Phishing resistant, hardware-based authentication for your AWS environment

The primary cause of hacking-related data breaches is compromised credentials. With the shift to work from anywhere / hybrid working, targeted cyber security attacks are on the rise. Strong multi-factor authentication (MFA) is proven to be the most effective way to stop account takeovers. But, not all MFA options are created equal—SMS codes and mobile authenticator apps are susceptible to modern cyber attacks, such as phishing, man-in-the-middle, and SIM swapping. Hardware-based authentication with the YubiKey offers the highest level of security, while also being easy to use. In fact, FIDO security keys like the YubiKey are proven to successfully combat phishing attacks 100% of the time.

The Yubico solution - authentication without compromise

Yubico, the inventor of the YubiKey, provides the highest assurance MFA security solution with a simple user experience that is proven to be 4x faster to login. The YubiKey enables secure authentication, encryption, code signing, and enables a single device to work across hundreds of applications and services. The YubiKey is available in a variety of form factors with a variety of connectors to work with your favorite devices.

YubiKeys proven to secure AWS customers

AWS Identity and Access Management (IAM) enables you to manage access to AWS services and resources securely. AWS IAM and root users can use their YubiKey as an MFA device to add an extra layer of protection on top of a username and password. YubiKeys allow customers to use the same key as the MFA device for multiple IAM and root users across AWS accounts. AWS Single Sign On service also supports WebAuthn to enable strongly attestable and phishing-resistant security across supported browsers using interoperable FIDO and FIDO2 authenticators like the YubiKey.

Whether your identity access management platform is AWS IAM, Okta, Ping, Duo, or another service, Yubico offers a secure authentication solution that meets you where you are on your Zero Trust, MFA, and passwordless journeys. Adding MFA for your AWS IAM users, AWS root users, and Amazon Cognito enhances your security posture right away and follows modern security best practices that effectively counter modern cyber threats.

Case study: Smartsheet

Challenges

Smartsheet needed to be FedRAMP compliant, which required securing infrastructure assets along with customer and federal data stored in the AWS cloud.

Solution

Smartsheet partnered with Anitian, and with Yubico's support, implemented YubiKeys as smart cards as well as FIDO U2F authenticators for the AWS Management Console to lock down their infrastructure. It provides quick, easy to use MFA for privileged and standard users.

Results

Embraced the framework, principles, and methodology to accelerate the ATO (Authority to Operate) process leveraging FIPS-validated YubiKeys.

Smartsheet became FedRAMP compliant in 60 days and offers convenient and flexible authentication for users with minimal training.
