

Dual-Pricing Payments

Discover the benefits of this payment processing feature.

Cash or card, let your customers decide

iPOS Systems' dual pricing allows your customers to choose the payment method that's right for them. Some might want to save on their purchase by paying with cash, others might want to pay with a debit or credit card to earn extra rewards for a future purchase.

We do the heavy lifting for you

POS software that can be configured to accommodate dual pricing solutions needs calculations that can be complex. No matter what logic you want to apply to your dual pricing strategy, we can help you create the calculations in your iPOS instance.

Transparent pricing

Items are always displayed in dual pricing mode, with receipts showing cash-paying customers how much money they saved, and customers who pay with methods other than cash will see an MSRP or list price.

Worry-free pre-tax calculations

By referencing a built-in, itemized price list, the dual-pricing solution accurately calculates cash discounts and administers a preset discount to a merchant's suggested retail price enabling customers to view their pricing options and choose to pay with cash, debit or credit.

Dual pricing provides merchants with a flexible tool to adjust prices based on changing market conditions, consumer demands or competitive pressures. With dual pricing merchants gain a competitive edge and the ability to reduce their credit card processing fees, lower their overhead and increase cash flow.

It's all about the power of choice.
