DESCRIPTION AND APPLICATION OF COUNTRY CLASSIFICATION

1. BASIC NUMERICAL CODE

Annex I to this document sets out a numerical code designed for international use. Each item of the code identifies a country or territory of the world. These codes may also be considered as suitable for identifying nationality and currency. The adoption of this basic code will represent an important step in information transmission and in the standardization of material for data processing.

The basic numerical code consists of a three-digit number which serves to identify each country or territory uniquely. These numbers have been obtained by arranging the countries in alphabetical order, using their names in the English language, and assigning a number following this order. Intervals have been provided in the numerical sequence to allow for future development and extension of the list. The countries included, and the form of the country names used, are as specified in "Country Nomenclature for Statistical Use, Rev 7" (document of the Statistical Office of the United Nations), updated to July 1969.

2. BASIC UNIT OF CLASSIFICATION

The entities which have been coded in annex I relate to the geographic area of the countries and territories. The codes, however, can also be used in a broader sense to represent the customs area of a country, the unit employed for external trade purposes. This will not result in contradictory usage of the code since, in external trade, the associated country or territory does not exist as a separate entity. For example, code 250 which designates the geographic area of France can also be used to represent the customs area of France which includes Monaco; code 492 which designates the geographic area of Monaco has no application in the second instance. The customs

areas of the countries are defined in Customs Areas of the World (in press). Where for special purposes, however, component parts of a named entity are required, an elaboration of the three-digit code is necessary; this is discussed below (paragraph 6). As mentioned above, these codes can also be for nationality where appropriate and also for the main unit of national currency, e.g., 250 France can also indicate French nationality and the French franc or 504 Morocco - Moroccan and dirham.

It is expected that, although this classification of countries and territories is complete, there may be specialized entities which a user of this scheme will need to identify. Therefore, to meet this requirement the codes from 900 to 999 have not been allocated, thus reserving them for the user's own purposes. In any transmission of data using this coding scheme, a simple check for codes with a leading 9 would eliminate any non-standard code.

3. EXTENDED USE OF BASIC CLASSIFICATION

In order to obtain classifications of countries according to differing criteria, the three-digit code is designed to be expanded by the addition of a prefix. A prefix of one or more digits would indicate the characteristics of a country for classification purposes. Thus, with a two-digit prefix, the first or left-most digit of the prefix would indicate the first level or criteria of classification, the second digit representing subdivisions within the first. For example, the first digit of a prefix may represent classification by continent and the second a geographic region within the continent. However, further subdividing may not be possible although other groupings are still required. For instance, economic groupings are frequently needed which cut across geographic regions and even across continents. Also, it may be impractical in terms of the use of the computer storage to have prefixes made up of a great many digits.

4. TABLE LOOK-UP METHOD OF AGGREGATIONS AND GROUPING COUNTRIES

To overcome the above limitations, another method can be used to allocate a country's data to its appropriate grouping or aggregate. This is to have a table stored in the computer giving either the countries for each required grouping or defining the totals into which each country is to be aggregated. In operation this method works as follows. A piece of data is read and its country code is matched successively with items in a stored table of country codes. Finding a match, the data are allocated to the codes associated with the matching item. Here again, it is useful to have a prefix attached to the country code and since the aggregation or grouping uses the "total" three-digit code of 000, it is absolutely necessary to have such a prefix to differentiate between totals. The difference from the previous use of the prefix is that the prefix does not have to contain all the information about the country to whose code it is attached. The value of the prefixes in this instance lies primarily in sequencing the data, such that, upon printing the total will be followed or preceded by the elements that went to make it up. Also there need be no correspondence between the prefix used for the country and that used for the total. The great advantage of this method is that a country can be put into an unlimited number of aggregations and not restricted to those defined by the number of digits of a prefix.

An illustration of a classification based on this method of coding is given in annex II. This example indicates the way in which the Statistical Office of the United Nations has constructed a general classification for the purposes of tabulating external trade. In order to present a fully comprehensive example, annex III shows a slightly modified version of the trade classification which is suitable for industrial and national accounts statistics. It should be noted the three-digit codes are never modified or changed, all the additional requirements being handled by prefixes and suffixes.

