, object, and tablespace.

Security Model

The execution privilege is granted to `PUBLIC`. Procedures in this package run under the caller security. The user must have `ANALYZE` privilege on the object.

Summary of DBMS_HEAT_MAP Subprograms

Table 74–1 DBMS_HEAT_MAP Package Subprograms

Subprogram	Description
BLOCK_HEAT_MAP Function on page 74-6	Returns last modification time for each block in a table segment
EXTENT_HEAT_MAP Function on page 74-7	Returns the extent level Heat Map statistics for a table segment
OBJECT_HEAT_MAP Function on page 74-8	Returns the minimum, maximum and average access times for all the segments belonging to the object
SEGMENT_HEAT_MAP Procedure on page 74-9	Returns the heatmap attributes for the given segment
TABLESPACE_HEAT_MAP Function on page 74-11	Returns the minimum, maximum and average access times for all the segments in the tablespace

BLOCK_HEAT_MAP Function

This table function returns the last modification time for each block in a table segment. It returns no information for segment types that are not data.

Syntax

```
DBMS_HEAT_MAP.BLOCK_HEAT_MAP (
   owner             IN VARCHAR2,
   segment_name      IN VARCHAR2,
   partition_name    IN VARCHAR2 DEFAULT NULL,
   sort_columnid     IN NUMBER DEFAULT NULL,
   sort_order        IN VARCHAR2 DEFAULT NULL)
RETURN hm_bls_row PIPELINED;
```

Parameters

Table 74–2 BLOCK_HEAT_MAP Function Parameters

Parameter	Description
`owner`	Owner of the segment
`segment_name`	Table name of a non-partitioned table or (sub)partition of partitioned table. Returns no rows when table name is specified for a partitioned table.
`partition_name`	Defaults to `NULL`. For a partitioned table, specify the partition or subpartition segment name.
`sort_columnid`	ID of the column on which to sort the output. Valid values 1..9. Invalid values are ignored.
`sort_order`	Defaults to `NULL`. Possible values: `ASC`, `DESC`

Return Values

Table 74–3 BLOCK_HEAT_MAP Function Return Values (Output Parameters)

Parameter	Description
`owner`	Owner of the segment
`segment_name`	Segment name of the non-partitioned table
`partition_name`	Partition or subpartition name
`tablespace_name`	Tablespace containing the segment
`file_id`	Absolute file number of the block in the segment
`relative_fno`	Relative file number of the block in the segment
`block_id`	Block number of the block
`write time`	Last modification time of the block

EXTENT_HEAT_MAP Function

This table function returns the extent level Heat Map statistics for a table segment. It returns no information for segment types that are not data. Aggregates at extent level, including minimum modification time and maximum modification time, are included.

Syntax

```
DBMS_HEAT_MAP.EXTENT_HEAT_MAP (
   owner             IN VARCHAR2,
   segment_name      IN VARCHAR2,
   partition_name    IN VARCHAR2 DEFAULT NULL,
RETURN hm_els_row PIPELINED;
```

Parameters

Table 74–4 EXTENT_HEAT_MAP Function Parameters

Parameter	Description
owner	Owner of the segment
segment_name	Table name of a non-partitioned table or (sub)partition of partitioned table. Returns no rows when table name is specified for a partitioned table.
partition_name	Defaults to NULL. For a partitioned table, specify the partition or subpartition segment name.

Return Values

Table 74–5 EXTENT_HEAT_MAP Function Return Values (Output Parameters)

Parameter	Description
owner	Owner of the segment
segment_name	Segment name of the non-partitioned table
partition_name	Partition or subpartition name
tablespace_name	Tablespace containing the segment
file_id	Absolute file number of the block in the segment
relative_fno	Relative file number of the block in the segment
block_id	Block number of the block
blocks	Number of blocks in the extent
bytes	Number of bytes in the extent
min_writetime	Minimum of last modification time of the block
max_writetime	Maximum of last modification time of the block
avg_writetime	Average of last modification time of the block

OBJECT_HEAT_MAP Function

This table function returns the minimum, maximum and average access times for all the segments belonging to the object. The object must be a table. The table function raises an error if called on object tables other than table.

Syntax

```
DBMS_HEAT_MAP.OBJECT_HEAT_MAP (
   object_owner      IN VARCHAR2,
   object_name       IN VARCHAR2)
 RETURN hm_object_table PIPELINED;
```

Parameters

Table 74–6 OBJECT_HEAT_MAP Function Parameters

Parameter	Description
object_owner	Tablespace containing the segment
object_name	Segment header relative file number

Return Values

Table 74–7 OBJECT_HEAT_MAP Function Return Values (Output Parameters)

Parameter	Description
segment_name	Name of the top level segment
partition_name	Name of the partition
tablespace_name	Name of the tablespace
segment_type	Type of segment as in DBA_SEGMENTS.SEGMENT_TYPE
segment_size	Segment size in bytes
min_writetime	Oldest write time for the segment
max_writetime	Latest write time for the segment
avg_writetime	Average write time for the segment
min_readtime	Oldest read time for the segment
max_readtime	Latest read time for the segment
avg_writetime	Average write time for the segment
min_lookuptime	Oldest index lookup time for the segment
max_lookuptime	Latest index lookup time for the segment
avg_lookuptime	Average index lookup time for the segment
min_ftstime	Oldest full table scan time for the segment
max_ftstime	Latest full table scan time for the segment
avg_ftstime	Average full table scan time for the segment

SEGMENT_HEAT_MAP Procedure

This procedure returns the heatmap attributes for the given segment.

Syntax

```
DBMS_HEAT_MAP.SEGMENT_HEAT_MAP (
   tablespace_id          IN  NUMBER,
   header_file            IN  NUMBER,
   header_block           IN  NUMBER,
   segment_objd           IN  NUMBER,
   min_writetime          OUT DATE,
   max_writetime          OUT DATE,
   avg_writetime          OUT DATE,
   min_readtime           OUT DATE,
   max_readtime           OUT DATE,
   avg_readtime           OUT DATE,
   min_lookuptime         OUT DATE,
   max_lookuptime         OUT DATE,
   avg_lookuptime         OUT DATE,
   min_ftstime            OUT DATE,
   max_ftstime            OUT DATE,
   avg_ftstime            OUT DATE);
```

Parameters

Table 74–8 SEGMENT_HEAT_MAP Procedure Parameters

Parameter	Description
tablespace_id	Tablespace containing the segment
header_file	Segment header relative file number
header_block	Segment header block number
segment_objd	DATAOBJ of the segment

Return Values

Table 74–9 SEGMENT_HEAT_MAP Procedure Return Values (Output Parameters)

Parameter	Description
min_writetime	Oldest write time for the segment
max_writetime	Latest write time for the segment
avg_writetime	Average write time for the segment
min_readtime	Oldest read time for the segment
max_readtime	Latest read time for the segment
avg_writetime	Average write time for the segment
min_lookuptime	Oldest index lookup time for the segment
max_lookuptime	Latest index lookup time for the segment
avg_lookuptime	Average index lookup time for the segment
min_ftstime	Oldest full table scan time for the segment
max_ftstime	Latest full table scan time for the segment

Table 74–9 (Cont.) SEGMENT_HEAT_MAP Procedure Return Values (Output Parameters)

Parameter	Description
avg_ftstime	Average full table scan time for the segment

TABLESPACE_HEAT_MAP Function

This table function returns the minimum, maximum and average access times for all the segments in the tablespace.

Syntax

```
DBMS_HEAT_MAP.TABLESPACE_HEAT_MAP (
    tablespace_name      IN VARCHAR2)
  RETURN hm_tablespace_table PIPELINED;
```

Parameters

Table 74–10 TABLESPACE_HEAT_MAP Procedure Parameters

Parameter	Description
tablespace_name	Name of the tablespace

Return Values

Table 74–11 TABLESPACE_HEAT_MAP Procedure Return Values (Output Parameters)

Parameter	Description
segment_count	Total number of segments in the tablespace
allocated_bytes	Space used by the segments in the tablespace
min_writetime	Oldest write time for the segment
max_writetime	Latest write time for the segment
avg_writetime	Average write time for the segment
min_readtime	Oldest read time for the segment
max_readtime	Latest read time for the segment
avg_writetime	Average write time for the segment
min_lookuptime	Oldest index lookup time for the segment
max_lookuptime	Latest index lookup time for the segment
avg_lookuptime	Average index lookup time for the segment
min_ftstime	Oldest full table scan time for the segment
max_ftstime	Latest full table scan time for the segment
avg_ftstime	Average full table scan time for the segment

75

DBMS_HM

This package contains constants and procedure declarations for health check management. Health Monitor provides facilities to run a check store and retrieve the reports through `DBMS_HM` package

> **See Also:** *Oracle Database Administrator's Guide* for more information about "Health Monitor"

This chapter contains the following topics:

Using DBMS_HM

Security Model

Users must have `EXECUTE` privilege to run the procedures of `DBMS_HM` package.

Summary of DBMS_HM Subprograms

Table 75–1 DBMS_HM Package Subprograms

Subprogram	Description
GET_RUN_REPORT Function on page 75-5	Returns the report for the specified checker run
RUN_CHECK Procedure on page 75-6	Runs the specified checker with the given arguments

GET_RUN_REPORT Function

This function returns the report for the specified checker run.

Syntax

```
DBMS_HM.GET_RUN_REPORT (
    run_name      IN  VARCHAR2,
    type           IN  VARCHAR2 := 'TEXT',
    level          IN  VARCHAR2 := 'BASIC',)
  RETURN CLOB;
```

Parameters

Table 75–2 GET_RUN_REPORT Function Parameters

Parameter	Description
`run_name`	Name of the check's run
`type`	Report format type. Possible values are `'HTML'`, `'XML'` and `'TEXT'`. Default report type is `'TEXT'`.
`level`	Details of report, possible value are `'BASIC'` and `'DETAIL'`. Caution: Currently only `'BASIC'` level is supported.