5. ALTERNATIVE METHOD OF AGGREGATING AND GROUPING COUNTRIES

Where a less complex classification is called for such as the regional breakdown within continent only, the procedure for forming aggregations or groupings is more direct and simpler. In this case, a masking process which replaces successive digits of the prefixes to the three-digit code by **zeros** starting from the rightmost, automatically creates a coded group total. As an example, if we take the country Algeria coded 012 (see annex I), we could attach a prefix 13 giving the code 13012. The 1 of the prefix signifies the over-all group, Africa, the 3 a subdivision of Africa - North Africa. The code immediately defines Algeria as a part of North Africa within the major group, Africa. Should we wish to aggregate data such that we have totals for the countries of North Africa, for Africa and for the world, there is a very easy computer method which can be used. We take a country and create from its code a new code in which the prefix remains and the three-digit code is replaced by three zeros e.g., 13000 from Algeria's 13012. If we do this to every country in North Africa, we will have several identically coded elements which, upon being summed, form a total for North Africa. Taking it a stage further, we could replace the rightmost digit of the prefix with a zero and thus create the code for Africa of 10000. The final stage of replacing the first digit of the prefix by zero gives the code for a world total of 00000.

6. CODING OF SUBDIVISIONS OF BASIC UNIT

For many purposes, statistical and otherwise, the component parts of a geographic entity are considered rather than the entity itself. In such cases a suffix may be added to the right of the three-digit country code with the object of subdividing the basic unit into regions or districts. In this context the composition of the United Kingdom, whose code is 826, could be identified as follows: Channel Islands, 8261, England and Wales, 8262, Isle of Man, 8263, Northern Ireland, 8264, Scotland, 8265. The three-digit code for the basic unit would take the suffix 0 in such cases.

It can be seen that any number of variations are possible with regard to the groupings and aggregations that can be created. However, it is imperative that in all usages the basic three-digit country code be kept constant.

It should be noted that, although there is a code for the Union of Soviet Socialist Republics, the Byelorussian Soviet Socialist Republic and the Ukrainian Soviet Socialist Republic are also included. This is to meet the United Nations requirement of having codes for all Member States, although for all other purposes the Union of Soviet Socialist Republics includes both of these Republics. It should therefore be noted that where the Byelorussian Soviet Socialist Republic and the Ukrainian Soviet Socialist Republic are used, the code for the Union of Soviet Socialist Republics is understood to exclude those two Republics.

7. ALPHABETIC COUNTRY CODES

No attempt has been made to give a standardized alphabetic country code which might be used instead of the purely numeric code. The reasons for this are, first, for internal usage in the computer, the representation of alphabetic characters requires more space in the present third-generation computers than the representation of a numeric code of an equivalent number of digits. Secondly, for coding input into the computer, certain alphabetic characters can be easily confused with numeric digits (e.g., I J L O P Q S Z), and since most data to be coded will be of the numeric kind, the intermingling of these alphabetic characters would lead to many input errors. The elimination of these characters is therefore necessary but it also results in the loss of one of the main advantages of alphabetic codes, the mnemonic capability, that is, the ready association of a group of letters with the word they stand for, in this case the country name. This mnemonic capability is extremely difficult to attain with less than three characters.

However, on output, some conversion is obviously required from purely numeric codes to a form that can be recognized

immediately by everyone. This output form has to be made up of alphabetic characters, although it does not in any sense constitute a code. The full country name could be used but space limitations in printing output from the computer will necessitate some abbreviation of most country name. To bring about standardization of these abbreviations, there are set out in annex IV three sets of abbreviated English country names using 4, 8 and 12 characters, respectively. Annex V gives the corresponding names and abbreviations in the French language.

It is hoped that one or other of these abbreviations will be used wherever possible in printed output from the computer.

ANNEX I

United Nations Numerical Country Code
Three-digit code

000	Total
004	Afghanistan
008	Albania
012	Algeria
016	American Samoa
020	Andorra
024	Angola
028	Antigua
032	Argentina
036	Australia
040	Austria
044	Bahamas
048	Bahrain
052	Barbados
056	Belgium