RUN_CHECK Procedure

This procedure runs the specified checker with the given arguments. It lets user to specify a name for the run, inputs needed and maximum timeout for the run. The run's report will be maintained persistently in database.

Syntax

```
DBMS_HM.RUN_CHECK (
   check_name     IN  VARCHAR2,
   run_name       IN  VARCHAR2 := NULL,
   timeout        IN  NUMBER := NULL,
   input_params   IN  VARCHAR2 := NULL);
```

Parameters

Table 75–3 RUN_CHECK Procedure Parameters

Parameter	Description
check_name	Name of the check to be invoked. Check names and their parameters can be accessed from the V$HM_CHECK and V$HM_CHECK_PARAM views. Users can run all checks which are not internal in nature: SELECT name FROM V$HM_CHECK WHERE INTERNAL_CHECK = 'N' retrieves the list of checks that can be run manually by users.
run_name	Name with which external users can uniquely identify this check's run. If NULL value is passed, then HM creates a unique name and associates with this check's run.
timeout	Maximum amount of time (in units of seconds), this checker run is allowed to run. HM will interrupt the run, if it the specified time elapses for the run. If NULL value is passed, HM doesn't impose any timeout limits on the run.
input_params	Input string: which consists of name, value pairs de-limited by a special character ';'. Example ('Data Block Integrity Check' invocation may take following type of input parameters. 'BLC_DF_NUM=1;BLC_BL_NUM=23456' Input parameters BLC_DF_NUM and BLC_BL_NUM have values '1' and '23456' respectively. Every check will have well defined set of inputs associated with it. These Input parameters, their types, default values and descriptions can be obtained using V$HM_CHECK_PARAM view. Example: The following query gets the list of parameters, their default values and descriptions for a 'Data Block Integrity Check' SELECT a.* FROM v$hm_check_param a, v$hm_check b WHERE a.check_id = b.id AND b.name = 'Data Block Integrity Check';

76

DBMS_HPROF

The `DBMS_HPROF` package provides an interface for profiling the execution of PL/SQL applications. It provides services for collecting the hierarchical profiler data, analyzing the raw profiler output and profiling information generation.

> **See Also:** *Oracle Database Development Guide* for more information about the "PL/SQL Hierarchical Profiler"

This chapter contains the following topic:

- Summary of DBMS_HPROF Subprograms

Summary of DBMS_HPROF Subprograms

This table list the package subprograms in alphabetical order.

Table 76–1 DBMS_HPROF Package Subprograms

Subprogram	Description
ANALYZE Function on page 76-3	Analyzes the raw profiler output and produces hierarchical profiler information in database tables
START_PROFILING Procedure on page 76-5	Starts hierarchical profiler data collection in the user's session
STOP_PROFILING Procedure on page 76-6	Stops profiler data collection in the user's session.s

ANALYZE Function

This function analyzes the raw profiler output and produces hierarchical profiler information in database tables.

Syntax

```
DBMS_HPROF.ANALYZE (
   location         VARCHAR2,
   filename         VARCHAR2,
   summary_mode     BOOLEAN     DEFAULT FALSE,
   trace            VARCHAR2    DEFAULT NULL,
   skip             PLS_INTEGER DEFAULT 0,
   collect          PLS_INTEGER DEFAULT NULL,
   run_comment      VARCHAR2    DEFAULT NULL)
  RETURN NUMBER;
```

Parameters

Table 76–2 ANALYZE Function Parameters

Parameter	Description
location	Name of a directory object. The raw profiler data file is read from the file system directory mapped to this directory object. Output files are also written to this directory.
filename	Name of the raw profiler data file to be analyzed. The file must exist in the directory specified by the location parameter.
summary_mode	By default (that is, when summary_mode is FALSE), the detailed analysis is done.When summary_mode is TRUE, only top-level summary information is generated into the database table.
trace	Analyze only the subtrees rooted at the specified trace entry. By default (when trace is NULL), the analysis/reporting is generated for the entire run. The trace entry must be specified in a special quoted qualified format (including the schema name, module name & function name) as in for example, '"SCOTT"."PKG"."FOO"' or '"".""."__plsql_vm"'. If multiple overloads exist for the specified name, all of them will be analyzed.
skip	Used only when trace is specified.Analyze only the subtrees rooted at the specified trace, but ignore the first skip invocations to trace. The default value for skip is 0.
collect	Used only when trace is specified. Analyze collect number of invocations of traces (starting from skip+1'th invocation). By default only 1 invocation is collected.
run_comment	User-provided comment for this run

Return Values

A unique run identifier for this run of the analyzer. This can then be used to look up the results corresponding to this run from the hierarchical profiler tables.

Usage Notes

- Use the `dbmshptab.sql` script located in the `rdbms/admin` directory to create the hierarchical profiler database tables and other data structures required for persistently storing the results of analyzing the raw profiler data.
- Running `dbmshptab.sql` drops the any previously created hierarchical profiler tables.

Examples

The following snippet installs the hierarchical profiler tables in HR schema.

```
connect HR/HR;
@?/rdbms/admin/dbmshptab.sql
```
